Heavy-oil burner. DECIO PIZZI. Ger. 516,567, Nov. 6, 1929 Details of construction are given

Heat exchanger. HANS SIMMON Ger 519,054, Aug 19, 1925 See Austrian 113,190 (*C. A* 23, 4109)

Heat exchanger, especially for steam generator. SCHMIDT'SCHE HEISSDAMPF-GES M. B H. Ger 519,056, Sept. 28, 1928.

Tubular heat-exchange apparatus. R. MORTON & CO., LTD., and P. ROBINSON. Brit. 339,869-70, Feb 7, 1930 Structural features

Apparatus for heating by means of gaseous or liquid fuel with recirculation of the active gases and elimination of the inert gases. PAUL G LINKE. Fr 696,346, May 31, 1930

Heat-transmission tubes for chemical apparatus. ROYAL BAKING POWDER CO. Ger 519,047, May 16, 1928. Brit. 311,092 (*C. A* 24, 534)

Control system for regulating the supply of fuel such as gas to boiler furnaces in accord with pressure variations. THOMAS A PEEBLES (to John M. Hopwood). U. S. 1,797,586, March 24. Structural features.

Prewarming and cooling apparatus for annealing pots. AKT.-GES. BROWN, BOVERI & CIE Ger 519,330, May 20, 1930.

Electric heater for liquids. EGERTON R. CASE. U. S 1,797,520, March 24 Structural features.

Electric water heater. A LOW & SONS, LTD., and D. W LOW. Brit. 339,734, Oct. 24, 1929 Structural features

Electric water heater. THOMAS B. ALLARDICE U. S 1,797,749, March 24.

Acid proofing. PAUL ASKENASY Ger. 516,745, Dec. 6, 1929 The rotating parts of centrifuges, etc., are rendered acid proof by coating with hard Pb contg Hg

Apparatus for evaporating brine, etc. PAUL H. MÜLLER. Ger 519,123, Aug 13, 1925

Apparatus for making foam. GEORGE M. THOMSON Ger 521,183, Feb. 8, 1928 See Brit. 299,242 (*C. A* 23, 3132).

Moisture-condensing device. CHARLES W. ARMBRUST (to International Life Saving Water Making Cup Corp.) U. S 1,797,894, March 24 Various details are described of a device "for condensing the moisture from exhaled breath," having for its stated object "the provision of a life-saving cup which will collect the moisture from the breath and condense it as pure water for and during emergency, as in shipwreck, or on the sea, or in desert places, without fresh water"

Cooling-tower. K. W BRANCZIK. Brit. 340,127, Dec 16, 1929

Precision casting machine. FRIEDRICH J. HAAS. Ger 521,387, Feb 13, 1926

Die-casting machine for artificial material. INTERNATIONAL METALL A.-G. Ger. 517,510, Mar. 25, 1928.

Device for removing the cores of castings. SIEMENS-SCHUCKERTWERKE A.-G. Ger. 517,781, Dec. 15, 1928.

Apparatus for electroösmotic purification of liquids such as water. SIEMENS-ELEKTRO OSMOSE GES. Brit. 339,673, Sept. 7, 1929. Structural features and various details of operation are described.

Apparatus for evaporating corrosive solutions such as caustic soda. R. M. WINTER and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 339,657, June 14, 1929. The liquid to be evapd. is passed as a film over a surface heated directly or indirectly by radiation from one or more incandescent plates arranged parallel to the surface. The plates may be formed as described in Brit. 25,808 of 1909 or consist of a metal plate supporting an alundum plate carrying granules of magnesia or the like. Various details of construction are described.

Lubricated rotary plug valve for fluids destructive to the lubricant. S. J. NORDSTROM (to Merco Nordstrom Valve Co.). Brit. 339,889, Feb. 26, 1929. Structural features.

Apparatus for grading tea or other materials by the action of air currents. W. G. FIRMAN. Brit. 339,758, Nov. 14, 1929. Various structural details are described.

Heated vacuum container with stirring device for mixing materials such as graphite and bearing metals. ERNST MEIER (to Braunschweiger Huttenwerk G. m. b. H.). U. S. 1,797,992, March 24. Structural features.

Mixing and emulsifying apparatus of the cylinder and plunger type. W. J. DAVY. Brit. 339,751, Nov. 8, 1929. Structural features.

Apparatus for testing the tensile strength of flexible materials. ALFRED SCHOPPER (to the firm of Louis Schopper). U. S. 1,797,734, March 24. Structural details of a gas inflation testing app. are described.

Apparatus and mode of operation for classifying sand or other powdered materials by aqueous suspension and centrifugal and gravity separation. L. ANDREWS. Brit. 340,027, Sept. 19, 1929.

Surface condenser. INGERSOLL-RAND CO. Ger. 520,462, Nov. 17, 1928. See Brit. 302,347 (*C. A.* 23, 4109).

Containers for storing gases or liquids under pressure. ALEXANDER BELDIMANO. Ger. 517,917, June 27, 1928.

Carbide agitator for acetylene generators. HERBERT G. IRWIN. U. S. 1,797,264, March 24. Structural features.

Acetylene generator. CARL KEEL. Fr. 695,278, May 7, 1930.

Acetylene generator. I. G. FARBENIND. A.-G. Fr. 696,359, May 31, 1930.

Thermoelectro-responsive device suitable for control of switches, etc. HERBERT E. RUPP (to Ohio Brass Co.). U. S. 1,797,369, March 24. Structural and elec. features. U. S. 1,797,370 describes a thermostatic elec. circuit control device.

Bimetallic thermostatic electric switch or cut-out. FELTEN & GUILLEAUME A.-G. Brit. 339,705, Sept. 6, 1929. Structural details.

Thermostatic device for control of electric circuits. ADOLPH A. THOMAS. U. S. 1,797,886, March 24. Structural features.

Thermostatic control device for gas fed to burners. OTTO FOX and WILLET E. STARK (to Bryant Heater and Mfg. Co.). U. S. 1,797,571, March 24. Structural features.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Harley James Morrison. A. S. RICHARDSON. *Ind. Eng. Chem.* 23, 594(1931).—Biography with portrait. G. G.

Karl Seubert's eightieth birthday, April 6, 1931. WILHELM BILTZ. *Z. angew. Chem.* 44, 269(1931).—Biographical note with portrait. E. H.

A reaction-velocity experiment. JACK P. MONTGOMERY *J Chem. Education* 8, 940(1931) —For class-room demonstration, the course of the acid hydrolysis of sucrose is followed by the change in sp gr of the soln., measured by a Westphal balance. E. H.

The specific gravity and the vapor pressure of concentrated sea water from 0° to 175°. K. HIGASHI, K. NAKAMURA AND R. HARA *J. Soc. Chem. Ind Japan* 34, Suppl binding 72(1931) —The sp gr and the vapor pressure of sea water at concns. from normal to satd NaCl and at temps. from 0° to 175° were detd V. F. H.

Nomography. OTTO LIESCHE. *Chem Fabrik* 1931, 122.—The chart shows change in % with changing wt. during evapn. and drying J H. MOORE

Addendum to the Utrecht radiation and temperature measurements on the measurement of a black body by means of the gold point. L. S. ORNSTEIN, D VERMEULEN AND J. WOUDA *Proc Acad Sci Amsterdam* 33, 985–9(1930) —Temps. of W lamp filament were measured with a calibrated thermopile and an optical pyrometer, and the space distribution and emission coeff calcd. To connect these measurements with the international scale a black body of Ni was inserted in a tube furnace. Just in front of this was placed a Pt-PtRh thermoelement clamped together with a small piece of very pure Au The temp was measured simultaneously with the thermoelement and a pyrometer, the interruption of the thermal current giving the m. p of the Au. GREGG M. EVANS

Theory of optical pyrometers and a description of several new improvements. S. HELD *Chaleur et ind* 11, 473–80(1930). cf *C. A.* 25, 1414 —Standardization, the action of selective filters, the transmission factor with a selective filter, an interpolation formula for selective filters, conditions for the use of optical pyrometers, calcn. of the temp of a black body as compared with a non-black body, a practical formula for measuring black body temp., measurement of the temp of a non-black body with selective screens and the possibilities of error, are treated mathematically and graphically S. L. B ETHERTON

Radiation pyrometry. E. L. FIDGE. *Chem. Eng Mining Rev* 23, 189–94(1931).—The application and use of radiation pyrometers in industry and lab. research are discussed. F. D. ROSSINI

Methods of measurement with the thermionic tube. ERNESTO DENINA *Atti III congresso naz chim pura applicata* 1930, 402–13 —The application of the thermionic vacuum tube to problems of phys. chemistry and electrochemistry is described

to the free energy change A correlation is claimed between the order of increasing free energy change and the order of increasing abundance of the element formed
J B AUSTIN

The new element rhenium. WILHELM FEIT. *Ind Eng Chem, News Ed.* 9, No 8, 122(1931) —Descriptive. E J. C.

Atomic weight of dvi-manganese (rhenium). J G F DRUCE *Science Progress* 25, 499–500(1931), cf *C A* 25, 2031 —A review of detns of this at. wt by various investigators The value 186 31 ± 0 02 is accepted as the most accurate J S H

Investigations for the concentration and isolation of the element having atomic number 61. L ROLLA *Atti accad Lincei* 12, 270–2(1930) —A review of work done to date in attempting to isolate element 61 from a large sample of com didymium, contg considerable Ce A W. CONTIERI

Statistic evaluation of the energy of interaction of a coulomb and a molecule. L. GOLDSTEIN *Compt rend* 191, 606–8(1930) —Math. GREGG M EVANS

Some aspects of the problem of molecular structure. JAMES KENNER *Rept Australian Assoc Advancement Sci* 18, 132 55(1926)(published in *Sydney Univ Reprints Ser* III, 1, Nos 45–61) —A presidential address before the Australian Assoc. Adv Sci 18, Sect B(1926) A general review C E P JEFFREYS

The physical identity of enantiomers. ALAN N CAMPBELL AND FREDERICK C. GARROW *Trans Faraday Soc* 26, 500–4(1930), cf *C. A* 24, 1000 —Extremely pure *d*- and *l*-mandelic acids are shown to differ slightly but distinctly in m p, rotatory power, rotatory dispersion and soly The hypothesis is proposed that enantiomers are not physically identical A P SACHS

Symmetric spherical oscillator and the rotational motion of homeopolar molecules in crystals. T E STERN *Proc Roy Soc* (London) A130, 551–7(1931) —A treatment of a homeopolar mol of type $X_4$ free to rotate in a field of force of axial symmetry is developed The method is more rigorous than that of Pauling (*C A* 24, 5558) and more extensive It is concluded that rotation occurs if $T$ is greater than $2V_0/k$ and that oscillation occurs if $T$ is less than $2V_0/k$, wherein $T$ is the temp, $k$ Boltzmann's const and $V_0$ the potential function defined by $P$ Thus two cases are distinguished, one of rotation and one of oscillation WILLIAM E VAUGHAN

Studies on coördination. III. The energy of coördination. F. J. GARRICK *Phil Mag* 11, 741–4(1931), cf *C A* 24, 2924, 5578 —The energy of coordination is the min potential energy ($\phi$) or the max energy evolved on formation of complex ion Values of $\phi$ calcd for Zn, Fe, and Mn as $MCl_2 6NH_3$ by the Born theory of lattice energy agree with those calcd by the previous method Data for calcns on hydrates are lacking ARTHUR FLEISCHER

The deformability of ions. R BRDIČKA *Chem Listy* 24, 374–9, 398–403(1930) — The Fajan's theory is used to explain many phys phenomena and chem properties, the theory remains on a qual basis but embodies a phys concept of atoms and ions The theory cannot be used to explain the color of salts as an absorption of visible radiations due to deformed anions, for the electronic system of cations also absorb in this range Adsorption may be associated with the deformability of ions the adsorption depends upon the potential at the interface of two phases The potential originates in the Helmholtz double layer and depends upon the distance between the opposite charges in the layer The more deformable ions permit a close approach of the electrons in a shell and force the pos layer to approach the neg layer This increases the adsorption potential and consequently the adsorption FRANK MARSH

Surface tension in a magnetic field. HERMANN AUER *Z Physik* 66, 224–8 (1930) —No effect of a magnetic field of 20,000 gausses could be detected within the accuracy of the expts ($10^{-4}$–$10^{-5}$) GREGG M EVANS

Concentrated space charge (polarization) in calcite. A JOFFE, D ROYANSKII AND K SINELNIKOV *Z Physik* 66, 143–71(1930) —The variation of space charge in the thin cathode layer was measured and expressed as the capacity of an equiv condenser The field at the cathode is so strong that a drop of Hg is flattened when used as an electrode Measurements were made of (1) current with const p d, (2) potential with const current and (3) residual current always reached as a min (in reality a leakage current of the condenser) The capacity was, in general, higher parallel to the $Z$-axis than at right angles to it, but was unchanged with time The cond increased logarithmically with temp The behavior of the different crystals and electrodes was individual The space charge leaked away, even when no imposed current was passing, but took months for complete leakage at room temp The concn of space charge in calcite crystals in these cathode layers is attributed to impurities in the crystal
GREGG M EVANS

**Electrical conductivity and high voltage polarization of saltpeter crystals.** Boris Hochberg and Valentine Joffe. *Z Physik* 66, 172–91(1930), cf preceding abstr — The $NaNO_3$ crystal was made from a melt The ratio of polarization e. m. f. to that imposed decreased with increase in temp and imposed e m f The space charge is coned in thin layers at *both* electrodes and is attributed to impurities, since the polarization decreases with increased purity of the crystal Grego M Evans

***Thermomagnetic study of some anhydrous compounds of cobalt and nickel.*** B Cabrera and A Duperier *Anales soc espaü fis quím* 29, 5–14(1931) —The thermic variation of magnetic susceptibility of some Co and Ni compds was detd by the Faraday method of electrodynamic compensation $CoSO_4$ and $CoF_2$ obey the Curie-Weiss law $NiF_2$ and $NiBr_2$ obey this law, but $NiSO_4$ show such wide deviations from the linear function that a transformation of the cation at 280° is possible, raising the magnetic moment 2 units However, the deviations for $NiCl_2$ do not permit such a conclusion Perhaps here the equation $(\chi + K)(T + \Delta) = C$ is applicable, where $\chi$ = sp susceptibility of the salt and $K$ the app const F M Symmes

**Molar refraction of methanol. I. Influence of concentration of solution in a non-polar substance.** M Velasco *Anales soc espaü fis quím* 29, 15–20(1931), cf preceding abstr —The molar refractions of many solns of MeOH in $C_6H_6$ were detd, showing that there is no effect of conen on molar refraction The bond between the *dipoles of MeOH due to assocn does not modify the forces that act on the peripheral* electrons of atoms constituting the mol E M Symmes

**Dependence of the magnetic properties of the cobalt-chromium mixed crystals upon the temperature.** Franz Wever and Heinrich Lange *Mitt Kaiser-Wilhelm Inst Eisenforsch Düsseldorf* 12, 353–63(1930) —A series of Co-Cr alloys, in which the Cr content varied from 0 to 20%, was prepd from exceptionally pure materials The magnetic properties of these alloys were studied over a wide range of temps with special attention to the region of the Co-rich mixed crystals A description is given of the *astatic magnetometer* which was developed for this investigation and which proved to be very well adapted to tracing magnetization curves under unfavorable circumstances. The results are presented in a series of curves from which a no of conclusions are drawn The polymorphic transformation of the Co-Cr mixed crystals shows an exceedingly large temp hysteresis In addn. to the retarding action of the Cr this seems to be due to the small energy difference between the types of crystal lattice when both are in equil at the temp of transformation For both the modifications of the Co-Cr mixed crystals there is always a sp temp conen line for the loss of magnetic properties These lines are very nearly parallel to each other. This confirms Heisenberg's deductions according to which the sepn of the atoms and the coördination no det. the magnetic behavior. The absence of sharp breaks in the equil curves for the polymorphic transformation again confirms the idea that the magnetic transformation is not to be considered as a phase transformation in the sense of the phase rule, W. W Stifler

**Change of the magnetic moment of nitric oxide with temperature.** E. C. Wiersma, W. J. de Haas and W H. Capel *Proc Acad Sci Amsterdam* 33, 1119–24(1930) — The susceptibility of NO was measured in terms of the forces exerted on a small, evacuated glass bulb, placed in a non uniform magnetic field, when surrounded by NO and by $N_2$, resp The diamagnetism of $N_2$ was assumed to be independent of the temp The results range from $\chi \times 10^6 = 49.07$ at 292.1°K to 87.32 at 112.8°K, and the agreement with the predictions of van Vleck's theory is excellent. W. W. Stifler

***The magnetization-temperature curves of iron, cobalt and nickel.*** F. Tyler *Phil. Mag* [7], 11, 596–602(1931), cf *C A*. 24, 4218 —The curves for $\sigma/\sigma_0$ against $T/\theta$ are almost identical for Fe, Co and Ni They are definitely incompatible with the classical curve and with quantum curves for $j$ greater than, or equal to, 1. There is close agreement when $j = 1/2$ The electron spin is to be regarded as the fundamental magnetic element operative for Ni, Fe and Co The value of $j = 1/2$ means that electron spins are independent and that there is a tan $h$ distribution The electrons are not free but assocd with ions as in Heisenberg's theory Arthur Fleischer

**Anomalous diamagnetism and crystal structure.** V. I. Vaidyanathan. *Indian J. Physics* 5, 659–72(1930).—The anomalous diamagnetism of graphite, Bi, and Sb was found to be diminished on mech. colloidalization The decrease for graphite was *greater than for the other two Single natural crystals of graphite* were found to be magnetically anisotropic, in the ratio of 1.6.7 for the crystal axis, resp, perpendicular and parallel to the field In compds of Bi and Sb the ionic values were found to be much smaller than for the crystals state, *e. g.*, for $Sb^{III}$ $\chi = -26 \times 10^{-6}$, for $Sb^{V}$, $\chi = -66 \times 10^{-6}$, for $Bi^{III}$, $\chi = -40 \times 10^{-6}$, for $Bi^{V}$, $\chi = -69 \times 10^{-6}$, and for

C in compds $\chi = -6 \times 10^{-6}$ The effects produced by colloidalization are ascribed to the existence of large electron orbits comprising groups of mols Magnetically, amorphous C is considered to be microcryst. graphite and it is said that this view is supported by the x ray results of Debye and Scherrer The magnetic anisotropy of graphite, Bi and Sb is ascribed to the unequal valency groups for these elements
W. W. Stifler

Diamagnetism, field strength and crystal structure. W J de Haas. *Nature* 127, 335–6(1931), cf *C A* 25, 855.—Some years ago de H called attention to the probability of a correlation between crystal structure, change in elec. resistance in a magnetic field, diamagnetic susceptibility and possibly the Hall effect Graphs are now given showing the susceptibility of Bi at 14.2°K as a function of the field strength, both for fields parallel and perpendicular to the binary axis Another set of curves shows the magnetization and change in resistance under the same conditions. In fields where the resistance increases, the magnetization remains nearly const and vice versa This is attributed to the behavior of the outer electrons and the explanation is offered that the diamagnetism of the outer electrons is superposed upon a paramagnetism due to the remainder of the atoms
W. W Stifler

The diamagnetism of polyhalides. Francis W. Gray and John Dakers *Phil Mag* [7], 11, 81–95(1931), cf *C A*. 24, 1613.—The mol diamagnetic susceptibilities of alkyl and tri alkyl phenyl substituted $NH_4$ and Rb halides and polyhalides were detd The structures are discussed by the method of Gray and Farquharson A. F.

Magneto-optical anisotropy in a plane normal to the optical axis of a hexagonal crystal. Paramagnetic rotatory powers and magnetic moments in directions close to the binary axes at very low temperatures. Jean Becquerel and W. J. de Haas *Proc Acad Sci Amsterdam* 33, 937–48(1930).—The magnetic rotations along the two varieties of binary axes differ and represent the first example of optical anisotropic phenomena in a plane normal to the optical axis of a uniaxial crystal By the definition of a uniaxial crystal this cannot be true of a purely optical phenomenon, and it is actually due to the paramagnetic nature of the phenomenon and to the magnetic anisotropy At the temps close to 1.7°K. the ratio of the Verdet consts., 0.579 at 77.5°K., falls to 0.21
A P. Sachs

Paramagnetic rotatory power of a crystal of tysonite in a direction normal to the optical axis at liquid-hydrogen temperatures. Jean Becquerel and W. J de Haas *Proc. Acad Sci Amsterdam* 33, 926–36(1930), cf *C A* 25, 873.—The ratio of the magnetic rotatory powers along a direction making a small angle with the optical axis and along the optical axis, found equal to 0.579 at 77.5°K. (see preceding abstr.) decreases as the temp falls
A. P. Sachs

Magnetic rotatory power of a uniaxial crystal in directions oblique to the axis; determination of the rotation of tysonite in a direction close to a binary axis at the temperature of liquid nitrogen Jean Becquerel *Proc Acad Sci. Amsterdam* 33, 913–25 (1930).—Expts at ordinary temps have already shown that tysonite has a smaller magnetic rotatory power oblique to the axis than along the optical axis (cf *C A* 23, 1792) At liquid N temp the law of variation of magnetic rotation with the inclination of the wave and the direction of the magnetic field with respect to the crystallographic axes is confirmed The observed magnetic rotation of tysonite in directions oblique to the axis is a paramagnetic rotation in the direction of a magnetization of the crystal resulting from the action of the magnetic field The ratio of rotatory power normal to the axis to the rotatory power along the axis is 0.579 at 77.5°K., instead of 0.83 at 293°K
A P. Sachs

Determination of the susceptibility of cupric sulfate pentahydrate at low temperatures; the magneton numbers of the iron group. W J. de Haas and C J. Gorter *Proc Acad Sci Amsterdam* 33, 1101–5(1930).—The susceptibility, $\chi$, of $CuSO_4 + 5H_2O$ was measured at a no of temps from 290°K. down to 14.3°K. The results range from $6.95 \times 10^{-6}$ at room temp to $121.6 \times 10^{-6}$ at the temp. of liquid $H_2$ When corrected for the diamagnetism of the anion and of the $H_2O$ of crystn., the values are $\chi' = 6.35 \times 10^{-6}$ and $1.22 \times 10^{-3}$, resp The results follow the Curie-Weiss law with $\theta = -70°$ and $\chi' T = 18.3$. The corresponding magneton no is 9.51 Weiss magnetons In the light of these results, the theory of Bose and Stoner is extended to cover deviations in the second part of the Fe group and an explanation is offered for the variable magneton nos found there.
W. W. Stifler

*Contribution to the theory of dielectrics.* G Guébey *Phil. Mag* [7], 11, 405–10 (1931).—Math A formula is derived on the assumption based on exptl facts that the current in a dielec is due both to the contribution of dipoles and to the presence of ions
Arthur Fleischer

The dielectric constant of water as determined by a resonance method. E. P. Linton and O. Maass. *J. Am Chem Soc.* 53, 957–64(1931).—The resonance method of Cuthbertson and Maass (*C. A.* 24, 1775) was reinvestigated and a method for calibrating condensers, which vary linearly according to their setting, is described. The effect of power of oscillating circuit and precautions required in work with media of high dielectric const are given The effect of cond. of medium on resonance point is negligible provided the cond is below $4 \times 10^{-4}$ (in the case of water) The dielec. const. of water is 79.2 at 25° based on 1.00 for air B. E. Tiffany

Dielectric characteristics of Seignette's salts. P. P Kobeko and I. V. Kurchatov. *J Russ Phys.-Chem. Soc.*, Phys Pt., 62, 251–65, *Z Physik* 66, 192–205(1930).—Experimentation indicates that high values of dielec. consts cannot be explained by high polarization The increase in the induction is believed due to (*1*) transmutation of electrons into atoms, (*2*) vibration of ions within the lattice and (*3*) orientation of mols. possessing a dipolar moment V Vesselovsky

*New results on dielectric constants of electrolyte solutions* (from measurements by A. Slama and O. Milicka). R Fürth *Physik Z* 32, 184–7(1931), cf. *C A* 18, 1606; 19, 1080, and Pechold, *C A* 22, 907.—It is shown that dielec const., *D*, detd by the ellipsoidal method of I is independent of the frequency, *f*, between 50 and 2200 cycles/sec The method is improved to give a precision of 0.6% up to a cond of $10^{-4}$ ohm$^{-1}$ cm$^{-1}$ The curves obtained by plotting *D* against *c* (molar concn.) are all of the same type with increasing *c*, *D* decreases to a min (at $c = 0.005$–$0.01$), then increases abruptly and finally approaches a limiting value which is frequently above the *D* of $H_2O$ With electrolytes of the 1–2 or higher valence types, the *c*, *D* curve may show two min or an inflection and a min The min *D* shifts toward higher *c* with increasing *f* The lowering of *D* observed here is much greater than at higher *f* (*e. g.*, $10^6$ cycles/sec) In the *c* range near the min *D* (where the electrolytes are largely dissocd.), it is assumed that most of the $H_2O$ mols are held oriented in the $H_2O$ sheaths about the ions Then as *c* increases, the ions tend to unite forming complexes and liberating $H_2O$ mols which are now free to rotate in accordance with an external field and *D* therefore increases The various min or inflection points probably indicate the formation of one or another complex Upon the assumption that, at the *c* of min *D*, all $H_2O$ is bound by the ions, *m* (the no mols $H_2O$ per mol of electrolyte) and *n* (the no mols $H_2O$ per unit ionic charge) were calcd for HCl, LiCl, NaCl, KCl, $FeCl_2$, $CuCl_2$, $BaCl_2$, $PbCl_2$, $AlCl_3$, $FeCl_3$, NaBr, NaI, $HNO_3$, $NaNO_3$, $Ba(NO_3)_2$, NaOH, KOH, $Ca(OH)_2$, $H_2SO_4$, $H_3BO_3$ and $H_3PO_4$ The values of *m* varied from 125 to 385 and those of *n* from $2 \times 10^3$ to $2 \times 10^4$. In general, *n* increased with the wt. of the anion (resp., cation) in a series of electrolytes having a common cation (resp., anion) This is in accord with the idea that the larger the ionic wt. the more points of attachment the ion would have for $H_2O$ mols The $H_2O$ sheath is pictured as being formed of more or less oriented $H_2O$ dipoles, the attractive force being "passed on" from link to link of the chain as in the case of iron filings picked up by a magnet. At low *f* the time required for the formation of such a "chain-model," $H_2O$ sheath is assumed to be small with respect to the duration of an oscillation but very large with respect to the relaxation time of the $H_2O$ dipole It is assumed further that at $f = 10^6$ this chain formation is too slow to take place and thus at high *f* more $H_2O$ dipoles are free for orientation in an external field; the *D* lowering is therefore smaller Oscar T. Quimby

Molar refraction of methanol. M Velasco *Anales soc. españ fís quím* 28, 1228–38(1930).—The sp. inductive power of solns of MeOH in $C_6H_6$ was detd., and the results were used to calc. the molar polarization of the solns *Variation of molar* polarization of MeOH as a function of the molar fraction contained in the soln was examd by the Debye theory to deduce the molar polarization at infinite dilu By the aid of this limit value the dielec moment of the MeOH mol. is calcd. as $\mu = 1.6 \times 10^{-18}$. E M. Symmes

*Dipole moments of some organic sulfur compounds and related substances. III.* Meaning of dipole measurements in the stereochemistry of carbon compounds. Ernst Bergmann, Leo Engel and Stefan Sandor *Z physik Chem.*, Abt B, 10, 397–413(1930); cf. *C A.* 24, 4274; 25, 212.—The following moments are given diphenyl sulfide 1.47, *p*-chlorodiphenyl sulfide 1.38, thioanisole 1.27, diphenyl selenide 1.38, diphenyl telluride 1.14, phenyl thiocyanate 3.59, *p*-chlorophenyl thiocyanate 2.93 benzyl cyanide 3.91, *p*-bromobenzyl cyanide 2.64, *o*-chlorobenzyl cyanide 4.76, phenyl mustard oil 2.76, diphenyl sulfoxide 3.88, nitrobenzene 4.08, fluoronitrobenzene 2.63 and benzyl chloride 1.85 From these values are established the characteristic valence angles for the following groups $SC_6H_5$ 71°, S 142°, SCN 127° and CN 154°. *p*-Substitution has little effect upon such angles, but they are affected by the susceptibility to polariza-

tion of the mol. as a whole The mustard oil group is built at an angle. The earlier mentioned "semi polar double bonds" cannot be confirmed. A model for the last 2 compds. is described from which the moments can be calcd with satisfactory accuracy
GREGG M EVANS

Comments on the paper by Shilling and Larton on "The effect of temperature on the viscosity of air." A O RANKINE. *Phil Mag* [7], 11, 225–7(1931); cf. *C. A.* 25, 10.—Polemical.
ARTHUR FLEISCHER

Flame temperatures of hydrocarbon gases. G W. JONES, BERNARD LEWIS, J B FRIAUF AND G St. J PERROTT. *J Am Chem Soc.* 53, 869–83(1931).—Measurements of flame temps. for air mixts. are reported for the following gases. Pittsburgh Natural Gas ($CH_4$), $C_2H_4$, $C_2H_2$, butane, isobutane $C_4H_{10}$, $C_3H_6$ and $C_4H_8$. A spectral line reversal method with Na and Li salt sprays was employed The temps. are a max. when the mixt. has a slight excess of combustible gas over the amt necessary to consume all the $O_2$ present. These max temps. range from 1880° for $CH_4$ to 1975° for $C_2H_4$ and agree with calcd values. Max flame temp is attained with a mixt. contg less combustible gas than the mixt. that gives max. speed of uniform flame movement.
J B AUSTIN

The velocity of sound in carbon dioxide. H. O KNESER. *Physik Z* 32, 179 (1931).—The velocity of sound in $CO_2$ increases with the frequency in the range 0.5–3.0 × $10^5$ cycles/sec. Above the frequency 3 × $10^5$ the velocity is again const. at 268.2 m./sec. (3.7% higher than the normal value) This leads to a value of 1.40 for $c_p/c_v$.
OSCAR T QUIMBY

A relation between orthobaric volumes and temperature. JURO HORIUCHI HARITTI *Sci Papers Inst Phys Chem Research* 15, 89–104(1931); cf *C A* 21, 860, 3871.—The applicability of H.'s equation of orthobaric vol to $CH_4$, $C_2H_6$, $C_3H_8$, $C_4H_{10}$, MeCl, EtCl, $Me_2O$, CO, $Me_2S$, $Et_2S$, $PH_3$, $Cl_2$, HCl, He, Ne and Xe is demonstrated. The various parameters are tabulated for the 58 substances studied in this and the previous papers The rules and approximations derived from the H equation were used to calc. the orthobaric d of Kr as follows 210°, 0.82 and 0.82, 200°, 1.34 and 0.40, 190°, 1.58 and 0.25, 180°, 1.75 and 0.17, 170°, 1.89 and 0.11; 160°, 2.00 and 0.07, 150°, 2.10 and 0.04
OSCAR T. QUIMBY

Properties of saturated vapors, including steam. A. PRESS. *Phil Mag* 11, 111–8(1931).—Math. The first law of thermodynamics is solved to give 2 functional equations. The first was used by Callendar for the construction of steam tables, while the second leads to a theoretical justification of the third law. For satd vapors, the equation of state takes the form $p = (\Gamma - 1)\, a_m\, t^{\Gamma/\Gamma-1}$, where $\Gamma$ is a const. characterizing a fluid and is the ratio of the gross latent heat to the net latent heat of evapn. For steam from 0° to 220°, $\Gamma$ = 1.11.
ARTHUR FLEISCHER

The pressure-volume-temperature values for ammonia to one thousand atmospheres from 30° to 200°. FREDERICK G KEYES. *J. Am Chem Soc.* 53, 965–7(1931), cf *C. A* 12, 550.—The *P-V* values for $NH_3$ (with vols. of 1.50–5 cc./g) were detd from 30° to 200° with a max. error of 0.25%.
W. C. FERNELIUS

The equation of state of propellant gases. A. D CROW AND W. E. GRIMSHAW *Trans Roy Soc.* (London) A230, 39–73(1931).—The app and exptl. procedure are described for measuring the pressures developed by exploding nitrocellulose, cordite and ballistite in a vessel of given capacity Observations were made over a range of loading densities and for 2 vessel capacities, the observed pressures being corrected for the cooling of the hot gases caused by the wall surface of the vessel and the work absorbed in the wall stress. The equation of state of the hot gaseous mixt. resulting from the explosions is the expression for the pressure exerted by the uncooled gases and is found to be $p_s = \lambda/[(1/\Delta) - \eta]$, where $\lambda$ is the ballistic force of the propellant, $\Delta$ is the density of loading, and $\eta$ is defined as the co-volume, its numerical value being about 4 times that of the mols. contained in 1 g of the gas complex The expression for the ballistic force is $\lambda = 84.80\ \{(\Sigma\ g\ mols.)/g\}\ T_s$, where $T_s$ is the temp of the explosion and depends on the constituents of the explosion, their heats of formation, the mean mol heats at const. vol. of the gases over the temp range involved (2700°K. to 4200°K.), and the control equation of the water-gas reaction. The co-vol. $\eta$ is evaluated from the constituents of the gas complex by using the hard kernel values of the mol radii increased by 2.5%.
C. C. KNESS

The constants of the Beattie-Bridgeman equation of state with Bartlett's *P-V-T* data on hydrogen. W EDWARDS DEMING AND LOLA E. SHUPE *J Am. Chem Soc.* 53, 843–9(1931), cf *C A* 24, 2925.—Applying Bartlett's *P-V-T* data (*C A* 22, 2302) to the Beattie and Bridgeman equation of state, $PV^2 = RT\,(V + B_0(1 - b/V))(1 - c/VT^3) - A_0(1 - a/V)$, gives the consts for $H_2$ Below the crit. d., $A_0$ = 124.040, $B_0$ = 20.22, $a$ =

56.18, $b = -7.22$, $c = 20 \times 10^6$, above the crit. d., $A_0 = 124\,040$, $B_0 = 17.50$, $a = 56.18$, $b = -19.68$, $c = 20 \times 10^6$. A break in the graph of $B$ vs. d. occurs near the crit. d. The Beattie-Bridgeman equation of state and Bartlett's $P$-$V$-$T$ data on a 3:1 hydrogen-nitrogen mixture. *Ibid* 860–9.—For a 3:1 mixt. of $H_2$ and $N_2$, the consts. are: Below the crit. d., $A_0 = 3000 \times 10^3$, $B_0 = 25.03$, $a = 21.36$, $b = -15.16$, $c = 16 \times 10^6$, above the crit. d., $A_0 = 3489 \times 10^3$, $B_0 = 21.42$, $a = 28.56$, $b = -30.58$, $c = 16 \times 10^6$. A break in the graph of $B$ vs. d. again occurs near the crit. d. DON BROWNE

State equation of easily liquefiable hydrocarbons. IV. Weight of the liter and compressibility coefficient of normal butane. MARCEL BECKERS. *Bull. soc. chim. Belg.* 39, 470–95(1930), cf. *C. A.* 24, 761.—This is a very careful exptl. detn. All the precautions needed to obtain the high degree of accuracy claimed are extensively described. It was found that for $C_4H_{10}$, $f_{(v,\theta)} = 0.997013$. The wt. of the normal l. is 2.70324. A. L. HENNE

Dimensional analysis applied to the thermal conductivity of liquids. J. F. DOWNIE SMITH. *Ind. Eng. Chem.* 23, 416–9(1931).—Thermal cond. of liquids is assumed to be a function of mol. wt., d., sp. heat, viscosity, gas const., thermal expansion and compressibility. By dimensional analysis, a formula is obtained connecting all these variables. It may be simplified and 2 functions plotted against each other, the graph showing a max. error of 4.5% in the thermal cond. G. M. MURPHY

Prediction of critical temperatures and heats of vaporization. K. M. WATSON. *Ind. Eng. Chem.* 23, 360–4(1931).—The crit. temp. of a non-polar liquid may be calcd. from its b. p., mol. wt. and liquid d. with an error of less than 2%. The latent heat of vaporization at any temp. or pressure may be calcd. by 2 methods when the crit. temp. and normal b. p. are known. The error is generally less than 5%. For either polar or non-polar liquids, the latent heat of vaporization may be calcd. at any temp. if the crit. temp. and 1 exptl. value of the latent heat are known. G. M. MURPHY

Allotropy in liquids. J. A. SMITS. *Z. physik. Chem.*, Abt. A, 153, 287–98(1931), cf. *Verslag Akad. Amsterdam* 1912, 418.—The allotropic theory is extended for the cases of monotropic and enantiotropic liquid transitions. ARTHUR FLEISCHER

The influence of intensive drying on inner equilibria. J. A. SMITS, E. L. SWART, P. BRUIN AND W. M. MAZEE. *Z. physik. Chem.*, Abt. A, 153, 255–61; *Proc. Acad. Sci. Amsterdam* 34, No. 1, 160–4(1931); cf. *C. A.* 21, 1049, 22, 1523, 23, 1327.—Eight mos.' intensive drying over $P_2O_5$ in a modified app. (cf. Terwen, *C. A.* 11, 553) insuring a gas-free liquid showed no effect in accord with those recorded by Baker. Baker's effects on intensively dried liquids were due to superheating which occurs readily in dust free liquids. ARTHUR FLEISCHER

Superheating and intensive drying of liquids. ERNST COHEN AND W. A. T. COHEN-DE MEESTER. *Proc. Acad. Sci. Amsterdam* 33, 1003–14(1930); *Z. physik. Chem.*, Abt. A, 153, 241–53(1931).—The authors confirmed the work of Lenher (cf. *C. A.* 23, 4388) and concluded that the abnormal rise in the temp. of the boiling liquid observed by Baker (cf. *C. A.* 16, 2441) was not due to the drying. GREGG M. EVANS

Apparatus and methods for precise fractional distillation analysis. New method of gas analysis. WALTER J. PODBIELNIAK. *Ind. Eng. Chem., Anal. Ed.* 3, 177–88 (1931); cf. *C. A.* 24, 5092.—The construction and operation of the latest development in fractional distn. of complex hydrocarbon mixts. are described. The operation is based on distn. at low temps. and at pressures of 1 atm. abs. or below. Distn. curves are given for natural gas, manufd. gas, refinery tail gases, natural gasoline and other hydrocarbon mixts. having compds. boiling below $C_4H_{10}$. The accuracy of analyses is discussed. M. C. ROGERS

Measurement of viscosity and its applications in chemistry. A. BOUTARIC. *Industrie chimique* 17, 762–5, 841–3(1930), 18, 6–7(1931).—A review. P. T.

Viscosity of liquids. Methods of measurement and applications. A. BOUTARIC. *Rev. chim. ind.* 39, 194–9(1930).—A review. P. THOMASSET

Hydrodynamics of systems of varying viscosity. IV. MARCUS REINER. *Kolloid-Z.* 54, 175–81(1931), cf. *C. A.* 24, 2052.—The fundamental law $\varphi = \varphi_\infty - (\varphi_\infty - \varphi_0)e^{-\tau/c}$ is derived for non-Newtonian liquids, i. e., liquids with structural viscosity. In the equation $\varphi_0$ is the fluidity at rest, $\varphi_\infty$ at the largest fluidity, $C$ the stability coeff. of the liquid structure, $\varphi$ the fluidity at the tangential tension $\tau$. An equation for the capillary viscometer is also derived. ARTHUR FLEISCHER

Necessity of using the absolute kinematic viscosity coefficient in the practical determination of viscosity. PAUL WOOG. *Bull. inst. phys.* 1931, 23–4, 41–7.—After showing the function and importance of viscosity and discussing the effects of temp. thereon, the chief viscometers now in use and the various methods available for actually measuring

the true viscosity coeff are described A plea is made for the adoption of such methods and of the poise and stokes as practical units of measurement A P-C.

Experimental contribution to study of uniform laminary flow. G B Ugolini *Ann lavori publici* 68, 496–510(1930).—The generally assumed parabolic distribution of velocity along the tube diam is not substantiated by expts with water in cylindrical glass tubes 4 5 mm in diam Velocity distribution seems to be more like that of a turbulent stream E I S

The mechanism of plastic flow. G F Cunningham *J Phys. Chem* 35, 796–814 (1931).—The mobility of clay pastes was found to vary markedly with the pressure L Onsager

The surface tension of crystals. D Balarew *Kolloidchem Beihefte* 32, 205–11 (1931).—No equil can exist between a single crystal and its mother liquor for a homogeneous surface according to the Ostwald-Freundlich equation Such an equil is possible provided the surface tensions at edges and corners are greater than the surface tension at a face The faces are believed to grow in a mosaic pattern thus giving an inhomogeneity to account for a greater surface tension R. H Lambert

Strength of salt crystals partially immersed in water. A. Smekal. *Physik Z.* 32, 187–92(1931). cf *C. A* 23, 3836.—The tensile strength of NaCl crystals, whose midportions were bathed in water, was much greater than that of a normal dry crystal, but the increase was less than a tenth that reported by Joffé (*C. A.* 22, 518). Oscar T Quimby

Progress and problems of chemical crystallography. H Steinmetz *Fortschr Min Krist Petr* 12, 193–219(1927). E H

Some examples of cyclic twin formations. R. Brauns. *Centr Mineral., Geol., Paläont.*, Abt A, 1929, 357–66, *Chem Zentr* 1930, I, 957.—Cyclic twin formations, which give the impression that the crystals have a higher symmetry than they possess in reality, are described with $K_2SO_4$ and alexandrite as examples. With the former the twin planes are (110) and (1$\bar{1}$0) and with the latter they are (130) Serial twins were not observed on either one G Schwochi

*The possible orientation of cubic crystals deposited on a sheet of mica.* L Royer *Compt rend* 191, 1346–8(1930).—Crystals of alk fluometaphosphates are oriented on mica similarly to those of alk. halides, suggesting an analogy between the structures of the two series of compds Orientation takes place only if the structure is octahedral and of the face-centered cubic class like NaCl Values for the unit length of the (111) face of $KPF_6$, $RbPF_6$, $NH_4PF_6$ and $CsPF_6$ are calcd and it appears that the difference between these values and that for mica (5 12 A U) in a case of mutual orientation of crystals of different species must not exceed 0 69 A U H. W Walker

The dehydration of heulandite studied by means of x-rays. J Wyart *Compt rend* 191, 1343–6(1930).—Up to about 210° the axis of symmetry of heulandite contracts 0.35 A U or 2% with loss of water No modification in the at arrangement takes place and the change is reversible Above 210° with a 10% loss in wt a large contraction occurs, the crystal form is altered, and the structure becomes heterogeneous like that of dehydrated mica and kaolinite. Cryst. platelets of diverse orientation result Such a change is irreversible H. W. Walker

Crystallographic researches on some racemic compounds and the respective optical antipodes of the asparagine group. Guido Carobbi *Rend accad sci Napoli* 36, 49–55(1930).—The following properties were detd *l-* and *d Chloroacetylasparagine* m. 150°, monoclinic, sphenoidal, $a\ b\ c = 0.7876\ 1\ 0.4281$, $\beta = 96°22'$; simple forms $a(100)$ $b(010)$ $b'(0\bar{1}0)$ $m(110)$ $m'(1\bar{1}0)$ $\gamma(101)$ $\gamma'(10\bar{1})$ $y(121)$ $x(12\bar{1})$; elongated along the *y*-axis, the bisectrix emerges from (100), inclined to the normal of that plane, and at a large angle relative to the optic axes, plane of the optic axes is normal to (010), sp gr 1 538, mol vol 135 59 *dl-Chloroacetylasparagine* m 105°, triclinic, pinacoidal; $a\ b\ c = 0.9068\ 1\ 0.8617$, $\alpha = 63°29'$, $\beta = 113°20'$, $\gamma = 117°15'$; simple forms, $a(100)$ $b(010)$ $c(001)$ $n(110)$ $m'(1\bar{1}0)$ $\gamma(101)$ $\gamma'(10\bar{1})$, elongated along the *y*-axis and somewhat tabular relative to (100); in convergent light one axis emerges from (100) at the edge of the field, on (100) the direction of max extinction makes an angle of 5° with the *y*-axis in the obtuse angle formed by [1$\bar{1}$0.100] and [00$\bar{1}$·100]; on (001) the extinction angle is 22° with the *y*-axis in the obtuse angle formed by [00$\bar{1}$·-·100] and [00$\bar{1}$ 110], sp gr 1 560, mol vol 145.23. *l-* and *d-Benzenesulfonylasparagine* m 163°, monoclinic, sphenoidal, $a\ b\ c = 0.7557\ 1\ 0.7105$, $\beta = 104°42'$; simple forms, $a(100)$ $b(010)$ $b'(0\bar{1}0)$ $c(001)$ $m(110)$ $m'(1\bar{1}0)$ $q(011)$ $q'(01\bar{1})$, often tabular with respect to (100), in convergent light, crossed nicols, an optic axis emerges from (100) at the edge of the field plane of the optic axes parallel to (010), sp gr 1 434, mol vol 189 80 *dl Benzenesulfonylasparagine* m 172°, minute crystals, mono-

clinic prismatic, elongated relative to the *z*-axis, and tabular relative to a pair of parallel faces, probably (100) In convergent light, with the crystal lying on (100), there appears one bisectrix slightly inclined, and both optic axes at the edge of the field, plane of the optic axes is normal to (010), sp gr 1.550, mol vol 171.50 *dl-Benzoylasparagine* monoclinic, prismatic, $a\ b\ c = 0.8865\ 1.0\ 0.5020$, $\beta = 92°12'$; simple forms, $a(100)$ $b(010)$ $o(111)$ $\omega(111)$, elongated along *z* and tabular relative to (100), on (010) a direction of max extinction makes an angle of 7° with the *z*-axis in the angle formed by [010 100] and [100 111] the acute bisectrix emerges slightly inclined from (100) at a small angle with the optic axes, the plane of the axes is normal to (010), angles of the optic axes are $2E_{Li} = 21°0'$, $2E_{Na} = 28°50'$ $2E_{Tl} = 30°10'$, sp gr. 1.433, mol vol 164.76 Values of the interfacial angles are given for the above crystals.

R H Lombard

**Regularity in crystal structure in hydrides, borides, carbides and nitrides of transition elements.** Gunnar Hägg *Z. physik Chem.*, Abt B, 12, 33–56(1931); cf *C. A.* 24, 1591.—The structure of crystals of binary compds contg a so-called "transition element" and either H, B, C, or N is critically examd with respect to the ratio of at radii If this ratio $r_m : r_x > 1.7$ the structure is simple, while if the ratio is smaller the structure becomes more complex the smaller the radius of metal ion Only these combinations show a typical metallic character in crystal structure which is termed an infiltration structure The latter shows a combination $M_4X$, $M_3X$, $MX$ and $MX_2$, each of which is described The face centered cubic or close packing hexagonal lattice, both of coordination no 12 are most often observed One case each of body-centered cubic and simple hexagonal, both of coordination no 8 was found A careful discussion follows of the packing arrangement of atoms and the relation to coordination nos

R H Lambert

**Röntgenographic investigations of potassium fluoborate.** B Prscr *Gazz. chim. ital.* 60, 936–9(1930).—Basche and Mark found that $SrSO_4$, $PbSO_4$, $KMnO_4$ and $KClO_4$ are of the same structural type, and contain 4 mols in the elementary cell (cf. *C. A.* 20, 3597) $KBF_4$ should belong to this same series, for it is isomorphic with $KClO_4$ and $KMnO_4$ (cf Zambonini, *C. A.* 17, 2080) It was therefore of interest to study $KBF_4$ by x rays (Cu radiation) The exptl $d_{18}$ was 2.554–559 (cf $d_{18}$ 2.198 of Stolba, *Jahresber. Chem.* 1872, 231). The x-ray examn showed $a_0 = 7.84$, $b_0 = 5.68$, $c_0 = 7.38$ (rhombic lattice), with $a\ b\ c = 1.382\ 1\ 1.297$. Montemartini reported the prepn. of a cubic form of $KBF_4$ (cf *Rend. accad. Lincei* 3, 359(1894); *Gazz. chim. ital.* 24, I, 478(1894)), but by following the procedure of M., a product was obtained that gave röntgenographs identical with those of the rhombic form, whether the gelatinous compd was dried in air without heating or dried at 100° After drying at 100°, its d was 2.555 The so-called cubic form and the cryst. rhombic form are therefore identical

C. C. Davis

**An x-ray study of mannitol.** Geo. W. McCrea. *Nature* 127, 162–3(1931).—Results for *d*-mannitol are space group $D_2^4$, $a = 8.60$ A. U., $b = 10.58$ A. U.; $c = 5.50$ A. U., calcd d 1.522, 4 mol. per cube

Malcolm Dole

**Conductivity of zirconia.** Hans Schweitzer *Z. anorg. Chem.* 44, 151–2(1931).—The cond was detd. between 200° and 800° (450–1100° abs.) One sample of $ZrO_2$ contained 2% of MgO and the other 1% $Cr_2O_3$, a trace of $TiO_2$ and 0.3% $H_2O$. Graphs are given showing the log cond against the reciprocal of the abs temp The curves for both the specimens show breaks, approx at 450–550°, when the values obtained with increasing temp are plotted Values obtained with decreasing temp give a straight line considerably below the other values, it is suggested that this is due to a loss of $H_2O$ which occurs in the pure material at approx 510–50°. The purer sample (contg no Mg) showed a much higher cond and it is reasoned from this that the cond. of fused, pure $ZrO_2$ is probably appreciably smaller than that of quartz. The relationship between cond and field strength for the Mg-free $ZrO_2$, which had been heat-treated at 800°, was found to be linear up to 1500 v./cm

Edward B. Sanigar

**The properties of chlorides of sulfur. V. Metastable states.** Thomas M. Lowry and Gilbert Jessop. *J. Chem. Soc.* 1931, 323–9; cf. *C. A.* 24, 4111.—The period of induction in the combination of $SCl_2$ with $Cl_2$ can be eliminated or reduced by catalysts such as I and $SbCl_5$ or by autocatalysts The combination of $SCl_2$ and $Cl_2$ to form $SCl_4$ is instantaneous even at —80°, no lag can be detected in restoration of equil when $SCl_4$ is melted below —20°. The freezing and melting of $SCl_4$ is characterized by a marked lag A displacement with temp of the equil concns. in samples of $SCl_2$ was established by observations of d., the dissocn increases from about 15% at 0° to about 25% at 100°.

P. H Emmett

**Langmuir's adsorption isotherm.** R. S Bradley *Phil. Mag.* 11, 690–6(1931).—

Polanyi's theory is criticized on the basis that the heat of adsorption and the adsorption potential cannot be identified The capillary condensation method is inconclusive By the application of the theory of *imperfect gases in a two-dimensional* phase, the equation, $\log c_1c_2 = \text{const}/T + \text{const}$, is derived The consts. $c_1$ and $c_2$ are those of Langmuir s equation The equation was found to apply except at low temp ARTHUR FLEISCHER

Adsorption intensity and its importance in technical processes. *Isidor Traube Z angew Chem* 44, 73-5(1931).—Several means of measuring adsorption intensity have been, or are being developed Where no reaction occurs the intensity of adsorption is proportional to the amt of heat generated, the phys. conditions of the adsorbant and the substance undergoing adsorption being always a const Methods based upon displacement principles and vapor pressure were also found satisfactory for estg adsorption The adoption of such a standard method would be of great value in the *flotation and lubricating-oil industries* and be an aid to botanical studies. W. H TIFFANY

Some relationships between phase-boundary potential, adsorption, surface tension and particle size. FREDERICK K. V. KOCH *Phil Mag* 11, 585-92(1931).—Math The equation for the difference in potential between a spherical particle and a plane surface is derived. ARTHUR FLEISCHER

Discontinuous nature of the process of sorption of gases and vapors by porous solids. A. J. ALLMAND AND L. J. BURRAGE *Proc Roy Soc. (London) A130, 610-32(1931).*—Work pointing to the discontinuous nature of the sorption of vapors by charcoal is reviewed Eight isothermols of the sorption of $CS_2$, $CCl_4$, $C_6H_6$, $H_2O$, $C_5H_{11}OH$ and $CO_2$ on different charcoals showing the great no of observations made are given Isothermals of $C_6H_6$, $CCl_4$ and $H_2O$ on silica gel showing the discontinuous sorption are presented The theory of the sorption of vapors over a wide range of concn on charcoal is discussed S LENHER

Heats of wetting and of adsorption on zinc oxide. WARREN W EWING *Ind Eng Chem.* 23, 427-9(1931).—Heats of adsorption and of wetting of $CO_2$, $NH_3$, $SO_2$, Nujol, $C_6H_6$, $C_6H_5Me_3$, $C_5H_5N$, linseed oil, 1 5% Zn oleate in $C_6H_6$, 5% Zn oleate in $C_5H_5N$ and $H_2O$ on ZnO have been measured at 25° with a simple calorimeter S L.

Specific adsorption properties of activated carbon. L M M DUBININ *J. Russ Phys.-Chem Soc* 62, 1627-33(1930); cf *C. A* 25, 13.—A preliminary theoretical discussion of possible properties of activated carbon to be followed by exptl investigations. The quantity of adsorbed gas is expressed by $a = Cr \times S$ ($Cr$ is the quantity of gas adsorbed by one unit of adsorbent surface and the surface $S$ depends upon the diam of the pores $D$ $S = f(D)$) In case of adsorbed liquids the activity is characterized *by the sum of volumes of the pores and their radius* $v = \varphi(S)$ In case of solns. the equation for the adsorption of gas $a = Cr \times S$ may be used. $Cr$ depends upon the nature of the solvent, nature of the surface of the carbon (amorphous, cryst , interacted with O of the air, contg impurities, formation of an elec. charge greatly affects adsorption of strong electrolytes) The value of $S$ (adsorbing surface) depends upon the nature of the adsorbed mols. of the solute J. G TOLPIN

The adsorption of ethylene on wood charcoal, silica gel and alumina. A. MAGNUS AND H WINDECK *Z physik Chem*, Abt A, 153, 113-26(1931); cf *C. A.* 23, 2340, 24, 4683.—Adsorption curves were detd from low pressures to about 550 mm at 0°, 20°, 40° and 60° Comparison at 0° and 50 mm. pressure shows that 1 g of the beechwood charcoal, 3 6 g $SiO_2$ gel, and 5 33 g of $Al_2O_3$ adsorb equal quantities of $C_2H_4$ The adsorption curves for charcoal show a sharp rise against the flat curves shown by $SiO_2$ gel and $Al_2O_3$ The value of $\beta/0$ for charcoal decreases with temp although the theory requires it to be const. For $SiO_2$ gel and $Al_2O_3$ fictitious values of $\beta/0$, a term in the Magnus equation of state for adsorbed gases, are obtained A. F

Adsorption within the crystal of a salt. I N STRANSKI. *Kolloidchem Beihefte* 32, 197-204(1931).—S does not believe that the Gibbs-Ostwald Freundlich equation relating soly and surface tension of particles is sufficient to explain the effect of grain size He objects to Balarew's freely interchanging the terms surface tension and soly. Various extracts from B 's paper are given and criticized The assumption that water of hydration for crystals like those of $BaSO_4$ is " free" seems untenable The theoretical results given by B therefore can lead to erroneous conclusions. R H L.

The kinetics of surface processes on crystal lattices. I. The adsorption system barium sulfate-electrolyte solutions. LUDWIG IMRE *Z physik Chem*, Abt. A, 153, 262-86(1931), cf *Z physik Chem*, Abt. A, 153, 127(1931).—The adsorption of radioactive Th B, isotope of Pb and of Act, isotope of La, was detd on pptd $BaSO_4$ at 18° in the presence of various ions The velocity of adsorption of Act is decreased by the addn of Ba ions and increased by the addn of $SO_4$ ions Foreign electrolytes such as

HCl diminish the speed of adsorption. Qualitatively the curves for Th B are similar. Quant inspection reveals the differences that Th B is adsorbed to a much smaller extent and that the initial slope of the Act curves is much greater than that of the ThB curves The differences illustrate the previous results The Act curves are characteristic of those of easily sol electrolytes in which valence is the important factor. The Th B curves are characteristic of those of difficultly sol electrolytes in which the velocity is controlled by the recrystn of the adsorbent in accommodating the exchange reaction. ARTHUR FLEISCHER

Adsorption. JOHANNES TERWELLEN *Z physik Chem*, Abt. A, 153, 52–67 (1931).—The adsorption of methyl violet and methylene blue on Ag and Ni wires was detd. by measuring the change in concn. of the solns spectrophotometrically To avoid aging effects in the dye solns, pure dyes were used, the solns were kept in the dark except for the photometer measurements, and $O_2$ and $CO_2$ were excluded from the solns The curves for amount adsorbed against dye concn rise rapidly to a satn. value, which remains const. up to a high concn., after which the adsorption again increases rapidly Methyl violet on Ag shows a bimol. layer if a cubic mol is assumed, and a monomol layer if the mol has a cross section of $3.283 \times 10^{-15}$ cm.$^2$ and a length of $17.49 \times 10^{-8}$ cm. Methylene blue on Ag is adsorbed as a monomol layer if the cubic form of the mol is assumed. Heating the Ag wires to 400° for 2 hrs reduced the adsorption considerably Methylene blue is adsorbed more readily by Ni than by Ag, while methyl violet is adsorbed to a smaller extent. Electrolytic Ni (marked II) adsorbed more than the regular Ni wire The satn values in $g \times 10^4$ for 1000 cm.$^2$ of wire surface are given in the table

| | Ag | Heated Ag | Ni I | Ni II |
|---|---|---|---|---|
| Methyl violet | 2.002 | 0.604 | 1.263 | 3.633 |
| Methylene blue | 1.078 | | 1.877 | 1.927 |

The satn. value depends on the nature of the adsorbent and on the dyestuff so that detn. of surface by detn. of the adsorption is an empirical method. Langmuir's theory of monomol adsorption is not confirmed in the above results ARTHUR FLEISCHER

Adsorption. HERMANN SCHLÖTER. *Z physik Chem*, *Abt. A, 153, 68–82(1931).*—The adsorption of $CS_2$ from 0.05 to 0.9 $p/p_0$ was detd. on glass powder at 43.5° and on Ag powder at 25° and 43.5° The adsorption of pentane on the two powders was detd. at 34°. The curves are all similar and may be expressed by the equation $N = a\,b^P$, where $N$ is the no of layers of mols. in the adsorbed film, $P$ is the pressure and $a$ and $b$ are const. In all cases the adsorbed layer is polymolecular. The results can not be explained by capillary adsorption or by a soln. effect like that of water on a glass surface. ARTHUR FLEISCHER

The activity coefficients and the adsorption of organic solutes. I. Normal butyl alcohol in aqueous solution by the freezing point method. WM. D. HARKINS AND ROY W. WAMPLER. *J. Am Chem Soc* 53, 850–9(1931).—The activity values for the aq solns. of BuOH were detd. by the use of a specially designed app for the detn. of f.-p. lowering sensitive to 0.00001°. The activity coeffs of the carefully purified BuOH in 1, 0.5 and 0.1 *M* solns. are 0.8227, 0.8681 and 0.9433, resp Calcns. based upon the usual "adsorption equation" show that the film of BuOH on aq solns. is monomolecular; the area per mol is 23.7 sq A. U P. H EMMETT

The effect of the hydrogen-ion concentration in the adsorption of ions of barium, aluminum and thorium by clays. N. A. HELD AND M. N. SOKOLOVA. *J. Russ. Phys.-Chem Soc* 62, 1571–5(1930).—Glukhov kaolin adsorbs Ba-ion from solns of $Ba(OH)_2$ to a much larger extent than OH-ion, Ca-ion enters the soln. instead of Ba; therefore this is a case of substitution adsorption. This satisfies Freundlich's equation $x/m = aC^b$. Comparison of adsorption of Ba from solns of $Ba(OH)_2$, $BaCl_2$ and $BaCl_2$ + HCl showed a decrease of adsorbed Ba with increase of H-ion concn In agreement with this, Th ion is adsorbed less than Al ion and less than Ba ion, from solns. of equal concn as its hydrolysis results in a higher concn of H ions J. G TOLPIN

Adsorption of chlorides of aluminum and thorium by clays and kaolins. N. A. HELD. *J. Russ. Phys.-Chem Soc.* 62, 1553–70(1930).—H studied the character of adsorption of these salts by 5 kinds of Russian clays and made a no of electrometric titrations of the ions of $AlCl_3$ and $ThCl_4$. A no of tables and curves show that $Cl^-$ is adsorbed in negligible quantities; while Al and Th are adsorbed in different proportions by different clays (from 1 to 10 times) The general character of adsorption shows that with increased concn. of the cation the quantity adsorbed approaches a limit and seemingly satisfies the isothermal adsorption equation of Freundlich. The cations $Ca^{++}$ and $Mg^{++}$ substitute $Al^{+++}$ and $Th^{++++}$ in the soln., i. e., substitution

adsorption takes place It is suggested that the clays can be characterized by the amts. of adsorbed aluminosilicates. Displacement of hydrolytic equil. results in acidity of the soln. The hydrolysis is expressed by: $AlCl_3 + 2H_2O \rightleftharpoons Al(OH)_2Cl + 2HCl$ $ThCl_4 + 3H_2O \rightleftharpoons Th(OH)_3Cl + 3HCl$ Detd. consts. for the hydrolysis of $AlCl_3$ at 20° range from $1.1 \times 10^{-3}$ to $1.95 \times 10^{-3}$ at 25° from $2.5 \times 10^{-3}$ to $3.6 \times 10^{-3}$, for $ThCl_4$ at 20° $5.5 \times 10^{-11}$ to $5.9 \times 10^{-11}$ J. G. Tolpin

**Adsorption of easily soluble and difficultly soluble electrolytes on precipitates with large surface.** L. Imre. *Z. angew. Chem.* 43, 875-7(1930).—In adsorption phenomena on ppts. with large surface generally 2 processes are involved. The process first ("momentary" adsorption) is an ion adsorption that depends on the charge on the surface and the valence of the adsorbed ion. The second process consists of a building up of mols. and re-soln. of the resulting mols. at the surface layer. In this process the velocity of the decrease of surface and the insoly. of the adsorption compd. are important factors. Curves are given showing the adsorption of Pb (Th B) and actinium on AgCl, AgBr and AgI as a function of time. If the systems are brought together immediately on prepn. adsorption increases with time, otherwise it steadily decreases. With AgCl and AgBr the adsorption increases quickly to a max. and then gradually decreases. R. I. Rich

**Problems of the boundary state.** Wm. Hardy. *Trans. Fey. Soc.* (London) A230, 1-37(1931).—More than 100 substances, chiefly long-chain compds. including normal paraffins, acids and alcs., and carbinols, were used as lubricants in expts. to det.: (1) the static friction between solid surfaces, either clean or separately coated with solid lubricant, (2) the static friction of clean surfaces joined by fluid lubricant, (3) the tangential force needed to produce slip in a solid joint between a cylinder and a plate, (4) the normal force to break a fluid joint between a cylinder and a plate, (5) the normal force needed to break the same joint when solid. The thin films of lubricant between the solid surfaces may be regarded as a fourth state of matter since the energy of these films is shared so overwhelmingly with the enveloping phases. For each load there is a value $h$, sepg. cylinder and plate, at which the capillary pressure is equal to the loading. This value is const. for all fluids including clean air and for different solids when the surfaces are clean. This capillary pressure is called the Leslie pressure, it may be accounted for: (1) by direct attraction of relatively long range as contemplated in the Laplacian theory of short range forces; or (2) by the spreading from mol. to mol. of a state of strain. Mols. that are oriented and strained and in turn can orient and strain mols. beyond them are in a polarized state and the spreading of polarization from mol. to mol. is termed diachysis. The Laplacian theory seems to account most satisfactorily for the Leslie pressure in clean air, but in liquids the most promising view of the boundary state is that it is due to the formation of chains of polarized mols. stretching through the lubricant from one boundary surface to the other. Each chain has little strength in shear and great strength in tension, but both shear and tensile strength decrease as the length of the chain increases. C. C. Kiess

**Anomalous velocity distribution in thin lubricant films.** H. Umstätter. *Kolloid-Z.* 54, 220-6(1931).—The Hagen Poiseuille equation assumes optically thin layers and 0 velocity at the wall layer. These assumptions are not true in lubrication, where processes at the wall may not be neglected. An attempt is made to derive a law by math. summation of the forces acting between the wall and the various layers. Dynamic viscosity, the true measure of the value of an oil for lubrication, is the sum of the true viscosity and the adhesiveness, the specific combination between oil and metal. At present it is only possible to get an indication of the adhesiveness from the temp.-fluidity curves of the lubricant. The fluidity of oils with symmetrical molecules varies as the square of the temp.; for those with unsymmetrical molecules it varies as the temp. A flat temp.-fluidity curve signifies orientation and "adhesiveness" (anomalous velocity distribution). The viscosities of a Baku spindle oil, a Pennsylvania oil, a *Rhenania fraction 310-350°*, *Shell Valtol*, *castor oil and rapeseed oil* were detd. with a microviscometer from 30° to 200°. The results may be expressed by a semi-empirical rule $\eta = (CM^3)/(t - t')^n$ where $C$ is a characteristic const. for a homologous series, $M$ is the mol. wt., $t'$ is a reference temp. and $n$ a value from 1 to 2 depending on the elec. symmetry of the mol. Arthur Fleischer

**Adhesive forces on surface films.** T. M. Lowry. *Nature* 127, 165(1931).—L. explains Adam's contention (*C. A.* 25, 1422) that the mols. of a fatty acid on the surface of water may be held together by mutual attraction of the heads on the basis of the conception of the coördination of H. Malcolm Dole

**The film state of matter.** A. V. Blom. *Kolloid Z.* 54, 210-20(1931), cf. *C. A.* 23, 1290, 2048, 4087, 5336.—Films stand between dispersoids with large unconnected sur-

faces and solid bodies with small but connected surfaces The types of film are the unimolecular (Langmuir, etc.), Hardy films which are thicker than the active range of molecular forces, and zone films. Films may be formed by physical and by chemical processes. The kinetics of film formation by evaporation are reviewed. A. F.

Elliptical polarization by reflection at the surface of liquids: application to the study of monomolecular surface films. Ch Bouhet *Ann phys* [10], 15, 5–130(1931).—A study of elliptical polarization by reflection at Brewsterian incidence from the surface of water, salt solns., pure org liquids and solns. of fatty acids. The ellipticity ($K$) is shown to be pos in all these cases. $K$ for salt solns. is identical with that for pure $H_2O$ (0.00040), confirming the presence of a Gibbs' layer of adsorbed $H_2O$ at the boundary surface Surface films of fatty acid solns. have a thickness calcd from $K$ and Drude's theory of the order of mol dimensions and particularly of approx the same magnitude as $d$, the mean distance between the mols. as detd. from x ray studies, indicating their monomol nature In the case of monomol fatty acid films $K$ consists of 2 terms, $K_2$ pos. and relating to the $H_2O$ or other liquid supporting the film and $K_1$ neg., due to the film and relating to the length of the mols. composing the film. In the case of pure liquids $K$ is given as a first approximation by a relationship of the form, $K = d \times F(\lambda, T, \ldots)$ A P Sachs

Certain mechanical properties of surface tension. V Ducceschi *Boll soc. ital biol sper* 5, 1069–76(1930), cf *C A* 25, 1136.—The formation of adsorption films in the interface liquid ($H_2O$)-gas ($H_2O$ vapor) is accompanied, for certain substances, by the production of a marked quantity of mech energy, capable among other things of producing a regular and continuous movement of a small rotor with rotating blades on the water This mech factor, along with the great velocity with which mol dispersion of almost bidimensional form takes place, should be considered in physiol. processes in which surface-tension energies predominate, *e. g.*, muscle contraction Diagrams and description of the app are given Peter Masucci

A microscopic method. E. H Synge. *Phil Mag* 11, 65–80(1931), cf *C. A.* 22, 4048.—The use of a colloidal Au particle at the focus of a slightly elliptical mirror is proposed as the source of a spot of intense light, very small in comparison with the wave length A particle $10^{-4}$ cm in diam. will scatter sufficient light to operate a photoelec. cell This method would increase the resolution 10 to 20 times beyond that of the ordinary microscope. An instrument using this principle is named an *hyperultramicroscope*. Arthur Fleischer

Measurements of suspensions and deposits. Pierre Mercier. *J. phys radium* [7], 1, 292–305(1930).—A float is attached by means of a hair to a lever It is immersed in homogeneous or heterogeneous suspensions. While the suspensions settle, the movement of the lever is optically recorded The results are presented in curves upward pressure on the bob vs. time, and pptn. velocity vs. concn A. L. H.

Further progress in ultrafiltration. Erwin Kratz. *Chem.-Ztg* 55, 257–9(1931). E. H.

Form and structure of colloidal particles. A. Boutaric. *Rev gén. sci.* 42, 11–9 (1931).—A descriptive paper summarizing the modern conception of colloidal particles. A. Lloyd Taylor

The explanation of Stokes' rule. Franz Urbach *Sitzb. Akad. Wiss. Wien*, Abt. IIa, 139, 473–81(1930).—Theoretical The relationship between Stokes' rule and the sec. law of thermodynamics is discussed, with the use of an idealized cyclical process It is shown that deviations are possible through the effect of the heat energy. It is necessary to assume that the emission mechanism is independent of the heat energy. E. J. R

Temperature and the stability of colloidal solutions. S. I. D'yachkovskii *Kolloid-Z.* 54, 278–84(1931).—The absorption spectra of well-dialyzed hemoglobin and albumin sols were detd. from 20° to 100° at 10° intervals. All solns. after coagulation showed a Tyndall cone. Surface tensions were detd. for a no. of sols from 10° to 70°. The curve of $\Delta\sigma/\Delta t$ against the temp shows a max., which is very decided for $Fe_2O_3$ sols at 30–40°. A large no. of sols were subjected to freezing at temps. from —20° to —182° and the coagulation was noted The surface tension and cond of the thawed sols were detd. The behavior of the sol upon freezing is a good indication of its stability. Uranium and tungstic acid sols were fractionated by use of successive lower temps. of freezing. Arthur Fleischer

Contributions to colloidal syntheses with well-crystallized organic compounds. Nadine von Veimarn. *Kolloid-Z.* 54, 296–306(1931); cf. *C. A.* 24, 2357, 2657, 3415, 3506.—Colloidal solns. of papaverine, camphor, salol, benzophenone, anthracene, an-

[illegible] and phenanthrene in aq. sugar solns. are described. Freshly prepd. salol and anthracene sols have spherical liquid particles. In the coarse particles the [illegible] can be detected. ARTHUR FLEISCHER

Photometric measurements of concentration and dispersion in colloidal solutions. III. [illegible] *Kolloid Z.* 54, 150–6 (1930); cf. *C. A.* 25, 870.—The use of the Zeiss [illegible] was studied by means of mastix sols. If the incident radiation is [illegible] and again the [illegible] weakening const. a max. appears. The curves at different wave lengths are nearly the same; slight deviations are due to errors in the prism factor and to the Tyndall effect. Kirchmann's rule with const. dispersion holds up to the value of the weakening const. of [illegible]. The usefulness of nephelometry ceases where light-weakening measurements begin. The red part of the spectrum is most useful for white sols. Nephelometry is very sensitive to changes in the dispersity. ARTHUR FLEISCHER

Investigations of colloids, prepared by the method of condensation of molecular rays. I. Organosols of the alkali metals. ADOLPH I. RABINOVICH, V. A. KARGIN AND [illegible] *Kolloid Z.* 54, 288–95 (1931).—A *new app.* is described for the prepn. of more stable sols of the alkali metals in org. solvents. K sols in ether can be prepd. which are stable for 2 to 3 mos. Cataphoretic measurements indicate that the particles are neg. charged. KI increases the stability and also the cataphoretic velocity. Light causes the ppt'n. of metal from the pure sol, and a blue gel from the protected sol. K sols in benzene, xylene and tripropylamine are very unstable. K sols in ethylamine are stable for 3–9 hrs. and are characterized by the presence of K in true soln. A. F.

Dielectric constant and structure of thixotropic sols. S. S. KISTLER. *J. Phys. Chem.* 35, 815–23 (1931).—The dielec. consts. of thixotropic $Al_2O_3$, $Fe_2O_3$ and gelatin sols were measured with 32.7-cm. waves by the second Drude method. In all cases the dielec. consts. decreased with increasing concn. of electrolyte ($K_2SO_4$). The absorption of the elec. waves was practically the same for the sols as for pure water. Pure $K_2SO_4$ solns., which were measured for comparison, showed a negligible decrease of dielec. const. and a definite increase of absorption. The reversible sol-gel transition of a colloid is not accompanied by discontinuous changes in its dielec. properties. L. ONSAGER

Specific inductive capacity and molecular weights of colloids. NINA MARINESCO. *Compt. rend.* 192, 625–8 (1931).—An equation is derived from the Debye relation which permits detg. the mol. wt. of dissolved proteins from the dielec. dispersion of the system and the wave length. The mol. wt. obtained by this method corresponds to the smallest particle of dissolved substance even if it is in the presence of more complex micelles that possess a high degree of assocn. The *mol. wt. of gelatin* is 11,300 by this method. J. R. ADAMS

Dispersoidological study of silver salts in aqueous ethyl alcohol, acetone and propione solutions. I. SHINJIRO ISHII. *Bull. Chem. Soc. Japan* 6, 53–60 (1931).—The complex solv. (solv. in the form of complex ions) of pptd. AgI in aq. EtOH solns. of KI and in aq. $(CH_3)_2CO$ solns. of KI was detd. The dispergation of the AgI in these solns. was also studied. The solv. is greater the higher the proportion of EtOH or $(CH_3)_2CO$ in the solvent. The greatest amt. of dispergation and the widest range of KI concn. through which there is dispergation is found at intermediate proportions of EtOH or $(CH_3)_2CO$. P. L. BROWNE

Investigations on the aging of aqueous ferric chloride solutions. A. LOTTERMOSER AND ERICH LESCHE. *Kolloidchem. Beihefte* 32, 157–68 (1931).—The changes in cond. of dil. solns. (0.00250 to 0.00000321 *M*) of $FeCl_3$ in cond. water were studied. The cond. does not attain a const. value at the end of 2000 hrs. The cond. of the more concd. solns. at that time is increasing slowly, while that of the more dil. has passed through a max. and is slowly decreasing. A rise in temp. increases the rate at which these changes go on, but a temp.-reversible equil. was not observed. The same is true for an aging $Fe_2O_3$ sol. Colorimetric detns. show that light is more strongly absorbed by $FeCl_3$ solns. as the wave length becomes shorter and the time of aging increases. J. W. P.

Studies in electroendosmosis. IV. The electroendosmosis of some organic liquids against a glass surface. FRED FAIRBROTHER AND MARK BALKIN. *J. Chem. Soc.* 1931, 389–403.—Measurements were made of the electroendosmosis of fourteen pure org. liquids and water through a diaphragm of sintered Jena-glass powder. $C_6H_6$ and $CCl_4$ show no measurable effect, $Et_2O$ is charged neg. toward the glass and all the other liquids are pos. charged. Surface cond. was found in the glass diaphragm in the case of each liquid that showed endosmosis. Up to 150 volts the relation between the voltage and the velocity of electroendosmosis was linear, but at higher voltages the velocity increased more rapidly than the voltage, which may be caused by the increased atom polarization experienced by the surface layer of the liquid in the diaphragm. In the cases where the dipole moment of the liquid, $\mu$, was known, the function $(D/\Delta f)^{1/2}\mu$

), where $D$ is the d , $M$ mol wt and $\eta$ viscosity, gave a straight line when plotted ıst the velocity of electroendosmosis per volt. J. G McNALLY

Studies on electrokinetic potentials. VIII. Ion antagonism. HENRY B. BULL, ROSS AIKEN GORTNER *J Phys Chem* 35, 700–21(1931), cf *C. A* 25, 1721 — electrokinetic potential for mixts of KCl and NaCl is merely a component of the ıdual potentials, no ion antagonism is evident. Similarly the results clearly ate the absence of ion antagonism between $MgCl_2$ and $CaCl_2$ as influencing the rokinetic potential MALCOLM DOLE

The influence of surface active compounds and electrolytes, with consideration of types of ions, on the electrophoretic velocity of lyophobic sols. SIAU HONG WHANG *ıdchem Beihefte* 32, 169–96(1931) —The electrophoretic velocity (cataphoresis) of ous lyophobic sols ($As_2S_3$, quartz suspension and $Fe_2O_3$), to which various amts of rent electrolytes or surface active compds (alcs , amines and fatty acids) had been d, was detd by the moving boundary method No well-defined relation was vered between surface activity and electrophoretic velocity The addn to quartz ension of an alc up to butyl or a fatty acid caused a decrease in electrophoretic ity, while amyl and hexyl alcs as well as various org bases, both surface active and ive, had the opposite effect The expts with electrolytes show that the electrophoretic velocity of charged particles decreases with increasing mobility of the oppositely ged ions but increases with increasing mobility of the ions of like charge J W PERRY

Effect of alkali salts on the cataphoresis and precipitation of colloidal gold. A contribution to the study of the Hofmeister series. ANNA LAGEMANN *Kolloidchem Beihefte* 32, 212–48(1931) —The effect of various alkali halides on the cataphoresis of ıdal Au was detd by a carefully worked out ultramicroscopical method The ts show that the charge on the Au particle was decreased in the order $Li < Na < K <$ The neg ions hindered this discharging action in the order $Br < Cl < F$ The ge on the particles did not completely vanish but approached an asymptote as the concn was increased from $2 \times 10^{-4}$ to $50 \times 10^{-4}$ $N$ This asymptotic charge eased as the alkali metal ion increased in at wt The change in charge with varying n can be represented by an adsorption curve The coagulating effect of the various was detd by observing color changes Those ions most effective in discharging Au sol were also most efficient in causing coagulation No quant. relation was d, however, between the 2 effects The varying effects observed with different ions be explained by differences in their at radius, mobility and degree of hydration mparison with similar effects observed with lyophilic colloids shows that the same meister series holds for both types of colloids. J W. PERRY

Contribution to the study of the action of electrolytes added to a colloidal solution oportions below those necessary to cause coagulation. G ROSSI AND A. MARESI *Gazz chim ital* 60, 903–6(1930) —Earlier expts showed (cf *C A* 21, 2411) electrolytes that normally are stabilizers (*e g*, $H_2SO_4$ and $Na_2SO_4$ for colloidal S ) function as stabilizers only within certain limits of concn , and at higher concns rue coagulants of the same solns. With a given colloidal soln , a given electrolyte e quantity necessary to cause coagulation, and another electrolyte for coagulant, is for the 1st electrolyte, with respect to the 2nd, an optimum concn that brings t the max stabilization Above this, but with quantities below those necessary for ulation, the electrolyte either does not bring about any change or brings about a ibilization This was demonstrated by expts on colloidal $As_2S_3$ solns , and for the of simplicity with HCl both as the electrolyte, added in quantity below that necessary for coagulation, and also as coagulant It was found that when added to a col- l $As_2S_3$ soln in quantity below that necessary for coagulation, HCl can either *lize or destabilize the soln toward the coagulating action of the HCl itself, according* e concn of the HCl At the concn of HCl which stabilizes the soln , there is an ase in the degree of dispersion, whereas the dispersion is diminished by the addn of antity of HCl which, though not reaching the min necessary for visible coagulation, ibilizes the colloidal soln toward the coagulating action of the HCl itself The ıdal $As_2S_3$ soln was prepd by passing $H_2S$ for a long time into an aq suspension of s, dilg and removing excess $H_2S$ with a current of inert gas, and dialyzing. The e of dispersion and the coagulation phenomena after the various treatments were ed by the ultramicroscope. C C. DAVIS

Coagulation kinetics of suspensoids. I. K. JABLCZYNSKI *Kolloid-Z.* 54, 164–9 l) —Modification of Smoluchowski's assumption by assuming that in coagulation [illegible] is established at which all particles are charged leads to the equation

time $t$ and $z$ the no. of charged particles. When $z$ = zero the equation is the same as S s. The equation holds well for the data of Westgren and Reitstötter on the coagulation with $z$ = 1. Spectrophotometric measurements of the rate of coagulation of $Fe_2O_3$, $As_2S_3$, $Sb_2S_3$ and AgCl sols by KCl at 18° agreed well with the formula.

ARTHUR FLEISCHER

Viscometric investigations of hemoglobin coagulation. S. L. Pepko. *Kolloid-Z.* 54, 170–5(1931). cf. *C. A.* 24, 637.—The effect of $CH_3OH$ and $C_2H_5OH$ on coagulation by KCl, $CaCl_2$ and FeCl was studied by the detn. of viscosity at 17°. In the presence of $CH_3OH$ the viscosity remains const. or decreases; in the presence of $C_2H_5OH$ the viscosity remains const. or increases. The valence effect of the cation in the presence of alc. is only slightly noticeable. At high concns. of $CaCl_2$ with $C_2H_5OH$ stabilization of the system was observed. Stabilization occurs with $FeCl_3$ and $C_2H_5OH$ from concns. of 0.1 *N* to 2 *N*, above which coagulation makes viscosity measurements impossible. Also in *J. Russ. Phys. Chem. Soc.* 62, 2273–82(1930).

ARTHUR FLEISCHER

Pectography—the study of the progressive drying of solutions. Paul Bary. *J. chim. phys.* 28, 1–13(1931). cf. *C. A.* 25, 1076.—The structure of deposits left on a glass slide placed vertically in a beaker contg. an evapg. colloidal soln. was studied. In general hydrophobic sols deposit a series of ridges resembling Liesegang rings while the residues from hydrophilic sols show no structure. Most colloids belong strictly to neither class but represent intermediate systems and may approach either autopeptization or coagulation on aging. $Fe_2O_3$ residues consist of two phases, one composed of doubly refracting filaments arranged parallel to each other and imbedded in an amorphous phase.

J. G. McNALLY

Periodicity and its fundamental principles. Maurice Copisarow. *Kolloid-Z.* 54, 257–65(1931).—Periodic formations are obtained when a $CO_2$ stream is solidified by cooling, in the sublimation of $(NH_4)_2CO_3$ and in burning Mg in oxygen. Yellow P did not show a rythmic structure either on oxidation or on sublimation in a $CO_2$ stream. Periodic structures are the outer result of a periodicity and are developed only in a system where there is harmony between wave frequency and amplitude and the natural frequency of the system.

ARTHUR FLEISCHER

The formation of Liesegang rings. (Miss) S. Roy. *Kolloid-Z.* 54, 190–3(1931).—The following new rings were formed: $HgI_2$ in $V_2O_5$ gel, $HgI_2$ and $AgCrO_4$ in $CeO_2$, TlI and $HgI_2$ in $ZnAsO_4$, TlI in $MnAsO_4$, $BaCrO_4$, $TlCrO_4$, AgI in $SrO_2$, TlI and AgI in starch, and TlI and CuI in agar. Liesegang rings are more marked when formed in the presence of light than in the dark, because of the accelerating effect on coagulation by light.

ARTHUR FLEISCHER

Microscopic and cinephotographic study of Liesegang rings. Suzanne Veil and L. Bull. *Compt. rend.* 192, 282–4(1931).—The rings formed by the action of a drop of $AgNO_3$ on dichromate-impregnated gelatin formed concentrically with pointed protuberances interrupting their continuity. As successive rings were formed the protuberances receded but the rings were left incomplete at these points. The velocity of formation of the rings decreases and the intercepting protuberances disappear as the contact line between the solns. recedes toward the center.

A. Lloyd Taylor

Practical method for determining vapor-tension diagrams. G. Calingaert. *Chimie & industrie* 25, 307–8(1931).—A brief description and explanation are given of a method recently introduced in America; cf. Davis, *C. A.* 24, 4967.

A. P.-C.

Calcium acetate gels. II. C. G. Smith. *Kolloid Z.* 54, 181–90(1931); cf. *C. A.* 23, 4393.—Further expts. were carried out on the formation of the gels with the use of pyridine, Me Et ketone, etc. The addn. of org. liquids immiscible with water shows no visible action in the formation of gels. $Mg(ClO_4)_2$ produces a cryst. ppt.; because of alcoholate formation $CaCl_2$ has no visible effect. Na and Mg acetates form gels quickly. Photomicrographs show that most of the gels have a honeycomb structure with $Ca(AcO)_2$ as the disperse phase. The gels formed by acetone in the presence of $C_6H_6$, $CS_2$ show a phase reversal. The $Ca(AcO)_2$ disperse phase on aging increases size and is accompanied by opalescence. The crystals finally formed may be the anhyd. or monohydrated $Ca(AcO)_2$. III. *Ibid.* 284–8(1931).—The viscosities of $C_2H_5OH$-$H_2O$ and $C_2H_5OH$-$H_2O$-$Ca(AcO)_2$ solns. were detd. from 15° to 40° in an Ostwald viscometer. For the alc.-water solns. the data agree with the literature, a max. occurring in each of the viscosity-temp. curves. The viscosity of the Ca acetate solns. increases with the Ca concn. The change from soln. to gel is very sudden, there is no gradual transition in viscosity. The general decrease in viscosity upon addition of alc. shows that the effect is mainly a dehydration of the Ca acetate. Other factors in gel formation are the lowering of the surface tension and the decreased dissocn. of Ca acetate in the presence of alc.

ARTHUR FLEISCHER

Investigations on gum arabic with the aid of colloidal silver and gold. J. Voigt. *Kolloid-Z* 54, 307–10(1931); cf *C. A.* 23, 3152.—Very pure gum arabic soln. does not reduce $Ag_2O$ or $AuCl_3$ solns. Preliminary illumination of the gum arabic soln decreases its protective action on Ag and Au sols. Arabic acid behaves similarly. Ag sols cannot be prepd by radiation when gum arabic or arabic acid is used as the protective colloid. The nature of the changes in the gum arabic is unknown. A. F.

The effect of salts on the ionization of gelatin. Kenneth V. Thimann. *J. Gen. Physiol.* 14, 215–22(1930).—The addn. of NaCl, $CuCl_2$ and $CaCl_2$ to gelatin solns. is shown from the Donnan membrane equil. to increase the ionization of gelatin. The effect is due to the formation of complex ions. The evidence supports the amphoteric ion structure of protein mols. rather than the classical theory of structure. C. H. R.

Diffusion in gelatin gels. Walter Stiles and Gilbert S. Adair. *J. Am. Chem. Soc.* 53, 619–20(1931).—The results of S. and A. (*C. A.* 16, 860) on the decrease in the rate of diffusion of electrolytes in gelatin gels as the concn. of the latter is increased agree essentially with the recent results of Friedman and Kramer (*C. A.* 24, 2934). J. G. McNally.

The index of refraction of gelatin solutions and the supposed hydration of the dispersed particles. G. Rossi and A. Marescotti. *Gazz. chim. ital.* 61, 14–26(1931).—A review of the literature on colloidal solns. of gelatin (to which numerous references are given) suggested that the expts. of Walpole (cf. *C. A.* 8, 859) on the relation between the *n* value and the concn. of gelatin be carried out with the greatest precision possible. Accordingly sterile aq. solns. of pure gelatin of various concns. at 18° were measured with an immersion refractometer, the technic of which is described. The results are tabulated and discussed in detail and lead to certain general conclusions. (1) Gelatin dissolved in water increases the *n* value of the latter, but this increase is not a linear function of the concn. of the gelatin. (2) This divergence from the linear relation is a confirmation of the hypothesis of R. (cf. *C. A.* 18, 3510) and of Kruyt (cf. *C. A.* 23, 3388), Kruyt and Tendeloo (cf. *C. A.* 19, 919, 3192) on the solvation of the particles of lyophilic colloids. (3) The differences in the *n* value of water as a result of the dissolved gelatin found at different temps. probably depend upon variations in the degree of hydration with change of temp. which are in conformity with the general behavior of lyophilic colloids. (4) Variations in the *n* value of gelatin solns. by addn. of salts ($Na_2SO_4$, NaI, NaBr and Na citrate were tested) are not strictly additive. The salts behave differently, in that both increases and diminutions in the viscosity of the gelatin solns. were found, and the variations caused by these salts are such that no explanation can be offered at present. C. C. Davis.

Structure of celluloid and nitrocellulose and the gelatinizing medium of nitrocellulose as a swelling medium. II. X-ray spectrograms of camphor celluloid with varying camphor content. J. R. Katz, J. C. Derksen, C. A. Kramers, Kurt Hess and Carl Trogus. *Z. physik. Chem.*, Abt. A, 151, 145–62(1930); cf. *C. A.* 24, 5201.—Camphor in celluloid acts as a lubricating agent between the micelles of nitrocellulose. In addn. to this, it forms with the latter, compds. sufficiently definite to show breaking up of the diffraction rings into segments, if the celluloid film is stretched. Typical spectrograms are reproduced and discussed. III. Celluloids with other cyclic ketones as jelling media. J. R. Katz, J. C. Derksen, Kurt Hess and Carl Trogus. *Ibid.* 163–71(1930).—Fenchone, menthone, carvone, cyclopentanone, cyclohexanone and cyclohexanol also form these addn. compds. with nitrocellulose. A tabular correlation is given of the ring diams. and the interplanar distance *d*, for various percentage mixts. of these compds. with nitrocellulose. IV. Acid amides and esters as jelling media. *Ibid.* 172–89(1930).—These compds. likewise form addn. compds. with nitrocellulose. Since ketones, amides and esters have only the carbonyl group in common, it is concluded that it is by means of the latent valences of this group that the addn. takes place. Gregg M. Evans.

Thermoelastic effect in cellulose ester films. J. G. McNally and S. E. Sheppard. *J. Phys. Chem.* 35, 100–14(1931).—At room temp. films of cellulose nitrate or acetate cool when stretched to small elongations but give off heat when elongated beyond their yield point. With strongly biaxial films the secondary heating effect is absent. Under proper stress and temp. conditions cellulose nitrate films contract when heated and the coeff. of thermal expansion depends on the previous mech. treatment of the material, the temp. range, the rate of heating and the stress on the film. A value of $6 \times 10^{-4}$ is given for the coeff. of linear expansion at low stresses between 15° and 45°. The results are related to micellar structure. J. G. McNally.

Solubility of nitrogen in water at high pressures and temperatures. John B. Goodman and Norman W. Krase. *Ind. Eng. Chem.* 23, 401–4(1931).—A high-pressure

**Changes of the osmotic water attraction of a system of phases. I.** F. A. H. SCHREINEMAKERS *Proc Acad Sci Amsterdam* 33, 691–701(1930). cf following abstr. —The problem of the general osmotic system $E E'$ is discussed, where both $E$ and $E'$ may represent any no of phases in equil Expressions are set up for the thermodynamic potential of the whole system and the following results are deduced (I) When the pressures or vols remain const, on both sides of the membrane, the $H_2O$ diffuses toward that side on which the osmotic water attraction (O W A) is the greater and no water diffuses when the O W A is equal on both sides (II) An increase in the pressure of an equil (i e, $I$ or $I'$) for which the vol increases with absorption of water results in a decrease in its O W A, and a decrease in vol produces a decrease in the O W A (III) *When an equil takes in water at const pressure or at const vol, its* O W A *will* decrease unless all phases keep the same composition, and in general for a given quantity of water the effect at const pressure is greater than that at const vol. From these it follows that (IV) increase in pressure or decrease in vol of a liquid or vapor decreases its O W A and (V) when a liquid or a vapor takes in water at const pressure or at const vol, the O W A is decreased and for a given quantity of water the effect at const vol is greater than at const pressure The paper is highly mathematical W W S

**Equilibria in osmotic systems, in which forces act. II Osmotic systems with an active membrane, permeable for several substances** I A H SCHREINEMAKERS *Proc Acad Sci Amsterdam* 33, 1133–9(1930) cf preceding abstr and *C A* 24, 4417 —The general problem of osmosis deals with an active membrane permeable to more than one substance *An abstract mathematical treatment of the thermodynamics of this* case is presented and a no of conclusions are deduced, for which the original paper should be consulted W W STIEFLER

**New micro method for the ebullioscopic determination of molecular weights.** JAMES H C SMITH AND HAROLD W MILNER *Mikrochemie* 3, 117–22(1931) —(In English) An app and its use are described which is based upon the larger app of Menzies and Wright (*C A* 16, 2 3804) Satisfactory results can be obtained by using as little as 3 cc of solvent and 5–25 mg of solute It does not require a supply of Pt tetrahedra, as does the Beckmann micro method, substitutes a differential thermometer for the much more expensive and more difficultly obtainable Beckmann thermometer and the readings are easily obtained because the observed change is greater The app consists of a boiling tube, the *differential thermometer and a Cottrell pump Directions* are given for carrying out a detn and the results obtained shown for urethan, *p*-toluidine, vanillin, diphenylamine, naphthalene and triphenylmethane W T H.

**The surface tensions of aqueous solutions of *p*-toluidine.** R C BROWN *Phil Mag* 11, 686–90(1931) —The surface tension of *p*-toluidine solns with 0–0.6 g per 100 cc of soln was detd at 16.6° by the ring Ferguson, capillary rise and pull-on sphere methods with an accuracy of 0.5% The results are in fairly close agreement with Gans and Harkins The results by the Ferguson method (*C A* 16, 2136) do not agree with those obtained by the same method by Edwards (*C A* 19, 3185) A I

**The viscosity and density of rubidium nitrate solutions.** HAROLD G SMITH, JOHN H. WOLFENDEN AND HAROLD HARTLEY *J Chem Soc* 1931, 403–9 —The relative viscosities (*by the method of Merton, C A* 5, 1221) *and the relative ds* (by *the method* of Hartley and Barrett, *C A* 5, 2096) of 0.092–1.786 *N* aq $RbNO_3$ solns were measured at 18° and 25.01°. The viscosity concn curves for $RbNO_3$ solns at both temps are similar to those of Grüeisen for $KNO_3$ and of Merton for $CsNO_3$ For concns of $RbNO_3$ solns below 0.2 *N*, the relation between relative viscosity and concn is represented by the Jones-Dole equation (*C A* 23, 5375) The graph of $(\phi - 1)/\sqrt{c}$ against $\sqrt{c}$ for $RbNO_3$ *solns* at 18° and 25° shows that both the intercept $A$ and the temp coeff are neg *The "mol soln vol" is* calcd for $RbNO_3$ at various concns of solns from the d measurements and is shown to fall in the normal periodic order of the alkali nitrates J. BALOZIAN

**The behavior of electrolytes in mixed solvents II. Effect of lithium chloride on the activities of water and alcohol in mixed solutions.** R SHAW AND J A V. BUTLER *Proc Roy. Soc* (London) A129, 519–36(1930) —An air-bubbling method, in which the vol of air required is less than 2 l., was devised for the detn of the partial pressures of $H_2O$ and alc. in mixed solns Measurements were made at 25° of the partial vapor pressures of $H_2O$-alc solns contg from 0 to 100% alc and 0.5, 1.0, or 4.0 mol % While increasing concns of LiCl cause a decrease in the partial pressure of $H_2O$ in all solns, its effect on the alc. varies with the composition of the solvent In solns contg a large proportion of alc, its partial pressure falls steadily as the salt concn increases, and in solns contg 6.4 mols % of alc, it rises steadily, while in intermediate solns it first falls and then rises The fractional lowering of the vapor pressure of water is

always greater than that of alc An approx linear relationship is established between the relative activities of both water and alc., and the mol fraction of alc. in the solvent, at const LiCl concn It is possible to distinguish approx the effects of the soln. of ions by alc mols and the salting out of alc. by the interaction of the ions and water

A L Hevne

The fictive volumes of sodium sulfate in aqueous solutions of sulfuric acid and of iodine in an aqueous solution of potassium iodide. R E Gibson *J. Phys Chem.* 35, 690 9(1931) —The sp vols of 2 series of solns. of $Na_2SO_4$ were detd, in the first series approx 5% aq $H_2SO_4$ and in the second approx 10% $H_2SO_4$ being the solvent The fictive vols of $Na_2SO_4$ in these solns were calcd Peculiarities of the vol.-concn. curves indicate the formation of $NaHSO_4$ in soln Measurements of the sp vols of I in a 49% soln of KI showed that in solns contg 10 to 50% of I, the fictive vol of I is independent of the concn of I, and close to the most probable estimate of the sp vol of liquid I at 25°

L Onsager

The variation of the color of solutions of cobalt chloride. Er Toporescu *Compt rend* 192, 280–2(1931) —Solns of $CoCl_2$ 7 17 g /l change from blue to rose or rose violet at the temp indicated for each solvent MeOH, 3°, EtOH, —18°, PrOH, —32°, BuOH, —45°, AmOH, —65° For the same solvents the dielec. consts are 34 5, 32 5, 28 5, (37 5), 25 0 A relation probably exists between the decreasing dielec. consts and a variation in degree of polymerization which accounts for the color change

A Lloyd Taylor

The hydrolysis of zinc sulfate solutions, solubility product of hydrous zinc oxide and the composition of the latter precipitated from zinc sulfate solutions I M Kolthoff and Tohru Kameda *J Am Chem Soc* 53, 832–42(1931) —By using very pure materials it was found that the 2nd ionization const of $Zn(OH)_2$ at 25° is $4\,4\ (\pm 0\,4) \times 10^{-4}$ The soly of hydrous ZnO ppted from the sulfate is $1 \times 10^{-4}$ at 25° On pptn of the hydrous oxide from sulfate soln with NaOH the basic salt $3ZnO\ ZnSO_4$ is formed After heating to 80° for 10 days the ppt becomes more basic and the supernatant liquid more acid

Chansing Wilson

The transport numbers of hydrogen chloride in ethyl alcohol. J W Woolcock, Harold Hartley and O L Hughes *Phil Mag* 11, 222–5(1931), cf *C A* 22, 3084 —The e m f of the cell Ag, AgCl | HCl $m_1$ HCl $m_2$ | AgCl, Ag was measured at 25° The most probable value for the transport no of H ion at infinite dilu is 0 71 ± 0 01

Arthur Fleischer

The status of the investigation of superconductivity. W Meissner *Metallwirtschaft* 10, 289–94, 310–5(1931), cf *C A* 24, 5565 E H

Conductivity measurements in methyl ethyl ketone and acetone. P. Walden and E J Birr *Z physik Chem*, Abt A, 153, 1–51(1931), cf *C A* 21, 1396, 24, 542 —The cond of mono-, di-, tri- and tetra-alkylammonium picrates, iodides, bromides, chlorides, nitrates and perchlorates, of the picrates of Li, Na, K, Ag and Cd, of iodides of Na, K, Cd, and Hg, and of $HgCl_2$ were detd at 25° in Me Et ketone The alkyl groups include the Me, Et, *n* Pr, *n* Bu, isobutyl isoamyl and *n*-cetyl The ketone had a cond at 25° of $5\,0 \times 10^{-8}$, d from 0° to 50° expressed by the equation $d = 0\,82737\ (1 - 0\,0012635\,t)$ and viscosity of 0 005220 at 0°, 0 003929 at 25° and 0 003115 at 50° The cond of $NEt_4$ picrate was also detd at 0° and 50° The conductivities of tetra *n*-propyl, tetra *n* butyl and tetraisoamylammonium picrates and Li picrate were detd at 25° in acetone The limiting equiv condu tivities were calcd by the square root law ($\Lambda_\infty = \Lambda_v + a\sqrt{c}$) Me Et ketone and acetone are differentiating solvents, as shown by the calcns. of the dissoc. consts of the various salts In the various solvents the order of decreasing dissocn for the substituted $NH_4$ salts is the following tetra, tri, di- and mono- Kohlrausch's law of the independent migration of ions is substantiated Stokes' law or the Walden rule of the correspondence of the temp coeff of mobility and of fluidity is confirmed by the measurements on $NEt_4$ picrate Mobilities and solvation nos were calcd from the data Substituted alkylammonium salts with 4 $CH_3$ groups give the following order of ion mobilities $(CH_3)_4N > (C_2H_5)_2NH_2 > iso\text{-}C_5H_{11}NH_3$, which is the order observed in alc. and in water For the halogen and alkali ions, the mobility is inversely proportional to the size of the ion

Arthur Fleischer

Acidity in non-aqueous solvents Conductimetric and electrometric titrations of acids and bases in benzene. Victor K La Mer and Harold C Downes *J Am Chem Soc* 53, 888–96(1931) —Cond titrations of acids and bases in $C_6H_6$ exhibit the anomalous behavior of salts (*C A* 23, 5088) Electrometric titrations of $CCl_3COOH$ and $(C_2H_5)_2NH$ in $C_6H_6$, with quinhydrone electrodes, resemble the titrations of aq solns of strong acids and bases

Curtis L Wilson

New method for measuring the limiting potential of two phases B Lengyel.

*Magyar Chem Folyóirat* 36, 89–94, 105–11(1930).—The mutual charge of 2 outwardly isolated phases formed because of the change of potential in the double zone is used for quant measurement. The e m f of concn chains: normal electrode | soln | solid phase | soln | normal electrode, may be measured by this method. The method $c_1$ | dielectric | $c_2$ may be used directly for measuring the phase limit potential of quartz | aq soln, even solid cryst substances can be measured with slight modifications. The sensitivity of the method is ±1.5 mv. A metal electrode was used instead of dielectric in control expts., results of which agreed with the data of the former method. Preliminary report of phase limit potential of quartz | electrolyte soln. Quartz glasses are examd on their H electrode function by measuring the e m f of an acid alkali-chain and an alkali acid chain. The reproducible difference totaled about 300 mv. Preliminary concn-e m f curves show maxima at $p_H$ 12. S. S. DE FINÁLY

Electrometric determinations of the dissociation of glycocoll and simple peptides. PHILIP H. MITCHELL AND JESSE P. GREENSTEIN. *J. Gen. Physiol.* 14, 255–75(1930).—The apparent acid and basic dissocn. consts. were detd. potentiometrically by the methods of hydrolysis and titration for glycocoll, glycylglycocoll, alanylglycocoll, valylglycocoll, leucylglycocoll, methylleucylglycocoll, phenylalanylglycocoll and glycylglycylglycocoll. The dissocn. consts. were also detd. in the presence of KCl and $K_2SO_4$ at equal ionic strength. The relative order of magnitude of the dissocn. consts. decreases with the increase in no. of C atoms between the $NH_2$ and COOH groups. This is explained as follows on the basis of electronic structure with AcOH and glycocoll as examples. The highly electroneg. $NH_2$ group effects a deformation in the electronic nucleus causing a shift in position of the electron pairs toward the $NH_2$ group about the C and O atoms of the COOH group. In the O—H linkage of the COOH group, the electron pair is drawn closer to the O and farther from the H, decreasing the strength of the bond and increasing the degree of dissocn. of the acid. The proton set free combines at once with the 2 unshared electrons of the N, forming the dipolar mol. or amphoteric ion. Therefore the farther away the $NH_2$ group is from the COOH group, the smaller the deformation of the electronic nucleus and the slighter the dissocn. In general the dissocn. consts. were found to be functions of the H ion activity and of the ionic strength of the solns. Apparent contradictions to the Debye-Hückel theory are indicated and partially explained on the basis of specific ion effects. C. H. RICHARDSON

The electrode potential and the solvent: the solvation activity coefficient. FREDERICK K. V. KOCH. *Phil. Mag.* 11, 579–85(1931). cf. *C. A.* 24, 5574.—The solvation activity coeff. may be defined by the equation $A_s = RT \ln a_s$, where $A_s$ is the free energy involved in the transfer of an ion from pure solvent to a soln. of specified concn. It is related to the usual activity coeff. by the expression $a = a_c a_s$, where $a_c$ is the activity based on the transfer of the ion from vacuum to pure solvent. By considering the transfer of an ion from vacuum to soln. through an electrode the equation for the electrode potential becomes $E = E_s - E_E + (RT/nF) \ln a_c$, where $E_s$ is the solvation potential and $E_E$ is the element potential. The abs. normal potential is thus the difference between two potentials, one dependent on the solvent and the ion, the other on the element electrode and the ion. The Nernst soln. tension is the distribution coeff. between pure solvent and the element electrode. Solvation potentials were calcd. for H, Li, Na, K, Rb, Cs, Tl, Ca, Cl, Br and I ions from the estd. free energy of hydration. The solvation activity coeffs. were calcd. for ions in $C_2H_5OH$. The Born formula for the free energy of solvation holds only for the case where no sp. interaction of ions occurs. The Walden formula for solvation activities was not confirmed. ARTHUR FLEISCHER

Temperature coefficients of certain reference electrodes. PAUL PUTEYS. *Bull. soc. chim. Belg.* 39, 454–7(1930).—Exptl. detns. are reported. For a 0.1 *N* HCl electrode, $E_t - E_{18} = 0.334\,(t-25) + 0.00279\,(t-25)^2$. For a 0.01 *N* HCl, 0.09 *N* KCl electrode, $E_t - E_{18} = 0.391\,(t-25) + 0.00335\,(t-25)^2$. A. L. HENNE

Experimental researches of potential differences between mercury, amalgam and dielectric. B. BIESTERDY. *Magyar Chem. Folyóirat* 37, 23–32(1931).—Production of a zero electrode was tried by using different metal amalgams. Na, Zn, Cd, Sn, Pb and Ag were examd. without any result. S. S. DE FINÁLY

Glass-electrode measurements by means of a galvanometer with condenser attachment. MALCOLM DOLE. *J. Am. Chem. Soc.* 53, 620–2(1931).—With a ballistic galvanometer as a null-point instrument measurements of glass electrode potentials were made to 0.1 millivolt and were shown to agree with those of a H electrode. M. D.

Quinhydrone electrode for mass experiments. G. HATOS. *Magyar Chem. Folyóirat* 35, 168–70(1929).—A practical electrode for mass detns. of $p_H$ is illustrated and described. S. S. DE FINÁLY

Determination of hydrogen-ion concentration by Haber-Klemensiewicz' glass chain,

especially in soil examinations. G HATOS AND GY GOLL. *Magyar Chem. Folyóirat* 36, 33–40(1930).—On examn of 15 soils the method gave almost the same values for $p_H$ as the detn by the quinhydrone electrode. Agreement within about 0.1 $p_H$ resulted from the use of a dil. aq. suspension. Thicker suspension gave agreement within 0.2–0.3 $p_H$. The quinhydrone electrode seemed to be reliable for $p_H$ detns. S. S. DE FINÁLY

*The measurement of the hydrogen-ion concentration in unbuffered solutions.* II. Application of the hydrogen electrode. I. M. KOLTHOFF AND TOSHIRO KAMEDA. *J. Am. Chem. Soc.* 53, 821–4(1931).—It was found that an electrode made by coating a Pt wire with a thin bright layer of Pt yields satisfactory results in the measurement of $p_H$ in unbuffered or slightly buffered solns. The $p_H$ values of $(NH_4)_2SO_4$, $ZnSO_4$ and KCl solns. were measured. III. The colorimetric method. *Ibid.* 825–32.—The measurement of the $p_H$ of pure water, of neutral salts in pure water, and of very dil. NaOH solns. by the colorimetric method is described. The accuracy of the *sulfonphthalein* indicator method is 0.05 $p_H$ in pure water and 0.1 $p_H$ in the NaOH solns. CHANNING WILSON

Determination of hydrogen-ion concentration with a photoelectric colorimeter. RALPH H. MÜLLER AND HERMAN M. PARTRIDGE. *Ind. Eng. Chem., Anal. Ed.* 3, 169–71(1931).—The operation of the colorimeter depends upon the variation in photoelec. current with the transmittancy of the indicator soln. with changing $p_H$ value. The feeble photoelec. current is supplied to a 3-electrode vacuum tube of suitable mutual conductance and $p_H$ values are read in terms of the plate current of the triode. A filter is used between the light source and the soln., being such that it transmits light of a wave length corresponding to one absorption max. of the soln. The plate currents obtained with solns. contg. the same amt. of indicator but buffered to various $p_H$ values are plotted against $p_H$, giving the calibration curve for the indicator. If all factors are const. the plate current of the unknown soln. (contg. the same amt. of indicator) gives the $p_H$. An alternative method is to adjust the intensity of the lamp, vacuum tube filament, etc., to the same value for each expt. and to multiply the observed plate current by the factor representing the ratio between $p_H$ and the current for the indicator. Const. results were obtained over long periods of operation. Diagrams of the app. and calibration curves for various indicators are given, and the characteristics required in suitable vacuum tubes discussed in detail. EDWARD B. SANIGAR

The chemical reactivity of the fused bases. I. The action of the alkali amides upon electropositive metals. W. CONARD FERNELIUS AND P. W. BERGSTROM. *J. Phys. Chem.* 35, 740–55(1931), cf. *C. A.* 22, 1519.—An app. is described for the study of reactions of pure fused alkali amides which avoids contamination of the melt and permits viewing the reaction, controlling the temp., altering the fusion atms., quant. collection of gases and extn. of the melt with liquid $NH_3$. Mg reacts with $NaNH_2$ or $KNH_2$ in an $NH_3$ atm. to liberate the alkali metal. $Mg + 2KNH_2 \rightleftharpoons Mg(NH_2)_2 + 2K$, the equil. point being far to the right. Subsequent reactions are $Mg(NH_2)_2 + 2KNH_2 \longrightarrow Mg(NHK)_2 2NH_3$; $2NH_3 + 2K \longrightarrow 2KNH_2 + H_2$. Ca and Al also liberate K. Ca forms $CaNK_2 2NH_3$ and Zn forms $Zn(NHK)_2 2NH_3$, while Al forms $AlN \cdot NH_3$ + adsorbed $KNH_2$. Be forms $BeNNa_2 2NH_3$ with $NaNH_2$. Ce, Th and Mn are slightly attacked by fused $KNH_2$ while Hg, Cu, Cd, Tl, Ti, Zr, Ta, Cr, Ni, Pt and Ir are not noticeably attacked. Na gives with fused NaOH a blue color, Mg gives a similar color suggesting the reactions $Mg + 2NaOH \rightleftharpoons Mg(OH)_2 + 2Na$, $Mg(OH)_2 + 2NaOH \longrightarrow Mg(OH)_2 + 2H_2O$, $2Na + 2H_2O \longrightarrow 2NaOH + H_2$ (cf. *C. A.* 4, 871, 7, 2167). Ca and Na appear to give some hydride upon reaction with NaOH. W. C. FERNELIUS

Iron oxides and their reducibility with hydrogen and carbon. P. YA. RODE. *J. Russ. Phys.-Chem. Soc.* 62, 1453–66(1930).—The heating curve of $Fe_2O_3$ has a conversion point at 745°, quite likely corresponding to a definite modification of $Fe_2O_3$. Beginning with 1280° some irregularities are observed that probably have a connection with the beginning of loss of $O_2$. The temp. curve of reduction of $Fe_2O_3$ with $H_2$ has 2 kinks probably corresponding to 2 steps in reduction, first to $Fe_3O_4$ and then to a lower oxide. There is no definite proof of formation of FeO as an intermediate product. $Fe_3O_4$ is more easily reduced with $H_2$ than $Fe_2O_3$. In reducing hydrated iron oxides with $H_2$ the point where reduction begins could not be ascertained, because it lies in the region of decompn. of corresponding hydrates. If the products of reduction are cooled in $H_2$ they become pyrophoric when the heating temp. does not exceed 600–650°. A higher heating temp. makes them non pyrophoric. Reduction of $Fe_2O_3$ and hematite ore with C gives on the temp. curve 3 halts, probably corresponding to 3 consecutive stages of reduction to the metal. Here again $Fe_2O_3$ is more easily reduced than $Fe_3O_4$. S. L. MADORSKY

The reaction mechanism of carbon combustion at low pressures. V. SHIVONEN

*Z Elektrochem* 36, 806–7(1930) —The combustion of metallized C filaments was carried out in pure O as well as in additional gases The reaction velocity curves for the formation of the combustion products in pure O are expressed in micromol. per mm O pressure cm$^{-1}$ surface and second The results may be summarized as follows: Kinetic measurements on the C combustion at low O pressures, in general indicate a reaction of the first order The combustion in streaming O between 800° and 1400° forms a gas mixt of const compn ($CO_2$ + 2CO) Between 1400° and 1500° the C surface suffers a change whereby, according to the observation of Langmuir, CO is vaporized Here the velocity curves of both combustion products of C indicate a break Between 800° and 1200° CO formation is promoted through autocatalysis The presence of $CO_2$ retards the combustion of CO and C The velocity equation of $CO_2$ in the presence of CO for the temp between 1500° and 1800° gives an energy value of approx —17 kg-cal At 1600° a minute addn of water vapor accelerates the formation of both combustion products catalytically It appears that the adsorption heat of O on the C of approx. 90 kg cal observed by Marshall and Bramston-Cook corresponds to the formation of an atomic adsorption layer of O already proposed by Langmuir. W VANSELOW

Problems and results of the newer investigations of free radicals. KARL ZIEGLER *Z angew Chem* 43, 915–9(1930) —This is a concise discussion of the causes that det. whether or not a particular substance will be strongly or weakly dissocd The principal points considered are the energy of activation of $C_2H_6$ and the radical and steric factors. A L HENNE

Kordes' law K M STAKHORSKII *J Russ Phys-Chem Soc* 62, 1493–7(1930) —Aside from normal cases where both component compds of a system are unassocd Kordes' law can be used to det approx, from a study of the m-p diagram the mol condition of pairs of which one or both compds are assocd In such cases the assocn const $X_a$ is detd by placing $X_aM_a$ for $M_a$ in Kordes' equation, when $A$ is the assocd compd The equation then becomes $X_a = [M_b\,a(T_a - T_e)\,T_b/M_a\,b(T_b - T_e)\,T_a]$, where $a$ and $b$ are concns of the 2 components $A$ and $B$, $M_a$ and $M_b$ are their mol wts, and $T_a$, $T_b$ and $T_e$ are the m ps of $A$ $B$ and the eutectic mixt The fact that $H_2O$, alcs. and org acids are typical assocd compds is thus once more confirmed by the application of Kordes law S L MADORSKY

Relation between energy of activation and constant $S$ of Arrhenius' equation. E N GAPON *Ukrainskii Khem Zhur* 5, Sci Pt., 169–80(1930) —By the example of 4 reaction groups, it is shown that in a given group the reactions are characterized by the so-called inversion temp $T_i$, at which the reactions proceed at the same rate From this fact results the relationship between the energy of activation $E$ and the const $S$ of Arrhenius' equation $\log S = \log K_i + (E/RT_i)$, where $K_i$ is the rate of reaction const at $T_i$ Thus $K_i$ and $T_i$ are connected by the equation $\log K_i = \log \psi + (\varphi/RT_i)$, where $\psi$ and $\varphi$ are consts., characteristic of all reactions An equation is given describing the kinetics of 2S monomol reactions S L MADORSKY

The problem of dependence of yield on temperature. E N GAPON *Ukrainskii Khem Zhur* 5, Sci Pt, 165–7(in German 168)(1930) —Starting from equations of uni- and bimol reactions and the equation of Arrhenius, 2 equations are obtained showing the relation between temp and reaction yield $\log[\log A/(A - x)] = a_1 - (b_1/T)$ for monomol reactions, and $\log[X/(A - x)] = a_2 - (b_2/T)$ for bimol reactions, where $x$ = reaction yield at a given time, $A$ = initial concn, $T$ = abs temp and $a_1$, $b_1$, $a_2$, $b_2$ are consts These equations make it possible to det the order of reaction and activation energy from yield data at various temps S L MADORSKY

Equilibrium constants for the decomposition of ammonium bicarbonate. WM K. HUTCHISON *J Chem Soc* 1931, 410–2 —The equil consts for the decompn of $NH_4HCO_3$ are calcd from detns. of the partial pressures of $NH_3$, $CO_2$ and $H_2O$ in equil with satd $NH_4HCO_3$ solns. The mean values of $K$ and $K_1$ (detd by assuming the partial pressure of $H_2O$ vapor to be const. at const. temp) at 10° and 20° are:

| | $K = p_{CO_2} \times p_{NH_3} \times p_{H_2O}$ | $K_1 = p_{CO_2} \times p_{NH_3}$ |
|---|---|---|
| At 10° | 253 | 29.5 |
| At 20° | 3000 | 180 |

The general equation for $K$ is $\log_{10} K = 33.88 - 40{,}600/2.303RT$. J. BALOZIAN

*Equilibrium in the iron-oxygen-hydrogen system at temperatures above 1000°.* WALTER E JOMINY AND DONALD W MURPHY. *Ind Eng Chem* 23, 384–7(1931) —A method was developed to det. the equil point by regulating the ratio of $H_2$ to water vapor in gas passing over the Fe sample at a given temp The equil was detd from 1097° to 1427° From these data the m p of FeO is given as 1357° and the heat of fusion as +29,000 ± 5000 cal per g mol B E TIFFANY

Dissociation of sulfuryl chloride. KIMIO ARII. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 10, 256–65(1931). (Abstracts 32–3 [in English] published with *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 15, Nos. 289–91).—$K_p$ was measured for satd. and unsatd. vapors of carefully purified $SO_2Cl_2$ at 30°, 40°, 50°. The mean values agree with the calcd. ones. ALFRED BURGER

Dissociation of silver carbonate. MOTOKI WATANABE. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 10, 244–50(1931). (Abstracts 29–30 [in English] published with *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 15, Nos. 289–91).—The pressure of dissocn. of $Ag_2CO_3$ was measured by a static method between 120° and 201°. The values obtained agree with the calcd. ones. The following thermodynamic quantities were calcd.: $\Delta H_{298}$ for the formation of $Ag_2CO_3$ −119 362 cal., $\Delta F°_{298}$ −103 614 cal., $S_{Ag_2CO_3}$ at 25° 42.5 cal./degree. ALFRED BURGER

Investigation of equilibrium between vapor and solution in the system: acetic acid–acetic anhydride. S. I. CHERNOV. *J. Russ. Phys.-Chem. Soc.* 62, 1509–21 (1930). cf. *C. A.* 24, 4451.—The degree of assocn. of HOAc in soln. depends on the nature of the other component and on temp. A study was made of the vapor pressure of HOAc in the system HOAc – $Ac_2O$ at 60° and 80°, by M. Vrevskii's exptl. method. From these data the degree of assocn. of HOAc in the soln. was calcd. by means of Vrevskii's and Gibbs' equations. S. L. MADORSKY

The study of the complex silver hyposulfites of sodium. E. CARRIÈRE AND RAULET. *Compt. rend.* 192, 423–5(1931).—The reaction of AgCl with $Na_2S_2O_3$ solns. was studied by applying the mass law. The $Na_2S_2O_3$ is added from a buret to a known quantity of AgCl until completely dissolved. The ionic reaction is $AgCl + S_2O_3^{--} = AgS_2O_3^- + Cl^-$. Since the concns. of these ions are known, $K$ can be calcd. An excess of NaCl has little effect on $K$, but $AgNO_3$ in excess forms other complex compds. and could not be studied in this way. From the increase in $K$ with temp., the *heat of formation* of the complex ion was detd. as 7.7 large cals. The cond. of the mixt. after the soln. of the AgCl is the same as that of the original soln. since the number of ionic charges does not change. AMY LEVESCONTE

The equilibrium between chlorine, bromine and bromine chloride (BrCl). W. Jost. *Z. physik. Chem.*, Abt. A 153, 143–52(1931).—In the extinction curve for BrCl absorption is 0 at 575 mμ so that measurements beyond this range are not affected by BrCl absorption. Measurements were made of the correction necessary because of absorption of Br by foreign gases. The expts. at 18°, 88° and 230° yield the equation $\log K = (1320/4.57T) - 0.18$. The heat of formation of BrCl calcd. is 0.75 ± 0.5 kg.-cal. ARTHUR FLEISCHER

Thermal dissociation of nitrogen peroxide. O. KLAUSVIC. *Chem. Listy* 24, 473–4 (1930).—A glass tube 12–15 cm. long and 1 cm. in diam. is closed at one end and partly filled with powd. $Pb(NO_3)_2$ dried at 100°. The tube is sealed at the other end, and heated carefully and in intervals until the reaction $2Pb(NO_3)_2 \rightleftharpoons 2PbO + 4NO_2 + O_2$ is completed. The tube is filled with brown $NO_2$ and carefully cooled. By plunging the tube into cold $H_2O$, the contents become almost colorless as a result of the formation of $N_2O_4$. Warming the tube yields $NO_2$ again. The equation for the dissocn. is

$$\underset{\text{colorless}}{N_2O_4} \underset{-5°}{\overset{+150°}{\rightleftharpoons}} \underset{\text{brown}}{2NO_2}$$

FRANK MARESH

The interpretation of the thermal decomposition of nitrous oxide. H. C. RAMSPERGER AND G. WADDINGTON. *Proc. Natl. Acad. Sci.* 17, 103–5(1931).—The thermal decompn. of $N_2O$ has recently been found unimol. (cf. *C. A.* 24, 4980, 25, 868). According to the theories of Kassel and Rice and Ramsperger, only 1 classical oscillator is required to fit the data at 665°. The mol. diam. is $3.05 \times 10^{-8}$ cm., the crit. energy, 53,000 cal. per mole and $k_\infty = 1.78 \times 10^{-4}$. The const. $A$ in the equation for the rate const. is $4.0 \times 10^{9}$. A table is given for the 11 known unimol. reactions giving the pressure and temp. ranges that have been studied, the consts. $A$ and $Q$ in the rate const. equation and the no. of classical squared terms required by the theory. G. M. M.

The thermal decomposition of nitroxyl chloride. A homogeneous gas reaction of the first order. HANS-JOACHIM SCHUMACHER AND GERHARD SPRENGER. *Z. physik. Chem.*, Abt. B, 12, 115–31(1931).—A description and sketch of the app. for measuring thermal decompn. of $NO_2Cl$ is given together with the procedure for collecting the accompanying data. It is shown that the reaction is monomol. and is still independent of pressure at 10 atms. Its heat of activation is calcd. to be 20.5 kg.-cal. All contaminating gases increase the rate of decompn. about equally while $NO_2$ does so about 20% faster. Stoichiometric amts. of $NO_2$ and $Cl_2$ act like unchanged $NO_2Cl$. The exptl. data are discussed. R. H. LAMBERT

*The thermal decomposition of chlorine monoxide.* J J Beaver and G Stieger. *Z physik Chem*, Abt B, 12, 93–108(1931).—The thermal decompn of $Cl_2O$ follows a complicated chain reaction similar to that of $ClO_2$ rather than the simple bimol reaction believed to occur. Between 100° and 130° the rate is proportional to monoxide concn and at 140° to the exponent 0.75 of concn. A consistent explosion was observed at the end of the reaction. A mechanism of the reaction agreeing with the exptl results concludes the article. R H Lambert

The influence of foreign gases in gas decomposition reactions. N Nagasako *Z physik Chem*, Abt B, 11, 420–4(1931).—The theory of monomol reactions is extended to include the presence of foreign gases. New observations on the decompn of $N_2O$ in the presence of He are reported. J B Austin

*Kinetics of the combination of hydrogen and oxygen: Influence of iodine.* W L Garstang and C N Hinshelwood. *Proc Roy Soc* (London) A130, 640–54(1931).—The upper limit of the low pressure explosion region in the $H_2 + O_2$ reaction is lowered slightly by pretreatment with $H_2$, it is lowered also by water vapor in amts up to 22.7% of total pressure and above this percentage explosion is entirely inhibited. The surface reaction in $SiO_2$ vessels is accelerated by I. The gas reaction at high temps and pressures is retarded by I, and the explosion in the crit. low pressure region does not take place with I in concn greater than a minute amt. Amts. of I less than required to stop explosion entirely lower the explosion pressure. S Lenher

The kinetics of the reduction of cuprous oxide. I. The reduction at low pressures—with an appendix giving the results of further experiments on the oxidation of copper at low pressures. Frederick J Wilkins. *J Chem Soc* 1931, 330–5.—The reduction of $Cu_2O$ by $H_2$ is studied at pressures lower than 0.2 mm under such conditions that the Cu-$Cu_2O$ interface is effectively const. and the $H_2O$ formed is instantly removed from the reaction vessel. The rate of reduction is proportional to the pressure of $H_2$. The heat of activation in the reduction process is 18,000 cals. as judged by measurements between 144° and 250°, it is to be identified as the heat of evapn of the adsorbed $H_2$ into $Cu_2O$. Earlier expts. on the rate of oxidation of Cu are extended to low pressures, the oxidation rate is proportional to the pressure of $O_2$ and involves an energy of activation of 9600 cals. P H Emmett.

Chemical kinetics of ion reactions. I. Principles of the theory of Brønsted. Á Kiss. *Magyar Chem Folyóirat* 35, 139–44(1929).—Short summary of Brønsted's theory and its applications. II. Mechanism of reaction between ferric and iodide ions. *Ibid* 36, 49–59(1930).—The reaction proved to be bimol. for I ions and monomol. for $Fe^{+++}$ ions. Hydrolyzed ferric ions do not react with I ions. The primary kinetic salt effect agrees with Brønsted's neutral salt law in dild. solns. Alkali metals show a striking specific ion effect. Slowing influence of ferrous and sulfate ions must be considered as a secondary kinetic salt effect. III. Neutral salt effect and catalysis in case of ion reactions. *Ibid* 37, 17–23(1931).—Connections between the theory of Brønsted and catalysis, kinetic salt effect and medium effect are discussed. S S de Finály

Kinetics of chlorine bleaching. Joseph J Weiss. *Z angew Chem* 44, 102–4 (1931); cf. *C. A.* 25, 2044.—Polemical with H Kauffmann (*C A* 19, 561; 24, 5589). H Kauffmann. *Ibid* 104–5(1931), cf. *C A* 24, 5589, 25, 597.—A reply. L M Symmes

Reaction velocity in the system $Ag_2CO_3 \rightleftharpoons Ag_2O + CO_2$. Wilfred D Spencer and Bryan Topley. *Trans Faraday Soc* 27, 94–102(1931); cf. *C A.* 24, 2366.—Previous work was extended to include the recombination of $Ag_2O$ and $CO_2$, and the decompn of the $Ag_2CO_3$ at various pressures. When the pressure of the $CO_2$ is several times as great as the equil. pressure, recombination takes place rapidly at first and then the rate decreases suddenly. This initial rapid reaction becomes slower as the pressure is decreased. The decompn of the synthetic $Ag_2CO_3$ in a vacuum is more sensitive to temp. than that of the cryst. $H_2O$ vapor promotes recombination by facilitating the penetration of $CO_2$ through the $Ag_2CO_3$ first formed. Curtis L Wilson

Salt and medium effects on the temperature coefficient of the velocity of decomposition of diacetone alcohol. Geo M Murphy. *J Am Chem Soc* 53, 977–81(1931).—The velocity of decompn. of diacetone alc. was measured by a dilatometric method similar to that of Åkerlof (*C A* 21, 688). Different concns of aq. NaOH solns were used, also aq. NaOH-NaCl solns and aq. MeOH mixts. contg. NaOH. The temp. coeff. of reaction velocity is independent of the concn. of NaOH and NaCl in the NaOH-NaCl solns. In the MeOH-NaOH solns the temp. coeff. increases with increasing MeOH content. The energy of activation was computed as 18,000 cal. E. J. R.

Chemical kinetics in mixtures of solvents. VIII. G E Mukhin and R B Ginzburg. *Ukrainskii Khem Zhur* 5, No 2, Sci Pt 147–58(1930), cf. *C A.* 24, 2942.—

The velocities of reactions were studied between $C_5H_5N$ (I) and allyl bromide (II) and between $PhNMe_2$ and II in mixts of $Me_2CO$ and $CHCl_3$ at various temps The observed consts of reaction velocities of the mixts are smaller than the values calcd. according to the additive rules An increase in temp enlarges the percentage deviation of the observed consts from the additivity Under the same conditions this deviation is greater between $PhNMe_2$ and II than between I and II. IX. G L. Mukhin and R. I. Baranova *Ibid* 159–62.—The velocity of reaction between I and II was studied in equimol concns of 0.5 g mol per l in AcOEt, $MeCH_2CO_2Et$, $MeCH_2CH_2CO_2Et$ at 35° and 45°, in BzOMe, BzOEt and BzOPr, and $C_6H_4(OH)CO_2Me$ and $(CO_2Et)_2$ The most suitable solvents for this reaction are the esters of BzOH The greater the mol wt of the esters of fatty acids and BzOH, the smaller is the velocity const of the reaction The introduction of OH(BzOH to $C_6H_4(OH)CO_2H$) increases the velocity const.

Chas Blanc

The rate of solution of metals in acids. Contribution to the theory of local voltaic elements W Guertler and B Blumenthal. *Z physik Chem*, Abt A, 152, 197–234(1930).—The general course of the soln curves of Fe, Ni and Cu in 0.1 *N* HCl and the detailed rate of soln curves of 2 different samples of Zn were detd Exptl conditions were found under which reproducible values could be obtained. The rate of soln of Zn in 0.2 *N* HCl compared to 0.1 *N* HCl is not even approx proportional to the conductivities of the 2 acids contrary to the results of Frieson Auren and Palmaer (*Z physik Chem* 39, 1(1902) 45, 182(1903), 56, 689(1906)) In general, the rate of soln of metals in acids is proportional to the product of the cond of the acid soln and the difference between the anode and cathode potentials of the local voltaic element, Zn is the anode in the present case, whereas various impurities present in the metal constitute the cathode of the so-called local element The observed acceleration of the rate of soln with time in a particular acid is interpreted as being due to a decrease in the $H_2$ overvoltage of the cathode. When this observed variation of $H_2$ overvoltage is taken into account, the theory of local elements satisfactorily explains the rate of soln of Zn in HCl.

P H Emmett

The inhibition of chemical reactions. IV. The site of antioxygenic action. The oxidation of sodium sulfite and benzaldehyde. Kenneth C Bailey and Violet H French *J Chem Soc* 1931, 420–8, cf. *C A* 24, 2947.—The inhibition of the oxidation of aq $Na_2SO_3$ solns by isopropyl and *sec* butyl alcs. in aq soln is studied, the method of McBain and co-workers (*C A* 21, 3510, 24, 1560) being used For concns of the alc. in the aq soln greater than 2 g /l, Γ (increased concn of the alc. in the surface layer in g /sq cm) has a mean value of about $8.6 \times 10^{-8}$ g /sq cm for isopropyl and $10.3 \times 10^{-8}$ g /sq cm for *sec* butyl alc and varies only slightly with change in concn The results indicate an abrupt change in Γ between 2 and 1 g /l, the unimol layer being formed at a concn. of about 1.5 g /l It is shown that the inhibitor is preferentially adsorbed at the interface in aq solns of those alcs that inhibit the oxidation of the $Na_2SO_3$ solns. The graph of the oxidation velocity of aq $Na_2SO_3$ soln against the inhibitor (alc.) concn. does not show a discontinuity at this concn of alc. That the autoxidation of BzH is not identical with that of aq $Na_2SO_3$ solns is suggested by the velocity inhibitor curves

J Balozian

The molecular constitution of the α solid solutions of tin in copper and of the corresponding liquid solutions examined thermodynamically. Γ H Jeffery *Trans Faraday Soc* 27, 136–7(1931), cf *C A* 24, 2660, 25, 632.—From the equation used in previous work, it is concluded that the α solid soln, like the liquid soln, consists of $Cu_3Sn$ dissolved in monat Cu

Curtis L Wilson

The molecular constitution of the β solid solutions of tin in copper examined thermodynamically Γ H Jeffery *Trans Faraday Soc* 27, 137–9(1931), cf preceding abstract.—Evidence based upon the previous thermodynamic equations indicates that the β solid solns are monat Sn dissolved in monat Cu

Curtis L Wilson

A quantitative relation between the slope $dP/dT$ of the curves representing equilibrium at an invariant point. (Mlle) A E Korvezee (Mlle) N H J M Voogd and F Γ C Schepper *Rec trav chim* 50, 252–5(1931).—Equations are derived for calcg $dP/dT$ or the compn of the unknown phase at an invariant point (cf following abstr)

G M Murphy

The composition of the hydrate of hydrogen sulfide (Mlle) A E Korvezee and F Γ C Schepper *Rec trav chim* 50, 256–60(1931), cf *C A* 13, 3049 and preceding abstr.—Detn of the slope of 3 *P-T* curves and the compn of the phases at the quadruple point for the system $H_2S$–$H_2O$ gives $H_2S\ 6H_2O$ as the compn of the hydrate.

Thermodynamic relations in multi-component systems. Roy W Goranson

*Carnegie Inst Washington Pub* 408, 310 pp (1930).—A complete outline of the subject with accompanying tables. JOSEPH S HEPBURN

The equilibrium diagram of the chromium-carbon system. KAZUE HATSUTA *Kinzoku No Kenkyu* (J. for Study of Metals) 8, 81–8(1931).—The Cr C system was studied by means of thermal, microscopic and x ray analyses and the equil diagram is presented. There are 4 carbide phases, $\epsilon$, $\eta$, $\zeta$ and $\kappa$ corresponding to compds $Cr_4C$, $Cr_7C_3$, $Cr_3C_2$ and CrC (?), resp. The crystal form of $Cr_4C$ is cubic, that of $Cr_7C_3$ trigonal and $Cr_3C_2$ orthorhombic, but that of CrC was not detd. $\alpha$- and $\epsilon$-phases form a eutectic at 1485°, 3.7% C. The $\epsilon$- and $\eta$ phases are peritectically formed according to the following scheme, resp. $\eta$ + melt $\longrightarrow$ $\epsilon$, $\zeta$ + melt $\longrightarrow$ $\eta$. The peritectic temp of the former is 1530°, and that of the latter is above 1600°. The $\zeta$-phase probably has the max m p on the liquidus curve and forms a eutectic with $\kappa$-phase, a transformation takes place at 1505° in this phase. M KURODA

Fractional crystallization in the Blanc process with hydrochloric and nitric acids. GIOVANNI MALQUORI *Atti III congresso naz chim pura applicata* 1930, 420–31; cf *C A* 23, 2876.—Discussion of various ternary systems of the 5-component systems $AlCl_3$-$FeCl_3$ KCl HCl $H_2O$ and $Al(NO_3)_3$–$Fe(NO_3)_3$ $KNO_3$ $HNO_3$ $H_2O$ which are of interest in connection with the extn of K and Al salts from leucite by the Blanc process. Consideration of the phase diagrams shows how large yields and extreme purity of the products may be obtained. G M MURPHY

Melting point diagram in the system zirconium dioxide beryllium oxide. O RUFF, F. EBERT AND H v WARTENBERG *Z anorg allgem Chem* 196, 335–6(1931); cf *C A* 24, 3336.—Earlier expts are repeated and the conclusion is reached that no compd is formed in the system $ZrO_2$ BeO, but that there is a eutectic line at about 2200°. In the system $ZrO_2$ CaO, the compd $ZrCaO_3$ is demonstrated, with m p 2350°. H S

Autocatalysis in oxidation. III. The mechanism of the action of positive catalysts in the autoxidation of abietic acid. G DUPONT, J LEVY AND J ALLARD *Bull soc chim* 47, 942–52(1930); *Bull inst chim* 1931, 20–30; cf *C A* 24, 855, 2915, 25, 1148.—The autoxidation of abietic acid is a normal autocatalysis, normally, it is greatly accelerated by Co abietate, acting as a pos catalyst. However, an extremely small quantity of catalyst (*about 0.001 of Co salt*) *has a marked antioxygen effect. O is* absorbed rapidly, at an increasing rate, until one atom has been absorbed by the abietic acid, the oxidation continues then much more slowly, until a second atom of O has been taken up. From there on, the absorption of O becomes an extremely slow process. The results are explained by the Moureu-Dufraisse theory. It is claimed that the effective catalyst is probably a complex oxidized acid Co abietate, the supporting evidence is furnished by a comparison of the absorption spectra of slightly acid Co abietate, *Co abietate in abietic acid and oxidized abietic acid contg Co abietate*. A L HENNE

Cysteine and glutathione as anticatalysts in oxidations with molecular oxygen. A SCHÖNBERG. *Ber* 64B, 540–61(1931).—The rate of oxidation of leuco methylene blue by mol $O_2$ in the presence of $Cu(OAc)_2$ was found to be due to 2 reactions a primary involving the transfer of $O_2$ by the $Cu(OAc)_2$, and a secondary in which the leuco dye is oxidized by the $H_2O_2$ in the soln. The amt of $O_2$ taken up by the leuco dye depends *upon the ratio of the velocities of these 2 reactions*. The addn of cysteine (I), cysteine hydrochloride (II) or glutathione (III) retards the oxidation. Curves are given showing the effects of the addn of various concns of I, II or III on the velocity of the reaction. In the presence of I, II or III the reaction velocity increases with time, while in their absence it decreases. This increase is thought to be due to the oxidation of *I, II or III by $H_2O_2$ to the disulfides*, which are considered inactive, for cystine has only a very weak anticatalytic action. Increasing the concn of I, II or III retards the oxidation, which is probably due to the formation of complex Cu compds. In high concns of I, II or III the Cu complex is only slightly dissocd., while in low concns there is greater dissocn and hence a higher concn of the catalytically active Cu ions. HCN, which also forms Cu complexes, retards the oxidation of leuco methylene blue with mol $O_2$ in the presence of $Cu(OAc)_2$, *but has no effect on the autoxidation of the leuco dye. Since the addn of* cystine causes little retardation, its Cu complex may be more highly dissocd. It is also possible that the SH group may have a sp effect. RUTH BERGGREN

A simple method of measuring the specific heat of a solid body at ordinary temperature. Application to beryllium. P. VERNOTTE AND A JEUPROY. *Compt rend* 192, 612–4(1931).—A method is very briefly described for detg sp heat of solids without the temp uncertainties encountered in the usual procedure. The solid is allowed to come to a const *temp* in a thick, tightly closed metal box and is then dropped into cold water in the calorimeter and the reading is recorded. This method can be used for higher

temps in which case an oven is used to regulate the temp Be was found to have a sp ht of 0.397 at 13°
J. R. ADAMS

Vapor pressure and heat of dilution. VIII. Heat of dilution of cane sugar in aqueous solution and of urea and calcium chloride in alcoholic solution. R. B. VALLEE AND E. P. PERMAN *Trans. Faraday Soc.* 27, 124–35(1931); cf. *C. A.* 25, 2350.—The heats of dilu. of cane sugar were measured at 0°, 20°, 40°, 60° and 80°, over a range of concn. from near satn. down to about 25%. Small values, never greater than 3 cal. per g. of $H_2O$, were obtained for all heats. They were all neg. Urea in alc. gave very small heats of dilu., all pos. $CaCl_2$ in alc. had neg. heats of dilu. The heats of dilu. calcd. from the vapor pressures agreed with the exptl. values for urea and $CaCl_2$, but not for cane sugar. The osmotic pressures were calcd. from the heats of dilu. of cane sugar, and agreed with the exptl. values.
CURTIS L. WILSON

The heat of formation of gaseous mercury, cadmium and zinc halides. H. SPONER *Z. physik. Chem.*, Abt. B, 11, 425–32(1931).—It is assumed that the bands of the diatomic Hg, Cd and Zn halides reported by Wieland (cf. *C. A.* 23, 4888) represent transitions from the basic level to an excited state. The vibration quanta were extrapolated on this basis and give the following heats of dissocn. (in kg.-cals.): HgCl 32, HgBr 25, CdBr 60, CdI 32 and ZnI 46. By combining these results with existing thermochem. data the following are obtained: $HgCl + Cl = HgCl_2 + 72$ kg.-cals.; $HgBr + Br = HgBr_2 + 62$ kg.-cals., $CdI + I = CdI_2 + 48$ kg.-cals.
J. B. AUSTIN

The heat of formation of the nitrides. I. Manganese nitride and chromium nitride. B. NEUMANN, C. KRÖGER AND H. HAEBLER. *Z. anorg. allgem. Chem.* 196, 65–78(1931).—A new method is described for detg. the heat of formation of nitrides directly by heating the metal in a small elec. furnace, contained in a bomb calorimeter, in $N_2$ under pressure. One min., 45 sec. sufficed to heat the metal to 900° and nitride it. The Mn nitride formed at 500° to 1000°, under 10 to 25 atm. $N_2$, is closely $Mn_4N_3$; and the heat of formation is, $5Mn + N_2 = Mn_4N_2 + 57,180$ (±400) cal. By use of the less accurate method of burning nitrided Mn in $O_2$ in a bomb calorimeter the value, 62 400 cal., was detd. When Cr was nitrided at 600°, 25 atm. $N_2$, for 1 min., 15 sec., only 0.65% N was absorbed, but at 900°, in 1 min., 45 sec., 15 to 24 g. N per 100 g. Cr reacted. The product was largely CrN. The heat of reaction of 1 at. of N with Cr was found to be 29 500 ± 500 cal. The exptly. detd. heats of formation agree poorly with values calcd. from dissocn. pressure data, indicating that the dissocn. pressures in these systems, metal $N_2$, are not sufficiently accurate to permit the estn. of the influence of mixed-crystal formation on the quant. calcn. of the equil. by use of thermodynamic equations. The *electrolytic prepn. of pyrophoric, metallic Mn and Cr*, with a Hg cathode, is described.
R. H. LOMBARD

The reversible oxidizability of organic substances: thermochemistry of the oxidation of rubrene. CHARLES DUFRAISSE AND LEON ENDERLIN. *Compt. rend.* 191, 1321–3 (1930).—The reversible oxidation of rubrene ($C_{42}H_{28}$) appears similar to that of hemoglobin. The photochem. oxidation of rubrene is exothermic, indicating that light acts as a catalyst and that other catalytic agents must exist. The heats of formation of rubrene and its oxides in Cals. are: Rubrene (R) —131, (oxyrubrene (dissociable), ($RO_2$)) —108.4, isooxyrubrene ($RO_2$) —50.4, metrubrene (RO) —92.4. The liberation of 23 Cals. in forming the dissociable oxide is much less than the heat (about 50 Cals.) evolved by introducing O into ethylene and the heat of formation of the other rubrene oxides.
H. W. WALKER

van't Hoff's stability rule. B. BRCZS. *Rec. trav. chim.* 50, 230–7(1931).—Available exptl. data support the rule that from 2 modifications of a system, the one with higher sp. heat becomes stable at higher temp. Ordinarily low temps. suffice for application of this rule but in case of intersecting (gas-solid) sp.-heat curves lower temps. must be considered. The rule also fails for cases like ortho-$H_2$, where the modification appears only due to the lowering of the thermodynamic potential of the other form.
G. M. MURPHY

The transformation of heat into work and "chemical" energy into heat as viewed in the light of the modern "volume energetics." RICHARD V. DALLWITZ-WAGNER *Wärme* 52, 549–50, *Chem. Zentr.* 1929, II, 1385.—If the abs. temp. is replaced by $(1/\delta)$, $\delta$ representing the cubic coeff. of expansion at the resp. temp., then the thermodynamics become vol. energetics and the efficiency of processes in which no temp. drop is involved can be calcd. $A = \frac{1.97}{[(c_p/c_v)-1]}\left(\frac{1}{\delta_1}-\frac{1}{\delta_2}\right)$ or $\frac{1}{[(c_p/c_v)-1]}(KV_1 - KV_2)$; $\delta_1$ and $\delta_2$ represent the coeffs. of expansion and $K$ represents the cohesion pressure. Thus 8750 cal./g. is obtained for the combustion of gas coal (mol. wt. 36, $c_p - c_v = 1.97$), 72

kg -cal for the combustion of $H_2$ and 2 v for the e m f of the H-O element. v. D gives a vol -energetic formulation of the 2nd fundamental law of thermodynamics G Schwoch

New methods of establishing thermodynamic diagrams. Some simpler aspects of the corpuscular theory of light and the wave theory of matter. Gilbert D West *Science Progress* 25, 622–6(1931) —An attempt to harmonize the 2 theories Joseph S Hepburn

secondary phenomena, particularly the *reflection of electrons* For I a max. for the formation of ions occurred at 2–4 v., with a probability of $10^{-4}$ Neg ion formation in Hg vapor and A was shown only when electron speeds approached the ionization potential In these cases neg ions are formed probably from excited atoms The probability curve for I reached a min at 0 5 v. L. P Hall

Some new aspects of radioactivity. C D Ellis *Science Progress* 25, 607–21 (1931).—A review Joseph S Hepburn

A spintharıscope for measuring radioactivity. H A Mangan and Herman Schlundt *Trans Electrochem Soc* 59 (preprint) 7 pp (1931).—*The spintharıscope is* serviceable in rapidly establishing the fact of radioactivity in living persons, but in its present form it is quite inferior to the electroscope for accurate estn of small quantities of radioactive emanations C G F

The column ionization of single α-particles. K Diebner *Physik Z* 32, 181–2 (1931), cf *C* 1 22, 4365.—The degree of satn of ionization of single α particles in air and $CO_2$ was investigated with varying angles between the direction of the incident beam and the elec field A strong Po prepn was used giving an av of 26 α particles per hr At 18° and 1 atm., the const $K_0$ in the Geiger formula is found to be for air, 6 26 × $10^4$, for $CO_2$, 8 31 × $10^4$ cm $^{-4/3}$ The const $Z$ (atoms decompd by 1 g Ra per sec.) is 3 71 × $10^{12}$ G M Murphy

*The ionization of individual α- and H-rays at the end of their range* Ewald A W Schmidt and Georg Stetter *Sitz Akad Wiss Wien*, Abt IIa, 139, 123–38(1930), *cf C A* 24, 1279.—*The tube electrometer was used to measure the ionization of many* individual rays at various absorptions α-Rays from Po prepn and H rays (at fragments), obtained by α rays from Po prepn impinging on paraffin sheets, were studied A special valuation method succeeded in approx fixing the sp ionization of a single α and a single H-ray at the end of their ranges as 20,000 and 5400 elementary quanta per cm., resp., or a ratio of 4 to 1 By use of the tube electrometer this makes possible definite recognition of *α rays of small range from H rays* This definite sepn should prove of value in investigations of at disintegrations Oden E Sheppard

Recent progress in the study of the magnetic spectrum of α-rays Salomon Rosenblum *J phys radium* [7], 1, 438–44(1930), *cf C A* 24, 4457.—Resolution of α-rays from Th C was effected in a powerful magnetic field. Plates are shown for a direct method and a focal method Relative velocities of 4 groups of rays from Th C referred to the strongest ray were measured as 1 0034, 0 975, 0 902 and 0 964, resp., and several other groups were detected, showing that particles are not all of the same velocity The energies of these groups differed from the energies of the main Th C group by 40 6, 287, 442 and 441 kv. electrons. Certain groups of γ-rays possessed energies of 40 8 and 279 kv. electrons L P Hall

*Investigations with the tube electrometer on the α-reflection and the shattering* effect on light elements. Ewald A W Schmidt and Georg Stetter *Sitzb Akad Wiss Wien*, Abt. IIa, 139, 139–50(1930).—The secondary radiations produced by α-particles from Po impinging on the light elements *B, Be, C and N were investigated by* the use of the tube electrometer in an attempt to det. whether at. disintegrations took place. The measurements were made in an angle range of 135° and by comparison with analogous expts using a thin Au foil it was detd whether a surplus of reflected α particles was present. The values for Be and N are in good agreement with the theoretical but for B and C the expts., with α particles of 3 5-cm residual range, show 4 to 4 5 times the theoretical no of secondary α-rays With α-particles of 2 3-cm residual range C does not show this surplus of α rays With a special arrangement of the app attempts were made to det. whether this excess of α-particles was due to anomalous scattering or to at. decompn but a definite decision is not yet possible. In the 90° angle range C showed the same particle no as in the 135° angle range, which tends to disprove anomalous scattering *With α-particles of 2 3 cm range B still shows clearly at* decompn Oden E Sheppard

Application of Chamie's photographic method to the determination of the chemical behavior of polonium. Marietta Blau and Elisabeth Rona *Sitzb Akad Wiss Wien*, Abt IIa, 139, 275–9(1930), cf *C A* 24, 1279.—Highly purified solns of Po were mixed with the reagents considered and the mixt. was then placed in a small closed cell in contact with the photographic plate and the plate developed If there is uniform darkening of the plate the Po is considered to be in soln equally distributed but if there are dark spots on a lighter background it is considered that slightly sol Po compds are formed which collect in groups The expts indicate that *N* chromic acid and *N* $HNO_3$ do not repress all hydrolysis of Po salts but that *N* HCl does; KOH partly dissolves the hydrolysis products; *glycerol tends to suppress hydrolysis*, $H_2S$ ppts a Po compd

which dissolves in 4 *N* HCl but not in $K_2SO_4$. $SO_2$ reduces Po compds in $H_2SO_4$ soln but not in HCl. In hydra the reduces Po compds in HCl soln., tartaric acid added to $HNO_3$ soln produces more insol compds. During electrolysis of Po compds in $H_2SO_4$ soln + Ni more dark spots appear in the photographs produced by anode soln than by cathode soln but if Ni is absent the dark spots are seen in either. Further investigation of these electrolysis effects is planned in the hope of throwing light on the catalytic migration of material during electrolysis. ODEN L. SHEPPARD

Emanation apparatus. WINFIELD LATSHAW. *J. Chem. Education* 8, 966–7 (1931).—An app. for the collection of emanation from a radioactive substance is described. The device is particularly useful in connection with lecture demonstrations and was designed to be used as a storage vessel as well as a working app. J. H.

The distribution of radon between liquid and solid phases of water and of benzene. FRANZISKA WITT. *Sitzb. Akad. Wiss. Wien, Abt. IIa* 139, 195–202(1930).—Expts. showed that the quantity of Rn in the solid phase depends on the rate of freezing of $H_2O$ or $C_6H_6$ solns. of Rn. Exhaustive expts. failed to show any simple relationship between rate of freezing and Rn content but did show that when $C_6H_6$ solns. are frozen very slowly Rn is not present in the solid phase. The phenomenon seems to be one of occlusion rather than solv. The fact that even very slow freezing did not reduce the Rn content of ice below $-4°$ is probably due to the air bubbles enclosed in the ice. O. J. S.

Discoloration of glass and some minerals by β- and γ-rays. JOSEF HOFFMANN. *Sitzb. Akad. Wiss. Wien, Abt. IIa* 139, 203–30(1930).—Many different glasses and mineral specimens were irradiated with β- and γ-rays from 610 mg. $RaCl_2$ until no further color change took place. Many samples were also irradiated with *ultra violet rays* from a quartz Hg vapor lamp. When heated most of the samples lost the color caused by irradiation but in some cases heating caused a change in color. For Mn free glasses the irradiation colors are yellow, reddish yellow, brown, reddish brown, gray and blackish. Alkali metal atoms are most commonly the cause of color, then Pb, Ba and Zn and certain heavy metal atoms follow. Only Pb glasses produce a reddish shade as a ground color. Pb glasses are recognizable because they show fluorescence under ultra violet light. Glasses relatively unstable because of high basicity, heavy metal oxide components, several different acid components, etc., frequently show first a gray color, then a brown and finally a blackish color. The Mn glasses present a unique problem which will be considered in a later paper. Violet is a common final color with Mn glasses. ODEN E. SHEPPARD

Radium-bearing minerals from Great Bear Lake, Northwest Territories. HUGH S. SPENCE. Can. Dept. Mines, Mines Branch, *Memorandum Series* No. 48, 4 pp. (1931).—Analyses of 2 pitchblende samples showed $U_3O_8$ 56.91, 63.04, Th nil, $V_2O_5$ trace, nil, Cu 0.70, 0.66, Ni trace, Co 0.13, 0.10, PbO 12.00, 12.13, Bi 0.18, trace, As 0.15, 0.14, Fe 1.01, 0.77, S 2.08, 0.90%, Ag 1.41, 1.72, Au 0.19 oz. per ton, trace. $U_3O_8$ content of 8 samples was 27.88–83.90%, equivalent to 70.79–213 mg. per ton. Quartz was the principal impurity. Pb was present up to 11.25%. Flotation tests showed only little improvement in grade with a loss of 7.51% of the $U_3O_8$. ALDEN H. EMERY

The distribution of spate-potential in high-frequency glow discharge. D. BANERJI AND R. GANGULI. *Phil. Mag.* 11, 410–22(1931); cf. *C. A.* 24, 5612. A. F.

The regularities of x-ray spark spectra. SAKAE IDEI. *Science Repts. Tôhoku Imp. Univ.* 1st series 19, 551–8(1930).—The values of $\Delta\nu/\sqrt{\nu/R}$ and $\Delta\nu/R$ between the so-called spark lines in the x ray spectra and their main line have been studied as functions of the at. no., and it is found that $\Delta\nu/\sqrt{\nu/R}$ is nearly const. and $\Delta\nu/R$ varies linearly with the at. no. By these regularities it was possible to correlate certain spark lines found by several investigators. C. J. HUMPHREYS

The fine structure of the Moseley curves for the *M*-absorption edges in the heavier elements. SAKAE IDEI. *Science Repts. Tôhoku Imp. Univ.*, 1st series, 19, 651–2(1930), cf. following abstr.—Discontinuities in the Moseley curves for the *L*-absorption edges and for some emission lines in the *L*- and *M* series at Pt(78) and near Th(90) were reported in a previous paper. Similar discontinuities have been confirmed for the *M* absorption edges by the method of the modified Moseley curves. C. J. HUMPHREYS

The precise measurements of the *L*-group of the x-rays in the heavy elements. SAKAE IDEI. *Science Repts. Tôhoku Imp. Univ.*, 1st series, 19, 559–639(1930).—Complete results are presented of the measurements of the wave lengths of the x ray lines in the *L*-group for the elements, Ta(73) to U(92). The wave lengths of the stronger lines detd. by Firman and Wennerlöf were used as standards. Siegbahn's tube spectrometer was used throughout the expts. The differences in the values of $\nu/R$ for the energy levels, $[L_I L_{II}]$, $[L_I L_{III}]$ and $[L_{II} L_{III}]$ have been calcd. from the data given by the emission lines

and are compared with the values obtained from the measurements of the absorption edges The correlation of the exptl data with the process of atom building has been attempted by the method of the modified Moseley curves, which have been constructed for the elements studied Regularities in the orders of the intensities as a function of the at. no are discussed C J HUMPHREYS

**The fine structure of the Moseley curves for the energy levels in the lower elements.** SAKAE IDEI *Science Repts Tôhoku Imp Univ*, 1st series, 19, 641–9(1930), cf preceding abstr —The fine structure of the Moseley curves for the energy levels in elements of low at no has been studied by a simple method proposed by I, according to which the curve is assumed to be a straight line, $\sqrt{\nu/R} = a + bZ$, after which the differences between the actual values of $\sqrt{\nu/R}$ and corresponding points on this line are plotted against $Z$. Such a difference curve is called a modified Moseley curve Many discontinuities in the curves studied corresponding to the stepwise process of atom building are brought out in a striking manner Some considerations are put forward on the screening effect of other electrons C J HUMPHREYS

**The fine structure of the *K*-absorption spectrum of selenium.** SAKAE IDEI *Science Repts Tôhoku Imp Univ*, 1st series, 19, 653–8(1930) —Measurements of the fine structure of the *K*-absorption edge of Se are reported The effect of chem combination on the principal *K*-absorption limit has been found to be negligibly small Suggestions which have been made as to the possible origin of such structures will require data from a larger no of elements for confirmation C J HUMPHREYS

**Theory and practice of x-ray analysis.** WILLIAM H BARNES *Can Chem Met* 15, 67–70(1931) —A short review with brief mention of some of the fundamental conceptions on which the subject is based and an outline of a few of the fields of application The production, nature of x-radiation and phys chem and biol effects thereof are discussed Applications to spectroscopy and crystallography are noted W H B

**Construction and operation of a simple x-ray spectrograph.** I VIAN J WOOD *J Chem Education* 8, 952–63(1931) E H

**Quantitative chemical analysis by means of the absorption of x-rays.** N H MOSNES *Z physik Chem*, Abt *A* 152, 380–408(1931), cf *C A* 24, 548 —An analytical method based on the absorption of x-ray line spectra was developed A photographic-photometric method for measuring the intensity of x rays was described When it was applied to the *analysis of Zn* in ZnO and *Ni* in NiO, the max errors were 10 and 39%, resp. FRANK URBAN

**Protective lead thickness in the German protective recommendations.** J H VAN DER TUUK AND W. H. BOLDINGH *Fortschr Gebiete Röntgenstrahlen* 41, 965(1930) — The conclusion is drawn that the international recommendations regarding Pb thickness for x-ray protection are preferable to those of the German Rontgen Society Dosage measurements were made to obtain the necessary data H E SEEMANN

**Protective lead thickness in the international and in the German protective recommendations.** R. GLOCKER *Fortschr Gebiete Röntgenstrahlen* 41, 967(1930) —G. refers to the work of van der Tuuk and Boldingh (preceding abstr.), and points out the difference in principle used in deciding upon the international and the German recommendations A decrease in thickness from 5 mm to 4 5 mm for 200–220 kv appears desirable H E SEEMANN

**The electronic energy levels of the elements, with special reference to their connection with the sizes and electronic states of atoms in metallic crystals.** WILLIAM HUME-ROTHERY *Phil Mag* 11, 649–78(1931), cf *C A*. 24, 5559 —The size of the atom in a crystal is detd principally by the outermost complete shell of electrons of the at core or ion and not by the valency electrons When the interat distances vary as $1/Z^2$ at the beginning of a period, the electronic energy levels vary linearly with $Z^{2/3}$ for the $N_1$ electrons of the outermost group of electrons of the at core This rule was tested for the various groups by plots of $\nu/R$ against $Z^{2/3}$ or for the higher powers log $(\nu/R)$ against log $Z$. The slope of the line when the interat. distance is plotted against $Z$ is $^1/_3$ that of the slope of the energy level line and with the opposite sign From this the no of electrons in the outer shell may be deduced The rule is applied to various elements ARTHUR FLEISCHER

**Excitation of the visible spectrum of helium.** J S TOWNSEND AND F LLEWELLYN JONES. *Phil. Mag.* 11, 679–85(1931).—The intensity of red light for a given current increased 2 7 to 1 when the pressure was decreased from 10 4 to 2 3, for violet light the intensity increased 4 3 times. The calcd. mean energy of the electrons is 3–4 v. This is not in agreement with the properties of the Bohr model of He, which requires 20 v. for radiation emission ARTHUR FLEISCHER

The magneto-optical dispersion of organic liquids in the ultra-violet region of the spectrum. II. The magneto-optical dispersion of methyl propionate, ethyl propionate and ethyl formate. IRIVAL JENKINS AND T. J. EVANS. *Phil. Mag.* 11, 377–96(1931); cf. *C. A.* 24, 441. The consts. $b_1$ and $b_2 \times 10^{-4}$, resp., for the equation given in *C. A.* 24, 441 satisfying the exptl. data at 19° are for methyl propionate 0.1066, 4.771; ethyl propionate 0.1061, 5.068; ethyl formate 0.1061, 4.72. The values of $e/m$ for the light used, calcd. were 0.96, 0.99 and 0.996, resp. The ordinary dispersion may be expressed by the equation $n^2 - 1 = b_0 + [b_2/(\lambda^2 - \lambda_1^2)]$ with the const. $b_0$ 0.8716, 0.8761 and 0.8761 and const. $b_2 \times 10^{-4}$ 8.68, 8.99 and 8.30, resp., for the 3 compds.

ARTHUR FLEISCHER

The optical excitation function of helium. WALTER C. MICHELS. *Phys. Rev.* 36, 1[illegible]. BERNARD LEWIS

Vacuum spark spectra to 40 A. U. the spectra of Be III, Be IV, B IV, B V and C V. BENGT EDLÉN. *Nature* 127, 405–6(1931). cf. *C. A.* 24, 2048.—The series of H and He like spectra which was previously traced to Be IV, has now been completed with B IV, B V and C V, and the limit of optical spectra brought down to 40.28 A. U. The vacuum spark was produced by a capacity of 0.3 μf charged to 60,000 v. Half an hr. with about 30 sparks a min. was sufficient for an exposure. The plates were taken with the same metal grating as was used before, but now set up in a new spectrograph at a glancing angle of 5.4°. Tabulated results for the 2 series of isoelectronic spectra are reproduced below.

| | Be IV | | B V | |
|---|---|---|---|---|
| | ν | λ | ν | λ |
| $1^1S - 2^1P$ | 1,317,084 | 75.925 | 2,058,247 | 48.585 |
| $1^1S - 3^1P$ | 1,560,962 | 64.063 | | |

| | Be III | | B IV | | C V | |
|---|---|---|---|---|---|---|
| | λ | ν | λ | ν | λ | ν |
| $1^1S - 2^1P$ | 100.25 | 997,500 | 60.31 | 1,658,100 | 40.28 | 2,482,600 |
| $3^1P$ | 88.30 | 1,132,500 | 52.68 | 1,898,300 | | |
| $4^1P$ | 84.75 | 1,179,900 | | | | |
| $5^1P$ | 83.19 | 1,202,100 | | | | |
| $6^1P$ | 82.37 | 1,214,000 | | | | |

The ionizing potentials, computed on the assumption that the quantum defect, $n - n^* = 0.013 \pm 0.001$, calcd. from the series of Be III, is const., are in good agreement with the quantum theoretical values given by Hylleraas. C. J. HUMPHREYS

Note on wave lengths in the vacuum copper arc. A. G. SHENSTONE. *Phys. Rev.* 36, 602–3(1930).—For the measurement of Cu II low level spark lines, spark spectra lines are satisfactory standards. However, for high level lines an error of about 2.7 wave nos. is introduced by the same procedure. BERNARD LEWIS

Fluorescence of mercury vapor under atomic and molecular absorption. HENRYK NIEWODNICZANSKI. *Nature* 127, 406(1931). cf. Rayleigh, *C. A.* 25, 2051.—Lord Rayleigh has recently pointed out that the fluorescence of Hg vapor is due to both at. and mol. absorption. This conclusion is supported by expts. on the influence of the magnetic field on this phenomenon. The fluorescence was excited by radiation of λ2537 A. U. The tube with the Hg vapor was placed between the poles of an electromagnet and the intensity of the fluorescent radiation observed at different field strengths. The variation of the intensity of the green fluorescence was found to be similar to that of the resonance radiation investigated by M. Schein. It is concluded, therefore, that, in the excitation of the fluorescence by λ2537, the at. absorption forms the first necessary step. C. J. HUMPHREYS

Intensity, broadening, extinction and secondary continua of the mercury resonance line on addition of rare gases. PAUL KUNZE. *Ann. Physik* 8, 500–20(1931).—The effects of He, Ne and A on the emission and absorption of Hg 2537 have been further investigated. Monochromatic light is passed into a cell, connected directly with this resonance cell is an absorption cell contg. the same mixt. of gases. The photoelec. cell used to measure the resonance is on a line with the resonance and absorption cells. All measurements were made at 21.5°. The pressures of the rare gases varied from 0 to 1 atm. Absorption is greatly decreased by even small quantities of the gases, with increasing pressure the 3 curves (absorption *vs.* pressure) become almost coincident and are almost parallel to the pressure axis, although still decreasing. The sp. broadening according to the Lorenz theory should be 1.1.1 for He, Ne and A, exptly. it is 18, 12 and 19 milli A. U., resp. The extinction of the resonance intensity decreases in the order He,

Ne and A; for He it is almost 0, for Ne small and for A marked. A discussion is given. WILLIAM F. VAUGHAN

**The presence of neutral oxygen in the gaseous nebulae.** I. S. BOWEN. *Phys. Rev.* 36, 600(1930). BERNARD LEWIS

**The two forms of hydrogen.** T. FERKO GRUZ. *Magyar Chem. Folyóirat* 36, 1-10 (1930).—A theoretical discussion of para- and ortho H. S. S. DI LINAY

**The ortho-para-hydrogen conversion at surfaces.** HUGH S. TAYLOR AND A. SHERMAN. *J. Am. Chem. Soc.* 53, 1614-5(1931).—Neither with an active ZnO nor with the more active hydrogenation agent Zn-Cr oxide is there any para H formed at liquid air temps. even after 14 hrs.' contact, in the temp. region where, on these surfaces activated adsorption of H sets in ($T > 0°$) there is an immediate activity in the reconversion of the 50% para H to the normal 1-3 mixt. The relative activities in this respect are exactly parallel with the influence of compn. on the velocity of activated adsorption. C. J. WEST

**The Stark effect in band spectra.** W. G. PENNEY. *Phil. Mag.* 11, 602-9(1931).—Math. Appreciable Stark effect may be expected when an elec. field is applied to a radiating mol. system when for that mol. $\Omega \neq 0$ and there is a non-vanishing permanent moment. The splitting will be quadratic at first, then linear when the energy shifts become large compared with natural Δ doubling intervals. A similar result is obtained for polyat. mols. with 2 nearly equal moments of inertia. For polyat. mols. with 3 appreciably different moments of inertia only the lowest quadratic states will give a measurable splitting. ARTHUR LEIFSCHITZ

**The Raman effect in acetylene.** P. SECRÉ. *Atti accad. Lincei* 12, 226-8(1930).—The Raman effect in gases has not been studied very extensively as in many cases the ultra-violet rays usually used (from Hg) have a chem. action on the gases. S., therefore, utilizes some of the *visible* rays from the Hg spectrum in studying the action on $C_2H_2$. Five sharp lines and one faint line were obtained in the spectrograph. The 5 sharp lines were at $\nu = 25\,117$, 25,377, 25,318, 22,725 and 20,950 cm.$^{-1}$, excited by the 3650, 4046 and 4358 A. U. lines of Hg. The difference in displacement in various spectrographs was $\Delta\nu = 1979 \pm 6$ cm.$^{-1}$. The 6th line is of about 21930 cm.$^{-1}$. The frequency 1979 cm.$^{-1}$ has also been observed in the infra-red absorption and is one of the fundamental frequencies of $C_2H_2$. A. W. CONTIERI

**Raman spectrum of hydrogen peroxide.** S. VENKATESWARAN. *Nature* 127, 406 (1931).—The Raman spectrum of $H_2O_2$ (Merck's perhydrol 30% soln. in water) has been photographed. The prominent feature is the presence of a sharp Raman frequency of 875 accompanied by a weak component at 903 cm.$^{-1}$. The low values of the frequencies suggests that they arise from O atoms, and as such may be compared with the $O_2$ oscillation frequency 1552 obtained by McLennan (*C. A.* 24, 1294). The large difference between the 2 values is indicative of the fact that the O atoms in $H_2O_2$ and $O_2$ mols., resp. are bound differently. Besides the above 2 frequencies there appear other bands which are less intense and sharp, the origin of which is under investigation. C. J. W.

**The electrolytic dissociation of nitric acid as revealed by its infra-red absorption spectrum.** I. I. KISSEY AND J. W. ELLIS. *Phys. Rev.* [II], 36, 603-4(1930).—In solns. of $HNO_3$ of various concns. and of the fuming acid only the water bands in absorption were found. They were sharp and shifted slightly toward shorter wave lengths. In the fuming acid new strong maxima appear which are attributed to the undissocd. $HNO_3$ mol. In the vapor a group is found which is believed to be the same as that for the liquid. Each band, however, is shifted to shorter wave lengths. B. I.

**Photosensitized decomposition of nitrogen trichloride.** I. JOHN G. A. GRIFFITHS AND RONALD G. W. NORRISH. *Proc. Roy. Soc.* (London) A130, 591-609(1931).—The decompn. of $NCl_3$ in Cl alone is sensitized by Cl and the net reaction is $2NCl_3 \longrightarrow N_2 + 3Cl_2$. The reaction is strictly of 0 mol. order with respect to $NCl_3$ until the decompn. is practically complete; a semi-explosive reaction then occurs. The velocity is directly proportional to the light absorbed by the $Cl_2$. Quantum efficiencies were measured in 4360 A. U. light and 3650 A. U. light; pressures of $NCl_3$ ranged from 0.116 to 2.48 mm.; $Cl_2$ pressures varied from 22.3 to 700.0 mm. The quantum efficiencies are high (between 17 and 5) at low concns. of $Cl_2$ (between 22 and 100 mm.) and approach a limiting value in the neighborhood of 3 at the highest pressures of $Cl_2$. The results are reproduced by the equation $\gamma = (1/0.0038)(1/p_{Cl_2}) + 2.5$. No decompn. occurs in green or yellow light. The app. is described. A short discussion is given. O. and N. postulate an initiation of the reaction by Cl atoms; it then proceeds by way of reaction chains of short length. WILLIAM E. VAUGHAN

**The oxidation of sulfur dioxide in ultra-violet light.** O. KORNFELD AND E. WIEGMANN. *Z. Elektrochem.* 36, 789-91(1930).—The $SO_2$ and O mixt. was exposed in small

quartz vessels The $SO_3$ content was detd iodometrically The illumination was conducted with light of the following wave lengths 3130, 3020 to 2970, 2800, 2537, 2300 to 2190 A U with the use of a monochromator At 2537 A U the conversion was less than 0.01 mol per quantum For the same wave length the quantum efficiency, $\phi$, for conversion is dependent upon the concn of $SO_3$, decreasing as the concn. of $SO_3$ increases At 1849 A U the decrease is greater than at 2070 A. U The reaction velocities are independent of the concn of $SO_3$ and $O_2$ Any temp influence on the velocity between room temp and 65° was not ascertained Corresponding quantum efficiencies are for (1849 A U = 1.00), (2070 A U = 0.71), and (2300 A U. = 0.53) A partial discussion of the reaction mechanism was based on the dissocn of O since the reaction limit is concordant with the range of the O dissocn The absorption spectrum of $SO_3$ has 2 feasible regions between which the one reaction lies Conclusion The mechanism of the decompn reaction in the long wave length region must be entirely different from that in the short wave length region in view of energy considerations.

W. Vanselow

Experiments on the luminescence of zinc sulfide and diamond under the influence of radioactive radiation Berta Karlik *Sitzb Akad Wiss Wien, Abt IIa*, 139, 509–19(1930).—The decrease in luminescence of a ZnS screen under the effect of pure $\alpha$ radiation from Po was measured The results are compared with those of Marsden (*C A* 5, 242) A filter was found which seps. the 2 bands in the emitted light the individual variations of these bands was studied Another sample of ZnS of smaller scintillating ability showed a smaller decrease in luminescence. The Rutherford formula was found not to fit the data when applied to the individual bands A satn value for $\gamma$ radiation was found This was shown not to be caused by regeneration in the dark Expts were made on the effect of $\alpha$- and $\gamma$ radiations on a sample of diamond The results were similar to those obtained with ZnS A description is given of the method by which the ratio of luminescence intensity to particle density was controlled

C J Rosenbaum

Band width and temperature dependence of the emission bands of phosphorescent alkali halides. Franz Urbach *Sitzb Akad Wiss Wien, Abt IIa*, 139, 349–52 (1930). cf *C A* 24, 1289.—*U* has derived a theoretical equation which requires that (1) for bands of the same width, the displacement with temp is the greater for those bands which show the larger deviation from a linear relationship between the band width and $\sqrt{T}$ (2) for bands of equal deviation from the $\sqrt{T}$ law, the broader bands show the greater displacement These predictions have been checked against the data of W Meyeren (*C A* 24, 4223) Within the limits of error the predictions are fulfilled

E J Rosenbaum

Luminescence of the alkali halides I. Introduction and orientating observations. II. Methods of measurement—first results—theory of thermoluminescence Franz Urbach *Sitzb Akad Wiss Wien, Abt IIa*, 139, 353–62, 363–72(1930).—For a series of alkali halides, NaCl, KBr, RbBr, RbCl, CsCl and natural rock salt and sylvine, U made preliminary visual observations of the bands emitted around 5000–5200 A. U, during and after exposure to Ra emanations The phosphorescence on heating and illumination and the triboluminescence were observed Rock salt showed a blue phosphorescence, while the artificial NaCl showed a yellow, which could be changed to blue on melting or applying pressure. The blue of rock salt could not be changed to yellow KCl gave a sec. intensity max. of fluorescence when illuminated again after a pause of a few sec For sylvine it was found that the total amt of fluorescence was greater under illumination than from heating An estimate of the proportion of active centers leads to the order of magnitude $10^{-4}$ Expti. details are given for quant measurements, made by means of photoelec. cells. The existence of the recuperation effect was confirmed Curves are presented showing the variation of thermoluminescence with time A theory of thermoluminescence is developed, based on the assumption that an activated center must pass a threshold energy level before it can return to an unactivated state III. Measurements of thermoluminescence, luminescent-center hypothesis. Franz Urbach and Georg Schwarz. *Ibid* 483–95.—Errors in the measurement of the thermoluminescence of the alkali halides are discussed critically Curves are presented for data obtained by varying the time of irradiation with Ra, the color of the illumination, the state of subdivision, and pressure applied before and after irradiation Reproducible results could be obtained only by tempering the crystals at 200° for 24 hrs The results are interpreted with the aid of the luminescent-center hypothesis, modified by ascribing a finite life to the luminescent centers which is dependent on the temp E J R.

Luminescence analysis. III. The alkaline earth group and quantitative knowledge of luminescence. Ernst Beutel and Artur Kutzelnigg *Monatsh* 57,

15–9(1931), cf *C A* 25, 2579.—CaO, $Ca(OH)_2$, $CaCO_3$, $CaSO_4$ and the corresponding compds of Ba and Sr were investigated with a photometer through red, green and blue filters. The results are given tabularly. GREGG M. EVANS

**Experiments on radiothermoluminescence.** FRANCES G. WICK. *Sitzb. Akad. Wiss. Wien*, Abt. IIa, 139, 497–508(1930). *J. Optical Soc. Am.* 21, 223–31(1931).—Quant. observations were made of the thermoluminescence, after irradiation with Ra, of synthetic $CaSO_4$ with added Mn and of samples of fluorite. The photoelec. method of Urbach was used, exptl. details are given. The $CaSO_4$ used showed a single intensity max. which was lowered by pressure applied either before or after Ra irradiation. Fluorite showed a series of max. which are ascribed to the rare earths on the basis of a spectroscopic examn. These max. also were lowered or destroyed by pressure, while a blue band was relatively intensified by pressure applied before irradiation. The natural thermoluminescence of the fluorite samples was examd. The effect of Ra irradiation on the substances investigated is similar to that obtained with Rontgen rays. E. J. R.

**Determination of ultra-violet-ray content of sunlight.** TORATARO HANZAWA. *J. Agr. Chem. Soc. Japan* 6, 1093–102(1930).—A chem. actinometer using $NH_4$ molybdate in dil. HCl with small quantities of EtOH is suggested. Y. KIHARA

**Photochemical action of intermittent and complex light.** M. PADOA AND N. VITA. *Z. wiss. Phot.* 28, 153–67(1930).—It was found experimentally that under certain conditions the photochem. reaction of HI oxidation with filtered light gives a higher effect than with white light. It was shown that Berthoud's law holds for HI oxidation in white light and that, for monochromatic light, for each wave length there is a different ratio between intensity and effect. A. P. H. TRIVELLI

**Photovoltaic studies on metal and oxide electrodes in distilled water and in dilute solutions.** B. LÁNYI AND E. THEISZ. *Magyar. Chem. Folyóirat* 35, 129–39, 145–51(1929).—Ag, Cu, $Ag_2O$ and CuO electrodes were studied in distd. water and in dil. solns. *Expts. were carried out both in the absence of foreign gases and with various gases* bubbled through the solns. and over the electrodes. Pure metals showed effects up to 1 mv., while metals with oxidized surfaces showed effects up to 200 mv. The effects were the same in distd. water as in dilute solns. of electrolytes. H, N and O were without effect. An explanation is offered based on a photochem. reaction between the electrode and the soln. This reaction is probably reversible in the dark, since the photovoltaic potential gradually becomes zero after illumination ceases. S. S. DE FINÁLY

**Photophoresis and the influence upon it of electric and magnetic fields.** FELIX EHRENHAFT. *Phil. Mag.* 11, 140–6(1931); cf. *C A* 22, 1723.—With transverse magnetophotophoresis, the movement of the particles is reversed on reversing the magnetic field. This reversal does not occur in longitudinal magnetophotophoresis. With a transverse elec. field, particles on illumination may move in either direction. Te, Sb, and I particles move at low fields strengths, while Ni, Fe, Sc and Bi require high strengths. No effect is observed in an alternating elec. field. The effect is capable of quant. measurements. ARTHUR FLEISCHER.

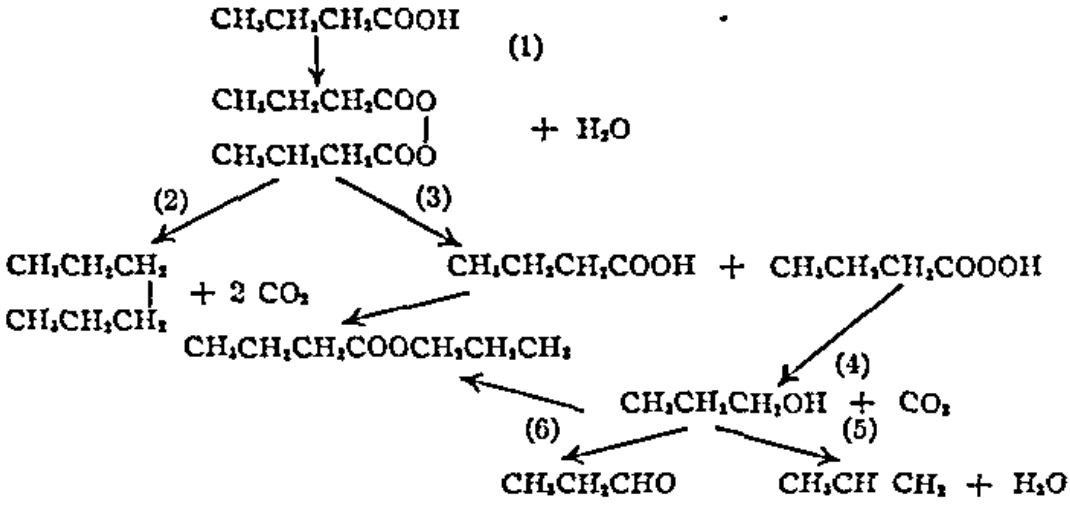
The coating material melts at 102° and is applied at 204° W H BOYNTON

Economy of electric resistance furnaces from the standpoint of power industry and consumer. V PASCHKIS *Elektrizitätswirtschaft* 29, 474-9(1930). E I S

Electric resistance furnace. KNOOPS *Elektrizitätswirtschaft* 29, 465-73(1930) —The advantages of elec. furnaces for the power industry and the consumer are discussed, and the principle types are described Their field of application is outlined and consumption data are given E I S

Electrodes of the third order. J. VELÍŠEK *Chem Listy* 24, 443-7(1930) —An electrode of the 3rd order consists of a metal surrounded by 2 insol (depolarizer) salts which also sat the soln The first depolarizer has a cation corresponding to the metal of the electrode, the potential depends only upon the concn of the cation in the electrolyte The electrodes of the third order are used practically to det concns of such metals (Ca, Tl) which decompose with $H_2O$ and cannot be constructed as electrodes of the first order The system Pb | $PbSO_4$, $CaSO_4$, $Ca^{++}$ is discussed The system Hg | $Hg_2(IO_3)_2$, $Zn(IO_3)_2$, $Zn^{++}$ showed stable potentials only after 3 days With freshly silvered electrodes, the system Ag | $Ag_2C_2O_4$, $CaC_2O_4$, $Ca^{++}$ became stable in a few min The system Zn | $ZnC_2O_4$, $CaC_2O_4$, $Ca^{++}$ became const after 30 min and remained dependable, the Zn was amalgamated The system Hg | $Hg_2I_2$, TlI, $Tl^{++}$ is discussed Computations of potentials of the various systems are given F M

A Luther calcium electrode of the third order. J VELÍŠEK AND K SVENCON *Chem Listy* 24, 467-71(1930) —The electrode Pb | $PbSO_4$, $CaSO_4$, $Ca^{++}$ was constructed, it fulfils the conditions postulated by Luther for electrodes of the third order The second depolarizer is $CaSO_4$, its soly is too great to det. Ca ions accurately and yields as many Ca ions as a pure 0.01 *N* $CaCl_2$ soln. The potentials of individual electrodes (when compared to a standard Hg electrode) varied among themselves and fluctuated in the same series of measurements, although systematic changes in the potentials were not observed and indicate that all secondary reactions that Luther described progress so slowly that the potential becomes practically independent of the time For more accurate measurements of Ca ions another electrode must be devised, in which the second depolarizer is less sol FRANK MARESH



Electrolytic refining of aluminum and aluminates in an aluminum chloride-sodium chloride melt. V A PLOTNIKOV, N S FORTUNATOV AND V. P. MASHOVITZ *Z Elektrochem* 37, 83-8(1931) —A general review of patents and a discussion of all the

processes for refining Al. The authors carried out expts using a NaCl 1 5AlCl$_3$ electrolyte with a c d 1–1 5 amp /sq dm without any other aluminate addn The temp was 160°. The thickness of the Al deposited on the Fe and Cu plates was 0 01–0 05 mm Al thus produced contained 0 043–0 06% Fe, 0 023 Si and 6 015 Na. G. T. M.

Alkali chlorite oxidation and reduction cells. II. G R Levi and D Ghiron *Atti accad Lincei* 12, 158–61(1930)—*In a previous paper (C A. 25, 654)* several cells in which chlorite was reduced to chloride in neutral soln were studied The following addnl reactions have now been studied $Pt^- | KClO_2$ (0 1 *N*) or Ca $(ClO_2)_2$ || $KMnO_4$ (0.1 *N*) | $Pt^+$, in which $ClO_2^-$ is oxidized to $ClO_3^-$ while $KMnO_4$ is reduced to $MnO_2$, at a voltage of 0 175 at 20° On account of liberated alkali the voltage gradually increases to 0 4 and does not remain const , but when $Ca(ClO_2)_2$ is used, a const value of 0 175 v is maintained, as the $Ca(OH)_2$ combines with $MnO_2$ and is pptd The cell $Pt^- | KClO_3$ (0 1 *N*) || NaClO (0 1 *N*) | $Pt^+$ has an initial value of 0 084 v which increases to 0 10 and then decreases with time In this case the reaction $NaClO_3$ + NaClO ⟶ NaCl + $NaClO_3$ takes place Alkali bromites react in the same way, the voltage being only 0 06 at the start The cell $Pt^+ | KClO_3$ (0 1 *N*) || $H_3O_3$ (0 1 *M*) | $Pt^-$ has an initial value of 0.20 v and increases to about 0 25 v without becoming const The cell $Pt^+ | KClO_3$ (0 1 *N*) || $FeSO_4$ (0 1 *M*) | $Pt^-$ rapidly comes to equil. with a value of 0.253 v Finally, the cell $Pt^+ | HClO_3$ (0 01–0 1 *N*) || KCl, $Hg_2Cl_2$ (0 1 *N*) | $Pt^-$ attains a value of 0 58 v which changes less than 0 01 v per hr A W Contieri

Electrochemical production of sodium and lead arsenates. V A Plotnikov and M Ivanenko *Z Elektrochem* 37, 88–91(1931)—$Na_3AsO_4$ was obtained by electrolysis of a soln contg 150 g $As_2O_3$ as Na arsenite per l in the anolyte and 150 g NaOH in the catholyte Fe or Ni electrodes were used The c d was 3 amp /sq dm To produce Pb arsenate, solns were used contg in 1 l 20 g $Na_3AsO_4$ and 70 g $NaNO_3$ plus enough AcOH to neutralize the alkali in the anolyte and a 30% $NaNO_3$ soln in the catholyte The anode was of Pb and the cathode of Fe The c. d was 5 5–6 amp /sq dm Diaphragm (parchment) cells were used in both cases Current efficiencies were approx 100% Also in *Zhur Prikladnoĭ Khim* 3, 999–1005(1930) G T Motok

The electrolysis of salts of *n*-butyric acid and the questions connected therewith. F Fichter and Adolf Bürgin *Helv Chim Acta* 14, 90–101(1931), cf *C A* 24, 4205—Disagreement about products of electrolysis of the salts of butyric acid under different conditions made it necessary to repeat some of these expts to det definitely (*a*) whether differences in conditions cause variation in products, (*b*) whether isopropyl (I) or *n* propyl alc. (II) is a product and, if so, how it is formed, and (*c*) whether certain steps in the peroxide-per acid hypothesis are in accord with the facts The steps are:

In all expts the following were obtained in approx the indicated theoretical quantities on a basis of current used propylene (III), 2 7 to 11 4%, isopropyl butyrate, trace to 2 8%; I, 3 64 to 8 4%; *n* propyl butyrate, trace, propionaldehyde, trace, isopropyl butyrate, trace. Varying acidity, alky , c. d , diaphragm, type or material of electrodes, concn. of electrolyte, etc , apparently changes the products only quantitatively. To explain the formation of I it was first shown that 1 vol of butyric acid (IV) dissolves 4 197 vols of III at 0° and 2.28 vols at 20°. Fifty-cc portions of IV which had dissolved 209 85 cc. of III at 0° were sealed in glass tubes and heated 50

hrs at 1 *(illegible)* and 0 2531 (44 9% theoretical) 0.2531 (44 9%), 0.3164 (56.2%), and 0 2768 g (49 2%) of I obtained by hydrolysis was detd. by oxidizing to AcMe and colorimetrically estg with *o*-nitrobenzaldehyde This shows that III adds on to IV and hydrolysis of the ester formed yields I, the reaction indicating a possible origin of this alc during electrolysis. In order to det the possibility of step 2 the thermal and photochem decompn of butyryl peroxide (V) was studied. 0.3430 g of 99.2% V heated in a bronze bomb in an oil bath at 270° gave 99 18% of the theoretical quantity of $CO_2$ The yield of hexane in another detn was 62 6% of the theoretical 0 1910 g of 99 1% V in a quartz tube was exposed to a Hg vapor lamp for 22 hrs and yielded 98 6% of the theoretical amt. of $CO_2$ but only traces of hexane were obtained, and a colored residue remained in the tube In order to det. the possibility of step 3, weighed samples of V were dissolved in 10 cc. AcMe, 10 cc. of IV and 100 cc. water were added, the mixt was shaken at const. temp and samples were periodically analyzed to det. the extent of hydrolysis The samples were cooled to 0°, dild. with AcMe and KI in AcOH, and titrated cold with $Na_2S_2O_3$ to det per acid formed and then heated to 30–40° and again titrated to det. V. In one case 0 1804 g V at 31–32° showed 4 6% hydrolysis after 60 min., 7 14% after 180 min 8 44% after 200 min and 9 33% after 300 min. At 17–8 7 34% hydrolysis occurred in 300 min. In order to det. the possibility of reaction 4 the thermal and photochem decompn. of butyric per acid (VI) was studied. 0 5450 g of 87 2% VI in a bronze bomb was heated to 270° and 0 1775 g $CO_2$ (88 4% theory) and 0 1768 g III as propylene dibromide (VII) (92 1% theory) obtained. Four g of VI after 15-hrs. exposure to a Hg vapor lamp yielded only 0 150 g VII and a little $CO_2$ and indications were that more of VI decompd. to form $O_2$, satd hydrocarbons and resins

OREN E SHEPPARD

Principles of the hydrometallurgy and electrodeposition of the metals. T. P CAMPBELL. *Colo School of Mines Mag* 20, No 3, 13–15, 45, No. 4, 15–19, No 5, 26–8 1930 —A detailed review E I S

The cuprous-cupric equilibrium in copper sulfate and perchlorate solutions and the anodic behavior of copper E HEINERTH. *Z Elektrochem* 37, 61–76 (1931) —A detailed and practical description of the previous studies made on the equil. $2Cu^+ \rightleftarrows Cu^{++} + Cu$ The expts carried out in this study consisted in the analytical part of *a)* titration with $KMnO_4$, *b)* titration with $Ce(SO_4)_2$ Very pure Cu salts required in the expt. were prepd The equil was studied at 20° to 60° In a molar $CuSO_4$ soln there are 0 71 millimols of $Cu^+$ in equil at 20° and 3 15 at 50° In sulfate solns the ratio $\sqrt{Cu^{++}}$ molarity $Cu^+$ molarity is independent of the salt concn within wide limits From the values obtained with sulfate soln the reaction $Cu^{++} + Cu = 2Cu^+$ at temps of 20–60° gives a value of 18 850 cal and a calcd normal potential of 0 525 v for the reaction $Cu \longrightarrow Cu^+$ at 25°

G T MOTOR

A study of silver-plating solutions. B EDERER AND N PROMISEL. *Trans Electrochem Soc* 59 (preprint) 19 pp (1931) —A discussion is given of the effects of temp., c. d and concns of Ag, cyanide, carbonate and $CS_2$ on the resistivity, throwing power, and cathodic and anodic polarization in argentocyanide plating solns. Curves are shown. A comparison is made between solns. contg Na salts and those containing K salts, and the advantages of the latter pointed out. Optimum plating conditions and compns. for the above solns are suggested. The subject is treated mainly from the industrial standpoint, although theory is also briefly considered. C. G F.

Electrodeposition of silver from sulfate, nitrate, fluoborate and fluoride solutions. EDWARD B SANIGAR. *Trans Electrochem Soc* 59 (preprint) 21 pp (1931) —The possibility of electrodepositing Ag in a form suitable for electroplating purposes from silver sulfate, nitrate, fluoborate and fluoride solns. has been studied. Owing to the simple-immersion deposition of Ag from these solns upon Cu, Hg, brass and Ni, adherent deposits were obtained only upon Ag Relatively compact deposits of Ag were obtained upon Ag deposited from an argento-cyanide soln., from $Ag_2SO_4$ solns. contg boric acid or $Fe_2(SO_4)_3$, $AgNO_3$ solns. contg boric acid, silver fluoborate solns. and silver fluoride solns. However, these solns. showed a great tendency to yield treed deposits, and the conditions under which deposits free from trees could be obtained were limited. All the compact deposits were decidedly cryst., and while they might be of use in the electro-refining of Ag, as a means of obtaining dense Ag deposits instead of the loose crystals given by the nitrate soln., they offer no serious competition to the usual argentocyanide soln. for the electroplating of Ag, unless considerable improvement can be made, for example, by the use of "addition agents" A further difficulty in the use of these baths for Ag deposition is the unsatisfactory corrosion of the anodes. C. G F.

Electroplating on aluminum. H. K WORK. *Metal Cleaning and Finishing* 2, 777–80 (1930) —See *C. A* 22, 3844, 25, 2370 E. I S.

**Plating glass and clay.** I Werner *Sprechsaal* 63, 223-4(1930) To render clay or porcelain conductive, cover with graphite compn and heat to 200° or 400° E I S

**Improvement in electroplating quality needed to meet competition.** I B Nim *Automotive Ind* 63, 560-4(1930) The quality of plating and future protective progress are discussed Ni plating at low $p_H$, heat treatment of Cr plate, durability tests, control methods, Cr plating for resistance to abrasion and electrodeposition of Fe are also discussed I I S

**The influence of foreign metals during nickel plating.** B Šulik *Chem Listy* 25, 123-4(1931).—A Ni bath ($H_3BO_3$ 3.0%, $Ni(NH_4)_2(SO_4)_2$ 70%) contg 1% $CuSO_4$ (0.253% Cu) gave a dark and stained deposit or showed dark spots with 5% $CuSO_4$ (1.266% Cu) Ni plating was not possible, with 10% $CuSO_4$ (2.53% Cu), the Cu was pptd as a powder All of the Cu was easily removed upon a metallic cathode with a strong current The addn of 0.5% $ZnSO_4$ (0.113% Zn) to the Ni bath retards the rate of Ni deposition, with 0.266% Zn stains form over the deposit with 0.45% Zn the bath becomes useless The addns of 0.5% $FeSO_4$ (0.10% Fe), 0.20% Fe, and 0.403% Fe to the Ni plating bath showed no effect, with 0.601% Fe the bath plates well but gives a dark deposit, the addn of 2.02% Fe leaves unplated areas especially at the point of support and the deposits are dark and irregular Analysis of 4 brands of Ni showed Ni 96.7 99.2 Fe 0.54 2.01 and Cu 0.11-0.10% Analysis of 2 brands of Ni $SO_4 \cdot 6H_2O$ showed traces of Cu and 0.23-0.15% Fe Frank Marsh

**Further developments in low-$p_H$ nickel deposition.** W M Phillips *Trans Electrochem Soc* 59 (preprint) 4 pp (1931) cf *C A* 24, 4990.—Further commercial work indicates that (1) deposits from baths of low $p_H$ furnish better protection than those from baths of high $p_H$ (2) the hardness of deposits is not directly influenced by the $p_H$ Ni is softer from baths operated at elevated temps and (3) pitting is no worse at low $p_H$ than it is at high $p_H$ C G F

**A note on the tarnishing of chromium-plated brass** W M Phillips *Trans Electrochem Soc* 59 (preprint) 2 pp (1931).—In the St Louis district Cr plated articles appear to have 'tarnished' Investigation shows that where no Ni or insufficient Ni is first plated over brass or Cu articles, this type of failure can occur C G F

**Electrolytic production of hydrogen and oxygen.** F I Evandieu *Elec Times* 78, 389-92(1930).—The advantages and disadvantages of the filter-press-type and bell-type electrolytic cells are discussed and the Knowles plant at Bussi, Italy, is described in detail E I. S

**Leclanché-type primary cells.** Brit Eng Standards Assoc., *Specification* No 397, 26 pp (Sept., 1930).—Dry cell specifications E I S

**Asphalt composition vs. hard rubber in battery jars.** M Shank *Elec Mfg* 5, No 6, 37, 76(1930).—The relative merits of these 2 materials are discussed E I S

**The effect of electrical discharges upon thiocyanic acid.** W Glund and Clara Dieckmann *Ber ges Kohlentechnik* 3, 420-8(1931), cf *C A* 24, 5011.—The effect of elec discharges upon the reaction $HCNS(aq) \longrightarrow HCN(aq) + S(rhombic)$ was studied both silent and glow discharges being used With the silent discharge, the yields were too low and the energy consumption extremely high With the glow discharge, however, and with addn of H gas, about 80% of the HCNS was decompd., 95-100% of which was recovered as HCN Varying quantities of $SO_2$, $H_2S$ or S are also obtained, depending upon the exptl conditions Elec. efficiency is very low, the energy consumption being about 675 watt hrs per mol. of HCN as compared with a theoretical requirement of only 6.87 watt hrs H Stoertz

**Electrical gas purification and filtration.** R Seliger *et al* *Trans 2nd World Power Conference* (Berlin) 1, 492-508(1930).—A review Alden H Emery

**Mercury-arc power rectifier auxiliaries and accessories.** E S Waterman *Gen Elec Rev.* 34, 228-31(1931).—The rectifier depends on the successful functioning of its auxiliary app The exhaust system is important, as a high degree of vacuum must be maintained It consists of a vacuum valve, Hg condensation pump, receiver tank, *motor-driven rotary vacuum pump and the vacuum measuring and regulating devices* The contact making gage is made of three parts (1) thermal vacuum detector, (2) vacuum regulator and (3) source of excitation The vacuum regulator is composed of the following parts all mounted in one case (1) indicating motor, (2) regulator contacts and contact hammer, (3) small a c motor The regulator and its auxiliary relays perform the following functions (1) start and stop the rotary pump at desired *pressures, (2) remove the rectifier from service if the pressure becomes excessive, when* the unit is equipped with automatic control and (3) sound bell alarm if pressure be-

body such as Cu having a coating of a compd such as $Cu_2O$ placed in a suitable container with Hg under pressure. A layer of Pb foil also is used.

Electrodeposition of gold and silver. Asociación de Productores de Yodo de Chile. Ger. 519,208, Dec. 12, 1928. The electrolyte is AuI or AgI dissolved in a salt soln., e. g., in an alkali or alk. earth iodide soln. The method may be applied in refining the metals or in electroplating. Suitable electrolytes are AuI 21 and KI 140 g., or AgI 40 and KI 370 g., in 1 l. of water, and suitable conditions are a voltage of 0.1-0.3 and a c. d. of 100 amps. per sq. m.

Chromium plating. John J. K. McCullough and Benjamin W. Gilchrist (to Lemstedt Mfg. Co.). U. S. 1,797,357, March 24. A Cr plating bath is prepd. contg. Na chlorochromate, Cr chromate, HCl and water. Cf. C. A. 24, 302.

Electroplating iron and steel with other metals such as nickel and chromium. Metals Protection Corp. Fr. 695,068, May 9, 1930. See U. S. 1,774,209 (C. A. 24, 4003).

Producing coherent metal layers on crystals. Hanovia Chemical and Manufacturing Co. Ger. 519,110, Dec. 18, 1927. The crystals are subjected simultaneously to superficial reduction and electrodeposition, with the result that an alloy layer is formed on the crystal surface. Thus, a layer of cryst. $Cu_2O$, for use in a dry rectifier, may be treated with an acidified soln. of $NiSO_4$, $(NH_4)_2SO_4$, undergoing electrolysis.

Covering metals. Institut Français des Matériaux de Frottement. Fr. 696,588, June 5, 1930. In coating metals with compds. or mixts. known under the designation of W bronzes and Mo bronzes, the bronzes are obtained by electrolysis of solns. of salts of meta- or poly-tungstic acids, or salts of meta- or poly-molybdic acids, on the metal dipped into the soln. and used as cathode. The use of $BaW_4O_{13}.9H_2O$ and $SrW_4O_{13}.9H_2O$ is described.

**e. g.**, **an analytic apparatus.** André P. H. Peltier. Ger. 517,931, April 10, 1926.

*Depolarizer of an app. especially applicable for the decompn. of NaCl.*

Method and apparatus for sterilizing water in thin layers by electrolysis. Pierre M. R. Salles. Ger. 519,418, July 17, 1930.

Metallized asbestos diaphragm for electrolytic cells. Karl Wolinski. Ger. 468,432, Mar. 17, 1927.

Metals from ores. Dowsett Research Co. Fr. 696,418, April 2, 1930. A process for the elec. heating and fusing of conducting materials such as metals reduced from their ores is described. The material is introduced from below into a column which opens on to the hearth of a furnace, the top of the column being used as electrode to establish an arc between it and the electrode of the furnace. The temp. is regulated by varying the speed of feeding.

Aluminum. Pierre Hacquard. Fr. 695,097, May 15, 1930. Al is obtained by reducing Al compds. such as bauxite in an elec. furnace in the presence of W, whereby an alloy of Al and W is obtained, from which the W is removed by a sweating or liquation operation or an electrolytic refining below the m. p. of Al.

Magnesium. Alexis C. Jessup. Fr. 696,218, May 28, 1930. Mg is obtained by making an incompletely dehydrated mixt. of KCl and $MgCl_2$ in the proportion of 2 or 3 mols. KCl to 1 mol. $MgCl_2$, electrolyzing the mixt. until the mixt. contains at least 3 mols. of KCl for one of $MgCl_2$ and submitting the mixt. thus practically dehydrated to a second electrolysis. The no. of vats for the 2nd electrolysis is preferably greater than for the first.

Ammonium compounds. Emil Barkhard and Henryk Goldmann. Ger. 521,338, Feb. 17, 1927. In the manuf. of $NH_4$ compds. by subjecting a mixt. of N, H and other gases to elec. discharge, the tension is alternately raised and lowered during the process. Thus, a mixt. of N, H and HCl may be subjected to an electrostatic field, the tension of which is varied every few secs. between 100,000 and 120,000 v.

Dioxides of titanium, zirconium, hafnium and thorium. Imperial Chemical Industries, Ltd. and I. L. Clark. Brit. 300,608, Sept. 7, 1929. An alk. soln. or suspension of raw material contg. a compd. of the metal, such as a suspension of ilmenite, is electrolyzed to deposit impurities such as Fe in the metallic state (satisfy under 20 atm. pressure of H or air at 90–120° with an insol. anode of C, Ni or Cr steel). Various details and examples are given.

Oxidized layers on aluminum. Richard F Müller Fr 607,073, May 24, 1930 In the formation of oxidized layers on Al, oxides of other metals such as Fe are incorporated during the operation The result may be obtained by electrolysis, the electrolyte contg salts of Fe in the colloidal state, or the Al may be alloyed with metals to form the oxides such as Fe, Si and Cu

Enamelled designs on metal surfaces. Hugo Depach Ger 510,607, Aug 27, 1927 The metal surface is prepd chemically or electrochemically with layers which give the enamel the coloring of metal compds These layers are then covered with a transparent enamel or glaze The whole is then heated until the latter layer fuses Several examples are given In one a Cu surface is galvanically silvered and then galvanically coppered thickly for red parts and thinly for green parts. Electrolysis in a bath of 2% $NaNO_3$ and 1% $Na_2CO_3$ leaves the plate with a deposit of Cu, which is shaded off into the desired light, shade and color effects by a rotating or scraping tool. The coloring effect may be enhanced by under glaze pigments. The plate is then covered with glaze powder and heated in a muffle furnace.

Hydrogen peroxide. I G Farbenind A.-G Fr 606,150, May 27, 1930 An app is described for the production of $H_2O_2$ by electrolysis under pressure Hg electrodes comprising several trays filled with Hg or amalgam and placed one above the other in a common pressure vessel are used.

Hydrogen peroxide. I G Farbenind A.-G Fr 606,273, June 2, 1930 $H_2O_2$ is produced by the cathodic reduction of O, the O being controlled continuously or periodically or the H present being eliminated continuously or from time to time, preferably by catalytic combustion, or both methods are combined An automatic analysis app mounted in the current of O is used.

Carbon electrodes for electric furnaces. ROBERT SUCHY, KARL STAIB and WILHELM MOSCHEL (to I G Farbenind A G) U S 1,797,805, March 24 See Fr 665,620 (*C A* 24, 794

Electrode of very wide section for electric furnaces. SOC ELECTRO-METALLURGIQUE DE SAINT BÉRON Fr 696,319, May 30, 1930

Electrode for electrolytic apparatus such as cells for decomposing water JAMES N SMITH (to Westinghouse Elec. & Mfg Co) U S. 1,797,375, March 24 Structural features.

Electrodes for electrolyzers. GEORGE F JALBERT Fr 696,788, Sept 16, 1929 The electrodes are coated with a mineral or org colloidal substance, conductive or not, which prevents direct contact of the electrolyte with the metal of the electrode, whereby the polarization is diminished.

Soluble anodes for use in electrolysis. SIEMENS & HALSKE A G (Victor Engelhardt, inventor) Ger 521,509, May 17, 1928 The anodes are made in the form of very thin long or endless bands which are kept in const motion in the electrolyte

Electrodes for electric purification of gases. SIEMENS-SCHUCKERTWERKE A G Fr 695,777, May 17, 1930

Electrodes for secondary elements. I G FARBENIND A G (Karl Ackermann, inventor) Ger 519,456, Dec. 19, 1929 Addn to 491,498 (*C A* 24, 2066). The porous metallic material used in the method of Ger 491,498 is made of Cu-Ni alloy, *e. g.*, an alloy contg Cu 50 and Ni 50%. Cf *C A* 24, 4409

Depolarization electrodes. JOHANNES M SCHMIERER and DIAMCO A G Ger 519,148, Apr. 5, 1930 In the manuf of compressed depolarization electrodes, the active mass is mixed with org fibers, *e. g.*, ramie, in order to prevent swelling of the electrodes when in use

Device for joining carbon furnace electrodes. SIEMENS PLANIAWERKE A -G FÜR KOHLEFABRIKATE (Josef Soppa, inventor) Ger 520,394, Nov 21, 1928.

Spark-discharge apparatus for generating a bleaching gas for flour, etc. FRITZ STUFF. Ger. 521,300, Dec. 25, 1929. Addn to 510,419 (*C A* 25, 1008).

Electric apparatus for testing gases. EDUARD SENFTER Ger 516,719, June 6, 1928. The app. is suitable for testing air samples of crucible gas etc., from tubes of various pressures.

Apparatus for purifying gases. SIEMENS-SCHUCKERTWERKE A -G Fr. 696,117, May 26, 1930. The pipes for the sweeping gases for the insulators in elec. gas purification app. are disposed in the hot gaseous current passing through the app whereby the sweeping gases are heated.

Gas purification. METALLGES. A G Fr 696,286, May 30, 1930 Preliminary or premature ionization of gases to be purified by elec. means is suppressed by means of a screen disposed transversely in the current of the crude gases, the face of the screen being disposed above the source of the gas in the immediate neighborhood of the flame The screen may be provided with cooling means.

Removing chemically active gases from oil containers, in electric apparatus, etc. SIEMENS-SCHUCKERTWERKE A -G. Ger. 517,842, Aug. 7, 1928. The app. contains chambers with gas-absorbing solvents.

*Electric switches and fuses.* J LAWN. Brit. 339,748, Nov. 7, 1929 A tube filled with Ne, He or other rare gas, and constituting a glow-discharge tube is arranged across the terminals of a switch or fuse so that the tube glows when the switch is open or when the fuse blows, indicating the location of the switch or fuse in the dark.

Loading submarine signalling cables. STANDARD TELEPHONES & CABLES, LTD., and J. R. VEZEY. Brit. 339,989, Sept. 18, 1929. Mech features.

High-power incandescent lamps, tungsten arc lamps, x-ray tubes, rectifiers, etc. PATENT-TREUHAND-GES. FÜR ELEKTRISCHE GLÜHLAMPEN (to General Elec. Co., Ltd). Brit. 339,927, May 18, 1929. Structural features.

"Getter" for tungsten incandescent lamps. EGYESÜLT IZZÓLÁMPA ÉS VILLAMOSSÁGI RÉSZVÉNYTÁRSASÁG. Brit. 339,798, Dec. 18, 1928. As a "getter" there is used an inorg. water-absorbing substance gaseous at ordinary room temp. such as $SiF_4$, $AsF_3$ or a fluoride of P. The getter may be introduced as such or may be formed in the bulb, as by decompn of K silicofluoride

1930 Bleach out layers, sensitized with thiourea derivs, are fixed by destroying the sensitizer with $SO_2$ and, if necessary, removing the decompn product from the layer

Photographic bleach-out process. I G. Farbenind A G Fr 695,420, May 10, 1930 The binding agent for the colors in the bleach-out process is composed of a mixt of substances which dissolve the colors with substances which do not dissolve the colors and which swell in the fixer to be used in each case Cellulose ethers or ester-ethers may be used as the substances capable of swelling in the fixers ($C_6H_6$ other aromatic hydrocarbons benzine or ethers) and ales of high b p or cellulose esters such as nitrocellulose as the solvents for the colors

Photographic reproductions. Rudolf Fischer Fr 695,821, May 10, 1930 In the photographic reproduction of pamphlets, notes, etc, the actinic rays are prevented from traversing the emulsioned support by coloring the latter itself or a special layer applied thereto with substances which optically are as clear as possible but absorb the actinic rays

Photographic images. I G Farbenind A-G Fr 696,641, June 4, 1930 Bi chrome or polychrome photographic images are produced by one of the methods used in color photography, using esters or salts of esters of leuco compds of dyes as substances sensitive to light The sensitiveness to light may be increased by the addn of substances such as collodion having an oxidizing action in light.

Photographic films. Kalle & Co A G Fr 696,100, May 26, 1930 Photographic films, etc., particularly cellulose films sensitized by diazo compds, are protected against damp by coating them before use with a layer of varnish such as nitro- or acetyl cellulose varnish

Photographic films. Wladimir Reyos Fr 695,449, May 12, 1930 Sensitized layers on films are protected by a coating composed of a soln, in an appropriate solvent, of the substance composing the support or of a like substance capable of uniting intimately with the support, or such a substance in a liquid state Thus a soln of celluloid in AcOAm may be used on celluloid films

Metal cinematograph film Leopold Radó Ger 517,517, Nov 15 1927 The film consists of rolled metal, e g, Al, with a coating of cellulose, viscose, etc., which is given the sensitized coating in the usual way

Two-color cinematographic films. J E Thornton Brit 339,977, Aug 10, 1929 In a modification of the process of film manuf described in Brit. 316,338 (*C. A* 24, 1588), feed perforations are made in the blank film before it is fed to the printing machine Various details of manuf are described

Coloring films. Multicolor Films Inc Brit 339,971, Sept. 17, 1929 See Fr 684,354 (*C A* 24, 5246)

Sound films I G Farbenind A G Fr 695,831, May 19, 1930 In making sound films in colors, the sound band is first produced in known manner by printing, developing and fixing, and afterward the colored image is produced in known manner The sound band is protected against modifications by an impermeable layer

Patterns for printing paper, etc. Conrad Lang and Arthur Lang Swiss 138,900, May 4, 1929 The pattern template is placed on a light sensitive layer which is protected from the action of the printed colors, prior to the copying and developed

Photographic prints in colors Agfa Trust Brit 340,044, Oct 1, 1928 In producing prints in natural colors with use of 3 sensitive emulsions each dyed with a transparent dye, which are printed from color record negatives, developed, hardened and the unhardened gelatin and silver image removed, auxiliary dyes which are easily removed after exposure are added to the quicker printing emulsion layers to equalize the times of exposure of the layers

Apparatus for developing blue prints. Bruno Stange G m b H Ger 517,668, May 2, 1929

## 6—INORGANIC CHEMISTRY

A R MIDDLETON

Surface chemistry of hydrates. I V R Damerell. *J Phys Chem* 35, 1061–7 (1931).—Hydrous Al oxide forms the trihydrate on standing in $H_2O$ contg small quantities of $NH_4$ Over drying agents the hydrate particles lose chemically bound $H_2O$ in proportion to the surface The difference in $H_2O$ content of ground and unground hydrargillite is due to increase in surface S Lenher

Hydrates of the alkaline earth oxides C Nogareda *Anales soc españ fis*

*quím* 29, 33–64(1931).—Systematic dehydration of 2 lime hydrates of different origins, contg a large excess of free moisture, was carried out. From the dehydration diagram obtained there was no evidence of the presence of hydrates of $Ca(OH)_2$, but the mol vol values of the free $H_2O$ pointed to the existence of a labile $Ca(OH)_2 H_2O$. By the *usual methods* $Ca(OH)_2$ *was obtained in macrocrystals, but without any hydrates*. $Sr(OH)_2 H_2O$ and $Ba(OH)_2 H_2O$ were obtained by allowing their hot, satd solns to stand. Dehydration diagrams and detn of mol vol of $H_2O$ of crystn showed clearly the presence of a little stable $Sr(OH)_2 8H_2O$ and $Ba(OH)_2 8H_2O$ and a very stable $Sr(OH)_2 H_2O$ and $Ba(OH)_2 H_2O$, showing again the great similarity of Sr and Ba compds.

E M Symmes

*Hydrates of the alkaline earth peroxides. II.* Their constitution. C Nogareda. *Anales soc espan fis quím* 29, 131–45(1931).—The d and mol vol of highly purified $CaO_2$, $SrO_2$ and $BaO_2$ octahydrates were detd. From previous work (*C. A.* 24, 3721) on d and mol vol of hydroxides of these metals the av mol vol for $8H_2O$ could be calcd., and by deducting this value from the values for the above peroxide hydrates the mol vol of the peroxides was obtained approx. The values found were $CaO_2 8H_2O$ d 1.700, *M.* 127, $CaO_2$ *M.* 21.2, $SrO_2 8H_2O$ d 1.951, *M.* 135.1, $SrO_2$ *M.* 28.3, $BaO_2 \cdot 8H_2O$ d 2.291, *M.* 136.8, $BaO_2$ *M.* 30.0. Comparison with the corresponding mol vol of the monoxides gives for the second O atom a vol about 0.25 normal, *i. e.*, 2.9 to 3.0 (Biltz, *C. A.* 25, 628). All peroxide compds show clearly the Rosenfeld reaction. Extn tests with $Et_2O$ by the Willstatter method to detect $H_2O_2$ were neg. The isotherm of breakdown of the hydrate can be followed up to a loss of 7.5 $H_2O$, and then decompn starts. From the course of the dehydration curve no conclusions can be drawn as to the existence of other hydrates. All properties of the hydrates tested point to the structure $X\begin{matrix}O\\|\\O\end{matrix} 8H_2O$. In the breakdown of the hydrates the 0.5 $H_2O$ remaining is *driven off only above 200° this can be explained by the assumption of a partial hydrolysis* of the peroxide hydrate with formation of a hydroxide. The ratio $XO_2$ $X(OH)_2$ in the dehydrated product was about 5:1. These hydroxides may act to stabilize the peroxides and explain the existence of $CaO_2$ obtained otherwise only under high pressure.

E M Symmes

Iodates of titanium. Privada R Ray and Haridola Saha. *Proc 15th Indian Sci. Congr* 1928, 169–70.—*By the action of $HIO_3$ dissolved in $HNO_3$ (1:3 by vol.)* upon freshly prepd titanic acid dissolved in the same solvent, a basic iodate of Ti has been obtained. The individuality of the substance in question has been established by the fact that the same product was obtained from the liquid phase of varying concn. It is preferable to regard the compd as a complex tetrahydroxydiiodatotitanic acid for several reasons. It is converted by heating to 100° to the proper basic Ti iodate. Salts of complex hydroxyiodatotitanic acid have also been prepared.

E J C

A contribution to the study of the formation of salts with glycine. J V Dubský and A Rabas. *Spisy vydávané přírodovědeckou Fakultou Masarykovy Univ.* No 123, 3–18(1930), cf. *C. A.* 24, 4722.—Glycine (I) 7.5 g in 100 cc $H_2O$ was treated with 4.07 g ZnO at 20–40°, filtered and crystd., it yielded 2.8 g $(NH_2CH_2CO_2)_2Zn + H_2O$ (II). II is a white, cryst nonhygroscopic substance, sol in $H_2O$ 1.10, turns yellow at 240–260°, decomposes at 310°, hydrolyzes at 65–70° in $H_2O$ with the formation of $Zn(OH)_2$. II was also prepd by treating I with $ZnCO_3$ or $Zn(OH)_2$; II could not be prepd by treating $NH_2CH_2CO_2Ag$ with $ZnCl_2$. The mother liquor from II was further evapd at 50°, yielding 2.9 g of a white cryst mass $(NH_2CH_2COO)_2Zn$ 3 glycine + $H_2O$ (III). III melts with decompn at 245°, is sol in $H_2O$ 1.6 and nonhygroscopic, the solns are neutral. Aq solns of III crystallize, forming first I and then III in the last fractions. III was also prepd by treating 4.07 g ZnO in 100 cc $H_2O$ with glycine (15 g.) and evapg until crystals began to appear. $ZnCl_2$ 3 glycine (IV) was prepd by dissolving 3 g glycine in 20 cc $H_2O$, adding 2.73 g anhyd $ZnCl_2$ in 5 cc. $H_2O$ and permitting free crystn to occur for 10 days. The yield was 1.9 g., m. (with decompn.) 228°, hygroscopic, acid to litmus and having a bitter taste. $ZnCl_2$ 2 glycine + $2H_2O$ was prepd by treating 6.81 g anhyd $ZnCl_2$ in 3 cc. $H_2O$ with 7.5 g glycine in 18 cc hot $H_2O$. The filtered soln immediately gave glassy crystals m. 100° and decompg at 230°. $ZnBr_2$ 2 glycine + $2H_2O$ was prepd by mixing 2.25 g $ZnBr_2$ and 2.25 g glycine in 7 cc. $H_2O$. After standing, crystals (transparent) appeared, they m. 98°. $ZnSO_4$ glycine + $5H_2O$ (11.6 g.) was prepd from 11.5 g. $ZnSO_4 7H_2O$ and 3 g glycine in 10 cc. $H_2O$ by allowing crystn to proceed for 14 days. The white transparent crystals lose 4 $H_2O$ at 50–60° and leave $ZnSO_4$ glycine after drying at 80–125°. The crystals are stable in air, nonhygroscopic (m. 82°) and decompose at 320°. $(NH_2$-

The formation of green manganous sulfide. II. Influence of $NH_4Cl$, $NH_4OH$ and $NH_4HS$ on the transition of the red sulfide to the green. Georg Lansen. *Z. anorg. Allgem. Chem.* 193, 277–96 (1930). cf. *C. A.* 18, 598.—The effect of $NH_4HS$, $NH_4OH$ and $(NH_4)_2S$ on the transformation of the red to the green MnS was detd. by observations over 6 years. The presence of a slight excess of $NH_4OH$, up to 1 mol. per atom of Mn, greatly decreases the time required for the initial appearance of the green form. A larger ratio of $NH_4OH$ has the opposite effect. Changing the ratio of $NH_4HS$ or of $(NH_4)_2S$ used for pptn. does not affect the initial appearance of the green. An excess of $NH_4OH$ also does not increase the total rate of transformation. Independently of the green transition and simultaneously with it, but somewhat faster, occurs a transition to the orange sulfide. This modification, like the red, is amorphous while the green is cryst. The presence of $NH_4OH$ also hastens the red to orange change. The interpretation of these results shows that the initial reaction in the pptn. reaction yields the complex Mn(OH)HS from which the stable green MnS is formed. In the presence of a large excess of $NH_4OH$, the equil., $Mn(OH)_2 + 2NH_4HS \rightleftharpoons Mn(HS)_2 + 2NH_4OH$, is shifted to the left. Green MnS is formed from $Mn(HS)_2$ only by evolution of $H_2S$, which accounts for the slow transformation.

H. F. Johnston

Lead oxides and their reducibility with carbon. P. Ya. Rode. *J. Russ. Phys. Chem. Soc.* 62, 1419–42 (1930).—The existence of 2 classes of lead oxides is established. To the first class belong oxides forming a series of solid solns., $\alpha$, from PbO to $PbO_{1.47}$ (content of active O from 0 to 1.47%). The color of these oxides varies from light to dark brown. To the second class belong lead oxides forming a series of solid solns. $\beta$ from $PbO_{1.5}$ to $PbO_{1.33}$ (active O content from 2.2 to 6.24%), and solid solns. $\gamma$, from PbO to $PbO_{1.5}$ (active O content from 0 to 0.1%). Between the $\beta$ and $\gamma$ series there is an interval from $Pb_3O_4$ to $PbO_{1.5}$. The color of the oxides varies from dark brown in $PbO_{1.33}$ to red in $PbO_{1.5}$ and from light brown in $PbO_{1.5}$ to yellow in PbO. The character of the bond of active O in all these oxides is of the zeolite type. Reduction with solid C is highly exothermic in the case of oxides rich in active O. Reduction takes place in 2 stages of which the first probably corresponds to formation of a suboxide and the other to complete reduction. Oxides rich in active O contain some $H_2O$ in the form of solid solns. The change of red lead oxide to yellow is not accompanied on the heating curve by any thermal effect.

S. L. Madorsky

Action of aqueous sodium polysulfide solutions on metallic copper. K. Fischbeck and E. Elben. *Z. Elektrochem.* 34, 642–5 (1928).—The times taken by sulfide solns. of various contents to form Cu$_2$S layers on metallic Cu of a standard color were measured. With solns. contg. virtually $Na_2S_4$ the velocity of thickening of the layer is proportional to the polysulfide content of the soln. and inversely proportional to the thickness of the layer. An analogous result is obtained with S vapor. The method of observation previously used (Fischbeck, *C. A.* 20, 3152) cannot be applied to the interaction of S and Cu. Some observations are made on sulfide solns.; the pentasulfide ion is probably more highly colored than the tetrasulfide ion.

B. C. A.

The action of hydrogen sulfide on potassium chromate solution. H. B. Dunnicliff and Chaman L. Soni. *Proc. 15th Indian Sci. Congr.* 1928, 167.—In dil. solns. (2.15% $K_2CrO_4$) the color changes from yellow to green with evolution of heat. The

Cr is recovered quantitatively as hydroxide and the K is obtained as $K_2S_4$ and $K_2S_2O_3$. E J C

The interaction of sulfur dioxide and ammonia. G Sambamurti and M N L Narasimham *Proc 15th Indian Sci Congr 1928*, 169.—Dry $SO_2$ and dry $NH_3$ interact to form 2 isomers of the constitutions $H_2NS(O)ONH_4$ and $H_2NS(O)_2NH_4$. No details are given. L J C

*Reactions involving hydrogen peroxide, iodine and iodate ion. III The reduction* of iodate ion by hydrogen peroxide. Herman A Liebhafsky *J Am Chem Soc* 53, 896–911(1931) cf *C A* 25, 1430.—The rate of reduction of iodate ion by $H_2O_2$ is expressed within ±5% by $-d[IO_3]/dt = 2.6 \times 10^{-4}[H_2O_2][IO_3^-] + 12.9 \times 10^{-4}[H^+][IO_3^-][H_2O_2]$. The first step in the reduction of iodate may occur in the following ways $IO_3^- + H_2O_2 \longrightarrow IO_2^- + H_2O + O_2$; $IO_3^- + H_2O_2 + H^+ \longrightarrow HIO_2 + H_2O + O_2$ followed by $H^+ + IO_2^- \longrightarrow HIO_2$, $HIO_2 + H^+ + I^- \longrightarrow 2HIO$; $2HIO + 2H_2O_2 \longrightarrow 2I^- + 2H^+ + 2H_2O + O_2$; $HIO + I^- + H^+ \longrightarrow H_2O + I_2$. At the beginning of every expt there is an interval of time during which the rate of formation of $I_2$ differs from that required by the equation $dI_2/dt = k_1[H_2O_2][IO^-] + k_2[H^+][H_2O_2][IO_3^-]$. *This time interval is necessary to establish the concns of intermediate products required for the reduction of the iodate ion.* Don Brouse

The influence of coördinately bound groups on the properties of the central iron *atom in iron cyanide compounds* Oskar Baudisch *Biochem Z* 232, 35–49(1931).—Reagents are described for the identification of complex Fe ions. Benzidine and guaiac solns are oxidized by ferri as well as autoxidized ferro-aquo salts, but 5 aminouracil reacts only with the latter at $p_H$ 3.8–8.0. Other compds of the same type as 5 aminouracil give the same reaction and serve as very sensitive reagents for the ferro-aquo salts. From fermentation isobutyl alc a N contg substance was obtained which also reacts with freshly prepd ferro-aquo salt solns. Ferric ions can be demonstrated in the presence of complex ferric ions by means of thioglycolic acid, while nitrosophenol distinguishes ferrous ions. For the identification of ferro-aquo ions the reaction with dithiooxamide has been employed. The ferro-aquo salt soln is oxidized by 0.01 *N* $H_2O_2$ *directly only in an acid medium. The ability of a series of substances to reduce* ferri aquo salt solns and to inhibit the reaction with dithiooxamide is recorded in a table. S Morgulis

The influence of $p_H$ upon the formation and decomposition of the chloro derivatives of ammonia. Robert M Chapin *J Am Chem Soc* 53, 912–20(1931), cf *C A* 23, 4158.—This paper is a study of factors influencing the kind and amt of products obtained by the chlorination of $NH_4$ ions. $Cl_2$ attacks $NH_4$ ion only after conversion into HClO. H ion induces the formation of $NH_4$ ion from $NH_2Cl$ and $NHCl_2$, particularly below a characteristic $p_H$, the HClO resulting ($NH_2Cl + H^+ + H_2O \longrightarrow NH_4^+ + HClO$) reacts to produce a more highly chlorinated deriv. OH ion induces the formation of Cl ion from $NCl_3$ or $NHCl_2$, *particularly above a characteristic* $p_H$, with $N_2$ and ClO ion as the principal assocd products. With increasing dilu $N_2O$, $NO_2$ ion and $NO_3$ ion also appear. C is unable to confirm the statement that some $O_2$ is formed by the passage of $Cl_2$ into $NH_3$ water. Cf *Chem News* 5, 246 (1862). W C Fernelius

The system water–potassium nitrate–calcium nitrate at 25°. Mohammad A Hamid and Ram Das *Proc 15th Indian Sci Congr* 1928, 169.—On account of the relatively great electroaffinity of the $NO_3$ ion, the formation of double nitrates is found to occur only when one of the metals has a valency greater than two or when one metal is of high at wt and vol. The unexpected formation of a double nitrate of K and Ba, $K_2Ba(NO_3)_4$ (*Wallbridge, Am Chem J* 32, 251(1904)) *led to a consideration of the* possibility of the existence of similar double nitrates of K with other alk earth metals. In the case of Ca no evidence of double-nitrate formation has been found from an investigation of the system $H_2O$–$KNO_3$–$Ca(NO_3)_2$ at 25°. A no of hydrates of $Ca(NO_3)_2$ have been reported in the literature. H and D 's observations that the only stable hydrate at 25° is the tetrahydrate, $Ca(NO_3)_2 \cdot 4H_2O$ agree with those of Basset and Taylor (*C A*. 6, 2044). E J. C

Pneumatolytic synthesis of silicates. I. C. J van Nieuwenburg and H B Blumendal. *Rec trav chim* 50, 129–38(1931).—On the basis of previous expts (*C. A* 24, 5553) *on* the volatilization of $SiO_2$ by steam above its crit temp., *silicates* have been *synthesized by placing* the metal oxide and $SiO_2$ in sep *crucibles and heating* them in an autoclave with steam at temps of about 365° and pressures of 200 to 250 atm. In this way β wollastonite, Sr metasilicate, alamosite, illemite, tephrosite, antigorite and diopside have been prepd. Such syntheses may be very significant from

a geological point of view. Ferricyanide may, in general, be used instead of $S_2O_3$. J. H. REEDY

The composition of the cyanide complex radical of metals. II. Cadmium cyanide complex radical. KOSAKU MASAKI. *Bull. Chem. Soc. Japan* 6, 60–4 (1931). *cf. C. A.* 24, 2178.—The complex of the cadmium cyanide complex ion is probably $Cd(CN)_4^{--}$ at all concns. The ratio of combined cyanide to Cd in the complex ion was detd. by the titration method previously described (*C. A.* 24, 2178) in solns. of $Cd(CN)_2$, $CdSO_4$ and $CdCl_2$ in NaCN. Electrometric measurements of the concn. of $Cd^{++}$ ion confirmed the above conclusion. F. L. BROWNE

Lanthanum alkali oxalates. I. M. KOLTHOFF AND RUTH DUGGIST. *J. Am. Chem. Soc.* 53, 1222–6 (1931).—$La_2(C_2O_4)_3$ is found to be in equil. with $La_2(C_2O_4)_3 \cdot Alk_2C_2O_4 \cdot aH_2O$ at approx. 0.012 *N* $(NH_4)_2C_2O_4$, 0.01 *N* $K_2C_2O_4$ or 0.02 *N* $Na_2C_2O_4$. With 0.125 *N* $K_2C_2O_4$ or 0.225 *N* $Na_2C_2O_4$ the compd. $La_2(C_2O_4)_3 \cdot 2Alk_2C_2O_4 \cdot nH_2O$ forms. Double compds. do not form with $H_2C_2O_4$. J. E. SNYDER

Ammines and amides of quadrivalent platinum as acids and bases. A. A. GRINBERG AND G. P. LAVRMANN. *Z. anorg. allgem. Chem.* 193, 193–23 (1930).—The ammines and amides of Pt in aq. soln. have weak acidic and basic properties, resp., owing to the reaction, $[R_2Pt(NH_2)_2]^{++} \rightleftharpoons [R_2Pt(NH_2)]^{+} + H^{+}$. The extent of this reaction for several complexes was detd. by colorimetric measurement of the $p_H$ of their dil. solns. Of the 5 amides studied the strongest base was $[en(NO_2)_2NH_2ClPt]$, for which the $p_H$ = 10.2 for 0.002 molar soln., at 25°, a value approx. equal to that of aq. $NH_3$. At the same concn. and temp. the $p_H$ values of the other amides were $[Pt(NH_3)_2(NH_2Cl)]Cl_2$ 9.1, $[Pt(NH_3)_2NH_2NO_2Cl]Cl$ 9.5, $[enNH_2ClNO_2ClPt]$ 9.8, and its isomer, $[enNO_2ClNH_2ClPt]$ 9.8. [en = $(CH_2NH_2)_2$.] The value of the const. $K = [OH^-]^2/C$ is only slightly affected by the concn. but increases greatly with temp. The acid reaction of the complex ammines decreases as follows: hexammine > pentammine > tetrammine > diammine. The value of $K = [H^+]^2/C$ for the hexammine is of the same order as that of boric acid. The hydroxo-ammines of Pt have amphoteric properties due to the cleavage of $H^+$ from the $NH_3$ and to attachment of $H^+$ by the OH group. From a similar study of Rh complexes it is concluded that the dissocn. of complex bound $H_2O$ is $10^8$ times that of complex bound $NH_3$. The data are in agreement with the theories of Kossel and of Brønsted on acid and formation. H. F. JOHNSTONE

Compounds of hexamethylenetetramine with certain salts of silver and other metals and the influence of anionic volume on the capacity for association by the central positive atom. PRIYADA K. RAI AND JNANENDRA D. GUPTA. *Proc. 15th Indian Sci. Congr.* 1928, 168.—It has been established by Ephraim (*C. A.* 14, 2309, 15, 2258) that the capacity of a cation to assoc. with neutral mols. increases with the anionic vol. To test further the validity of this conclusion R. and G. prepd. a no. of well-crystd. compds. of $(CH_2)_6N_4$ (I) with various Ag salts such as AgCN, $AgCNO$, $AgCNS$, $AgClO_4$, $AgCrO_4$, $Ag_2Cr_2O_7$, $Ag_2SO_4$, $Ag_2SeO_4$, Ag molybdate and Ag tungstate. From a study of the nature and compn. of these compds. as well as of some other Ag salts of I previously described by others, it was concluded that Ephraim's generalization holds good also in the case of compds. of I. The anomalous result in the case of AgF is attributed to the formation of a complex anion of Ag and F due to polymerization. With a common anion the capacity of the cation for assocn. has also been studied in the case of certain newly prepd. compds. of I with cyanides of Cu, Cd and Ag. The compn. of these last compds. can also be explained in the light of Ephraim's conclusion. The failure of Ag tellurate, phosphate, borate, iodate, arsenite and arsenate to assoc. with mols. of I can also be accounted for on similar grounds. All the compds. of I described in this paper were obtained by a method based on the principle of substitution from an ammoniacal soln. of the salts. E. J. C.

## 7—ANALYTICAL CHEMISTRY

W T HALL

Recommended specifications for analytical reagent chemicals. W. D COLLINS, GREGORY P BAXTER H V FARR, J V EBERMAN, JOSEPH ROSIN, G C SPENCER AND EDWARD WICHERS *Ind Eng Chem, Anal Ed* 3, 221–4(1931).—Specifications for reagents to be used in careful analytical work are given for 60% $HClO_4$, $CdCl_2 2½H_2O$ $CrO_3$, $Pb(NO_3)_2$, MgO, $HgCl_2$ $Hg_2Cl_2$ $Na_2NOFe(CN)_5$ and $UO_2(NO_3)_2$ Corrections are given for published specifications for the correction to be applied in the gravimetric detn of $SO_4^{--}$ for $H_3PO_4$, $(NH_4)_2HPO_4$, $BaCO_3$, $MgCl_2$, $K_4Fe(CN)_6$, $K_3Fe(CN)_6$, $KH_2PO_4$, $NaHCO_3$, $Na_2HPO_4$ and $Na_2S_2O_3$ W T H

A simple method for determining the concentration of definite colloidal solutions. OTTO FINSTEIN AND HERMANN BORCHERT *Z anal Chem* 83, 101–10(1931), cf *C A* 24, 1267.—To a soln contg *sol* add portions of liquid until the Tyndall or fluorescent effect disappears With the aid of standard curves it is then possible to est the concn of the sol Exptl results are shown with mixts of cholesterol and water and also eosin and water W T H.

*Applications of ceric sulfate in volumetric analysis. IX. Standardization of thiosulfate solutions. Determination of thiosulfate.* N HOWELL FURMAN AND JOHN H WALLACE, JR *J Am Chem Soc* 53, 1283–8(1931), cf *C A* 24, 3720.—$Na_2S_2O_3$ solns can be titrated iodometrically with standard $Ce(SO_4)_2$ soln, the starch iodide end point gives better results than the potentiometric method Air must be excluded and if $Fe^{+++}$ is present, it must be rendered inactive by adding $PO_4^{---}$ The initial vol should be 10 times that of the 0.1 *N* thiosulfate used and 0.15 g of KI should be used for each 125 cc. of the initial soln W. T. H

Stabilizing hydriodic acid. HENRY BUKOSKI. *Chemist-Analyst* 20, No 3, 15 (1931).—*The addn of 1 g of red P to 1 l of HI soln will stop the liberation of I* Filter just before using W. T. H.

The use of polarographic methods in applied chemistry. J. HEYROVSKÝ. *Chem Listy* 24, 110–28, 147–8(1930), cf *C A* 24, 4200.—A résumé of the application of polarographic methods is given FRANK MARSH

Some application of Wood's light. I. COLOMBIER *Ann falsi.* 24, 89–96(1931).—The fluorescence of various compds when exam'd by ultra-violet light was exam'd with the following results: *Eosin* varies from dark to luminous over a $p_H$ range of 2.5–4.5 *Erythrosin* varies from dark to luminous over a $p_H$ range of 4–4.5 *Fluorescein* varies from dark to luminous over a range of 4–4.5 *Quinine* shows strong fluorescence at $p_H$ 5, decreasing sharply at first and then more slowly, becoming dark at $p_H$ 9 *Acridine* shows a sharp change from green to violet at $p_H$ 5 With *umbelliferone* fluorescence appears sharply at $p_H$ 6.5 With *β-methylumbelliferone* fluorescence appears sharply at $p_H$ 7. With *β-naphthol* fluorescence appears sharply at $p_H$ 9.5 None of these compds. is suitable for $p_H$ detns, but the last 4 can be used as acidimetric indicators Particularly with umbelliferone and β-methylumbelliferone, good results were obtained with strong acids and bases at dilns up to 0.001 *N* and with AcOH and $NH_3$ at dilns up to 0.01 *N*; also with carbonates by working at boiling temp, or preferably by adding excess acid, boiling to expel $CO_2$ and titrating back with alkali Acridine gives good results, but its use is advantageous only for $NH_3$ for which it can be used at dilns. up to 0.002 *N*, at higher dilns. it is less sensitive than umbelliferone. *β-Naphthol* is of some interest, but its end point lies in the alk. range, and the use of umbelliferone is preferable. Detn of the acidity of wine by titration in ultra-violet light in the presence of umbelliferone is not satisfactory because of the strong absorption of ultra-violet rays by the wine; it can be carried out by microdetn (dilu of 1 cc. of wine to 250 cc. and titration with 0.001 *N* alkali), but the results are considerably lower than by titration in the presence of phenolphthalein because the end point of the latter is at a considerably higher $p_H$ (9–10 as compared with 6.5 for umbelliferone). The method gave excellent results for the direct titration of highly colored dye-house effluent with 0.1 or 0.01 *N* alkali A no. of qual. tests based on the formation of a fluorescent compd have been developed (1) *Detection of malic acid*: add 1 cc of 0.1% soln. of resorcinol *to a few cc. of soln. or a few particles of powder to be tested*, evap. to dryness on a water

...ut take up in 1 cc. of 3 1 $H_2SO_4$ (3 vols $H_2SO_4$ + 1 vol. water), heat 5 min. on the ... with dil. with 10 cc. water and neutralize exactly with NaOH; if malic acid is ... there is a beautiful blue fluorescence in ultra-violet light, the test is sensitive ... mg. The reaction is not absolutely sp., as it is given by all β-ketonic acids; but ... are of rare occurrence and their other characteristics are quite different. (2) ... *citric acid* boil a few cc. of the soln. with dil. $KMnO_4$ to a light yellow ... add 1 cc. of 0.1% resorcinol and proceed as for malic acid. The reaction is sp ... test to 0.1 mg. The color of the fluorescence is different from that produced by ... acid and is readily distinguished therefrom, especially if a comparative test is ... (3) *Detection of resorcinol* add 1 cc. of concd. $H_2SO_4$ to a small amt. of the ...mple followed by 1 cc. of acetoacetic ester. Sufficient heat is developed by the reaction. Observe directly; resorcinol gives a beautiful violet fluorescence, which is intense even with 0.05 mg. resorcinol. The reaction is sp., β naphthol being the only other phenol giving a similar reaction, but the coloration is quite different and is produced by the addn. of $H_2SO_4$ alone. (4) *Detection of β-naphthol* dissolve a few mg. of the sample in concd. $H_2SO_4$ and heat 2 min. on the water bath; in ultra-violet light there is a beautiful violet blue fluorescence if β-naphthol is present. The reaction is sp. and is particularly useful for distinguishing between α- and β naphthol. (5) *Detection of orcinol* in Crump's reaction (treatment with $CHCl_3$ and potash) after dilu. there is produced a beautiful green fluorescence, which is much stronger in ultra violet light than in ordinary light and which readily makes possible detection of a fraction of a mg. of orcinol. A. Papineau-Couture

Diphenylamine as an inside indicator for the determination of iron. Carroll B. Core. *Chemist-Analyst* 20, No. 3, 14 (1931).—Further commendation of this well-known method. Even with $KMnO_4$ titrations the addn. of 4 drops of the indicator soln. has been found advantageous. W. T. H.

Solutions for colorimetric standards. IV. Some factors affecting the color of indicator solutions. M. G. Mellon and G. W. Ferner. *J. Phys. Chem.* 35, 1025–43 (1931); cf. *C. A.* 24, 2962.—Because of trouble in detg. $p_H$ values with indicators from different sources the present work was undertaken to secure information on the effects of (1) the purity of the indicator, (2) the method of prepg. stock solns. of indicators and (3) aging, particularly with respect to the effect of light upon the color. Thirteen indicators were studied: methyl orange, tropeolin OO, bromophenol blue, bromocresol purple, bromothymol blue, phenol red, bromocresol green, methyl red, cresol red, thymol blue, chlorophenol red, bromophenol red and cresolphthalein. As a result of a systematic spectrophotometric study, it is clear that the source of the compds., the way in which the solns. are prepd. and the effect of ultra violet rays are not without influence on the color of the solns. On account of the decolorizing effect of ultra-violet radiation on buffered solns. contg. indicators, the solns. to be used as standards should be protected from strong sources of photochemically active radiant energy. A uniform method should be followed in making up the color standard solns. Definite specifications should be established for indicators to be used as color standards. W. T. H.

The reduction of phosphomolybdic acid by monomethyl-*p*-aminophenol and its use in the quantitative determination of phosphorus. S. L. Leiboff. *J. Lab. Clin. Med.* 16, 495–9 (1931).—Monomethyl *p*-aminophenol is a satisfactory reducing agent for phosphomolybdic acid in the detn. of P. The reagent is stable in the presence of $Na_2SO_3$ and the color produced is stable within a wide range of acidity. E. R. Main

Oxygen in aluminum and a method for its determination. Takayasu Hakada. *Anniversary Vol. Dedicated to Masumi Chikashige* 1930, 237–43.—Less than about 0.38% of O is present in solid soln. in Al metal. If more O is present in a sample, it exists as $Al_2O_3$ at the boundary lines of the Al crystals. The method described depends upon heating Al shavings gradually to 750° in a strong stream of $Cl_2$, which has been purified by passing the gas over hot C; it was proved that the CO formed had no effect upon the analysis. After 15 min. at 750° all of the Al should be removed as volatile $AlCl_3$. The residue in the boat was washed with very dil. HCl and analyzed for $Al_2O_3$ after removing Fe and $SiO_2$. W. T. H.

A qualitative color reaction for magnesium. J. V. Dubský and Arn. Okáč. *Chem. Listy* 24, 492–3 (1930).—*o,p*-Dihydroxybenzeneazo-*p*-nitrobenzene gives a blue coloration with salts of Mg in an alk. medium. The color is not a compd. of Mg or a lake, but an adsorption of the dye upon the $Mg(OH)_2$. The color is not sp.: Ni salts give an identical color, while Co salts give a different shade of the same color. The dye (0.5 g.) is dissolved in 100 cc. of a 1% alk. soln.; the dye is very insol. in neutral water. One drop of the dye soln. is added to an unknown Mg soln. and 2 *N* NaOH is added. The alk. dye soln. is violet, upon adsorption by the $Mg(OH)_2$ a distinct blue color

*appears It will detect 0.000002 mg Mg Thiazole yellow A in a 0.01% soln is pale* orange, upon adsorption by $Mg(OH)_2$ it becomes rose and will detect 0.0002 mg Mg per cc Toluyl orange R (S), benzopurpurin 4B(Gr-P), azo blue By and diamine pure blue FF (C) give only vague color changes FRANK MARSH

A method for the determination of thorium, uranium and potassium in specimens *of stones and minerals* HEINRICH GRAVEN *Sitzb Akad Wiss Wien Abt IIa*, 139, 181-93(1930).—A modified C T R Wilson tilted electroscope with ionization chamber attached was designed to use in detg the U, Th and K contents of stones and minerals without even breaking the specimens A careful study of the thickness correction was made by the use of artificial stones made of plaster of Paris with active substances mixed in To det U, Th and K it is necessary to make 3 measurements of the *ionizing* power, one without absorber, one with glass or gypsum absorber (differential absorption of U and Th series radiations), and one with Al foil for K detn An indication of the accuracy of the method is the uniform decreasing activity with increasing basicity of the rocks The method is probably accurate within 10% for U and Th but not so good for K ODIN P SHEPPARD

A sensitive test for molybdenum JOSEF V LASCHNA *Chem Ztg* 24, 105-6 (1930).—The test for Mo with K l t xanthate can be made more sensitive by using a deriv of a higher alc the cetyl alc deriv is the most sensitive The soln is prepd by mixing a satd soln of cetyl alc in $CS_2$ with powd KOH or a satd alc soln of KOH The unknown neutral soln is treated with a few drops of cetyl xanthate and made acid with 1.0 *N* HCl The presence of molybdic acid gives a dark violet color in extreme dilns the color adheres to the suspension of cetyl alc The limit of detection is 0.0005 *mg Mo per cc and the limit of dilu 1 2,000,000 Mo may be detected in a drop of* unknown liquid filter paper is impregnated with cetyl xanthate, dried, treated with a drop of unknown soln and exposed to HCl fumes The limit of detection is 0.0001 mg Mo per 0.05 cc The filter paper must be freshly prepd, as it keeps only about 24 hrs The effect of inorg salts upon the reaction is insignificant W gives no color *reaction with xanthates, so Mo may be detected in the presence of W Solns with* a high W content must be made strongly acid to insure a complete soln of Mo and W 0.01 mg Mo in the presence of 0.5 g W contained in 5 cc water was detected by the reagent The limit of dilu which still gave a color was 0.00002 mg Mo per 0.05 cc soln FRANK MARSH

Lead in basic bismuth nitrate. N SCHOORL *Pharm Weekblad* 68, 277-9(1931).—The $H_2SO_4$ test for Pb in basic Bi nitrate is capable of detecting 0.1% A W DOX

Method for the determination of silver. R STEVENS GIBBS *Chemist Analyst* 20, No 3, 10-1(1931).—*Directions are given for detg Ag as AgCl The manipulation* is somewhat different from that ordinarily recommended W. T. H.

Modified gravimetric determination of manganese. FREDERICK G GERMUTH *Chemist Analyst* 20, No 3, 11(1931).—$MnO(OH)_2$ can be ppted in the presence of $H_2SO_4$ by adding $K_2S_2O_8$ Upon ignition $Mn_3O_4$ is formed W. T. H.

*Determination of zinc with pyridine and ammonium thiocyanate.* C FRANKLIN MILLER *Chemist-Analyst* 20, No 3, 8-9(1931).—For the analysis of a Zn salt, take an aliquot contg about 0.3 g Zn, dil to 500 cc and add a soln of 4 g $NH_4CNS$ and 2 g pyridine in a little water. Filter, wash first with a soln contg 3 g $NH_4CNS$ and 5 cc pyridine per l, next with a mixt of 13 cc 95% alc, 85 cc water, 1.5 cc pyridine *and 0.1 g $NH_4CNS$, then with 10 cc of alc mixed with 1 cc of pyridine and finally* with 15 cc of ether contg 2 drops of pyridine Dry to const wt (10 min.) at 65-70°. The ppt contains 19.25% Zn W. T. H.

Colorimetric determination of minute amounts of cadmium. LAWRENCE T. FAIRHALL AND LEON PRODAN. *J Am Chem Soc* 53, 1321-3(1931).—The method, applicable to the detn. of traces of Cd in org material, depends upon pptn by means of $H_2S$ in the presence of 0.5 mg Cu and 2 g of Na citrate in a soln which has been made $p_H = 3$. The ppt of CuS and CdS is dissolved in aqua regia, the soln evapd to dryness and again treated with $H_2S$ *under the same conditions as before and finally a third* pptn is effected at $p_H = 2$ without any addn of citrate This last ppt is dissolved, the acid removed from the soln by evapn and the residue dissolved in a definite vol of water. Aliquots are then dild, treated with KCN soln and some $H_2S$ water. The color of the ppt is then compared with that of similarly-treated standard solns under *a flood of ultra-violet light.* The color deepens on standing W. T. H.

Colorimetric determination of tungsten. G HEVNE *Z. angew. Chem* 44, 217-8 (1931).—In the absence of $NO_3^-$, $Fe^{+++}$, $Tl^{++++}$, Cb, $CrO_4^{--}$, $ReO_4^-$ and $MoO_4^{--}$, small quantities of W can be detd *satisfactorily by the reaction with hydroquinone* in the presence of concd. $H_2SO_4$ If Mo is present, the test fails because of its color

reaction with the reagent In such cases *Rhodamine B* is a more satisfactory reagent. To be sure it also reacts with Mo salts but it requires 10–20 times as much Mo as of W to give the test so that it can be used when the quantity of Mo is smaller than that of W Otherwise it is necessary to det the Mo by a different method and apply a suitable correction Directions are given in detail for carrying out these tests, which have already been described by others W. T. H.

Estimation of copper in cyanide solutions. E H Smith *Chemist-Analyst* 20, No 3, 10(1931) —To det Cu in a soln used for extg Au from ores, take 100 cc. and destroy $CN^-$ by adding 5 cc of concd $HNO_3$ Evap to 20 cc., make acid with AcOH, add KI and titrate with $Na_2S_2O_3$ W. T. H

Study of the electrolytic determination of copper in the presence of platinic ion. T Leonard Kelly and Joseph J Molloy *J Am Chem Soc* 53, 1337–41(1931) —Fales and also Popoff, have shown that sometimes Pt is dissolved off the anode and deposited upon the cathode during electrolysis and the question arises as to whether the deposited Pt will dissolve off the cathode when the Cu is dissolved in $HNO_3$. In the 20 expts here described, a little $H_2PtCl_6$ was added to the electrolyte after a considerable part of the Cu had been deposited After the electrolysis, the gain in wt. indicated that practically all of the Cu and Pt had been deposited and, after dissolving off the Cu, the cathode weighed more than originally In only 6 cases, however, was the final gain in wt of the electrode equal to the total Pt in the soln and in no case was there any evidence of any Pt coming from the anode in spite of the fact that a little $Cl^-$ was added with the Pt The results show that Pt deposited on top of Cu during electrolysis is only partially dissolved by treatment with 6 *N* $HNO_3$ To test for Cu, diethyldithiocarbamate was used W. T. H.

New method for determining mercury in mercuric cyanide. E Cattelain *Ann chim anal chim appl* 13, 97–8(1931) —See *C A* 25, 1179 W. T H

Determination of traces of mercury Alfred Stock, Hermann Lux, Friedrich Cucuel and Franz Gerstner *Z angew Chem* 44, 200–6(1931) —After considering the various methods that have been proposed for the detn of traces of Hg, a method is described which permits the exact detn of as little as $1 \times 10^{-4}$ mg of Hg and the detection of $2 \times 10^{-5}$ mg The method depends upon the electrolytic deposition of the Hg on a Cu wire from a soln contg $HgCl_2$ After the electrolysis, the wire and its deposit are dried and heated The Hg distils off and is collected in a capillary. It is finally made to collect together into a tiny globule, the size of which is measured under the microscope To det Hg in urine, feces, etc., the Hg is pptd together with about 20 mg of added Cu by introducing $H_2S$ into the chlorinated soln , the mixt. of CuS and HgS is transformed to chloride and the soln (not over 20 cc ) is electrolyzed The method appears to be extremely sensitive and remarkably accurate but there are so many possible sources of error that the original paper should be studied carefully before attempting to make an analysis By means of this method, Hg has been detected in nearly every reagent in the lab , especially in HCl which has in every case showed a positive test Blue vitriol, $KClO_4$, tap water and distd water are among the few things that have been found to contain no Hg W. T. H.

Determination of a very small quantity of cadmium in a rich zinc ore. J G Fairchild *Chemist-Analyst* 20, No 3, 5–7(1931) —A soln 3 *N* in $H_2SO_4$ is recommended for the pptn of CdS in a sample sufficiently large to cause some pptn of ZnS. The ppt is dissolved and the pptn repeated twice more By evapn. with $H_2SO_4$, $CdSO_4$ is obtained and weighed W T. H.

Modification of Penny's method for determining iron in ores. Roy P. Hudson *Chemist-Analyst* 20, No 3, 6–7(1931) —The titration with diphenylamine as inside indicator is recommended with $H_2SO_4$-$H_3PO_4$ mixt added, as in $KMnO_4$ titrations Full directions for analyzing an ore are given W. T. H

Detection of the tin group metals and their separation from the copper group by means of ammonium monosulfide. Leo Lehrman *J Chem Education* 8, 946–51 (1931) —By passing $H_2S$ through 10 cc. of concd $NH_4OH$ for 15 sec a reagent is obtained which is recommended for the sepn of the sulfides of As, Sb and Sn from those of Hg, Bi, Pb, Cu, Bi and Cd. The advantage of such a reagent is that it does not dissolve appreciable quantities of the latter group of sulfides and the disadvantage is that it does not dissolve SnS well. The claim is made, however, that enough $Sb_2S_3$ and SnS dissolve to give pos tests W T H

Determination of silver in steel. Walter Berg *Chem.-Ztg* 55, 259(1931) —Treat 10–15 g of drillings with 250 cc. of 6 *N* HCl, evap to dryness and take up with HCl as in the detn. of $SiO_2$ Filter off the insol residue, which will contain AgCl, and

wash with hot water Digest the ppt with 5 *N* $NH_4OH$ and filter through the original filter Make the ammoniacal soln acid with HCl and set aside in a dark place. Heat the filtrate from the original $SiO_2$ pptn and introduce a vigorous stream of $H_2S$ for 0 5 hr Filter, wash with $H_2S$ water, dissolve the ppt in aqua regia and evap. to dryness Take up with 6 *N* HCl, make ammoniacal, heat to boiling and filter Make the filtrate acid with HCl, heat to boiling to coagulate the AgCl and filter off this ppt. together with that originally obtained Dry and weigh W T H

Thermal reduction of sulfur in a hydrogen atmosphere applied to the analysis of iron and steel Yoshito Yamaguchi *Anniversary Vol Dedicated to Masumi Chikashige* 1930, 111–8 —The assumption is made that aged samples of iron and steel contain free S and sulfates The following procedure is shown to take care of these constituents Weigh out a suitable quantity of sample into a porcelain boat and heat for *30 min at 800° in a stream of* $H_2$, *passing the gas from the furnace into ammoniacal* Cd soln Det the S in the resulting CdS by the usual iodometric method. Take the ignited residue, transfer to a flask and det its S content by the usual evolution method for detg S in steel W. T H.

Quantitative spectral analysis of metallic alloys. Gastone Guzzoni *Atti III congresso naz chim pura applicata* 1930, 636–7 —See *C A* 24, 2691 G M Murphy

Estimation of ferric oxide and magnetic oxide in the presence of iron and ferrous oxide. E W Cheesbrough *Chemist-Analyst* 20, No 3, 14–5(1931) —For detg. metallic Fe, treat 1 g with 100 cc of 20% $CuSO_4$ soln , filter, make acid with $H_2SO_4$ and titrate with $KMnO_4$ To det FeO, treat the residue from the Fe detn with 50 cc. of 7 *N* $H_2SO_4$ in a stoppered flask, filter, wash and titrate the filter with $KMnO_4$ To det total Fe, proceed in the usual manner To det. $Fe_3O_4$, place 0 5 g of sample on filter paper, rub the mass with another paper, tap off all powder from the latter, remove $Fe_3O_4$ with a magnet and weigh W T. H

Volumetric determination of magnesia and alumina in minerals and refractory stones. Horst Eckstein *Chem -Ztg* 55, 227(1931) —The following procedures are said to be accurate, but no analytical results are shown To det. Mg in ores, slags, etc., take up 2 5 g of sample in HCl, remove $SiO_2$ *as usual* and ppt Fe and *Al* twice with $NH_4OH$ Make up the filtrate to 500 cc. and take 20 cc. for the Mg detn. Dil to 100 cc., add 3–5 g $NH_4Cl$, 15 cc. of 3% 8-hydroxyquinoline and 2 cc. of concd $NH_4OH$. Boil, filter, wash, dissolve the ppt in HCl and titrate with 0 1 *N* KBr-$KBrO_3$ To det. *Al in refractory materials, fuse* 0 5 g *of* the sample in a Pt crucible with *5 g of borax*, take up the melt in dil HCl and remove $SiO_2$ in the usual way Make up the filtrate to 250 cc. and take 25 cc. for further analysis Dil to 100 cc., add 5 g $NH_4Cl$ and $NH_4OH$ until a faint turbidity results Add an excess of the reagent, heat to 70° and det the Al in the ppt. with 0 1 *N* KBr-$KBrO_3$ soln W T H.

Determination of lime and magnesia in roasted pyrite. Louis Schreiber. *Ann chim. anal chim. appl.* 13, 98–102(1931) —The method described calls for treatment with concd HCl, dehydration and removal of $SiO_2$, double pptn with $NH_4OH$ and $H_2O_2$, pptn of $CaC_2O_4$ and $MgNH_4PO_4$ No attempt is made to remove Pb or Cu but, when the former is present, $NH_4OAc$ is added to prevent formation of Pb oxalate or phosphate No analytical results are given to show that the procedure is accurate. W T H

Potassium permanganate as a reagent for the detection of lower oxides in phosphoric acid. John W Smith. *J Chem Soc* 1931, 528–9 —*To detect lower oxides in* $P_2O_5$, dissolve 1 g. of sample in 10 cc. of water in a glass-stoppered test tube In a similar tube place 10 cc. of pure $H_3PO_4$ soln of approx the same concn Add 1 cc. of 0 001–0 0002 *N* $KMnO_4$ to each soln and allow to stand for 2 hrs If there is any perceptible difference, the lower oxide is present. In this way as little as 0 002 mg of $P_2O_5$ can be detected For these small quantities of impurity it is well to keep the tube immersed in water at 60° for 2 min W. T. H

Quantitative analysis of phosphoric acid. V. New colorimetric determination. Masayoshi Ishibashi. *Anniversary Vol Dedicated to Masumi Chikashige* 1930, 1–7; cf. *C. A.* 23, 4645 —The method depends upon pptg the $PO_4^{---}$ as $MnNH_4PO_4$ and the colorimetric detn. of Mn as $MnO_4^-$ after oxidation with $NaBiO_3$ in $HNO_3$ soln In the expts described, in which the P content varied from 4 to 0 2 mg of $(NH_4)_2HPO_4$, the pptn , dissolving and treatment with bismuthate all took place in a centrifugal tube of 15 ml. capacity. *To the soln of* $(NH_4)_2HPO_4$ *a little 10% NH*$_2$*OH HCl* soln. and an excess of $MnCl_2$ were added together with about 100 mols of $NH_4Cl$ for each mol. of $MnCl_2$ The soln was heated to about 90° and concd. $NH_4OH$ added to effect complete pptn. of $MnNH_4PO_4$ After 5 hrs the ppt. was washed with a slightly ammoniacal molal soln of $NH_4Cl$ contg. a little $NH_2OH$. The ppt. was dissolved in 4

It seems probable that the Clark and Jelley test depends on some substance other than $S_4O_6^{--}$ which is formed from $S_2O_3^{--}$ by oxidation with I. By titrating dil $S_2O_3^{--}$ solns with I-starch azide mixt the method may be made quant In the discussion Clark and Jelley showed a new reaction a soln of $NaN_3$ and $K_2S_4O_6$ forms $S_2O_3^{--}$ and $N_2$ on heating They think it possible that nascent $S_4O_6^{--}$ is sufficiently active to react with $N_3^-$, re forming $S_2O_3^{--}$ which then reacts with the excess of I present, restarting the cycle, so that a small quantity of $S_2O_3^{--}$ can cause decompn of a large amt of azide E. E JELLEY

The detection and determination of methanol. LUCIEN SEMICHON AND MICHEL FLANZY *Ann falsi* 24, 80–7(1931) —A complete oxidation of MeOH to $CO_2$ and $H_2O$ *can be accomplished by excess* $K_2Cr_2O_7$ *in* $H_2SO_4$ *soln, when MeOH is in excess* the products consist of a mixt. of $CH_2O$, $HCO_2H$ and methylal or of a mixt of $HCO_2H$ and methylal The methods proposed to date for the oxidation of MeOH to $CH_2O$ give a yield of only 3 10% of theory, but S and F obtain a yield of about 32% by first detg the total oxidizability of the mixt Details of the technic are described The $CH_2O$ can be identified by means of $NH_2OH$, $PhNMe_2$ or preferably $PhNHNH_2$.HCl by the method of Bertrand, for the detn a known amt of MeOH is simultaneously treated in exactly the same way as the sample, and the 2 solns are compared colorimetrically A PAPINEAU COUTURE

The de Haas fluorescence reaction of β-naphthol N SCHOORL *Pharm. Weekblad* 68, 279 80(1931) —The green fluorescence described by de Haas (*C A* 25, 1183), obtained when an aq soln of β naphthol is treated with glacial AcOH and concd $H_2SO_4$ is added, does not occur immediately with purified AcOH unless a trace of AcH is added It does occur, however, with highly purified AcOH if the reaction mixt is allowed to stand for a long time A W DOX

The Hehner test for formaldehyde (in milk). CHARLES C FULTON *Ind Eng Chem, Anal Ed* 3, 199–200(1931) —The Hehner test is improved by using Br as oxidizer and by dilg the $H_2SO_4$ The improved test is sensitive to 1 1,000,000 Two procedures are given For a zone reaction dil 5 cc. concd $H_2SO_4$ with 1 cc. $H_2O$ and cool To 3 cc of this diluted acid add a small crystal of KBr Shake and then overlay with 1 cc. of the milk to be tested A violet zone quickly develops To obtain a uniform color throughout the soln, dil 8 cc. concd $H_2SO_4$ with 5 cc. $H_2O$ and cool To 4 cc. of this diluted acid add 1 cc of the milk and mix under cooling Add 0 5 cc of *a mixt of equal vols of concd* $H_2SO_4$ *and satd Br water and shake. A violet color* develops at once This procedure is well suited for distillates Dil the acid with the distillate to be tested and use pure milk C. A ABELEDO

The opium alkaloids as reagents for formaldehyde. CHARLES C FULTON *Ind Eng Chem, Anal Ed* 3, 200–1(1931); cf *C A* 24, 467 —The addn of an oxidizing agent increases the sensitivity of the test for detecting $CH_2O$ with alkaloids With *apomorphine, codeine or pseudomorphine the test is unmistakably sensitive to 1:500,000,* with papaverine, to 1 100,000 The oxidizing agent used is a 10% soln of $Fe_2(SO_4)_3$, or 5 drops of concd $HNO_3$ in 50 cc. water The tests are not sp for $CH_2O$ but when carried out on a distillate its identification is fairly certain. Papaverine gives the most nearly sp test. C. A ABELEDO

The iodometric determination of copper and its use in the estimation of reducing sugars. R INTONTI *Ann chim applicata 20, 583–90(1930)* —The iodometric titration of $Cu_2O$ dissolved in $HNO_3$ is preferred to the result obtained by the vol procedure of Fehling To make sure that no $HNO_2$ is present, treatment with $CO(NH_2)_2$ is recommended A W. CONTIERI

Bromopotentiometric titration of β-naphtholsulfonic acids in presence of each other. III. Mixtures containing oxy-Tobias acid, F acid and trisulfo acid. J. SMITH HARLAND, STANLEY D FORRESTER AND DAVID BAIN *J. Soc. Chem Ind* 50, 100–2T (1931); cf *C A*. 25, 474 —The β naphtholsulfonic acids, with no sulfonic group in the 8-position, can be detd in the presence of those acids which have the $SO_3H$ group in this place, but an excess of KBr is necessary for the potentiometric titration if crocein or oxy-Tobias salts are present In the presence of 10 *N* $H_2SO_4$, the OH group of the β naphtholsulfonic acids is converted completely to sulfate and this, when associated with the $SO_3H$ group in the 8-position, prevents the Br from entering at the 1-position. F acid exists as the tetra, di-, and mono-hydrates as well as in the anhydrous condition The tetrahydrate m 67°, the dihydrate m 95°, the monohydrate m 108–9° and the anhydrous acid m 115–6°. The method recommended for analyzing the mixts is that recommended in Part II W. T. H.

Qualitative testing of acetic acid. E. TSCHIRCH. *Oesterr. Chem.-Ztg* 34, 38–40 (1931) —The red color produced with $FeCl_3$ is not a reliable test for acetate, the for-

mation of ethyl acetate, to be identified by the odor, is a useful test but depends too much upon the personal equation. The cacodyl test is not at all reliable as the higher homologs of AcOH give a similar result. The test with phthalaldehyde and $NH_4OH$, which gives a bluish green color, is less well known, it is fairly sensitive but is given by the homologs of AcOH. The best test is that of treating 1–3 cc. of soln. successively with 1 cc. of 5% $La(NO_3)_3$ soln., 1 cc. of 0.02 *N* I soln. and a few drops of $NH_4OH$. On gradually heating to boiling, a starch blue color develops, which is a good test not only for La but also for $AcO^-$. The homologs of AcOH give similar color effects and $SO_4^{--}$ or any anion that ppts. La must be removed. The fact that AcOH can be distd. off easily from a soln. often helps in the prepn. of suitable solns. for the test. $SO_4^{--}$ and $PO_4^{---}$ can be removed by ppts. with Ba and when large quantities of $NO_3^-$ or $Cl^-$ are present, advantage can be taken of the fact that 100 cc. of abs. alc. dissolves 1.81 g. of NaOAc but only 30 mg. of $NaNO_3$ and 65 mg. of NaCl. W. T. H.

*Methods for the analysis of technical solvents. II. Color tests for benzene, nitrobenzene, toluene and xylene.* Hans H. Weber. *Chem. Ztg.* 55, 201–3(1931), cf. *C. A.* 24, 2083.—For the colorimetric detection of these aromatic hydrocarbons it is well to transform them first into polynitro compds. Take not over 0.5 cc. of the solvent, or *more* if it is a soln. in gasoline or the like, and mix with 1 cc. of concd. $HNO_3$ and 2 cc. of 100% $H_2SO_4$. Shake 1 min. and cool. Take 0.1 cc. of the acid layer and dil. with 1 cc. of water, which will cause the formation of a suspension in water of the nitro compds. Sufficient water must be used so that the alc. subsequently added will not be attacked. *Detection of benzene.*—Mix 0.5 cc. of the aq. suspension with 1 cc. of isoamyl alc., add 2 *N* NaOH till alk. and shake for 1 min. with a stick of NaOH 1 cm. long. If only benzene is present, the amyl alc. layer remains practically colorless, but if the higher homologs are present a dirty brown paste is formed with fugitive colorations. Now, with still a little solid NaOH remaining undissolved, add 1 cc. of acetone, an intense blue to permanganate-violet color should form, becoming brown on long standing. By this test benzene can be identified in the presence of its homologs and in mixts. with EtOH or $C_2H_3Cl_3$. *Detection of nitrobenzene.*—This gives the same test as benzene, but on account of the great difference in b. p. as well as odor, there is little danger of confusing the two. In case of doubt, however, take 10 cc. of the original sample and treat in a large test tube with 10 cc. of abs. alc. and 5 cc. of concd. HCl, add a small piece of Sn and some coppered Zn, heat 15 min. on the water bath, sep. from undissolved metal in a separatory funnel, pour off the liquid from the undissolved metal into a small separatory funnel, draw off the bottom layer, add a little $KClO_3$ and 0.5 cc. of concd. $HNO_3$ (Peset's test for aniline), after the mixt. has stood without shaking rings with red and blue edges form if only a trace of nitrobenzene was originally present (resin oils give brownish red colors and some phenols give pale red effects). *Detection of toluene.*—Mix 0.5 cc. of the aq. suspension with 1 cc. of pure benzyl alc., add 2 *N* NaOH to alk. reaction and shake. The alc. layer will be colored brownish red, a violet shade sometimes appearing first. *Detection of xylene.*—Mix 0.5 cc. of the aq. suspension with 1 cc. of cyclohexanol, make alk. with 2 *N* NaOH and shake well. The alc. layer should be an intense green. This test depends upon a reaction of *m*-xylene, which constitutes 70–85% of com. xylene. It can be used successfully in the presence of benzene and toluene when not more than 10% of these lower homologs is present in the original solvent. In case of doubt try the test after adding 96% alc. to the original solvent (xylene fraction) and then water until a turbidity results, xylene will sep. before benzene or toluene, and in this way a portion rich in xylene can be obtained and the presence of 2.5% xylene detected in a mixt. W. T. H.

Separating arsenic from vanadium and phosphorus. OSKAR JOCHUM Ger. 521,191, June 16, 1929 A soln contg these elements as alkali or $NH_4$ arsenates, vanadates and phosphates is satd at 30–100° with $SO_2$ or a bisulfite, and the soln is then boiled to remove excess of $SO_2$ A ppt contg the V and P but no As is thus obtained.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T WHERRY AND J P SCHAIRER

Practice of mineral polishing. WERNER GRÖNDER *Metall u Erz* 28, 143–7 (1931).—Various methods of prepg specimens for microscopic examn are investigated Relief polishing is not always the most suitable means of bringing out the structure of the sample Plane polishing in which the structure is brought out in only very weak relief, is often more satisfactory An oil emery mixt is found suitable for this purpose The details of mounting and prepg the specimens are given H STOBBTZ

Stephanite, argentite and silver, South Lorrain, Ontario. T L WALKER Univ Toronto Studies, *Geol Ser*, No 29, Contributions Can Mineral, 1930, 13–5.—The Ag minerals occur in veins with a gang of calcite assocd with arsenides of Co, Ni and Fe Some vein cavities contained argentite, wire Ag, stephanite, proustite and rarely pyrostilpnite followed by a final deposition of calcite lining the cavity walls Argentite was the most abundant J W SHIPLEY

Mineralographic study of the marcasite group ELLIS THOMSON Univ Toronto Studies, *Geol Ser* No 29, Contributions Can Mineral, 1930, 75–83.—A description is given of marcasite, loellingite, arsenopyrite, safflorite, rammelsbergite, glaucodite alloclasite and nickel skutterudite based on a study of polished mineral sections etched with various special reagents The phys and microchem properties are listed in a table J W SHIPLEY

Fibrous marcasite in crystalline calcite near Logansport, Indiana. ERNEST R SMITH AND RUSSEL A SCHROEDER *Proc Indiana Acad Sci* 38, 231(1929).—Analytical data are given to show that a fibrous greenish gold, metallic mineral zonally distributed through the outer portions of calcite masses has the compn $FeS_2$ The color of the sulfide indicated it was marcasite rather than pyrite, and this is considered to have been confirmed by soln in concd $HNO_3$, free S being formed H. M S

Lodestone from Bon Accord, Transvaal. T L WALKER Univ. Toronto Studies, *Geol Ser.* No 29, Contributions Can Mineral, 1930, 17–0.—The analysis of a sample from a specimen of lodestone secured 10 miles north of Pretoria, S. Africa, indicated magnetite 54 06%, limonite 9 35%, ferric titanate 35 32%, Si and Mg 1 62% when the Ti was considered as occurring as the dioxide and the reducing action toward $KMnO_4$ ascribed entirely to $Fe^{++}$ Since 95% of the specimen appeared to be one mineral species, W. suggests that the Ti is present as $Ti_2O_3$, which on going into soln reacts with the $Fe_2O_3$ as follows: $Fe_2O_3 + Ti_2O_3 \longrightarrow 2FeO + 2TiO_2$. A recast of the analysis would give 13 87% for spinel, 76 67% of sesquioxides largely ferric, and the residue limonite. The dominant mineral would then be titaniferous maghemite, $(Fe, Ti)_2O_3$ J. W. SHIPLEY

X-ray distinctions between magnesite and dolomite. FRANZ HALLA. *Monatsh* 57, 1–8(1931).—Powder spectrograms of very pure samples of the minerals from various sources have been utilized to establish their structure. They can be distinguished with certainty in this manner The parameters of the rhombohedral unit cell of $CaMg(CO_3)_2$ are $a$ 6 050 ± 0 004 A. U., and $\alpha$ = 46°54′. Detailed studies and reproductions are given. GREGG M. EVANS

The optical properties of manganese-poor grünerites and cummingtonites compared with those of manganiferous members. N SUNDIUS *Am J. Sci* [5], 21, 330–44(1931).—Full optical data are given ALDEN H EMERY

Pyroxene and scapolite from Templeton Township, Quebec. A. L. PARSONS Univ. Toronto Studies, *Geol. Ser* No 29, Contributions Can Mineral, 1930, 25–8.—A description of crystals of pyroxene and scapolite is given together with a chem analysis of each J. W. SHIPLEY

Chemical and optical study of amphibole. A L PARSONS Univ. Toronto Studies, *Geol. Ser.* No 29, Contributions Can. Mineral, 1930, 29–33.—A crystallographic and chem study of black crystd hornblende from Monteagle Township, Hastings County, Ontario, was made An increase in the $n$s of the amphiboles, closely related to the total Ti and $Fe^{+++}$ oxides, was observed J. W. SHIPLEY

Calamine, galena, magnetite. T. L. WALKER AND A L PARSONS Univ. Toronto

Studies *Geol Ser* No 29, Contributions Can Mineral, 1930, 21–3.—Specimens of calamine from the Broken Hill Mines, Northern Rhodesia, were examd crystallographically the form (052) was observed Galena from the Ivanhoe Pb-Ag mines at Sandon B C was found to contain free S The alteration products form a series of fine parallel bands in the mineral with an occasional small cavity containing brilliant crystals of anglesite Large crystals up to 10 lbs of magnetite were obtained from Faraday Township Ont The largest crystal encloses both apatite and lepidomelane and a cavity from which some mineral possibly calcite or apatite, has disappeared Analysis indicated an almost perfect balance between RO and $R_2O_3$ J W. S

Chemical formulas of hallyuite and cancrinite. L H Borgström *Bull comm geol Finlande* 1930, No 92 51–7.—An English version of the article abstracted in *C A* 24, 3196 H C. Duus

Lattice dimensions of heulandite from Wasson's Bluff, Nova Scotia. A L Parsons Univ of Toronto Studies, *Geol Ser* No 29, Contributions Can Mineral 1930, 37–8.—The dimensions of the unit cell for the heulandite were found to be *a* 7 5438, *b* 17 969 *c* 15 913 A U and β 83°34′ (Dana) The sp gr of the crystal was 2 22 Calcn from the chem analysis of heulandite from the traps of Digby Gut, Nova Scotia, failed to give a simple formula for the mineral but corresponded to a mixt of a hydrous metasilicate with a hydrous orthosilicate in the proportions of 4 1 From this assumption N = 1 0113 Other mixts are equally possible but the evidence indicates an isomorphous mixture of 2 types of mols in heulandite J W Shipley

Lattice dimensions of natrolite from Wasson's Bluff, Nova Scotia. A L Parsons Univ of Toronto Studies *Geol Ser* No 29, Contributions Can Mineral 1930, 35–6.—The dimensions of the unit cell for the natrolite were found to be *a* 18 306, *b* 18 708 and *c* 6 6814 A U The sp gr of the crystal was 2 257 and there were 8 mols in the unit cell by using Brögger's value for *c*, N is found to be 8 0934 J W. S

Collophanite from Miocene brown shales of California. E Wayne Galliher *Bull Am Assoc Petroleum Geol* 15, 257–69(1931).—An impure, pyritized oölitic collophanite occurs in the Miocene brown shales of the southern San Joaquin Valley, Calif The grains are 0 1–0 5 mm in diam Their chem compn and phys properties depend on the degree of pyritization The grains are embedded in a matrix which is dominantly clay These oölites are syngenetic The mechanism of pyritization is discussed Alden H Emery

Quinquennial review of the mineral production of India for the years 1924 to 1928. *Chromite* E H Pascoe *Records Geol Surv India* 64, 28–31(1930), cf *C. A* 24, 1824.—Indian chromite is usually assocd with serpentine In Bihar and Orissa it occurs in bed like veins and as scattered granules in serpentinized saxonites and dunites forming laccolitic intrusions As in Baluchistan the chromite is of primary (magmatic) origin and contemporaneous with the peridotites. The subsequent serpentinization of the peridotites has been accompanied by widespread silicification with the production of marginal zones of chert. The output is steadily increasing Graphite. E L G Clegg *Ibid* 106–9.—Graphite occurs in various parts of India in schists Magnesite. E H Pascoe *Ibid* 166–72.—In the Salem district a network of magnesite veins pierces 2 great intrusive masses of serpentinized ultra basic rocks Production is steadily increasing Cyanite. J A Dunn *Ibid* 403–5.—Important deposits of cyanite and of cyanite quartz rock occur in India Sillimanite. J A Dunn *Ibid* 426–9.—Sillimanite-corundum deposits assocd with cordierite biotite quartz microclinegneiss and sillimanite quartz schists occur in Assam Alden H Emery

Relation of the ore deposits of the southern Rocky Mountain region to the Colorado Plateau. B S. Butler *Proc Colo Sci Soc* 12, No 2, 23–36(1929).—Ore deposits of the southern Rocky Mountain region are coned in a narrow belt surrounding Colorado Plateau, assocd with volcanic fields which are also largely confined to the same belt Igneous activity resulted in deposition of the ores A bibliography is given E I. S

Geological and metallogenetic study of South Africa A Demay *Rev ind minérale* 229, 271–98(1930).—A review of the essential elements of geology, stratigraphy and eruptive phenomena of South Africa, central Rhodesia and regions further north,

including the province of Katanga of Belgian Congo Notes are given on the principal deposits of this region which is one of the richest mining districts of the world
E I S

Impressions of the mineral industry of British South Africa. W B Timm. Can Dept. Mines, Mines Branch, *Memorandum Series* No 46, 27 pp (1931) —T. discusses diamonds, asbestos, Pb, Zn, V etc ALDEN H EMERY

Geology of South Park Section. A. Lakes *Mountain States Mineral Age* 1, No 3, 7, 20–1(1930) —*Notes on Au, Ag* Pb and coal deposits are given and oil possibilities discussed E I S

*Geology and ore deposits of Bannack and Argenta, Montana.* Philip J Shenon *Mont Bur Mines and Geol Bull* No 6(1931) —These 2 districts were the first important placer and lode mines in Montana and have produced Au, Ag, Pb, Zn and Cu The ore deposits are closely related to intrusive rocks, but occur also in sedimentary rocks near intrusive contacts Those with obvious exposures have been largely exhausted, but it is possible that additional discoveries may be made. CURTIS L WILSON

Geology of the Shonia Lake area, district of Kenora (Patricia portion). H C. Laird *Ann Rept Ont Dept Mines* 39, Pt 3, 1–21(1931) —Extrusive rocks (greenstones) forming the basement schist series are surrounded by granite. Gabbrodiorites *and amphibolites of pre granite age form 40% of the schist area* Descriptions of the rocks and Au prospects are given ALDEN H EMERY

Geology of the area from Minaki to Sydney Lake, District of Kenora. D R Derry *Ann Rept Ont Dept Mines* 39, Pt 3, 25–41(1931) —The consolidated rocks (all Pre Cambrian) fall into 2 series (1) a sedimentary-volcanic series, much folded and metamorphosed, and (2) an intrusive series ranging from diorite to granite and pegmatite The intrusives occupy 80% of the area They are described in detail Mineralization (usually replacement of the country rock) was closely assocd with the later phases of intrusion Quartz veins are rare. Pyrrhotite with minor pyrite and *molybdenite carrying Au and Ag is known in the coarser gneiss Pyrite, in a siliceous* groundmass with varying proportions of chalcopyrite and carrying Au, occurs in the volcanics and fine quartzitic sediments A cobaltite vein has been prospected
ALDEN H EMERY

Geology of the Shoal Lake (west) area, District of Kenora. Leonard Greer *Ann. Rept Ont Dept Mines* 39, Pt 3, 42–56(1931) —A thick and intricate Keewatin section is exposed Lava flows, agglomerates and obscure sediments are interbedded with no particular order *Intrusive into them are bodies of granite, felsite and quartz* porphyry Au-bearing quartz veins occur chiefly in greenstone The rocks are de scribed in detail ALDEN H EMERY

Geology of the Bigstone Bay area, Lake of the Woods, district of Kenora. G G Suffel. *Ann Rept Ont Dept Mines* 39, Pt 3, 57–71(1931) —A basic and siliceous series of volcanic rocks, largely extrusive, are intruded by a series of dioritic to gabbroic bodies. All of these are intruded by granite and many small granite, felsite and quartz porphyry dikes Much later the complex was intruded by narrow diabase dikes Au-bearing quartz veins occur assocd with the contact between the granite and basic schists *Ag, pyrite, arsenopyrite, chalcopyrite, sphalerite, galena and tellurides* have been reported The rocks are described ALDEN H. EMERY

Geology of the Eagle-Circle District, Alaska. J B Mertie, Jr *U. S. Geol Survey Bull* No 816, 166 pp (1930) —M discusses the geologic history, distribution of placers, sources of Au and placer mining operations Two groups of claims, comprising 7 mi of placer ground on Coal Creek, are regarded as good hydraulic venture
E. I. S

Geology of the Panamint Silver District, California. F. MacMurphy. *Econ Geol.* 25, 305–25(1930) —The Ag bearing fissure veins occur largely in limestone. They *comprise: quartz-galena-pyrite* veins and pyrrhotite-pyrite-quartz veins. The mineralogy of ores is described and origin and age of deposits discussed A bibliography is given. E. I. S

Mineral association at the Marble Bay Mine, Texada Island, B. C. T. L. Walker Univ. Toronto Studies, *Geol Ser* No 29, Contributions Can Mineral, 1930, 5–8 — The ores of the Marble Bay mine are chalcopyrite and bornite, rarely native Ag and molybdenite. The non-metallics are represented by garnet, wollastonite and epidote. *The deposits occur at the contact of a diorite porphyrite intrusion with Mesozoic lime*stone. Analyses of the bornite, wollastonite, andradite and grossularite are given
J. W. Shipley

Geological and microscopical study of some copper deposits of China. C. Y.

Hsieh *Bull Geol Soc China* 8, No 4, 263-326(1929)(in English)—Deposits in Hupeh Yunnan and Szechuan are described E I S

Lubi and Lukula lead-copper deposits, their origin and their relation to stratigraphy of the region. J Polinard *Ann soc geol Belg* 52, No 11, 85 pp (1929)—N'Tendu ore occurrence is regarded as float mineral and not a deposit in place A discussion of the assocd minerals and a theory of the origin of the deposits are given E I S

Iron and manganese deposits of Brazil. L P de Oliveira *Echo mines et métal* 57, 686-7(1929)—Iron deposits constitute the largest mineral resource of Brazil Outline descriptions of principal Fe and Mn ore deposits are given, with analyses of Mn ore E I S

The iron ore deposits of South Africa Hans Schneiderhöhn *Arch Eisenhüttenw* 4, 269-76(1930) A survey of the nature, geographical positions and sizes of the Fe ore deposits of So Africa based on the latest literature and some personal observations J Balozian

World deposits of nickel H Carlbom *Jernkontorets Ann* 1929, 493-4—C gives descriptions of Ni ore minerals mining and refining processes, and mine production statistics for 1913 to 1927 The present yearly consumption is 40 000 tons A bibliography is appended E I S

Platinum deposits of South Africa. P Kerlik *Glückauf* 66, 868-74(1930)—A review E I S

Tin deposits of Morococala, Bolivia. R Geyer *Z prakt Geol* 38, 113-21, 135-42(1930)—A geological treatment, including description of the deposits E I S

Mercury deposit in Coso range, Inyo County, California. T Warner *Min in Calif Calif Div of Mines and Min* 26, No 1 59-63(1930)—In a crater like opening in a conical hill of altered rhyolite, there is a network of veins seams, crevices and fractures through which cinnabar crystals and free S have been deposited Average samples contained 0 16 and 0 19% Hg selected ore 7 to 11 percent The origin of the deposit is discussed F I S

The geology of gypsum deposits. V Charrin *Rev matériaux construction trav publics* 1931, 99-101—The deposits of gypsum near Paris and in Lorraine or the Provençales occur either in Triassic or Miocene formations F O Andreegg

Gypsum of P'ing Lu District, South Shansi. S L Tsao *Bull Geol Soc. China* 8, No 4, 327-41(1929)(in English)—Veins veinlets and beds of gypsum occur in red marl both conformable and oblique to bedding, it is mined in a primitive manner, the output being about 10 tons per day and price at river bank $6 40 per ton E I S

Alabaster deposits at Campredon near Carcès V Charrin *Génie civil* 97, No 1, 18-9(1930)—Geological features of deposits and methods of mining are described E I S

Kentucky fluorites. W R Jillson *Pan Am Geol* 54, No 1, 29-30(1930)—Production data, 1926 to 1929 are given E I S

The origin of the Lichtenburg diamonds Alfred L Williams *S African Min eng and Eng J* 41, Pt 1, 314(1930)—Geological Alden H Emery

Carbons and industrial diamonds in 1930 L M van Moppes. *Mining J Ann Rev* No 9 Jan. 24, 1931 Alden H Emery

Contribution to study of evolution of fuels of the coal basin of Liége. M Legraye *Rev univ mines* [8], 4, No 1, 5-11(1930)—The nature of coal and variations in content of volatile matter are discussed. A map is shown of distribution of coal and coal formations in the Liége basin, Campine, Limbourg and western Germany Modifications are attributed to tectonic forces E I S

Genetic connection between salt deposits and petroleum. A Weinfeld *Intern Z Bohrtech., Erdölbergbau u Geol.*, May 1, *Oil and Gas J* 28, No 5, 159(1929)—Contrary to the current idea of migration of oil from mother rocks, W assumes that the greater part of the oil found in porous beds is primary in character, formed in rocks where actually found by drill His explanation is that animal organisms with soft bodies were abundant where the NaCl content of the water was high, and that these organisms constituted the mother substance of petroleum E I S

Some factors of solidification in relation to metallurgical and geological problems. S W Smith. *J. Chem Met Mining Soc S Africa* 31, 195-8(1931), cf *C A* 24, 3970, 5004, 5675, 25, 476, 1184 Alden H Emery

Separation of solid phases in heavy liquids and melts with aid of the centrifuge. W Jaeger *Glückauf* 66, 661-8(1930)—J discusses applications of the centrifuge to petrography, giving new methods of sepn with its aid, gravimetric and volumetric processes, with aid of heavy liquids, and details of Wolff centrifuge. E. I S

Petrography of the rocks in the vicinity of Killarney, Ontario. W A Jones. Univ of Toronto Studies, *Geol Ser* No 29, Contributions Can Mineral 1930, 39–60 — A detailed study of the rock types in the area adjacent to Killarney Village, Ont., was made. A sharp contact was observed in the field between the coarse-grained Killarney granite-gneiss on which the village stands and the fine-grained granite-gneiss to the east. Dikes of the fine-grained rock cut the coarse grained. At the contact of these 2 rock types the fine grained granite-gneiss has apparently been chilled, since its texture is unusually fine. A series of chem. analyses of samples taken across the strike of the rock from the quartzite into the coarse-grained rock showed no progressive decrease in silica and increase in alkalies. Microscopic examn. of thin sections did not reveal proof of the origin of the fine-grained granite gneiss by the metasomatic replacement of quartz by feldspar. The Killarney granite-gneiss is intrusive into sediments of Huronian age. Microscopically and chemically, its character is that of an igneous rock of plutonic origin. The compn. of the coarse-grained rock is not widely different from that of the fine grained, so that the latter is probably a slightly younger, more quickly cooled intrusive rock which has originated in the same magma reservoir. J W S

Certain xenoliths occurring in gabbro at Sudbury, Ontario. W A Jones. Univ of Toronto Studies, *Geol Ser*, No 29, Contributions Can Mineral 1930, 61–73 — The inclusions of white rock at Sudbury originated contemporaneously with the enclosing gabbro as a result of the action of the magma on a nucleus of siliceous sedimentary material. No remnants of foreign material were found to prove this conclusively. Actual fusion of the inclusions did not occur. The process was one involving the penetration of materials from the magma which reacted with quartzite to form hornblende and plagioclase in an essentially solid xenolith. Mol. transfusion of material from the magma into the xenolith accounts for the mineralogical symmetry of the inclusion. The penetrative ability of Fe and Mg would not be as great as Al, Ca, Na and K, and hence the border zone of the xenolith would tend to become rich in Fe and Mg and the formation of hornblende crystals would result. At the edge of the inclusion crystal centers would be close together and a medium textured aggregate made up chiefly of hornblende would result. Within the xenolith the penetration of Mg and Fe would not be so great, with the result that large crystals would gradually develop. Impoverishment of the reacting liquid in Mg and Fe due to the pptn. of hornblende would result in the development of bytownite in the interstices between the hornblende crystals. It is thought that Na and K would explain the presence of andesine in the center of the body rather than bytownite. The presence of a great no. of fluid inclusions in the residual quartz of the xenoliths indicates that the reaction between magma and quartzite took place in the presence of mineralizers. J W Shipley

The aqueous chilling of basaltic lava on the Columbia River Plateau. Richard E. Fuller. *Am J Sci* [5], 21, 281–300(1931) —A petrographic study. A H E

Dalmatianite, the spotted greenstone from the Amulet Mine, Noranda, Que. T. L. Walker. Univ Toronto Studies, *Geol Ser* No 29, Contributions Can Mineral 1930, 9–12 —Microscopic and chem. examn. of the greenstone indicated considerable variation in the compn. of the specimens, some being fairly acid while others are quite basic. The S and Zn contents indicate a change from the original volcanic type due to contact with the sulfide ore body. The spots represent amygdaloidal filling. J W Shipley

*Compaction of sediments.* Parker D Trask. *Bull Am Assoc Petroleum Geol* 15, 271–6(1931) —The initial $H_2O$ content of sediments varies with the fineness of the constituent particles. A tentative estimate indicates that it is approx. 45% in well sorted fine-grained sands, 60% in silts, 80% in clays and > 90% in colloids. A H E

The influence of withdrawn chemical substances in creating empty underground spaces and pressure. Cesare Vercelli. *Ind mineraria* 5, 81–2(1931) —Very strong pressure noted in the Monte Cani pits was studied as to its cause, with the conclusion that the $ZnCO_3$ and $PbCO_3$ of these were produced by the oxidation of the ZnS and PbS through the action of water, $CaCO_3$ and $MgCO_3$ and that the last 2 were transformed into the sol. sulfates and were carried off by water, leaving empty spaces, while the ZnS and PbS remained as insol. carbonates. R Sansone

Chemical transformations caused by the decomposition of vegetable wastes. P. Vinassa de Regny. *Ind mineraria* 5, 21(1931) —Many plants, or plant parts, die every season, and the waste produced contains mineral salts and org. matter with H, C, O, N. If in contact with much O as in tropical regions, a slow combustion follows, while under woods or in immature peat bogs in large masses, contact with atm. O is difficult, and these become putrid by the action of bacteria and fungi, and $H_2O$, $CO_2$ and a little N are produced, there being only as exceptions solid remains as liptobiolites. With excess

of $H_2O$ and absence of O or if the mass freezes, or the ground is calcareous or has salt, the fungi and decompn. bacteria do not vegetate, or even die. Besides this, if in a year fungi and bacteria cannot act on all the vegetable mass this is increased by other additn., and the wastes can rise for several yards being dry at the top and wet and rotten at the bottom. There is then formed mixed material where humus predominates. This is a collection of negatively charged colloids which remain such as long as there is water, resisting flocculation by univalent ions while they are more sensitive to bivalent such as Ca. Acid humus reacts in an opposite way to O and reduces and renders sol. ferric compds. In layers under sand and peat bogs all the Fe and CaO is eliminated in this way.
R. Simons

Recent advances in science geology. G. W. Tyrrell. *Science Progress* 25, 579–86(1931).—A review of recent work on the geochem. of the igneous rocks.

## 9—METALLURGY AND METALLOGRAPHY

D. J. Demorest, H. W. Gillett and Richard Kimbach

The fiftieth anniversary of Rudolf Vondráček. Ferdinand Schill. *Chem. Listy* 25, 73–5(1931).—A review of V.'s contributions to physicochemical *analyses of metallurgy*.
Frank Mares

Bibliography of the metallurgical work of the U. S. Bureau of Mines in 1930. R. S. Dean. Bur. Mines *Information Circ.* 6449, 7 pp. (1931).—Over 60 references are given to articles on *fundamentals ore dressing*, Fe and steel, hydrometallurgy, Mn investigations, rare and precious metals, non-ferrous metals, lab. app., methods and discussions.
Alden H. Emery

The metallurgy of some of the rarer metals. C. J. Smithells. *Metal Ind.* (London) 38, 836–8(1931).—The development of elec. lamps and thermionic valves has created a demand for metals and alloys with very special properties. While W has generally met the requirements for lamp filaments, Mo, Ta and Ni are used for electrodes of thermionic valves. The production of ductile Zr and of ductile Ta and of Mo are outlined as is the manuf. of sheet Mo.
W. H. Boynton

Calculation of metal yield in ore-dressing processes. Otto Stelzner. *Metall u. Erz* 28, 140–3(1931).—Methods of calcg. yields in the various ore-dressing processes are discussed.
H. Stoertz

The scientific fundamentals of colloidal ore dressing. Carl Goerz and Alexander Horovic. *Intern. Bergwirtsch. u. Bergtech.* 24, 37–42(1931).—The elementary theoretical principles relating to suspensoids are reviewed. The peptization of a complex Rammelsberg ore analyzing $SiO_2$ 19.67, S 24.63, CaO 16.31, Cu 8.3, Pb 5.17, Fe 17.28 and Zn 5.28%, and sieved through 10,000 mesh was studied by shaking with citric acid soln. for definite periods, settling, and detg. the quantity in suspension. The max. quantity of ore remaining in colloidal suspension depends on the citric acid concn. and on the ratio of ore to peptizing soln. The results are in agreement with Ostwald's pptn. rule.
Arthur Fleischer

Modern technic in the investigation of opaque minerals and ores. F. Coles Phillips. *Science Progress* 25, 633–41(1931).—A review with sections devoted to (*a*) the prepn. of polished surfaces, (*b*) reflecting power, (*c*) anisotropism, (*d*) other properties and (*e*) a bibliography of 24 references.
Joseph S. Hepburn

Flotation tests on converter slag. Frank S. Wartman. Bur. Mines, *Rept. of Investigations* 3068, 7 pp. (1931).—It is possible to recover by flotation about 90% of the Cu content of a chilled converter slag contg. 3% Cu and to obtain flotation concentrates

contg 35% Cu Reagents were 0.14 lb No. 5 G N S. pine oil per ton of slag, 0.1–0.15 lb amyl xanthate, 1.25–3.0 lb $H_2SO_4$ and 0.12–0.25 lb P E oil A H E

*Influence of the iron content of zinc blende upon its adaptability for flotation.* Ludwig Kraiber *Metall u Erz* 28, 128–30(1931) See *C A* 25, 2082 H S

Operating practice in the copper-flotation plant of Minas do Valle do Vouga, Portugal. G Telher *Metall u Erz* 28, 125–8(1931) The installation at this plant is described The ores are complex (Cu pyrites Zn blende, Fe pyrites) The processes used are described, and the difficulties and methods of overcoming them are recounted H Stoertz

Leaching copper from its ores. John D Sullivan *J Chem Education* 8, 829–47 (1931) A review E H

Extraction of soluble copper from ores in leaching by percolation. John D Sullivan and Kenneth O Bayard Bur Mines, *Rept of Investigations* 3073, 43 pp (1931) The phys nature of the rock its porosity degree of kaolinization and sericitization, and the amt of natural slime det the amt of soln that will be retained and the difficulty that will be found in washing out the sol salts The rate of removal of sol Cu decreased with increases in the amt of slime present and increased only slightly with temp Wet charging the ore into the vat was advantageous In washing, the cycles of submergence and draining should be as close to each other as possible, consistent with fairly thorough mixing of the $CuSO_4$ in the wash soln and thorough draining of the soln The $CuSO_4$ concn was greater at the bottom than at the top of the ore column Circulating the solns increased extn rates Piston displacement washing removed Cu more rapidly than batch washing, but the vol of wash soln required was greater Downward and upward percolation of wash solns gave virtually identical extn rates Less $CuSO_4$ was ppted in the ore when the impregnating solns were acidic Alden H Emery

The extraction of copper from oxidized ore by cyanide solution. E T Dunstan *J Chem Met Mining Soc S Africa* 31, 190–4(1931) Cyanide extn of a malachite ore from Katanga contg 0.36% Cu resulted in high cyanide consumption Elec regeneration was impossible Details are given Alden H Emery

Magnetite in copper mats F G Hawley *Eng Mining J* 131, 319–22(1931) — Magnetite causes Cu losses in the slag from the smelting of mat This study of the distribution of the magnetite should help in the soln of the problem and also demonstrate the value of improved chem and microscopic methods of analysis Analytical data are discussed The sulfide is sepd from the magnetite as follows Dissolve 30 g $NaClO_3$ in 50 cc hot water Cool and add 50 cc of $HNO_3$ Cool again and add 30 cc of 85% $H_2SO_4$ and cool to room temp or lower *The $NaClO_3$ must be entirely in soln when the acid is added* Weigh 0.5 g of mat into a 600 cc beaker and add 8–10 drops of water Spread the mat over the bottom of the beaker by shaking, place in a cooling trough and cautiously add 25 cc of the chlorate In a few min heat the beaker nearly to boiling add 50 cc of cold water and immediately filter and wash The magnetite may be weighed as such and then a correction made for the impurities, or it may be ignited and weighed as $Fe_2O_3$ and impurities deducted, or the Fe may be detd volumetrically and calcd to $Fe_3O_4$ W H Boynton

Significance of the Dwight-Lloyd method for working up of Rammelsberg ores. W Sauerbrey *Metall u Erz* 28, 101–11(1931) —The advantage of the Dwight Lloyd method for roasting Rammelsberg ores (galena, zinc blende, Cu pyrites, Fe pyrites and heavy spar) *is primarily in the fact that the process is uninterrupted* The capacity is also great and the efficiency good the operating cost for the roasting and sintering of a ton of raw ore being about a third less than the usual roasting and briquetting methods Another advantage is in the handling of large quantities of raw materials without a preliminary roasting, and in making available the $SO_2$ gas for $H_2SO_4$ manuf As a result of the increase in furnace capacity and the saving of coke, together with a more favorable yield of metal, the total cost has been lowered considerably H Stoertz

Milling methods at the Hughesville concentrator of the St. Joseph Lead Co., Hughesville, Mont. Wm O Vanderburg Bur Mines, *Information Circ.* 6447, 15 pp (1931) —Galena sphalerite, marmatite and pyrite occur in a fissure vein in syenite. The first 2 are argentiferous A small quantity of Cu occurs as cupriferous pyrite and chalcopyrite The gang consists of altered syenite and rhyolite with subordinate amts of calcite, barite, quartz, rhodochrosite and marcasite. The av. grade of the ore is Pb 6.21, Zn 5.01% and Ag 9.09 oz./ton By selective flotation 2 concentrates are made: one Pb 61, Zn 5.7% Ag 50 oz. and Au 0.05 oz. per ton and another Zn 51, Pb 1%, Ag 31 oz. and Au 0.02 oz./ton Pb recovery is about 97%, Zn about 92% and Ag 80%. Alden H. Emery

Milling methods at the Hurley plant of the Nevada Consolidated Copper Co.

Hurley, New Mexico FRED HODGES Bur Mines, *Information Circ* 6394, 16 pp (1931) The Cu mineral is chiefly chalcocite, although this is in places accompanied by azurite malachite chrysocolla and cuprite The gang is quartz, pyrite, sericite and halloysite For the first 4 months of 1930 heads averaged 1 32% Cu and 3 14% Fe Recovery was 83 9% Concentrates assayed 27 51% Cu, 0 04 oz Au and 0 55 oz Ag per ton Ore is concd by flotation with lime, raconite and pine oil A H F.

Metal working in power presses. E V CRANE *Am Inst Mining Met. Eng., Inst of Metals Division* (preprint) 1931, New York meeting, 31 pp —Metal working in presses is discussed under the subdivisions of shearing bending, drawing, stamping, squeezing extrusion and forging from both the metallurgical and stress analysis viewpoints The stamping trade does its engineering largely by trial and error The principal operations of metal forming have many features in common with rolling and wire drawing methods The division between hot and cold working is taken as the recrystn range of temp of the metal being worked The specific features of the different operations and the factors involved are analyzed in some detail C. L MANTELL

Recent design of quicksilver plants. C N SCHUETTE *Eng Mining J.* 131, 316–8(1931) —Three types of furnaces are in common use—the old Scott furnace, the rotary kiln and the Herreshoff furnace The Scott is unsuited to intermittent operation and requires a reasonably dry feed The Herreshoff furnace has the advantage of a higher fuel economy than the rotary kiln and no occasional shutdowns for relining are necessary Dust elimination is discussed and several illustrations from installations at different mines are shown W H BOYNTON

Reduction of zinc oxide by methane or natural gas. H. A. DOERNER. Bur Mines, *Rept of Investigations* 3091, 14 pp (1931) —$ZnO + CH_4 = Zn$ (gas) $+ CO + 2H_2$ is nearly complete when equil is attained (O gas velocity) at about 927° The reaction rate increases with temp, but $CO_2$ formation and subsequent reoxidation of Zn also increase Temps should therefore be kept below 1000° Crude natural gas gives approx the same results as $CH_4$, the higher reducing power of the homologs of $CH_4$ being compensated by their greater tendency toward thermal decompn. A preliminary treatment to remove (sulfate) S is advantageous. This may be accomplished by heating the calcine at 800° in an atm of natural gas or the gaseous products from the Zn condenser Cd may also be eliminated by this step In the temp range 975–1000° the rate of Zn distn. compares favorably with that obtained from retorts by standard practice the metal produced is of exceptional purity and no appreciable amt. of blue powder is formed. The special requirements of a furnace for com. reduction of Zn by natural gas are (1) a retort and condensing system as nearly gas-tight as possible, (2) continuous feed and discharge of ore at a slow rate (time of residence about 34 hrs.), (3) continuous counterflow of gas at a low velocity (time of contact, about 1 min.) (4) retorts having a large capacity, and (5) pretreatment of the ore in a sep retort at 800° or lower with gas from the Zn metal condenser Under these conditions Cd and S are volatilized and Fe is reduced to metal. The length of the retort is limited by the resistance of the ore to the flow of gas and by the necessity to prevent transportation of dust incident to the higher gas velocity required by long retorts if the time of contact is const. The smallest dimension of the retort will be limited by the requirements of heat transfer The relatively low operating temp and the presence of the excellent thermal conductor, $H_2$, facilitate the flow of heat and permit large units to be used ALDEN H EMERY

Iron and steel in 1930 ANON *Mining J.* (London) *Annual Rev No.* (Jan. 24, 1931) 1 Copper in 1930 EDWARD H ROBIE *Ibid* 2 Tin in 1930. E BALIOL SCOTT *Ibid* 3–4. Lead and spelter in 1930. P W SMITH *Ibid* 6 Gold and silver in 1930. ANON *Ibid* 7 Platinum in 1930 ANON *Ibid* 8. Cadmium. W. G RUMBOLD *Ibid* 13 Modern industrial applications of steel. ANON *Ibid* 15, 17, 19, 21–2 —The following uses of steel are discussed the constructional industry, high-pressure and high temp vessels, chem and allied industries, automobile and aircraft construction, mine shafts and underground supports, rock drilling, railroad, bridge parts, crushing and pulverizing machinery The use of alloy metals in iron and steel. ANON *Ibid* 23 ALDEN H EMERY

New views on smelting [of iron ores] and remelting processes. J E FLETCHER. *Foundry Trade J* 44, 175–6, 195–7, 211–3, 227–9(1931) —See *C. A* 24, 5263 D S

Smelting in the lead blast furnace. Handling rich charges. VI. Conditions and problems introduced by increasing the ratio of concentration. G L. OLDRIGHT AND VIRGIL MILLER. Bur Mines, *Rept of Investigations* 3088, 7 pp (1931), cf *C A* 24, 319 ALDEN H EMERY

Design of open-hearth ports. V BALABANOV *Iron Age* 127, 1254–7, 1273(1931) E H.

*Graphical carbon balance of the blast furnace.* T J Ess *Iron Steel Eng* 8, 173–6(1931) —Charts developed to facilitate a check on gas production, blast vol and furnace practice are shown and the application is explained in detg the carbon balance The balance, worked through analytically, agrees substantially within slide rule limits W H Boynton

Carbon can be regulated by cupola practice. Gottfrid Olson *Foundry* 59, 62–3 (1931) —In order to control the C in cupola low C gray irons it is necessary to have (1) a forehearth, (2) low tuyères, (3) correct tuyère ratio, (4) proper amt of air supplied under proper pressure, (5) rapid melting, (6) high temp in melting zone, (7) large amts of steel scrap, (8) coke with approx 7% ash, (9) coke with moisture under 1% Downs Schaap

Regularities in the composition of basic Siemens-Martin slags. Siegfried Schilfichier *Arch Eisenhüttenw* 4, 239–44(1930) —From the analyses of 29 slags it appears that the MnO content depends on the value of CaO + MgO The sum of the 3 values is practically const at 61 5% Furthermore, the Fe content decreases with increasing $SiO_2$ and $P_2O_5$ If the Fe and MnO contents of a slag are known the approx compn can be calcd H F Johnstone

Application of cementation methods of the systems Sb–Cd, Zn–Cd, Pb–Cd, Sn–Cd and Bi–Cd. W L Loskiewicz *Przeglad Tech* 69, 508–13(1930) —A cementation method as described elsewhere (*Przeglad Gorniczo Hutniczy* 1929, 583) was employed in investigating the cementing characteristics of the systems Sb–Cd, Zn–Cd, Pb–Cd, Sn–Cd and Bi Cd, which on cementation below the eutectic temp form permanent openings *at the junction* By *cementation at a temp above the eutectic temp the eutectic is* formed, this is followed by fusion at the junction, which prevents permanent openings Tests carried out below the respective eutectic temps showed no evidence of cementation, while those cemented 3% above the eutectic temp showed fusion and quantities of the eutectic Methods employed are discussed In the Sb–Cd system Cd–Sb is formed at the junction, while in the other systems investigated, eutectics were formed in every case In the system Bi–Cd, there exists a fusion in a stable form and in the other systems tests corroborate the existence of such fusion Frank Kokoski

The constitution of the iron–carbon–silicon–system. II. Section through the tridimensional diagram at 8% silicon A Kříž and F Pobořil *Collection Czechoslov Chem Comm* 3, 61–72(1931), cf *C A* 24, 5705 —The properties of 7 alloys were investigated These alloys were prepd by melting in an elec resistance furnace. The percentage chem compn. of the alloys tested is

| Alloy No. | C | Mn | Si | P | S | $Ac_2$ in degrees |
|---|---|---|---|---|---|---|
| 34 | 0 14 | 0 43 | 7 97 | 0 041 | 0 011 | 645 |

Samples for thermal analysis and microscopic examn after heat treatment were taken from each alloy The constitutional diagram of the ternary Fe–C–Si system contg 8% Si is given The region of the homogeneous γ phase does not exist in these alloys The pearlitic transformation of the alloys with more than 0 48% C ends at the beginning of melting The transformation $Ac_2$ in the alloys with 8% Si lies in the region α + C at 665° G T. Motok

Practical use of the knowledge of structure of steels. F González V *Rev quim* 6, No 2, 21–5(1930) —Based on the chem compn of the steel an attempt is made to calc all the structural phases existing in steel such as free pearlite, $Mn_3C$, MnS, $Fe_3P$ and free ferrite The Juptner, Neil and Osmond formulas have been used in calcg tensile strength, hardness and elasticity G T. Motok

*Corrosion* and metal protection in steam power plants. IV. R. Stumper *Korrosion Metallschutz* 7, 25–8(1931), cf *C A*. 25, 1206 —A boiler-tube failure from a gas fired furnace using a hard water was investigated metallographically A deposit of $CaSO_4$ was found to exist throughout the entire length of the tube Sections of the tube were cut from the tube at the point of failure and at a point some distance from the blow out Microscopic examns of the metal surface of both sections revealed decarburization of the outer side of the section which failed, and indicated that the temp of the inside of the tube had been between the $Ac_1$ and $Ac_3$ points, while temp conditions in the other portions of the tube had apparently been such as to cause no changes in the micro-

structure The conclusion was reached that localized overheating due to an impinging flame had caused the failure R J Roehrig

**The corrosion of iron by steam at high temperatures and its physico-chemical basis** I W Kraus *Korrosion Metallschutz* 7, 29-31(1931).—A method is described for measuring the rate of oxidation of Fe in superheated steam at high temps The method consists in measuring the increase in elec resistance of a metal wire during the process of oxidation The resistance $R = \frac{\varphi \rho_2 l}{\pi}\left[\frac{1}{\varphi r_2^2 \rho + \rho_2(r_1^2 - r_2^2)}\right]$, in which $r$ and $r_1$ are radii of the bare wire and the oxide covered wire $\rho_1$ and $\rho_2$ the sp resistances of the metal and the oxide $\varphi$ is the ratio of molal vols of the metal and the oxide, and $L$ the length of the wire Measurements of resistance changes made at temps ranging from 400 to 800° and detns of $O_2$ in the oxide film showed the ratio of $O_2$ used to be reacting to be approx that found in $Fe_3O_4$ Sep detns of wt increases due to oxidation of Fe in a furnace at the same temps were found to agree well with those calcd from the resistance changes Both methods indicated that the thickness of the oxide layer increased with time according to the diffusion equation $y^2 = kt$ in which $y$ = thickness in $\mu$, $t$ the time in min The values of $k$ were detd for temps of 800°, 700°, 600° and 400° and were resp $8.08 \times 10^{-4}$, $1.77 \times 10^{-4}$, $1.22 \times 10^{-5}$ and $1.27 \times 10^{-7}$ Temp coeffs for the reaction rate were found to be 3% per degree between 800° and 700° and 1.5% per degree between 700° and 800° R J Roehrig

**Corrosion of iron by carbon tetrachloride** J Milbauer *Collection Czechoslov Chem Comm* 3, 73-75(1931) Iron is corroded by $CCl_4$ in presence of EtOH and water A test made consisted in boiling iron for 1 hr in a mixt of $CCl_4$, EtOH and water The results obtained were

| % $CCl_4$ | % $C_2H_5OH$ | % $H_2O$ | g Fe dissolved |
|---|---|---|---|
| 80 | 11 | 9 | 0.21 |
| 50 | 41 | 9 | 0.93 |
| 30 | 60 | 10 | 0.9 |
| 80 | 18 | 2 | 1.04 |
| 45 | 5 | 50 | 0.13 |
| 90 | 9.1 | 0.9 | 0.63 |
| 70 | 27.3 | 2.7 | 1.81 |
| 70 | 20 | 10 | 0.74 |
| 70 | 10 | 20 | 0.16 |
| 100 | 0 | 0 | 0 |
| 0 | 100 | 0 | 0 |

Max corrosion is obtained with a mixt of 70% $CCl_4$, 27.3% EtOH and 2.7% water The presence of EtOH favors the corrosion of Fe by $CCl_4$ G T. Motok

*Aerating apparatus for flotation plant for ores, etc.* CENTRAL-EUROPÄISCHE SCHWIMM-AUFBEREITUNGS A G (R C Gibbs, inventor) Ger. 510,033, Feb 2, 1929 Addn to 1 [illegible] (C A 25, 1200)

Concentrating ores RUTHERFORD B MARTIN U S 1,797,356, March 24 In effecting [illegible] such as Florida phosphate ore screenings with selective agents such as [illegible] the water content of the ore is regulated to the amt necessary to wet [illegible] all the ore particles without having present an excess which will settle out [illegible] and the wetted ore is tumbled with the selective agents to prepare it for [illegible]

Electromagnetic separator for ores, etc. WM M MORDEY Ger 521,020, May 16, 1924 Corresponds to Brit 224,024

Briquetting ores FRIED KRUPP GRUSONWERK A G (ALBERT KNAPP and LÉON MAYER Ger 517,735 April 1, 1926 Addn to 501,585 (C A 24, 4752) The method of 501,585 for briquetting Mn ores [illegible] with C and low stage oxidation compds of Fe, is extended to ores of Cr W V Mo U Ni Co and P

Treating ores, etc FRIED KRUPP GRUSONWERK A G Ger 519,484, April 13, 1926 Addn to 473,016 (C A 23, 2859) The method of Ger 473,016 is modified by supplying the materials to the furnace in a pre warmed state, or by heating the end of the furnace at which the materials enter *The reaction zone is thus extended toward* that end of the furnace and thus facilitates the completion of the volatilization before the residue in the furnace softens or sinters

Treating sulfide ores, etc HARALD SKAPIEL U S 1,797,700, March 24 Material such as sulfided heavy metal ore is subjected to a reducing smelting operation in the presence of light metal compds such as those of Ca or Mg, in such quantity and with such regulated conditions of reduction as to produce a slag having an Fe content of *below 15% FeO and a mat contg light metals* Numerous details and examples are given

Sulfide ores. SULPHIDE CORP Fr 696,520, May 22, 1930 Ores contg Fe and S are treated for the production of S, oxide of Fe and chlorides of other metals contained in the ores by forming $FeCl_2$ *with displacement of S in the form of vapors, followed by* oxidation of the $FeCl_2$ to $Fe_2O_3$ and $FeCl_3$, the latter did with N being used as a chlorinating agent for displacing S The temp in the chlorinating and oxidizing gases is maintained above the condensation pt of the S or of the $FeCl_3$, but below the temp which would produce fusion of the solids present

Chromium ores. I G FARBENIND A G (Paul Weise and Julius Drucker, inventors) Ger 511,743, Apr 17, 1927 Cr ores which have been heated and quenched *are decomposed* by subjecting them to the action of gases contg HCl Cl and reducing agents may be present in the gas Thus, Cr ore is heated to 800° and quenched in water The quenched ore is subjected to the action of gases contg HCl and a reducing agent at 550-600°, leaving moderately pure $CrCl_3$ Other examples are given

Extraction of iron from its ores. VEREINIGTE STAHLWERKE A -G Ger. 517,060, June 8, 1927 Fe ores are treated with Cl HCl gaseous chlorides, etc, and the resulting $FeCl_3$ is decomposed to obtain the Fe The $FeCl_3$ is heated to above its dissocn temp in an elec arc and the decompn products, Fe and Cl, are cooled and sepd

Extracting copper. ANGLO AMERICAN CORP OF SOUTH AFRICA, LTD Ger. 521,184, May 19, 1928 See Brit 301,859 (C A 23, 4181)

Extracting copper, etc. PATENTAKTIEBOLAGET GRÖNDAL-RAMEN Ger 521,111, July 10 1929 Ores contg Cu and Zn are treated with $SO_2$, after addn of chlorides if necessary, until the HCl content is 5-10 g per l Part of the Cu is thus pptd as CuCl, and the pptn is then completed with Cu The lye and the ppt are then treated with Fe,

either separately or together to recover Cu The method may be applied to the lyes obtained by extg pyrites that have been roasted under chloridizing conditions, and if Ag and Au are present they may be pptd with the CuCl by using an excess of Cu

Nickel and copper. The International Nickel Co., Inc Fr 696,456, May 8, 1930 Ni and Cu are extd from materials contg them, particularly mats contg sulfides of Ni and Cu by heating the materials in the presence of a flux to obtain a molten mass and stratifying to sep the material contg Ni from that contg Cu The part contg Cu is heated in the presence of air to obtain porous Cu and the part contg Ni is submitted to the carbonyl process to obtain Ni

Reduction of tin Berzelius' Metallhütten G m b H Fr 696,146, May 27 1930 Finely granulated materials contg $SnO_2$ are reduced by solid, liquid or gaseous agents at a temp kept below the m p of the charge during the reduction and raised at the end of the reduction sufficiently to give a molten or pasty slag which surrounds the reduced Sn and preserves it from reoxidation in the furnace itself or during a subsequent treatment

Extracting zinc, etc Hanns Beermann Ger 521,485, Nov 7, 1929 In extg Zn and other volatile metals from a mixt of oxide ore and C in a horizontal, externally heated muffle a porous or perforated tube, to which gas is supplied, is arranged along the whole length of the bottom of the muffle The charge is loosened and agitated by the fine streams of gas ascending through it

Zinc. The New Jersey Zinc Co Fr 697,217, June 11, 1930 Cd and the like are removed from zinciferous materials by heating the materials in the presence of carefully regulated amts of a chlorinating agent, steam and air and the treatment is selectively regulated to volatilize the Cd without appreciable loss of Zn Cf *C. A.* 25, 907

Roasting pyrites, etc. Alexandre Follet and Nicolas Saindrichin Fr 697,006, May 20 1930 Pyrites and S contg ferruginous materials are roasted and agglomerated at the same time, by the progressive action of air, heated in a special app to temps of 650-800°, on the material advancing progressively in a thin layer in a rotating or other furnace

Treating roasted pyrites. Reymersholms Gamla Industri Aktiebolag Ger 517,748, Nov 13, 1925 The valuable constituents of chlorinated roasted pyrites are obtained by lixiviating the pyrites in stages with (1) lye poor in Cu but rich in Zn, contg mainly chlorides and (2) lye poor in Zn but rich in Cu, contg mainly sulfates Cu, Zn, Ag, Co, S and Cl compds are so obtained

Rotary ore-roasting and sintering apparatus. George E Storer (to National Processes, Ltd) U S 1,797,931, March 24 Structural features

Refining metals Syndicat des laitiers et scories. Fr 696,779, Sept 11, 1929 Loss of metals in slags during the refining of ferrous metals is reduced by adding to the slag, during or after refining suitable compds such as oxides, carbonates, chlorides borates or sulfates of alkali or alk earth metals or Mg

Refining metals Emil Vidal and Arnold H Stockhausen Fr 695,623, May 15, 1930 A system of extg and refining metals is described in which oily schist heated by oil burners fed by compressed air liberates oxidizing and reducing gases to the ore which, in the form of briquets or broken, is placed above the schist in a refractory brick furnace and covered with a layer of lime The metal in fusion falls through a grid of refractory bricks to wells which are heated from below The combustion products are delivered to clarification condensation and extn chambers

Volatilizable metals Metallges A G Fr 696,151, May 27, 1930 Metals such as Pb and Zn are volatilized by introducing the metal contg material mixed with a reducing substance into a rotating furnace and causing it to move continuously in the furnace The air is introduced into the reaction chamber in amt sufficiently low to insure a reducing atm in the reaction chamber The material is preliminarily heated by the complimentary combustion of the gases from the reaction chamber

Protecting metals C F Boehringer & Soehne G m b H Fr 695,787, May 17, 1930 Metals and their alloys are protected against destructive action by adding quinoidine or substances contg quinoidine to the agents coming in contact with the metals

Porous masses of metal or metal oxides. I G Farbenind A.-G Brit 339,645, Sept 5, 1929 A foam is formed from a mixt of a liquid, a foam producing agent and finely divided metals or metal oxides (or compds which are converted into metal oxides when heated) and the foam is dried Numerous details and examples are given, and according to the materials used the products may be suitable for use as bearing metals, storage battery plates or fillings for them, filters for liquids or gases, fillers for building

stones or bricks, diaphragms, molds for casting gypsum, glass or metals, backfire preventing devices for gas burners, fillings for teeth, etc

**Metal founding.** Fritz Singer Ger 516,575, July 23, 1926 A protecting layer is formed on molds, especially for Al, by coating with Zn or Mg and heating The Zn or Mg is applied as dust, optionally with a binding agent

**Foundry molds and cores** Jean B Durand Ger 520,175, April 5, 1929. A mortar is used which consists of a hydraulic binder, sand and an amt of water insufficient for the complete hydration of the binder A suitable compn is fine portland cement 100 sand 600 and water 90 pts by vol Cf *C A* 24, 2416

**Core-inserting or -removing apparatus for molds for centrifugal casting.** Centrifugal Castings Ltd Ger 519,236, Dec 11 1928 Corresponds to Brit 304,015

**Double-walled ingot mold.** Hubert Kamps and Hermann Zeppernick Ger 519 235 April 9, 1929

**Water-cooled mold for casting roller plates** Anton Mohr Ger 517,780, Feb 1, 1930

**Molds for casting iron and steel** Wilhelm Klepsch Ger 520,232, June 30, 1926 See U S 1,777,975 (*C A* 24, 5710)

**Block mold for casting steel.** Maxwell G Dumas Ger 517,778, June 2, 1928

**Apparatus for casting metals such as aluminum.** Birmingham Aluminium Casting (1903) Co., Ltd., and C Vaughan Brit 339,721, May 22, 1930 *Structural features*

**Casting aluminum and its alloys.** H Röhrig Brit 339,624, July 8, 1929 For obtaining a uniform cryst structure in an ingot of Al or Al alloy, the mold is cooled at the bottom only, the top and sides being heated or packed with heat insulating material

**Apparatus for centrifugal casting of metal pipes, etc.** J A Byers and M C Smotzer (to Centrifugal Pipe Corp) Brit 340,137, Dec 31, 1928 Structural features and various details of operation are described

**Centrifugal casting of metal pipes.** Leon L Mathieu (to Soc anon des hauts fourneaux et fonderies de Pont à Mousson) U S 1,797,872, March 24 Mech features

**Centrifugal casting of metal pipes, etc.** A Possenti and C Scorza Brit 340,129, April 12, 1929 App and various mech features are described

**Method of making hollow bodies by centrifugal casting.** Mannesmannröhren-Werke Ger 519 237, June 16, 1928

**Casting carbides of metals difficult to fuse.** Gewerkschaft Wallram Ger 516,656, Sept 9, 1924 Metals and metalloids difficult to fuse, such as W, B, etc, are superheated in a crucible with C, with such rapidity that an excessive amt of C is not taken up by the fused metal in forming the carbide The carbide is cast in the usual way Cf *C A*. 24, 5211

**Furnace for fritting powdered ores and metallurgical products.** Vereinigte Stahlwerke A.-G Fr 696,562, June 2, 1930

**Lining metallurgical furnaces.** Hirsch, Kupfer- und Messingwerke A.-G Ger 521,295, June 6, 1928 An elec conductive core corresponding in shape to the furnace interior and having a higher m p than the lining compn is introduced into the furnace The lining compn is placed in the space between the furnace wall and the core, and the latter is then electrically heated, directly or inductively, to a temp above the m p or sintering temp of the lining

**Cupola and like furnaces.** Joseph E Fletcher and The British Cast Iron Research Association Fr. 695,555, May 14, 1930 Means for controlling admission of air to the cupola is described

**Regenerative furnaces for fusing metals.** Walter Alberts and Paul Zimmermann Fr 695,850, May 19, 1930

**Method and apparatus for reducing dust losses in blast-furnace operation.** Georg Eichenberg and Nikolaus Wark Ger 520,164, Sept 15, 1929

**Water-cooling system for blast furnaces, etc.** B J Mullen Brit. 339,972, Dec 19, 1928 A signal system (details of which are described) is provided for operation *when leakage of gas into the water cooling system causes fall in the liquid level*

**Furnace for reclaiming scrap metal.** Theron D Stay and Harrison O Burrows (to Aluminum Co of Am) U. S 1,797,276, March 24

**Furnace for heating metal sheets and pairs.** Charles A Davis and Frank L Leahy. U. S 1,797,902, March 24 Structural features

**Cast iron.** Meier & Weichelt. (Emil Schuz, inventor). Ger. 521,432, May 14, 1924 Gray cast iron with a tensile strength above 28 kg per sq mm is prepd by casting com. Fe contg about 3 5% of Si under such conditions of regulated cooling that

the free C is uniformly distributed in the metal as graphite Fe eutectic. Casting may be effected in Fe molds

**Spongy iron** IVAR RENNERFELT and IVAR C S G BOHM Fr 697,038, June 3 1930 Spongy Fe is made by introducing a mixt of Fe ore and a carboniferous material into a furnace similar to a coke oven heated on the exterior by gas Toward the end of the operation gas is introduced into the furnace itself to absorb the remaining O The cake of spongy Fe is removed and introduced into a case kept free from air The reduction may be completed by the gas introduced

**Iron-reenforced converter floor for steel manufacture.** MANNESMANNRÖHREN WERKE Ger 517 814 May 8 1929

**Steel** FREDERICK F MCINTOSH to Crucible Steel Co of Am ) U S 1,797,728, 24 In melting and refining steel the product is withdrawn from the refining ce and while still molten there is added to it a predetd quantity of Mo sulfide, in r r to effect combination of both S and Mo with the steel

**Phosphorus steel** F BORGGRAEFE Brit 339 016, Dec 22, 1928 Easily machinable steel for pressed nuts etc , of high P content, is prepd by first melting down in a cupola a mixt of scrap iron siliceous pig iron and a material rich in P such as basic pig iron apatite or vivianite or ferro P (with adjustment of the P content according to the product desired) and decarburizing the melt in an acid lined Siemens Martin furnace Ferro-Mn may be added as a deoxidizing agent The steel produced may contain P 0 2–0 5 Mn 0 3 0 6 C 0 04–0 1 S 0 05 0 15 and Si up to 0 25%

**Rustless steel** VEREINIGTE STAHLWERKE A G Fr 695,398, May 10, 1930 A steel or cast iron which does not tend to rust is made by alloying, with the steel or Fe, elements whose electrolytic potential is below the const oxidation potential of the corrosion agent but is above the electrolytic potential of the steel or Fe, and which by reason of their electrochem properties provoke during the corrosion, the formation of an adhering anti rusting layer Sb As, Bi or Sn in amts of 0 5–5% alone or together and with or without Cu may be used

**Apparatus for heat-treating steel rolls for rolling mills.** CHARLES F LOGAN (to Union Elec Steel Corp ) U S 1,797,430, March 24 Structural features

**Alloys.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON Fr 696,142, May 27 1930 Alloys are made by intimately mixing easily reducible compds of the constituent metals, and reducing the mixt to the metallic state

**Alloy suitable for jewelry** HARRY KLAUSMANN and HENRY R KIEFF (to Baker & Co ) U S 1 797 236, March 24 An alloy, which is whiter and harder than Pd, is formed from Pd 75–98 and Rh 24 1%, the remainder being Ru (which may be present in the proportion of 2%)

**Aluminum alloys** THEODORE W BOSSERT and JOSEPH A NOCK, JR (to Aluminum Co of Am ) U S 1 797 801 March 24 Alloys which are suitable for mech working comprise Al at least 95% together with Mn 1–1 5 and Mg 0 5–1 5%, free from other substances except such as are present as incidental impurities

**Aluminum alloy** OTTO KASPER. Fr 695 838, May 19, 1930 An alloy of Al contains Ag Cu and Tl V Cd and Ni may also be added An example contains Cu 2–5 or Ni 0 2–0 8 or Cu and Ni together 2 5, Ag 0 2–1, Tl 0 02–0 2, V or Pd about 0 1% and Al the rest The stability on annealing of the alloy is increased by submitting the alloy in a liquid state and at a temp of about 750° to a refining with $SrCl_2$ The $SrCl_2$ may be introduced to the fused mass in an Al capsule *Cf C A* 25, 2410

**Improving iron-chromium-nickel-carbon alloys** FRIED KRUPP A-G Fr 697-188, June 11 1930 The resistance values of austenitic alloys of Fe-Cr Ni C (*e g*, Cr 6–40 Ni 40–4 and C 1%) are improved by submitting these alloys to a sudden tempering from a temp below 1000°

**Iron-nickel alloy for vapor burners.** AKTIEBOLAGET B A HJORTH & Co Brit 339 831 Feb 4, 1929 Double-walled caps forming the mixing chambers of vapor burners are made at least in part of an alloy comprising Fe 62–67 and Ni 38–33% which is stated to have a suitably low heat cond

**Ferrosilicon** I G FARBENIND A G (Carl Müller, Alfred Curs and Leo Schlecht, inventors) Ger 519 066, Apr 9, 1926 Fe Si alloys free from C or of predetd C content are prepd from Fe obtained by decompg $Fe(CO)_5$

**Magnesium alloys for pistons** I G FARBENIND A G Ger 519,377, Dec 6, 1923 Alloys for making pistons of internal combustion engines comprise Zn 1 5 and Si up to 6, with or without Al, Cu and (or) Sn up to a combined total of 5%, the remainder being Mg *Cf C A* 25, 2109

**Manganese steels.** TAYLOR WHARTON IRON & STEEL CO Fr. 695,871, May 20, 1930 See Brit 336,091 (*C A.* 25, 1792)

Steel alloys. Fried Krupp A.-G and Heinrich Koppers A.-G Fr. 697,053, June 2, 1930 Steel alloys resistant to chem. agents, *e. g.*, solns contg $H_2SO_4$, contain Cr 17–40, Ni 6–25 and C up to 0.5%, and particularly Cr 17–18, Ni 8–10 and C 0.02–0.2%, with or without Mo 0.2–3%

*Zinc alloys.* E. A. Anderson (*to New Jersey Zinc Co.*) *Brit.* 340,104, *June 5, 1929* Alloys suitable for die-casting are formed of Zn (of about 99.99% purity) together with an addn. of Al 2–10 and Mg 0.01–0.3% (the Pb and Cd together not being more than about 0.01%, preferably not more than 0.003% each of Cd and Pb and not more than 0.001% Sn) Zn alloys are also mentioned contg Al 4 and Cu 3%, with or without Mg 0.1% Cf. *C. A.* 25, 66

Cleaning metallic surfaces. James H. Gravell. Fr. 695,914, May 21, 1930 Metallic surfaces are exposed to the action of a soln. which contains a compd. of $H_3PO_4$ one atom of H of which is replaced by a metal or radical such as $NaH_2PO_4$ or $NH_4H_2PO_4$.

Rustproofing metals. Chemieprodukte G. m. b. H. Ger. 517,579, Oct. 18, 1928 Metal parts are protected against rusting when under water by giving them a ground coating of bitumen etc. to which is then added a difficultly sol. inorg. substance which will readily enter into ionic exchange with bases. Thus, the parts are coated with bitumen to which is added a coating of $HgSiO_3$. Further examples are given.

Rust-proofing iron, steel, etc. Wm. H. Cole Ger. 516,729, Mar. 19, 1928 See Brit. 292,666, (*C. A.* 23, 1382)

Coating metals with refractory materials. Doherty Research Co. Fr. 696,422, Apr. 8, 1930 Metals are coated by applying a refractory agglomerate to the surface and the free surface of this agglomerate is exposed to a high temp. to calcine or harden it, the subjacent parts of the agglomerate being exposed to progressively decreasing temps., and the metal is protected against exposure to a high temp. A binding substance capable of attacking the metal when heated may be added to the refractory material so that the products of the reaction, *e. g.*, the oxide of the metal, penetrate the refractory material which may be a compd. of Zr

Apparatus for annealing metal objects. Akt.-Ges. Brown, Boveri & Cie. Swiss 143,457, Jan. 4, 1930

Aluminum heat-transfer surfaces. Vereinigte Aluminium Werke A.-G. Brit. 339,722, Oct. 11, 1929 The heat absorbing or -radiating capacity of articles made of Al or its alloys is increased by producing an oxidized layer on the material, *e. g.*, an engine cylinder of Mg Al alloy may be coated with a layer of pure Al and the surface of the latter then oxidized.

Nickel products such as eyeglass frames. Wm. J. Wrighton and Edgar D. Tillyer (*to* American Optical Co.) U. S. 1,797,254, March 24 Ni products such as eyeglass frames are shaped to the desired form by stretching beyond the elastic limit of the material, and the surface fractures and pits are then filled with Ni which has not been worked beyond its elastic limit (suitably by electrodeposition)

*Non-corrosive water and alcohol solution.* Wm. S. Calcott (*to* E. I. du Pont de Nemours & Co.) U. S. 1,797,401, March 24 Corrosion of Fe and Cu by aq. alc. solns. is inhibited by adding a sol. amino carboxylic acid deriv. such as an ethanol amine salt of phenylglycine and a substance such as a mercaptothiazole such as is used as a collecting agent in the flotation of metals U. S. 1,797,402 specifies a similar mixt. in which the flotation collecting agent used is an org. tervalent N compd. such as azobenzene, aminoazotoluene or aminoazotolueneazonaphthol. Numerous examples are given. Cf. *C. A.* 24, 2755

Arc-welding electrodes. J. M. Weed (*to* British Thomson Houston Co., Ltd.) Brit. 339,930, July 8, 1929 An electrode is coated with an alkali metal acetate such as NaOAc in order to obtain a short arc with a low rate of fusion and deep penetrating power so as to produce a ductile weld, and the acetate may be mixed with carbonates of alk. earths such as those of Ca and Ba and with $TiO_2$, and, prior to coating the electrode with flux, the electrode may be pickled with a 10% HF soln. followed by rinsing and drying and it may be preliminarily degreased with a caustic soln.

Fusible electrodes for welding. La Soudure électrique autogène (Soc. anon.). Fr. 696,592, June 3, 1930 Electrodes for welding Al and its alloys in the elec. arc are composed of an Al-Si alloy, the content of Si being 3–13%

Welding magnesium. I. G. Farbenind. A.-G. Brit. 339,923, June 7, 1929 Welding is effected with the use of a flux as described in Brit. 313,487 (*C. A.* 24, 1075).

Solder. Siemens-Schuckertwerke A.-G. Ger. 520,336, Sept. 23, 1927. An approx. eutectic Ag-Pb alloy contg. Ag 0.25–5 and Pb 99.75–95% is alloyed with 0.25–10% of Cu The solder thus obtained m. between 300° and 325°.

# 10—ORGANIC CHEMISTRY

CHAS A ROCHELLE AND CLARENCE J WEST

Relativity and organic chemistry. W A WATERS *Science Progress* 25, 627–32 (1931).—Theories concerning the structure of org compds are reviewed "Only the resulting symmetry of our chem mols, inspected in the aggregate, is observable, and of the actual relative positions of the various atoms, one can be certain of very little" JOSEPH S. HEPBURN

The progress of organic chemistry 1924-1928. IV. Heterocyclic series. ERICH LEHMANN *Z angew Chem* 43, 1061–70, 1092–7, 1112–3(1930); *cf C A.* 24, 4755 V. Natural substances of less well-known constitution. *Ibid* 1113–9 VI. Organic compounds *Ibid* 1138–42 VII. New working methods of organic chemistry. *Ibid* 1142 5 E. H

Progress in the knowledge of oxidation processes. K. W. ROSENMUND *Arch Pharm* 269, 126–38(1931).—This is a review on the mechanism of oxidation, principally of organic compounds W. O. E.

Acetic acid and cellulose acetate in the United States. EVERETT P. PARTRIDGE. *Ind Eng Chem* 23, 482–98(1931).—A survey giving a general view of the AcOH industry in the U S and of the cellulose acetate industry as it affects the consumption of AcOH and $Ac_2O$ Five divisions were made as follows (1) the general developments affecting AcOH manuf since 1914, (2) the general technology of the various processes used or proposed for AcOH manuf, (3) the production of AcOH and its consumption in various industries during 1929 (4) the general development of the cellulose acetate as it affects the consumption of AcOH and $Ac_2O$ A complete bibliography of 44 references is appended and several illustrations charts and tables are included W H BOYNTON

Partial oxidation of methane in the presence of oxides of nitrogen. DAVID F. SMITH AND REID T MILNER. *Ind Eng Chem* 23, 357–60(1931).—The partial oxidation of $CH_4$ is markedly affected by addns of N oxides ($NO_2$, $NO + O_2$) and $HNO_3$ vapor Complete data on this reaction when carried out in glass or quartz in a small app are reported for varying conditions of heating time (0.19–0.66 sec.), temp (500–700°), gas compn and amt of catalyst A smaller vol of $CH_2O$ was always obtained than that of the N oxide used and as this latter was always destroyed if efficient conversion was had, it is concluded that the process offers *no commercial possibilities for $CH_2O$ synthesis* The mechanism is probably loose combination of $CH_4$ and N oxide with subsequent decompn to $CH_2O$ and $N_2$ ALBERT THOMAS FELLOWS

The formation of ethylene and acetylene from methane in electric discharges KURT PETERS AND O H WAGNER *Z physik Chem*, Abt A, 153, 161–86(1931).—An investigation of the optimum conditions of gas flow and compn, pressure and c. d. for the formation of $C_2H_4$ and $C_2H_2$ from $CH_4$ have been investigated The min. energy consumption was 13 kw hr per cu m of $C_2H_2$ and 53 kw hr per cu m of $C_2H_4$ Under the condition of min energy consumption, the exit gas from the discharge tube contained 4.2% $C_2H_2$ and 0.8% $C_2H_4$, whereas the max concns of these gases obtainable were 20 and 3% resp The best gas mixt. for the prepn. of $C_2H_2$ and $C_2H_4$ contained $CH_4$ and $H_2$ in a 2 1 ratio A spectral analysis of the products showed that the reaction region might be either one of 2 types In one of these only the CH bands were visible, whereas in the other with a high energy input there were in addn to the CH bands, the Swan spectrum, the Balmer series, and the C line spectrum The spectral measurements were supplemented by temp measurements in the discharge For the reaction mechanism in the region of low energy input the known scheme for the decompn of $CH_4$ into a series of H poor radicals was confirmed and the formation of the separate reaction products discussed The presence of higher satd and unsatd hydrocarbons in addn. to $C_2H_4$ is assumed to indicate polymerization reactions resulting from the impact of 2 or more radicals In the region in which the Swann spectrum is visible, there are 2 possibilities for the formation of $C_2H_2$ either the combination of 2 CH radicals, or of some reactive form of H with the $-C \equiv C-$ radical P H E

Catalytic condensation of amylenes. A MAILHE AND RENAUDIE *Compt rend* 192, 561–3(1931).—Isoamylene, $Me_2CHCH{:}CH_2$ (I), and 2-pentene (II) were each passed over silica gel in a quartz tube heated to 670° and at ordinary pressure I yielded a gas contg 47% ethylenic hydrocarbons ($C_4H_8$, $C_5H_{10}$), 38% $CH_4$ and 7% $H_2$; an oil and tar remained which on fractionation gave higher ethylenic and aromatic hydrocarbons and a residue in 80°. The gas from II was 52% $C_4H_8$ and $C_5H_{10}$ 34%

$CH_4$ and 6% $H_2$, the oil and tar yielded higher ethylenic and aromatic hydrocarbons and a residue m 53° The d n and I nos of the fractions are given D S S

**The oxidation of propenyl derivatives with diazo compounds.** A Quilico *Atti accad Lincei* **12**, 341–4(1930).—The oxidation of propenyl compds with normal diazo hydrate noted by Q (cf Q and Ferri, *C A* **23**, 597) was explained by the interpretation by Angeli and Polverini (*C* **24**, 4770) A shows that the general reaction is.

$$\begin{array}{l} \text{RCH} \\ \| \\ \text{CHMe} \\ | \\ \text{O} \end{array} \longrightarrow \text{RCHO} + \text{OHC Me}$$

Thus using $PhN_2OH$ as oxidizing agent the reaction takes place in either of the following ways

$$\begin{array}{l} \text{RCH} \\ \| \\ \text{CHMe} \\ | \\ \text{O} \end{array} \longrightarrow \begin{array}{l} \text{RCH} \\ \| \\ \text{NNHPh} \end{array} + \begin{array}{l} \text{HCMe} \\ \| \\ \text{O} \end{array}$$

$PhN_2H$

or

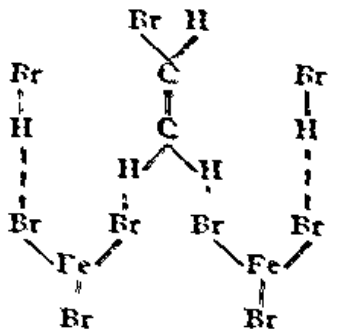
$$\begin{array}{l} \text{RCH} \\ \| \\ \text{CHMe} \\ | \\ \text{O} \end{array} \longrightarrow \begin{array}{l} \text{RCH} \\ \| \\ \text{O} \end{array} + \begin{array}{l} \text{CHMe} \\ \| \\ \text{NNHPh} \end{array}$$

$N_2HPh$

*i e*, forming either the alkyl or arylphenylhydrazone The former is not isolated as it combines with unchanged azo compd forming a formazylic deriv, $PhN_2CMe$ NNHPh A W Contieri

**Cuprous chloride as a catalyst for acetylene.** J A Nieuwland and W. L. Foohey *Proc Indiana Acad Sci* 38, 196(1929).—$C_2H_2$ when run into a soln contg CuCl and $NH_4Cl$ and satd with HCl forms $CH_2$ CHCl $C_2H_2$ run into a soln contg both CuCl and $CuCl_2$ forms equil mixts of *cis* and *cis trans* dichloroethylenes Solns of $CuCl_2$ in the absence of CuCl do not absorb $C_2H_2$ H M Stark

**Oleastene (hydrocarbon contained in the fruit of olives).** Giovanni Sani *Atti accad Lincei* **12**, 238–42(1930).—During the extn of olive oil with alkali to remove phytosterol, an orange oil seps which is unaffected by the alkali Extd with ether, crystals separate out, leaving the oil itself, which is insol in water and *dil* EtOH, but sol in other org solvents Its EtOH soln is flourescent $d_{17.5}$ 0.8934, analysis indicates the formula $C_7H_{12}$ It absorbs a max of 33.15% $O_3$, indicating that the mol formula is $C_{21}H_{36}O_3$, and the mol wt of the hydrocarbon is 288, $C_{21}H_{36}$ Two $N_2$ derivs were also prepd which will be described in a later paper A W C.



**The synthetic product cuprene (carbene).** Walter Herzog *Kunststoffe* **21**, 49–53(1931).—Cuprene, a polymerization product of $C_2H_2$, obtained when the latter is brought in contact with Cu or CuO at elevated temps, was first prepd by Erdmann and Kothner (*Z anorg Chem* **18**, 49, 57(1898)) Later investigations of this substance were carried out by Gooch and Baldwin (*Z anorg Chem* **22**, 255(1900)), Alexander (*Ber* **32**, 2381(1899)), Sabatier and Senderens (*Compt rend* **130**, 250(1900)) and Kaufman and Schneider (*C A* **13**, 1825, **16**, 2302 **18**, 1465) Although cuprene now is made on a large scale the technical details of the mfg process have so far remained a secret It is known only that Cu or cupriferous bronze powders are used as catalyzers at a temp of 200–260° under pressure with the combined action of dark elec discharges The presence of O (air) is a necessary factor A special arrangement to prevent the voluminous polymerization products from clogging up the reaction chamber is described in Swiss Pat 95,237, May 7, 1921 Addn of 5–15% N to the $C_2H_2$ has been found to give homogeneous and lighter colored products With undild $C_2H_2$ there is, as a result of the high reaction temp, a tendency to coking, resulting in dark products of less H content and a smaller yield A greenish blue, neutral, strongly unsatd, tar like liquid, the "*cuprene tar*," d 0.89 is obtained as a by product in amts of 5.5–7% besides 13–17% waste gases This tar has been investigated by Schläpfer and Stadler (*C A* 20, 1384) Under the proper conditions the yield of cuprene is 25% of the wt of $CaC_2$ used According to Ger pat 407,485, Dec 30, 1922, $C_2H_2$, mixed with indifferent gas, is conducted into stearic acid heated to 250–300° to which has been added Cu bronze The cuprene obtained by this process is finely powdered and of a light to dark brown color After sepn from the stearic acid the last traces of

the latter are removed by washing with caustic lye or solvents Addn. of air or O to $C_5H_8$ or addn of substances giving off O to the contact medium, has been found advantageous Sulfurized cuprene, contg 11% S has been prepd. by heating cuprene with $S_2Cl_2$ in the presence of benzene as suspending agent under reflux When working under 10 atm pressure and at 180–200° a product contg 13.6% S and 4% Cl was obtained These substances may be employed in the rubber industry. Because of its chem indifference and highly voluminous structure cuprene presents a material with possibilities for a large no of uses Its application in the manuf of acid resistant and elec insulating materials plastic masses electrodes and explosives, as a cork substitute in the linoleum industry and absorbing agent for illuminating materials and fuels or volatile matters is discussed D Thiessen

**Nuclear synthesis in the olefin series. II. 1,4-Diolefins.** Bernard H. Shoemaker and Cecil F Boord *J Am Chem Soc* 53, 1505–12(1931), cf *C A*. 24, 4756.—By the use of $CH_2$ $CHCH_2MgBr$ the β Br ether synthesis of olefins has been extended to the prepn of 1,4 diolefins *α Chloropropyl Et ether*, $b_{14}$ 34–6°, $d_4^{22}$ 0.954, $n^{25}$ 1.4129 (74% yield) *α chlorobutyl deriv*, $b_{18}$ 49–51°, $d_4^{22}$ 0.938, $n^{20}$ 1.4168 (81% yield) Bromination gives the *α β-dibromoalkyl Et ethers*, RCHBrCHBrOEt; R = *Me*, $b_{18}$ 79–82 $d_4^{22}$ 1.649 $n^{20}$ 1.5000, R = *Et*, $b_{14}$ 99–101°, $d_4^{22}$ 1.564, $n^{20}$ 1.4968. With $CH_2$ $CHCH_2MgBr$ (details of its prepn are given), there results *α-allyl β bromoalkyl Et ethers* RCHBrCH($C_3H_5$)OEt, R = *H*, $b_{11}$ 69–71°, $b_{18}$ 84–6°, $d_4^{22}$ 1.225, $n^{20}$ 1.4592 R = *Me* $b_{14}$ 72.5° $d_4^{20}$ 1.162, $n^{20}$ 1.4592, R = *Et*, $b_{18}$ 88–92°, $d_4^{22}$ 1.150, $n^{20}$ 1.4606 By the action of Zn in PrOH or BuOH there results 1,4 pentadiene, -hexadiene and *heptadiene*, the new compd $b_{738}$ 92–3.3°, $d_4^{22}$ 0.7176, $n^{20}$ 1.4202, the *tetrabromide* liquid, $d_4^{22}$ 2.091, $n^{20}$ 1.5734 The rule that unsatd compds with a double bond in the α position boil lower than the corresponding satd hydrocarbons has been confirmed It is further shown that in any given family the continuous chain diolefins form a definite series with gradually increasing b ps depending upon the relative position of the double bonds C J West

**Addition of gaseous hydrogen bromide to acetylene and to gaseous vinyl bromide under the influence of catalysts and the addition of hydrogen bromide to vinyl bromide and allyl bromide in the liquid phase.** J P Wibaut *Rec trav chim* 50, 313–37 (1931), cf *C A* 22, 1949, 24, 1076.—An apparatus was designed wherein the rate of flow of the reacting gases could be maintained fairly const., in this way a series of expts. under well-defined conditions could be made otherwise conflicting results were obtained as to the proportion of isomerides formed, even in duplicate expts The polymerization of vinyl bromide could be avoided by the addn of 0.1–0.2% hydroquinone (cf Moureu and Dufraisse *C A* 17, 2105) $MeCHBr_2$ was prepd from AcH and $PCl_3Br_2$ (Perkin, *J Chem Soc* 45, 522(1884), Anschutz, *Ann* 235, 300(1886)), the contact substances consisting of metallic bromides on asbestos, were prepd by impregnating the asbestos with the soln. of the bromide in concd HBr, evapg the latter on the water bath and drying in a current of dry HBr Anhyd HBr was prepd by the action of Br on boiling tetrahydronaphthalene (Houben *Methoden der organischen Chemie*, I 746) in an all glass app The detn of the solidification points of mixts. of $MeCHBr_2$ and $(CH_2Br)_2$ gave the following results 0% $MeCHBr_2$ 9.9°, 3.4, 7.3°, 6.0 5.4° 10.6, 2.6°, 14.0, 0.6°, 20.8, —4.2°, 25.5, —8.2°, 32.8, —13.6°, 47.4, —26.0° 57.8, —35.2° 78.8, —61.0°, 84.6 —77.5°, 90.1, —76.5°, 91.4, —74.0°, 100 —63.5° Samples contg more than 60% $MeCHBr_2$ were analyzed by means of the *n* 0% $MeCHBr_2$, $n_D^{25}$ 1.5372, 10.0, 1.5322, 29.9, 1.5270, 49.9, 1.5214, 59.9, 1.5194, 69.9 1.5167 80.0 1.5141, 84.9, 1.5129, 90.0, 1.5114, 100, 1.5080 In the expts. with vinyl bromide 50 g was used in the course of 4 hrs., an excess of HBr being used the results are given in the table below in the order contact substance temp (°C.), di Br compds. (g), $(CH_2Br)_2$ in reaction product (%) empty tube 100, 0, . . .; glass wool 100, 53, 99.7, 100 52, 100.0 200, 6 99.7, asbestos 100, 5, 68.1, silica gel 100, traces, , 200, 18, 6, 100, 5, 3 asbestos from another lot 100, 42, 98.2, $HgBr_2$ on asbestos 100, 20, 4, 100, 18, 20, 200 15 9, $HgBr_2$ cryst., no carrier 100, 0, . . .; $BiBr_3$ no asbestos 100, 16, 10, 100, 48, 48 200, 19, 6, $BiBr_3$ powder, no carrier 100, 3, 3, 150, 15, 4 $SbBr_3$ on asbestos 100, 30, 41, 150, 22 10, $AlBr_3$ on asbestos 100, 10, 48, 100, 34, 88.8, 200, 7, 0, 200, 6, 0, $AlBr_3$ powder, no carrier black condensation product formed, $FeBr_3$ on asbestos 100, 32, 2.5%, 100 66, 76, 200, 9, 33, $FeBr_3$ in small lumps, no carrier 100, 22, 9, 200, 6, 6 With *acetylene* the expts were made in order to find out the conditions under which the dibromoethanes could be prepd from $C_2H_2$, twice the quantity of HBr required for the complete conversion of the $C_2H_2$ into dibromo-

ethane being used. Results with 6.4 l. acetylene and 26.0 l. HBr in the course of 4 hrs.: pure asbestos 100, traces, . . ; $FeBr_3$ on asbestos 100, traces, . . , 200, traces, . . ; $FeBr_3$ on pumice 100, 7, 65.6; 200, 13, 95.8; 300, 23, 96.5; 100, 9, 77.0; $BiBr_3$ on pumice 100, 2, 96.0; 200, 1.5, 12; $HgBr_2$ on asbestos 100, 25, 97; 150, 19, 94.4; 150, 29, 96.4; $SbBr_3$ on asbestos 100, 10, 65; 100, 19, 87.1; 150, 14, 56. It thus appears that *the reaction between* $C_2H_2$ *and HBr is more difficult to realize than between vinyl* bromide and HBr; nevertheless, the prepn. of $(CH_2Br)_2$ from $C_2H_2$ and HBr is possible with reasonable yields. In the expts. in the liquid phase, 0.1 mol. vinyl bromide was heated with 30% excess of HBr for several days at 100°; another set of expts. was performed *with AcOH as a solvent and with the addn. of metallic salts.* The results are given in the following table in the order: temp. (°C.), duration of heating, substance added, yield $C_2H_3Br_3$ (%), MeCHBr, in reaction product (%). *Without solvent* — 100, 69 hrs., HBr d. 1.60, 16; 100, 100, 68 hrs., HBr d. 1.72, 24.9; 100, 42 hrs., HBr d. 1.82, 40, 60; 100, 68 hrs., HBr d. 1.80, 36, 65. *With 30% HBr in glacial AcOH* — 50, 14 days, none, 82, 90; 50, 14 days, none, 82, 98; 50, 14 days, none, 87, 80; 50, 17 days, none, 42, 70; 50, 12 days, $FeBr_3$, 82, 97; 50, 14 days, $HgBr_2$, 48, 100; 100, 44 hrs., none, 27, 70; 100, 70 hrs., none, 64, 71; 100, 60 hrs., none, 45, 75; 100, 66 hrs., $FeBr_3$, 53, 91; 100, 71 hrs., $HgBr_2$, 42, 80; 100, 68 hrs., $AlBr_3$, 50, 92; 100, 74 hrs., glass wool, 48, 92; 100, 47 hrs., asbestos, 82, 97. In these expts. $MeCHBr_2$ always is the chief product of the reaction while the metallic salts have little or no influence. With *allyl bromide*, 15 g. was heated with 42 g. glacial AcOH and 24 g. anhyd. HBr in sealed tubes at 50° or 100°, or was kept at room temp. either in the dark, in diffuse daylight or irradiated by an U. V. lamp; the highest yield obtained amounted to 48%, and 1,2-dibromopentane always was the chief product of the reaction. It follows from these expts. that the presence and nature of the solvent is the most important factor detg. the course of this reaction. If a liquid mixt. of allyl bromide and anhyd. HBr (without any solvent) is exposed to sunlight or to U. V. light, $CH_3(CH_2Br)_2$ is the chief product of the reaction, while in the dark a mixt. of both isomers is formed. In the gas reaction between vinyl bromide and HBr, glass wool and asbestos favor the formation of $(CH_2Br)_2$, while silica gel and ferric or Bi bromide, if used without a support, direct the reaction to the formation of $MeCHBr_2$. The reaction leading to $MeCHBr_2$ is the slower one of the 2 reactions, for in all reactions in which this isomer is obtained as the chief reaction product the yields are considerably lower than when $(CH_2Br)_2$ is the chief product. Obviously in a contact catalyst consisting of asbestos impregnated with a metallic bromide 2 catalytic activities are to be distinguished. With the freshly prepd. contact substance the influence of the metallic bromide predominates and $MeCHBr_2$ is formed as the chief product. If, however, the metallic bromide has lost its catalytic properties, the influence of the carrier, the asbestos, predominates and the 1,2 isomer is the main product. The formation of the $(CH_2Br)_2$ is explained by the repelling action of the Br atom in vinyl bromide, while the influence of the catalytic properties of the metallic bromides is explained by the phenomenon of directed adsorption (Kruyt and van Duin, *C. A.* 15, 3783, 22, 3031; 23, 5395). In the case of glass wool or asbestos there seems to be no reason why the mols. of vinyl bromide or HBr should be fixed on the adsorbent in a special manner, while for the contact substances, formed with metallic bromides, the assumption is made that the outer layer of the contact substance consists mainly of Br atoms and that complexes are formed of the (I)

type in which steric conditions are favorable for the formation of $MeCHBr_2$. The results obtained with vinyl and allyl bromide in the liquid phase are considered not to be in accordance with the theory of alternating polarity. C. F. VAN DUIN

Oxidation of methanol with air over iron, molybdenum and iron-molybdenum oxides. HOMER ADKINS AND WESLEY R. PETERSON. *J. Am. Chem. Soc.* 53, 1512–20(1931) —

of *2-ethoxy-1 butene*, b 85–7°, $n_D^{24.5}$ 1.4011. PhMgBr gives 60% of *α-phenyl-β bromoethyl Et ether*, $b_{18}$ 129–33° $n_D^{25}$ 1.5317. KOH gives 62% of $CH_2$ C(OEt)Ph, $b_{11}$ 109–12°, $n_D^{25.5}$ 1.5287 MeCHBrCH(OMe)Br and PhMgBr give 71% of MeCHBrCH(OMe)Ph, $b_{14}$ 122–4°, $n_D^{25}$ 1.5316 KOH gives 42% of *α methoxy β methylstyrene*, $b_{14}$ 96–8°, $n_D^{25}$ 1.5271 EtCHBrCH(OMe)Br and EtMgBr give 50% of *3-bromo-4 methoxyhexane*, $b_{14}$ 74–8°, $n_D^{25}$ 1.4495 KOH gives 79% of *3 methoxy-3 hexene*, b 114–5°, $n_D^{25}$ 1.4130 These unsatd ethers in the presence of a trace of acid or even semicarbazide-HCl, hydrolyze to the corresponding ketones C J West

**Methyl selenomercaptan.** A Baroni *Atti accad Lincei* 12, 234–7(1930).—MeSeH was prepd by treating alc NaSeH with MeI The NaSeH was made by satg a 10% soln of EtONa with $H_2Se$ until the NaSeH first pptd redissolved The reaction *was carried out in a flask equipped with a condenser, the receiving flask was cooled* with liquid $CO_2$ and $Me_2CO$ the product being distd off by heating on a water bath MeSeH is an almost colorless liquid having a very disagreeable odor $b_{744}$ 12° The *following metal salts were also prepd* (CH₃Se)₂Hg *is formed by addn of* Hg(CN)₂ while cooling strongly as yellow crystals The Pb salt is obtained by adding Pb(OAc)₂, the Ag salt by means of $AgNO_3$ and NaOAc, the Cu salt with Cu(OAc)₂, and the Bi salt with $BiCl_3$ and NaOAc These are all obtained as yellow cryst powders, whose analysis agreed very closely with that calcd A W Contieri

**Effects of activated and non-activated magnesium-copper alloy on the yields of some organomagnesium halides.** Henry Gilman and E A Zoellner *J Am Chem Soc* 53, 1581–3(1931).—When equiv quantities of Cu-Mg alloys are used alone, either in the activated or non activated condition the yields of some Grignard reagents are lowered However, small but effective quantities of the activated alloy appear to have no significant effect on the yield The other more commonly used catalyst, I, apparently has the same effect as the alloy on the yields of some Grignard reagents. C J West

**Preparation of organomagnesium halides in the presence of magnesium iodide. Studies on the capture of free radicals** Henry Gilman and E A Zoellner. *J Am Chem Soc* 53, 1583–6(1931).—In studies concerned with the capture of free radicals *formed during the prepn* of organomagnesium halides it has been shown that the quantity of I used to catalyze the formation of *tert* BuMgI has a significant effect on the yield There is no appreciable lowering of yield with a very small quantity or a full atom equiv of I Another catalyst, the Mg Cu alloy which is used with more refractory RX compds., also appears to have a corresponding effect on the yields of other RMgX compds. The av % yields of $Me_3CMgCl$ with varying amts of I (at. equiv given) are 0, 83.3, 0.0125, 83.6 0.025, 77.1, 0.05, 72.2, 0.1, 65.5, 0.2, 64.9, 0.3, 64.8, 0.4, 71.8 0.6, 76.2 1.0, 79.7 C. J West

**Some mechanisms for the formation of organomagnesium and other organometallic compounds.** Henry Gilman and R E. Brown *Rec trav chim* 50, 184–7(1931).—*The formation of Grignard reagents may be explained by the reactions* RX + Mg ⟶ R— + —MgX (I) R— + —MgX ⟶ RMgX (II) This mechanism, however, does not include all organomagnesium compds., *e. g.*, the prepn of $MgEt_2$ *from* $HgEt_2$ and Mg moreover, the Mg subhalides are hypothetical and the possibility exists that the reactions of the MgX compds. may be essentially those involving a catalytic effect of $MgX_2$ on Mg (cf Gilman and Brown, *C A* 24, 1857) Therefore, the following reactions are proposed for the formation of organomagnesium compds: 2 RX + Mg ⟶ 2 R— + $MgX_2$ (III), 2 R— + Mg ⟶ $R_2Mg$ (IV), $R_2Mg$ + $MgX_2$ ⟶ 2 RMgX (V) *There is definite expt evidence in support of reaction* III, *e. g.*, the transitory existence of benzohydryl radicals (Gilman and Zoellner, *C A.* 24, 5746) while there is also very compelling evidence for the correctness of reaction V (Gilman and Fothergill *C A* 23, 5468 Gilman and Brown, *C A* 24, 1853) All that is needed is support for reaction IV and this will probably come forth from the work *of Paneth on free Me and Et radicals* (*C A* 23, 5159 24, 3750), *in which it is* shown that some organometallic compds. decomp by pyrolysis *in vacuo* with the formation of the metal and free radicals $Et_4Pb$ ⟶ 4 Et— + Pb, which can then unite with some other metals to give other organometallic compds Although no expts. were carried out with Mg, the close relationship between Zn and Mg suggests the possibility of such reactions with Mg Expts. carried out with Et radicals, obtained by Paneth's method from $PbEt_4$ and a Be mirror, did not result in the formation of $BeEt_2$ and thus it could not be decided whether the removal of the Be mirror is due to atomic H such as had been suggested by Schultze and Muller (*C A* 24, 2036) C. F van Duin

**Effect of copper upon the yields of Grignard reagents.** GEO JOHNSON AND HOMER ADKINS *J Am Chem Soc* 53, 1520–3(1931).—The following yields were obtained with Mg and a Mg (88%) Cu (12%) alloy. BuBr 92.5, 78.7, *sec* BuBr 73.8, 49.6, BuI 82.4, 64.2, EtI 83.4, 76.1, $PhCH_2Cl$ 94.1, 80.2, cyclohexyl bromide 82.5, 64.7, allyl bromide 72.1, 60.0, PhBr 90.8, 89.1. These values show that the yields of the Grignard reagent were very considerably lowered, except from PhBr, by the presence of Cu which promoted the competitive Wurtz reaction. C. J. WEST

**Organic lead compounds. I. Action of acids on lead aryls.** PAUL R. AUSTIN *J Am Chem Soc* 53, 1548–52(1931).—The strong tendency of organo-Pb compds. to retain at least 2 Pb–C linkages has been further demonstrated by the action of $HNO_3$ and HBr on $Pb(o\text{-}MeC_6H_4)_4$. Heating $(o\text{-}MeC_6H_4)_3PbH$ in $C_6H_4Me_2$ for 24 hrs. gives *tetra-o-tolyllead*, m. 201.2°. $(o\text{-}MeC_6H_4)_3PbBr$ (18 g.) and PhMgBr give 16 g. *phenyltri-o-tolyllead*, m. 101.2°. $(o\text{-}MeC_6H_4)_3PbH$ (8 g.) and 40% HBr in $CHCl_3$, shaken for 2 hrs., give 4 g. *tri-o-tolyllead bromide*, m. 129–30°; the action of a larger quantity of HBr or the action of Br in $CHCl_3$ on $(o\text{-}MeC_6H_4)_4Pb$ gives *di-o-tolyllead dibromide*, m. 160°. $(o\text{-}MeC_6H_4)_3PbPh$ and 40% HBr, refluxed for 45 min., give 10% of *phenyldi-o-tolyllead bromide*, m. 117–8°; a larger quantity of HBr, refluxed 8 min., gives 44% of *phenyl-o-tolyllead dibromide*, m. 116–7°. $(o\text{-}MeC_6H_4)_3PbPh$ and $HNO_3$ in petr. ether give 69–93% of *phenyl-o-tolyllead dinitrate dihydrate*; the same product was obtained even with boiling $HNO_3$ (d. 1.42), together with some *di-o-tolyllead dinitrate*. A new volumetric method for the *detn. of Pb* in aryl Pb compds. is described. C. J. WEST

**Reactions of some organic lead compounds.** CHARLES D. HURD AND PAUL R. AUSTIN *J Am Chem Soc* 53, 1543–8(1931).—$PhEt_3Pb$ and HCl give $C_6H_6$ and $Et_3PbCl$; further reaction gives the less sol. $Et_2PbCl_2$. Both $PhEt_3Pb$ and $Et_4Pb$ react readily with $HNO_3$ to produce $Et_3Pb(NO_3)_3$, which reacts metathetically in MeOH with HCl to give the dichloride. In 0.1 *M* aq. soln. the dinitrate is apparently 79% ionized. Pyrolysis of $Pb(OBz)_4$ gives rise to BzOH and *Pb dibenzoate*, m. 119–20° (crystd. from MeOH) or 145–7° (block, after crystn. from $C_2H_4Cl_2$). Similarly, $Pb(OAc)_4$ gives AcOH and $Pb(OAc)_2$. C. J. WEST

**Synthesis of formaldehyde by catalytic oxidation of methanol.** H. KADOWAKI AND M. YAMADA *Repts Osaka Imp. Ind. Research Lab. Japan* 11, No. 19(1931). cf. *C. A.* 23, 4926.—A Ag catalyst was prepd. by evapg. to dryness a mixt. of $AgNO_3$ (2.5–3.0 g.) and pumice (1 g.) in water and later heating to 400–500° in an elec. furnace. The expt. was carried out under the same conditions as those reported previously. The effects of other elements are also discussed. Fe, Co, Cr, Mo, W, U, Mn, Zr, Th, Cu, Zn and Al show poisonous effects while Se and V slightly accelerate the reaction. Excess $CO_2$ is harmful, but its effect is negative if the % of $CO_2$ in the air is below 8%. F. I. NAKAMURA

**The oxidation of gaseous acetaldehyde with oxygen as an example of the combustion of hydrocarbons.** MAX BODENSTEIN *Sitzb. preuss. Akad. Wiss.* 1931, 73–88.—The reaction between gaseous AcH and $O_2$ at 0.1 atm. pressure and 70° gives $AcO_2H$ as the principal product. The rate is given by $d(AcO_2H)/dt = k(AcH)^2/(O_2) + m$, where $m = 150$ if the pressure is measured in mm. bromonaphthalene. It is not a chain reaction but the mechanism is as follows. A mol. of AcH becomes activated, reacts with $O_2$ and forms an energy rich mol. of $AcO_2H$. This transfers its energy to the AcH mol. primarily but secondary reactions are with $O_2$, negative catalysts or with the walls. The results are discussed in connection with the oxidation of $C_2H_4$ and other gaseous hydrocarbons. It is probable that the scheme could account for the oxidation of all hydrocarbons. G. M. MURPHY

**The course of the reaction between citronellal oxime and acetic anhydride.** J. ZIMMERMANN *Rec. trav. chim.* 50, 283–6(1931).—On boiling with $Ac_2O$, citronellal oxime passes into citronellonitrile (Semmler *Ber.* 26, 2235(1893)) and on this reaction the method of Dupont and Labaune (*Ber. Roure Bertrand fils* 1912, 3) for the quant. detn. of citronellal in essential oils is based. After having boiled the oxime with $Ac_2O$, the reaction product is treated with 0.5 *N* alc. KOH, the assumption being made that this has no influence on the nitrile. This assumption is, however, invalid, 7–12% of a non volatile residue being obtained by Z. in this way. The reaction between citronellal oxime and $Ac_2O$ is a very violent one if NaOAc is present, within a short time the temp. rises to 145°, while without NaOAc this violent reaction only occurs after heating on the water bath. In this reaction a partial resinification takes place and the formation of citronellamide besides a small amt. of a N compd. with a coumarin like odor was obtained, the same reaction occurs with concd. $H_2SO_4$ and, therefore, a N detn. cannot be carried out by the Kjeldahl method. The citronellolnitrile formation

is therefore unsuitable for the quant detn of citronellal The citronellal used in these expts was purified through the bisulfite compd; it $b_{4-6}$ 68–71°, $d_4^{27.5}$ 0 8435, $n_D^{27.5}$ 1.4435, $\alpha_D^{25}$ 10 10', citronellal oxime, $b_7$ 124–5°, $d_4^{27.5}$ 0 8971, $n_D^{27.5}$ 1 4711.

C. F VAN DUIN

**The action of Japanese acid clay on terpene compounds. II. Cyclization of citronellal.** TSUTOMU KUWATA. *J Soc Chem Ind, Japan* 34, Suppl binding, 70–2(1931); cf *C A* 24, 1857 —This clay with citronellal in MeOH gives 32% isopulegol and compds contg 23 44% MeO groups No menthoglycol was found V F HARRINGTON

**Syntheses from natural gas hydrocarbons. I. Caproic acid from pentane.** H B HASS AND J R MARSHALL. *Ind Eng Chem* 23, 352–3(1931) —Treatment of AmCl with NaCN gave 70% yields of AmCN, with recovery of 25–28% of unchanged chloride Other primary chlorides also reacted satisfactorily, but secondary chlorides or bromides gave poor yields (approx 30%), and tertiary chlorides and bromides, no nitrile NaI, acting as an intermediate compd catalyst, leads to 90% yields, although its use is only recommended for cyaniding the less reactive chlorides and bromides Hydrolysis of the AmCN with 67% $H_2SO_4$ is complete in 30 min Sepn of the nitrile from the halide is possible because AmCl and BuCl form binary min.-boiling azeotropic mixts with EtOH and ternary azeotropic mixts with EtOH and $H_2O$ These processes are suitable for the manuf of caproic acid with EtOH and ternary azeotropic mixts The method is a general one for the conversion of any primary alkyl chloride to the fatty acid contg 1 more C atom ALBERT THOMAS FELLOWS

**The bromides of the eleostearic acids. I. The hexabromides.** J VAN LOON *Rec trav chim* 50, 32–6(1931) —Recent researches have shown the eleostearic acids have the formula $Me(CH_2)_3CH\ CHCH\ CHCH\ CH(CH_2)_7CO_2H$ (Eibner and Rossmann, *C A* 22, 4839, Böeseken, *C A* 23, 5160, van Loon, *Diss* Delft, 1929, 62, *C A* 24, 4178) The formation of hexahalogen compds, however, does not take place easily and Kaufmann was the first to show the presence of 3 double bonds (*C A*. 20, 2989) titrimetrically although he did not isolate any hexa Br compd In order to prep these compds β-eleostearic acid was brominated in $CCl_4$ with the theoretical amt of Br under the influence of Uviol light after it had been shown that this light does not provoke any particular intramol change After evapn of the solvent and recrystn of the residue from petroleum ether to which a small amt of ether had been added, 0 5 g of the *hexabromide*, m 157°, was obtained from 7 g of the acid On debromination with Zn and alc HCl the hexabromide gave β eleostearic acid in quant yield, the same acid was again obtained on debrominating the oily mixt. of hexabromides which results after sepn of the cryst compd The same cryst hexabromide was also obtained from α-eleostearic acid, which is easily converted into the β form by traces of halogen, therefore most probably the hexabromides are formed in both cases from the same mixt of tetrabromides which are formed as the primary reaction products, tetrabromination taking place instantaneously and further bromination only very slowly The solid tetrabromide, m 114°, on bromination gives the same hexabromide, m 157°, the yield being only 10 g from 100 g of the tetrabromide, in this case again the oily hexabromides on debromination gave β-eleostearic acid C F VAN DUIN

**Preparation of dichloroacetic acid.** HOWARD W DOUGHTY AND GERHARD J. DERGE *J Am Chem Soc* 53, 1594–6(1931).—A simple and convenient method is described for the prepn of $Cl_2CHCO_2H$ by the reaction of Cu with $Cl_3CCO_2H$ in $H_2O$ The hydrolysis of $Cl_3CCO_2H$ has been studied at 60° and 100° and the temp coeff. found to be 2 576 The yield of the acid, m 5–6°, $d_{22}^{22}$ 1 5594, was about 80%

C. J WEST

**Esterification in the presence of anhydrous salts.** FRANCIS M. WHITACRE AND H T. BRISCOE *Proc Indiana Acad Sci* 38, 187–94(1929) —The anhyd sulfates of Cu, Cd, Al, Mn, Fe, Ca and K alum were tested as catalysts in the esterification reaction between EtOH and HOAc Higher alcs and higher acids and branched-chain compds were used with $CuSO_4$ $CuSO_4$ gave the highest yield of EtOAc, 84 1% after 264 hrs refluxing Plaster of Paris was a retardant and anhyd $Na_2SO_4$ had no effect. The temp at which the salt is dehydrated is important When the temp at which the salt is dehydrated is high enough to remove all the water of crystn the promoting effect is accelerated but this accelerating effect is reduced when the temp of dehydration is high W. and B conclude that the promoting effect of anhyd salts is partly due to removal of water and partly to other causes H M STARK

**Esterification with thiolacetic acid.** FRANCIS B STEWART AND PAUL V. MCKINNEY. *J Am Chem Soc* 53, 1482–90(1931) —$Me_2CHOH$ and AcSH yield only $H_2S$ and the normal ester, $Ph_3COH$ only $H_2O$ and the thiol ester, MeOH and EtOH

give 78% $H_2S$ and 22% $H_2O$. MeOH appears to esterify somewhat more rapidly than EtOH but both are much more reactive than $Me_2CHOH$, the data for $Ph_2COH$ are at 108° and since the higher temp. was necessary to obtain accurate results it is undoubtedly less reactive than $Me_2CHOH$. The quantities of $H_2S$ evolved by the 3 reactions show that there are 3 distinct processes, in $Ph_2COH$ only the HO group enters into the reaction, in $Me_2CHOH$ only the H takes part in the reaction, while in the cases of MeOH and EtOH either H or OH can split off. The question of the mechanism of esterification in general is considered and an explanation of certain anomalies is attempted. C. J. West

**Preparation of bisacetamide hydrochloride and its use as an acetylating agent.** Henry Stephen. *J. Chem. Soc.* 1931, 672-3.—$AcNH_2$ and $SOCl_2$ in $Et_2O$ give $(AcNH_2)_2$.HCl and MeCN. When $(AcNH_2)_2$.HCl is fused with an equimol. proportion of the HCl of a primary aromatic amine the Ac deriv. of the latter is formed together with a trace of an amidine. The reagents have been applied with success to the prepn. of $PhNHAc$ o-, m- and p-$MeC_6H_4NHAc$ and α- and β-$C_{10}H_7NHAc$. C. J. West

**The preparation of glycol chlorohydrin.** E. D. G. Fraim. *Rec. trav. chim.* 50, 261-7(1931).—$HOCH_2CH_2Cl$ (I) is always prepd. by the addn. of HOCl to $C_2H_4$, the HOCl being used in the form of $Ca(OCl)_2$ (cf. Norris, *C. A.* 13, 2740), NaOCl (Hasse and Ward, U. S. Pat. 1,534,608, *C. A.* 20, 3170) or Cl and water (Gomberg, *C. A.* 13, 2368). Irvine and Haworth (U. S. Pat. 1,496,675, *C. A.* 18, 2315) have proposed to use a 5% $CuCl_2$ soln. as a catalyst in this process but their method of prepn. is far too complicated. It is now pointed out that the reaction proceeds better on using 1% CuCl, while with 3% $CuCl_2$ less favorable results are obtained, the best results are, however, obtained with 0.1% $CuCl_2$, a rapid absorption of the $C_2H_4$ taking place with hardly any formation of $(CH_2Cl)_2$. Without the addn. of Cu salts a high yield of I may only be obtained when an excess of $C_2H_4$ is present during the whole course of the reaction; under these conditions, however, losses of $C_2H_4$ cannot be avoided. The formation of I is not only catalyzed by Cu salts, but Ni, Co and Fe salts exert the same action and it is noteworthy that all these salts accelerate the decompn. of HOCl into HCl and O as well. These results show that the formation of I from $C_2H_4$, water and Cl is not to be considered as an addn. of HOCl to $C_2H_4$ *but as an oxidation to ethylene oxide*, followed by a reaction of the latter compd. with HCl to form I. This conception of the reaction is supported by the formation of both isobutylene oxide and $Me_2COH$ on passing isobutylene into I KI (Pogorzelski, *Chem. Zentr.* 1905, I, 797). The amt. of acid formed in the reaction always surpasses the yield of I, which points to the formation of higher chlorinated products. By distn. of a larger amt. of $(CH_2Cl)_2$, obtained in several expts., a small amt. of tetrachloro- and pentachloroethane could be isolated. C. F. van Duin

**Reaction between propylene oxide and diethylamine.** K. A. Krasuskii and G. T. Pilyugin. *Ukrainskii Khem. Zhur.* 5, Sci. Pt. 135-8(1930).—The reaction between 1 mol. of $MeCH\,CH_2O$ and 2 mols. of $Et_2NH$ in water at concns. of 33 or 70% results in the formation of 85% of 3-diethylamino-2-propanol (I), $b_{758}$ 157.5-9°, $d_0^0$ 0.8677, $d_5^{20}$ 0.8511. The HCl salt is prepd. by passing dry HCl into I in $Et_2O$ and recrystg. from $Me_2CO$. The picrate is obtained by mixing I and picric acid in mol. proportions in alc., m. 89°. Chas. Blanc

**The reaction between ethylamine and diethylamine and isopropylethylene oxide.** F. F. Krivonos. *Ukrainskii Khem. Zhur.* 5, Sci. Pt. 141-6(1930).—The reaction between isopropylethylene oxide, $Me_2CHCH\,CH_2O$ (I), and $EtNH_2$ gives α-ethylamino-β-hydroxy-γ-methylbutane (II) when $EtNH_2$ is used in excess (2 mols. of amine to 1 mol. of I), while excess of I (1.5 mols. of I to 1 mol. of amine) produces bis(β-hydroxy-γ-methylbutyl)ethylamine (III). Similar reaction between I and $Et_2NH$ in all proportions gives only α-diethylamino-β-hydroxy-γ-methylbutane (IV). II was prepd. when a mixt. of 10 g. of I and 31% aq. $EtNH_2$ was heated 10 hrs. in a sealed tube in a water bath, the reaction product treated with $K_2CO_3$, separd., dried with KOH and redistd., yield 8 g., $b_{18}$ 150-2°, $d_0^0$ 0.9076, $d_5^{20}$ 0.8929. The HCl salt, m. 145°, is obtained by passing dry HCl into II in $Et_2O$. The picrate, m. 149-50°, results by mixing the alc. solns. With an excess of I under similar conditions are obtained 5 g. of II and 3.5 g. of III, $b_{18}$ 244-7°, the HCl salt is a heavy liquid. IV is prepd. when a mixt. of 15 g. of I and 15 g. of $Et_2NH$ in 30 g. of water is treated as described above, yield 14 g., $b_{18}$ 151-4°, $d_0^0$ 0.8671, $d_5^{20}$ 0.8512. The HCl salt is formed by dropping HCl into IV in water to acid reaction, evapg. and allowing to stand in a vacuum desiccator. The

picrate, m 80–1°, was obtained by mixing equimol amts of alc solns. of the acid and IV, adding drop by drop water to permanent turbidity, allowing to stand and filtering
CHAS BLANC

*Tin tetrahalides and dioxane.* HEINRICH RHEINBOLDT AND RICHARD BOY. *J. prakt Chem* 129, 268–72(1931).—$O(CH_2CH_2)_2O$ and $SnCl_4$, with cooling, give the compd $SnCl_4$ $2C_4H_8O_2$, sol in cold $H_2O$ and insol in $CS_2$, the same compd is prepd by soln of $SnCl_4$ 2H$_2$O $SnCl_4$ 2BzH, $SnCl_4$ 2BzMe or $SnCl_4$ 2PhCH CHAc in dioxane The compds $SnCl_4$ $2C_4H_8O_2$ and $SnI_4$ $2C_4H_8O_2$ were also prepd The dark violet iodide turns yellow in 2–3 hrs
C J WEST

**Dioxane and halogens.** HEINRICH RHEINBOLDT AND RICHARD BOY *J. prakt. Chem* 129, 273–7(1931).—Wurtz (*Ann chim phys* 69, 321(1863)) described the compd O $(CH_2CH_2)_2$ O $Br_2$ Kehrmann and Falke (*C A* 19, 816) prepd the same compd, but ascribed to it the formula O $(CH_2CH_2)_2O$ $HBr_2$ The following work confirms Wurtz's structure The compd was prepd from 10 cc dioxane and 5 g Br with or without cooling the Br detd titrimetrically and gravimetrically was the same, thus confirming the Wurtz structure, the compd, orange, m 65–6°, is stable for only a short time, is not attacked by cold $H_2O$ but is easily decompd by alkalies. I gives the *compd* $C_4H_8O_2$ $I_2$ red violet, m 84–5°, and is more stable than the Br compd, I being split off only after several hrs ICl gives the *compd* $C_4H_8O_2$ ICl, red-brown, m 50–8°, and is unstable The *compd* $C_4H_8O_2$ IBr, red brown, m 65°, is stable for only a short time
C J. WEST

**The methylation of putrescine.** WERNER KEIL *Z physiol Chem* 196, 81–6 (1931).—Of the 9 possible methylation products of putrescine 7 are already known Four of these have again been prepd, also the 2 missing members, thus completing the series *N N N′,N′ Tetramethylputrescine*, b 167–70°, was obtained by heating $(CH_2)_4(NH_2)_2$ 2HCl with paraformaldehyde in an oil bath at *190–210° for 0.5 hr*, then adding $H_2O$, filtering off the excess paraformaldehyde, adding NaOH to the filtrate and extg with $CHCl_3$ chloroaurate, m 210°, chloroplatinate, m 236–7° *N,N′-Dimethylputrescine* was prepd by heating $(CH_2)_4(NH_2)_2$ 2HCl with 40% $CH_2O$ and $CaCl_2$ until the temp reached 170°, adding $H_2O$ and NaOH, filtering off the $Ca(OH)_2$ and extg the filtrate with $CHCl_3$, chloroaurate, m 172°, chloroplatinate, m 237° Under the same treatment $Me_2N(CH_2)_4NH_2$ 2HCl yielded *N,N,N′-trimethylputrescine, chloroaurate, m 151°* Methylation of $PhO(CH_2)_4NH_2$ with $Me_2SO_4$ gave *δ* phenoxy-*α*-*N,N,N*-trimethyltetramethyleneammonium chloride (chloroaurate, m 112°), which was then refluxed with HI The resulting *δ* iodo-*α*-*N,N,N*-trimethyltetramethyleneammonium iodide (I), after removal of PhOH by $Et_2O$, was heated with alc $MeNH_2$ 1 hr at *100°*. Alc and *MeNH$_2$* were removed by evapn, *HI* by *TlOAc* and excess *Tl* by HCl The product was *δ N′-methylamino-α-N,N,N trimethyltetramethyleneammonium chloride* (II), corresponding to the base $MeNH(CH_2)_4NMe_2OH$, chloroaurate, m 205–6° A similar condensation of I with $Me_2NH$ yielded *δ-N′,N′-dimethylamino-α-N,N,N trimethyltetramethyleneammonium chloride* (III), corresponding to the base $Me_2N$-$(CH_2)_4NMe_2OH$, chloroaurate, m 244–5° (decompn), picrate, m 260°. *N,N-Dimethyl putrescine* was obtained by heating $Cl(CH_2)_4N(CO)_2C_6H_4$ with $Me_2NH$ in EtOH, evapg to dryness, adding KOH and distg. to dryness several times, the chloroaurate was prepd as usual II and III are the new methylated putrescines derivs A W. DOX

**The structure of the "mercaptomethanetrisulfonic acid" (thiosulfuricmethionic acid).** H J BACKER *Rec trav chim* 50, 268–78(1931); cf *C A*. 25, 76.—The acid *formed by the interaction of* $Cl_3CSCl$ *and* $K_2SO_3$ (*Rathke and Albrecht, Ber.* 3, 858 (1870), *Ann* 161, 129(1872)) has, up to the present, always been considered to be *$(HO_3S)_3CSH$, on oxidation with Br this acid gives* $CH(SO_3H)_3$, *exactly 6 atoms* of Br being necessary $(KO_3S)_3CSH + 6Br + 4H_2O \longrightarrow (SO_3H)_3CH + 6HBr + H_2SO_4$ (cf Backer, *C A* 25, 76) The acid, however, does not form mercaptides, reacts neutral, does not give ppts with Pb, Cu and Hg salts, is odorless and dissolves HgO with the formation of a white ppt, and the absence of most of the characteristic mercaptan reactions rendered the constitution as a mercapto compd doubtful On adding alkali to the soln of the acid, a yellow color is developed, which disappears on acidification, subsequent addn of $FeCl_3$ then produces a dark blue color This color reaction with $FeCl_3$ is obtained only when alkali has first been added and thus is not a *characteristic reaction* for the "mercapto compd" itself, but for the degradation product obtained by the action of alkali The same series of reactions is given also by thiosulfuric-carboxylic acids, their salts and esters which also dissolve HgO with the formation of a white ppt On heating salts of the acid, $SO_2$ is evolved with the formation of sulfate, *the same reaction taking place on heating the soln with HCl, with KCN* a ppt of $BaSO_3$ is formed if Ba salts are present. All these facts and analogies point

Recent work by Hill and Hibbert (*C A* 18, 1987) has shown that glyceryl acetal made *from paraldehyde consists of 80% I and 20% II, and that from the* $C_2H_2$ *method* ($HgSO_4$ and $H_2SO_4$ catalyst) is 64% I and 30% II. Ethylideneglycerol was made by N. and F. from $C_2H_2$ using $HgSO_4$ and anhyd fluo acids as catalysts, and the low temp of 37°. The products consisted of 78% of the I and 22% of II. The higher yield of the I in this case is attributed to the use of the fluo acid catalyst and to keeping the liquid cool during the reaction H M Stark

**Polymerization of methyl esters of highly unsaturated acids. VI. Hydrogenation of the polymerized product. VII. Hydrogenation of linseed oil and of the methyl esters of its liquid acids.** Kiichiro Kino *Sci Papers Inst Phys.-Chem. Research* (Tokyo) 15, 127–9, 130–6(1931)(in German), cf *C A* 25, 914.—The contentious *question is reexamd, whether polymerized acids suffer depolymerization when* hydrogenated The intrapolymerized complex $C_{21}H_{39}CO_2Me$ (3 double bonds), was hydrogenated in presence of Pd in AcOH at 90°, and without solvent at 180–220°. The I no was strongly reduced, the mol wt remained const In AcOH, more $H_2$ was absorbed than could be calcd from the I nos It is assumed, therefore, that *the 4-C ring was reopened.* Linseed oil, I no 183, sapon no 194, mol wt. 886, was polymerized by heating it under $H_2$ for 5 hrs at 290–300° The treated oil was extd 3 times *with 3–5 vols. of* $Me_2CO$ *The first* $Me_2CO$ *ext (I), and the final insol residue (II)* showed I no 118, 104, sapon no 191, 195, mol wt 861, 2311 The liberated acids from I and II were distd *in vacuo* to sep the liquid monomol acids from higher polymers. I furnished mainly intrapolymerized acids (III), II gave largely nondistillable high polymers (IV) The acids from III and IV, purified through the Pb salts, were hydrogenated in AcOH, in presence of Pd, at 50–70° The absorbed $H_2$ corresponded nearly to the figures calcd from the I nos Characteristics of the acids from III, before and after hydrogenation, were *I no* 146, 65 (calcd from $H_2$ absorption, 9), mol wt 285, 278 The high I no of the hydrogenated product must be ascribed to *reopening of the intramol 4 C ring* The hydrogenated acids from IV showed unchanged mol wts (564, 568) *Hydrogenation,* therefore, *did not cause depolymerization of intermol combined acids* A similar examn of the Me esters of the liquid acids from linseed oil led to the same conclusions K H Engel

**Continued studies on the splitting off of halogen from haloacylamino acids and polypeptides by dilute alkali.** Emil Abderhalden and Edgar Haase *Fermentforschung* 12, 313–28(1931).—The rate at which halogen is split off by dil alkali varies considerably with different haloacylamino acids according to the acyl group which carries the *halogen and the configuration of the amino acid* to which the acyl is attached A series of $BrCH_2CO$ derivs has now been prepd and studied with respect to rate of halogen cleavage. The derivs were obtained by treating the amino acid or peptide soln in *N* NaOH with $BrCH_2COBr$, and comprise the following *bromoacetylglycine* (I), m 115–6°; *bromoacetyl-d-alanine* (II), m 96–7°; *bromoacetyl-dl-α-aminobutyric acid* (III), m. 119–20°; *bromoacetyl α aminoisobutyric acid* (IV), m 159–60°, *bromoacetyl-β aminobutyric acid* (V), m 99–100°, *bromoacetyl-dl valine* (VI), m 142–4°, *bromoacetyl l-aspartic acid* (VII), m 134–5°, *bromoacetyl-d-glutamic acid* (VIII), sirup, *bromoacetyl l-proline* (IX), m. 118–20°, *bromoacetyl-d phenylalanine* (X), m 116–9°, *bromoacetyl l tryptophan* (XI), m 158–9°, *di(bromoacetyl) l-cystine* (XII), m 126–7°, *bromoacetylglycyl-dl valine* (XIII), m. 170–1°, *bromoacetyl-dl valylglycine* (XIV), m. 155–6°, *bromoacetylglycyl-dl-leucine* (XV), m 145–6°, *bromoacetyl dl leucylglycine* (XVI), m 147–8°; *bromoacetyl dl alanyl dl leucine* (XVII), m 154–5°, *bromoacetylglycyl dl-alanyl-dl leucine* (XVIII), m 167–8°; ⟶ *diglycyl dl-alanyl dl leucine*, m 110–2° (decompn), ⟶ *bromoacetyldiglycyl-dl-alanyl-dl leucine* (XIX), m 168–70° (decompn) These haloacyl derivs were subjected to the action of NaOH at $p_H$ 8.4° and 37° The liberated Br ion was detd. by the Volhard titration at intervals of several hrs By far the most rapid liberation of Br was from IX. The least reactive was VII, then in increasing order, XI, X, VIII, bromoacetyl *l*-tyrosine, VI, III, bromoacetyl *dl*-leucine, I, V, II and IV. Observations were not conclusive with XII because of its insoly Among the dipeptide derivs XIII gives up Br more readily than its isomer XIV, and XVI more readily than its isomer XV. *A comparison of* the $BrCH_2CO$ derivs of di-, tri-, and tetrapeptides, XVII, XVIII and XIX, shows that the rate of Br cleavage increases with increasing length of the peptide chain. The liberation of Br from I was not greater in the presence of 0.5 *N* $H_2SO_4$ than in $H_2O$ alone A. W. Dox

**The behavior of dipeptides containing *m*- and *o*-tyrosine, *p*-nitrotyrosine and phenyl-β-alanine toward *N* alkali, erepsin and trypsin-kinase** Emil Abderhalden and Walter Schairer. *Fermentforschung* 12, 295–312(1931).—Of the dipeptide derivs contg. no naturally occurring component, chloroacetyl-*dl*-*o*-tyrosine is the only one thus far found

to trypsin) enzyme hydrolysis. A no. of new derivs. have now been prepd. contg. glycine or leucine or the corresponding haloacylamino acids, linked to *m*- and *o*-tyrosine, *o*-nitrotyrosine and phenyl β-alanine. The tyrosines were prepd. by previously described methods: glycine anhydride was condensed with *o*-HOC$_6$H$_4$CHO, NaOAc and Ac$_2$O to yield bis(*o*-acetoxybenzal) 2,5-diketopiperazine, the latter reduced and hydrolyzed by HI and I, and the resulting *di-o-tyrosine* purified by esterification and saponification of the ester. *m*-HOC$_6$H$_4$CHO was condensed with hippuric acid, NaOAc and Ac$_2$O to the acylated lactimide of *m*-hydroxybenzoylaminocinnamic acid, the latter hydrolyzed and reduced to *m*-benzoyltyrosine, and finally the Bz removed by hydrolysis to yield *di-m-tyrosine*. Direct nitration of ordinary tyrosine gave *2-nitro-l-tyrosine*. The coupling of these tyrosines with haloacylamino acids and amination to the dipeptides was performed in the usual manner. *l*-Tyrosine + ClCH$_2$COCl ⟶ chloroacetyltyrosine ⟶ *glycyl-l-tyrosine*, decomps. 130°. *l*-tyrosine ester + *dl*-α-MeCHCH$_2$CHBrCOBr ⟶ *dl*-α-bromoisocaproyl-*l*-tyrosine ester, m. 70°, ⟶ free acid ⟶ *dl-leucyl-l-tyrosine* + 2 H$_2$O. *d*-*o*-tyrosine Et ester + ClCH$_2$COCl ⟶ *chloroacetyl-d-o-tyrosine Et ester*, sinters 90° ⟶ *chloroacetyl-dl-o-tyrosine*, sinters 121° ⟶ *glycyl-dl-o-tyrosine* + 2 H$_2$O, decomps. 120–30°. *o*-tyrosine + MeCHCH$_2$CHBrCOBr ⟶ *dl*-α-*bromoisocaproyl-dl-o-tyrosine*, sinters 94°, ⟶ *dl-leucyl-dl-o-tyrosine*. Similarly, *dl-m*-tyrosine ⟶ *chloroacetyl-dl-m-tyrosine*, m. 150° ⟶ *glycyl-dl-m-tyrosine*, m. 120–30° (foaming), *dl-m*-tyrosine ⟶ *dl*-α-*bromoisocaproyl-dl-m-tyrosine*, sinters 127°, ⟶ *dl-leucyl-dl-m-tyrosine*, m. 120–30° (foaming). 2-Nitrotyrosine Et ester ⟶ *chloroacetyl-l-2-nitrotyrosine Et ester*, sinters 92°, ⟶ *chloroacetyl-l-2-nitrotyrosine*, sinters 165–6°, ⟶ *glycyl-l-2-nitrotyrosine*, sinters 220° (decompn.). *l*-2-nitrotyrosine ester ⟶ *dl*-α-*bromoisocaproyl-l-nitrotyrosine ester*, sinters 72°, ⟶ *dl*-α-*bromoisocaproyl-l-nitrotyrosine*, sinters 170°, ⟶ *dl-leucyl-l-nitrotyrosine*, sinters 210–20° (decompn.). *dl*-phenyl β-alanine ⟶ *chloroacetyl-dl-phenyl β-alanine*, m. 141°, ⟶ *glycyl-dl-phenyl β-alanine*, m. 222° (decompn.). *dl*-phenyl β-alanine ⟶ *dl*-α-*bromoisocaproyl-dl-phenyl β-alanine*, m. 132°, ⟶ *dl-leucyl-dl-phenyl β-alanine*, m. 200° (decompn.). All of the above dipeptides were resistant to N alkali at 37°, showing practically no cleavage in 120 hrs. Chloroacetylnitrotyrosine was readily hydrolyzed. Erepsin attacked only the 2 peptides of *p*-tyrosine. An erepsin-free prepn. of trypsin kinase also attacked these 2 peptides, the relative extent of cleavage varying with the age of the enzyme prepn. A prepn. 24 hrs. old hydrolyzed leucyltyrosine more rapidly and glycyltyrosine less rapidly than the fresh prepn. The previously reported cleavage of chloroacetyl-*o*-tyrosine by trypsin kinase was confirmed, but the analogous bromoisocaproyl deriv. was found to be resistant, as were all the remaining haloacyl derivs. and their corresponding dipeptides.

A. W. Dox

**Preparation of dimethylacetoacetic ester and of Δ$^1$-2,2-dimethylbuten-1-ol.** Karl Folkers and Homer Adkins. *J. Am. Chem. Soc.* 53, 1416–9(1931).—Details are given for the prepn. of AcCHMeCO$_2$Et (70% yield) and of AcCMe$_2$CO$_2$Et (34% yield). Reduction of Et Δ$^1$-2,2-dimethylbutyrate with Na and EtOH, using the method of Adams and Marvel (*C. A.* 14, 1677) gives 61.8% of Δ$^1$-2,2-dimethylbuten-1-ol, b. 128.5–31°; there was also recovered 7.9% of the Na salt of the acid. C. J. West

**Rate of hydrogenation of acetoacetic ester, dehydroacetic acid, benzene, phenol and aniline over nickel at pressures from 27 to 350 atmospheres.** Homer Adkins, Howard I. Cramer and Ralph Connor. *J. Am. Chem. Soc.* 53, 1402–5(1931).—The relationship of pressure to the rate of catalysis by Ni of the hydrogenation of AcCH$_2$CO$_2$Et (I), dehydroacetic acid (II), C$_6$H$_6$, PhOH and PhNH$_2$ has been found to differ greatly among these 5 compds. It was entirely feasible to reduce I at pressures in the vicinity of 30 atm. but the rate of reduction was greatly increased by increases in pressures, especially in the range from 120 to 370 atm. II reduced more than twice as rapidly at 149 as at 108 atm. and about 4 times as rapidly at 323 as at 108 atm. It was found impractical to reduce PhNH$_2$ in the 30-atm. range. Increasing the pressure greatly increased the rate of hydrogenation but increasing the pressure in the higher ranges up to 350 atm. was not found to be particularly advantageous. The rate of reduction of PhOH and of C$_6$H$_6$ proceeded well in the 30–40 atm. range, increased with pressure to the 150–170 atm. range but was not sensitive to further increase in pressure up to 330 atm. C. J. West

**Reactions of malonic esters with formaldehyde. II.** Kenneth N. Walden. *J. Chem. Soc.* 1931, 653–7; cf. *C. A.* 24, 2429.—The reaction of malonic esters with HCHO is obviously of the 2nd order, the initial speed of reaction, *v*, is approx. proportional to the first power of the concn. of each reactant separately. Within the limits that could be conveniently investigated, *k* is inversely proportional to the H ion concn.

*Piperidine has a profound effect on the reaction velocity, while* $Me_3N$ and $NH_3$ are without action within the limits of exptl error, the action of $MeNH_2$ appears to be temporary (possibly due to the destruction of the catalyst) C J. WEST

Preparation of ethyl methylenedimalonate. KENNETH N WELCH *J Chem Soc* 1931, 673–4. cf *C A* 24, 2429.—$CH_2(CO_2Et)_2$ (36 g.) and 3 g. paraformaldehyde, heated on the water bath and treated with 10% EtOH KOH drop by drop until reaction commenced and then heated 6 hrs., give 8 g. $CH_2(CO_2Et)_2$ and 28 g. Et methylene dimalonate C J WEST

The structure and properties of crystal hydrates of oxalic acid. M A RAKUSIN *Chem.-Ztg* 55, 128(1931).—R discusses the structure of oxalic acid from the point of view of his theory of 'hydroxyl loading' (cf *C A* 25, 69). He concludes that the dihydrate is not $C_2(OH)_6$, as suggested by Mendelyeev and by Genther, but is $(CO_2H)_2 \cdot 2H_2O$. It has been incorrectly stated that cryst. oxalic acid begins to effloresce at 20°. A sample on a watch glass did not lose a trace of $H_2O$ in 29 days. B S LEVINE

Chemistry of the glutaconic acids. XXII. Optically active α,γ-dimethylglutaconic acid. TERENCE H McCOMBS, JOHN PACKER AND JOCELYN F THORPE *J Chem Soc* 1931, 547–60. cf *C A* 21, 1257.—*trans* $HO_2CCHMeCH$ $CMeCO\text{-}H$ (I), m. 147°, is easily resolved by strychnine in $Me_2CO$ or $Me_2CO$ and $Et_2O$. *strychnine l l* I ppts. on cooling, m. 208–9°, then solidifies and m. 200–3° and then decomps. dil. $NH_4OH$ gives *l* I, m. 132.5–3°, $[M]_D^{25}$ −100 ± 1° ($H_2O$, *c* 1 g. in 100 cc.), −106° ($H_2O$, *c* 4 g. in 100 cc.), $[M]_D^{25}$ −136° (EtOH, *c* 0.46 g. in 100 cc.). solns. of *l* I in $H_2O$ and dil. HCl, $NH_4OH$ and NaOH undergo no change in rotation at 25° for 3 days. The *d* I contained approx. 25% *dl* I, because of racemization in hot solns. of the strychnine salt. Brucine, quinine, quinidine, cinchonine and *d* $MeCHPhNH_2$ gave salts which either would not crystallize or were otherwise unsuitable for the resolution of the acid. Recombination of the active forms gives the *dl* acid, m. 147°. The action of strychnine on *dl* I in *insufficient and sufficient boiling* $Me_2CO$ *to dissolve the salts formed, in a cold* $Me_2CO$-$CHCl_3$ mixt. and in sufficient boiling $H_2O$ to dissolve the salts formed and of brucine in sufficient boiling $Me_2CO$ to dissolve the salts formed is described. Racemization of *l*-I in solvents is reported as follows (solvent, temp., *k* (hr.$^{-1}$) and half-change period are given). $H_2O$, 100°, 0.0388, 17.8 hrs., *N* HCl, 101.5°, 0.0325, 21.3 hrs., 5 *N* HCl, 101°, 0.128, 5.4 hrs. *N* NaOH, 101.5°, 1.70, 24.5 min., $Me_2CO$, 56.5°, about 0.0088, about 80 hrs. Mutarotation or racemization of *l* I also takes place more rapidly in hot solvents in the presence of strychnine than in its absence and even occurs very slowly in its presence in the cold, in boiling $H_2O$, *k* 0.577 hr.$^{-1}$, half-change period 72 min.; in boiling acetone the values are 0.451 and 92. I and AcCl, heated at 100° *for 6 hrs., give only 7% of the hydroxy anhydride*, m. 210°. *Strychnine H glutaconate*, m. 195° (decompn.); fractionation of this salt showed no resolution. C J. WEST

Structure of the glutaconic acids and esters. I. Cyanoglutaconic esters. GEORGE A. R. KON AND HOMI R. NANJI *J Chem Soc*. 1931, 560–75.—The cyanoglutaconic esters display tautomerism of the same type as that of many other unsatd. cyano esters. They can in some cases be isolated in 2 distinct forms, the reactions of these isomers are fully accounted for by the α,β- and β,γ-unsatd. formulas and the "normal" formulation suggested for some of them is no longer necessary. These isomers are interconvertible in the presence of suitable catalysts, forming equil. mixts., notably when they are liberated from their Na derivs. and for this reason the method of distinguishing between "normal" and "labile" isomers used by Thorpe and Bland is not effective. This statement applies only to α-cyano- and α-carbethoxyglutaconic esters, because the terms "normal" and "labile" have also been used to denote the esters of the glutaconic acids themselves. These are no doubt distinct and their isomerism presents a separate problem in which stereoisomerism unquestionably plays an important part. $EtO_2CCH(CN)CMe$ $CHCO_2Et$ [equil. mixt. with $EtO_2CC(CN)$ $CMeCH_2CO\text{-}Et$] (I) was prepd. by the following methods. Rogerson and Thorpe's method (*J. Chem. Soc.* 87, 1669), 33%; excess of *EtOH* removed *in vacuo* at 60°, 35%. EtONa prepd. *from* "mol." Na *in* dry $Et_2O$ with theoretical quantity of EtOH, 35%. K in place of Na, 56%. 20 g. K in 150 cc. EtOH, cooled, is treated with 56 g. $NCCH_2CO_2Et$, then with 65 g. $AcCH_2CO_2Et$ and kept at room temp. for 2 days, 80%; the yield with triethanolamine or piperidine is only 10 and 3%, resp. I $b_{14}$ 170°, $d_4^{15}$ 1.0897, $n_D^{15}$ 1.46917. Oxidation of I with $O_3$ gives $OHCCO_2Et$, $AcCH_2CO_2Et$, $AcCH(CN)CO_2Et$ and $OC(CN)CO_2Et$, whose *phenylhydrazone*, yellow, m. 127°. The pure β,γ-ester could not be prepd. The pure α,β-ester, *Et α-cyano-β methyl-Δ$^{\alpha}$-propene-α,γ-dicarboxylate* (II), $b_{14}$ 178–80°, $d_4^{19.6}$ 1.0918, $n_D^{19.6}$ 1.47409, I addn., 3% in 1 hr., results from the K salt of I with BrOH or HCl or by the action of *EtOH EtOK* on *I*; $O_3$ gives a mixt. of $AcCH_2CO_2Et$ and OC-

$(CN)CO_2Et$. EtONa gives the equil ester, the equil mixt. contains about 23% of α-ester. The K deriv. of II and MeI give the β,γ-di-Me deriv., of II, $b_{14}$ 162°, $d_4^{18}$ 1.0485, $n_D^{18}$ 1.46519; oxidation gives $AcCHMeCO_2Et$ and $OC(CN)CO_2Et$. $EtO_2CC(CN):CMeCHMeCO_2Et$ (equil. ester), $b_{14}$ 160°, $d_4^{18}$ 1.0708, $n_D^{18}$ 1.46996, $O_3$ gives $AcCHMeCO_2Et$, $MeCOCO_2Et$ and $AcCH(CN)CO_2Et$. The pure β,γ-compd. $EtO_2CCH(CN)CMe:CMeCO_2Et$ results by the action of BrOH on the K deriv. or with I and EtOK and $b_{14}$ 174°, $d_4^{20}$ 1.0720, $n_D^{20}$ 1.46918, the structure was established by oxidation. The γ-benzyl deriv., $b_{14}$ 215°, $d_4^{19.5}$ 1.0997, $n_D^{19.5}$ 1.51890, I adds 0, the action of EtONa gives the normal and labile esters as described by Thorpe and Bland. *Et α-cyano-α-methyl Δ^β^-propene α,γ-dicarboxylate*, $b_{14}$ 160–1°, $d_4^{22}$ 1.0662, $n_D^{22}$ 1.45244; does not react with ICl (30% yield), $O_3$ gives $OHCCO_2Et$. The α-*Et deriv.* $b_{14}$ 158.5–60°, $d_4^{20}$ 1.0483, $n_D^{20}$ 1.5324 (25% yield). $EtO_2CCH(CN)CH:CMeCO_2Et$, $b_{14}$ 165°, $d_4^{19.5}$ 1.0743, $n_D^{19.5}$ 1.45933, I adds 60% in 1 hr.; the use of EtOK in the cold gives a 65% yield; the color produced by aq. $FeCl_3$ quickly fades; oxidation shows the presence of the α,β- and β,γ-esters. *Et α-cyano-α,γ-dimethyl Δ^β^-propene α,γ-dicarboxylate*, $b_{14}$ 176.7°, $d_4^{20}$ 1.0729, $n_D^{20}$ 1.46818 (70% yield), oxidation gives $AcCO_2Et$ and a *phenylhydrazone*, m. 207–8°, doubtless from the ester $OHCCMe(CN)CO_2Et$. EtONa gives $Et_2CO_3$ and probably *Et α-cyano-α,γ-dimethylcrotonate*, $b_{14}$ 103°.

**The asymmetry of *meso*-tartaric acid.** F. Boesseken. *Pharm. Weekblad* 68, 246–8 (1931).—A theoretical discussion of the possible asymmetry of *meso*-tartaric acid and certain objections to the hypothesis proposed by Scheringa (*C. A.* 25, 1803).

A. W. Dox

**Theoretical and experimental study of a high-yield technical urea process.** A. Kallenberg. *Z. Elektrochem.* 36, 799–802(1930).—Urea may be prepd. by a method represented by $2NH_3 + CO_2 \rightleftharpoons CO(NH_2)_2 + H_2O$ (I) between a temp. range of 100° to 130°. At equil. the urea content calcd. on carbamate is 39–43%. The equil. is affected decidedly by the $H_2O$ so as to prohibit greater yields. Another method which has been previously studied from the standpoint of constitution of $NH_4$ thiocarbamates is represented by the equation $COS + 2NH_3 = CO(SNH_4)NH_2 \rightleftharpoons CO(NH_2)_2 + H_2S$ or $CO_2 + 2NH_3 = CO(NH_2)_2 + H_2S$ (II). K. studied the kinetics and quant. aspects of these methods, concg. more particularly upon the 2nd. The free energy of the reactions was calcd. from the knowledge of the free energies of the individual reactants. The pressures in atms. with which urea is formed in both cases are as follows: I, $1.9 \times 10^{-4}$ at 25°, $2.1 \times 10^{-2}$ at 77°, 0.57 at 100° and 0.74 at 130°. II, 42 at 25°, $4 \cdot 10^4$ at 100° and $3 \cdot 10^5$ at 130°. The enormous differences in pressures are not sufficiently accounted for by the differences in the reaction velocities. A more complete account will appear in *Z. anorg. allgem. Chem.*

W. Vansplow

**Structure of the urea molecule.** L. Ebert. *Ber.* 64B, 679–81(1931); *cf. C. A.* 17, 1579.—According to Devoto (*C. A.* 25, 626) urea and thiourea in $H_2O$ have the structure represented by the "zwitter-ion" formulas $NH_2{}^+C(:NH)O^-$ and $NH_2{}^+C(:NH)S^-$. Arndt (*C. A.* 25, 2145) suggests another polar formula, $NH_2{}^+ C(NH_2)S^-$. E. asserts that there is no basis for the assumption of a polar formula for urea because: (1) analysis of the dielec. polarization of aq. solns. gives no proof of the existence of an especially strongly polar form of urea. (2) "zwitter ion" formation can occur only if the product of the 2 dissocn. consts. of the neutral form of urea is greater than $10^{-28}$, this requirement can be fulfilled neither by the formula $CO(NH_2)_2$ nor by the formula $H_2NC(:NH)OH$. (3) the crystal mol. of urea is very sym. and there is no evidence that dissolving urea in $H_2O$ causes noticeable change in its structure.

Louise Kelley

**Configuration of the doubly-linked tervalent nitrogen atom. IV. The resolution of β-methyltrimethylene dithiocarbonate carboxyphenylhydrazone.** Wm. H. Mills and Bernard C. Saunders. *J. Chem. Soc.* 1931, 537–46.—Mills and Schindler (*C. A.* 17, 1628) resolved the pyridylhydrazone of cyclohexylene dithiocarbonate and concluded that its mol. dissymmetry was to be referred to the non-planar distribution of the valencies of the doubly linked N atom. Because of the absence of definite proof as to whether this has the *cis* or the *trans*-configuration, work was undertaken to prep. a doubly linked tervalent N compd. which would be better fitted to provide definite evidence of the non-planar distribution of the valencies of the N atom in this state of combination. EtONa, satd. with $H_2S$, $CS_2$ added and the soln. boiled for 0.5 hr. and then treated with $MeCH(CH_2Br)_2$ and allowed to stand 24 hrs., gives 50% of *β-methyltrimethylene trithiocarbonate* (I), yellow, m. 74°. I and EtOH-$PhNHNH_2$,

With the Na compd of $CH_2(CO_2Et)_2$ there results Et cyclopentane 1,1-dicarboxylate; $[NaC(CO_2H)_2]_2$ gave a mixt of *cis*- and *trans* hexahydrophthalic acids when the tetra-$CO_2H$ acid was converted by heating to the di $CO_2H$ acid $CH_2[NaC(CO_2Et)_2]_2$ gives a mixt of $(CH_2)_4C(CO_2Et)_2$ and a polymer of $CH_2C(CO_2Et)_2$ (Zelinskii, *Ber.* 22, 3296(1889)) C. J. West

**1-Benzylcyclohexene. Condensation of benzyl alcohol with cyclohexene under the action of phosphoric anhydride.** D. N. Kursanov *J. Russ. Phys.-Chem. Soc.* 62, 1691–5(1930).—1-Benzylcyclohexene (I) was obtained by dehydration with $P_2O_5$ of $PhCH_2OH$ in cyclohexene $C_6H_{11} + HOCH_2Ph \longrightarrow C_6H_9CH_2Ph$. Another product of the reaction is a resinous mass which cannot be distd. without decompn. To 80 g. cyclohexene and 50 g. $P_2O_5$ cooled with ice 30 g. $PhCH_2OH$ was added by drops. The mixt. was, after 12 hrs.' standing, treated with $NaHCO_3$ soln., washed with water, dried with $Na_2SO_4$ and fractionated, the collected fraction $b_{15}$ 127.2–8.4°, $d_{20}$ 0.9634, $n^{20}$ 1.5400. Other consts. as well as analysis show the product to be identical with I as described by its earlier investigators. K. assumes that the reaction takes place in 2 steps: (a) benzyl phosphate combines with cyclohexene at the double bond, (b) $H_3PO_4$ is liberated. Partial oxidation of I by means of alk. $KMnO_4$ at 0–4° results in formation of what K. believes to be the glycol $C_6H_9(OH)_2CH_2Ph$ and BzOH. J. G. Tolpin

**Preparation of highly active aluminum chloride.** K. Bodendorf *J. prakt. Chem.* 129, 340(1931).—Five g. Al powder, 1 g. $HgCl_2$ and 0.5 g. I in 100 cc. $C_6H_6$ are warmed nearly to boiling and dry HCl passed in with stirring, the $H_2O$ bath may be removed as soon as H evolution starts, the Al is not completely consumed since it is covered with $AlCl_3$; the product is ready to use when the H evolution ceases. C. J. West

**Reaction of aliphatic aldehydes according to Friedel-Crafts.** K. Bodendorf. *J. prakt. Chem.* 129, 337–9(1931).—Anhyd. $AlCl_3$ (1.2 mols.) in 300 cc. $C_6H_6$ is satd. with HCl at 0° and then treated slowly with 1 mol. aldehyde in 100 cc. $C_6H_6$ during 2 hrs. and then stirred 1–2 hrs. The $C_6H_6$ free residue (150 g.) from AcH gave 8 g. PhEt, 88 g. $MeCHPh_2$ and 33 g. of a yellow oil from which was recovered 4.5 g. of 9,10-dimethyl-9,10-dihydroanthracene (I). $MeCHPh_2$ (10 g.) and 20 g. $AlCl_3$ in 100 cc. $C_6H_6$ heated 1 hr., give 1.5 g. PhEt and 4 g. I. 10 g. of the oil, heated with $AlCl_3$, gives 1 g. $MeCHPh_2$ and 4 g. I. The residue from EtCHO (154 g.) gave 16 g. PhPr, 91 g. $EtCHPh_2$ and 36 g. high boiling products. The residue from PrCHO (173 g.) gave 29 g. PhBu, 82 g. $PrCHPh_2$ and 33 g. yellow oil, $b_{15}$ 175–240°. The residue from iso-PrCHO (162 g.) gave 21 g. iso-BuPh, 102 g. $Me_2CHCHPh_2$ and 29 g. yellow oil, $b_{17}$ 170–240°, 20 g. of the latter with $AlCl_3$ heated 1 hr., gave 7 g. iso-BuPh and 5 g. $Me_2CHCHPh_2$. C. J. West

**Electric moments of some organic molecules in benzene solution.** A. E. Eide and O. Hassel. *Tids. Kjemiog. Bergvesen* 10, 93–5(1930), cf. following abstract.—A series of results of detns. of elec. moments of various org. mols. in $C_6H_6$ soln. is given. The small value obtained for *p*-$O_2NC_6H_4CN$ ($0.72 \times 10^{-18}$) seems to be due to a neg. effect of the N when assocd. with C. The 2 hydrobenzoins were investigated as examples of 2 compds. standing to each other in the relationship of meso- and *dl* form. The moments are almost the same. The dipole moment of *p*-chloroaniline is $2.9 \times 10^{-18}$ while the calcd. value is about $3.0 \times 10^{-18}$. B. C. A.

**Electric moments of organic molecules. IV.** O. Hassel and E. Naeshagen *Tids. Kjemiog. Bergvesen* 10, 81–4(1930), cf. *C. A.* 24, 2346–7.—The structure of ring systems is discussed on the basis of the elec. moments of the mols. Results are given for a no. of cyclic compds. in $C_6H_6$ soln., and these are in general agreement with those of other observers. The moments of some methylated sugars are given, but from these data it is not possible to arrive at any accurate conclusions concerning the structure of sugars. For thiophene, the max. value found for the elec. moment was $0.63 \times 10^{-18}$, which may be compared with that for furan. The moment of carbone is $3.17 \times 10^{-18}$, which is somewhat different from that for menthone ($2.80 \times 10^{-18}$). B. C. A.

**Electric moments of organic molecules. VI. Ortho-effect of derivatives of *p*-dichlorobenzene and of the *sym*-trichloro- and tribromobenzenes.** O. Hassel and E. Naeshagen. *Z. physik. Chem.*, Abt. B, 12, 79–88(1931), cf. preceding abstr.—The position of substituents in benzene rings and in $C_6H_6$ may be detd. by measuring the dipole moment in benzene soln. The dipole moments were detd. for 2,5-$Cl_2C_6H_3NO_2$, *o*-, *m*-, *p*-dichloroaniline, 2,4,6-trichloro- and tribromoaniline, *o*-$ClC_6H_4CN$, 2,5-$Cl_2C_6H_3CN$, 2,4,6-$Cl_3C_6H_2CN$, 2,4,6-$Cl_3C_6H_2OH$, 2,4,6-$Br_3C_6H_2OH$, 1,2,4-$C_6H_3Cl_3$, 1,2,4,6-$C_6H_2Cl_4$ and $C_6H_3Br_3$, 2,4-$(O_2N)_2C_6H_3Cl$. Derivs. of sym-$C_6H_3Cl_3$ and $C_6H_3Br_3$ showed the ortho-effect distinctly. Frank Urban

**Nitridation studies. III. Phenyl iodide dichloride and the *N*-chloroacid amides as nitridizing agents.** A Laurence Curl and W. Conrad Fernelius *J. Am. Chem Soc* 53, 1478–82(1931) cf *C A* 24, 3498 —$PhICl_2$ and ICl may be used as nitridizing agents in liquid $NH_3$ but the *N*-Cl acid amides so far investigated are valueless in this connection $PhICl_2$ reacts with $NH_3$ (liquid or gas) to give N, PhI and $NH_4Cl$ The *N* Cl acid amides react with $NH_3$ to give the parent amides, $NH_4Cl$, N and, under certain conditions, tarry decompn products In $CHCl_3$, $PhICl_2$, dichloramine-T, AcNClPh and *N*-chlorosuccinimide convert $(PhNH)_2$ into a mixt of $(PhN)_2$ and $(H_2NC_6H_4)_2$ 2 HCl C J West

**1,3,5-Trinitrobenzene or benzite.** Louis Desvergnes *Chimie & industrie* 25, 3–17, 291–306(1931) —The properties and prepn of 2,4,6 $(O_2N)_3C_6H_2Cl$ and of 1,3,5-$C_6H_3(NO_2)_3$ are reviewed. A bibliography of 86 references is given Expts undertaken to det the most suitable process of manuf of these 2 compds are described Comparison of the Griesheim Chemische Fabrik process (Ger pat 78 309), Desvergnes process (modification of the preceding process in which the amt of $HNO_3$ is considerably reduced) and Frankland and Garner process (*C A* 14, 3068) for the prepn of picryl chloride showed that, from the standpoint of cost and consumption of raw materials, the Desvergnes and Frankland Garner processes yield a technically pure product at practically the same cost, which is much lower than that of the Griesheim process Comparison of the prepn of *s* $C_6H_3(NO_2)_3$ by (*a*) reduction of picryl chloride, (*b*) oxidation of trinitrotoluene with $K_2Cr_2O_7$ and (*c*) nitration of *m* $C_6H_4(NO_2)_2$ showed that (*b*) is the most advantageous from the doublest andpoint of the purity of the product and cost of production A Papineau Couture

**Determination of constitution by changing the order in which groups are introduced into the benzene nucleus.** J W Dienske *Rec trav chim* 50, 21–31(1931), cf *C A*. 25, 922 —4-$NCSC_6H_4NH_2$ was converted by means of the Sandmeyer reaction into *4 chlorothiocyanobenzene*, m 35 5–6°, which was obtained also from *p*-$ClC_6H_4NH_2$ by diazotization and treatment with CuSCN $Co(SCN)_2$ gives better results in this reaction than CuSCN, but much better results are always obtained in reactions of this kind by the method of Thurnauer (*Ber* 23, 769(1890)) namely, by taking a *soln* of CuSCN in a concd soln of KCNS Application of the Sandmeyer reaction to 4-$NCSC_6H_4NH_2$ also gave *4 bromothiocyanobenzere* m 54° (Challenger and Collins, *C. A* 18, 2689 give 56°), which could be prepd also from diazotized *p*-$BrC_6H_4NH_2$ by Thurnauer's method *4-Iodothiocyanobenzene*, m 51°, was prepd from 4-$NCSC_6H_4NH_2$ in the usual way, but could not be obtained from 4 $IC_6H_4NH_2$ on treating the diazotized soln with CuCNS, which is in accordance with the experience of Challenger and Collins (*C A* 18, 2689) Detailed directions are given for the prepn of *4-cyanothiocyanobenzene*, m 127 5°, and of *1,4-dithiocyanobenzene*, m 108 5°, from 4 $NCSC_6H_4NH_2$, on nitration with $HNO_3$ and $H_2SO_4$, the latter compd gives *2 nitro-1,4-dithiocyanobenzene*, m 146 5° (cf Challenger and Peters, *C* 1 22, 3152) which was now obtained also by means of abs $HNO_3$ The hydrolysis of 4-$NCSC_6H_4Br$ with boiling 10% KOH gave $(p\text{-}BrC_6H_4)_2S_2$ m 93°, together with 4-$BrC_6H_4SH$, the same compds being formed on boiling with 75% $H_2SO_4$ The compd remained unchanged, however, on boiling with 10% $H_2SO_4$ On hydrolyzing 4 $NCSC_6H_4I$ with boiling 10% NaOH, $(p\text{-}IC_6H_4)_2S_2$, m 125°, and 4 $IC_6H_4SH$, m 82–6°, were obtained These reactions are in accordance with the general rule that NCS compds are decompd by heating with acids or alkalies with the formation of mercaptans and disulfides (cf. Brüning, *Ann.* 104, 198(1857)) C. F van Duin

**The nitration of 4-thiocyanoacetanilide.** J W Dienske *Rec trav chim* 50, 165–83(1931) —The nitration of 4 $NCSC_6H_4NHAc$ (I) was studied in order to investigate whether the NCS group is displaced in nitration processes like the $SO_3H$ group (cf Zincke, *Ann* 339, 202(1905), de Lange, *C A* 20, 1982) Challenger and Peters (*C. A* 22, 3152) nitrated this compd with $HNO_3$ and $H_2SO_4$ to 2,4 $O_2N(NCS)C_6H_3NHAc$, D, using abs $HNO_3$, obtained *2,6-dinitro-4 thiocyanophenylnitramine* (II), the NCS group *not* being displaced At first an attempt was made to det the constitution of this compd by converting 4 thiocyanoanisole or -phenetole into the 2,6-dinitro deriv, which was further transformed into the amino compd The latter, however, could not be transformed into the nitramine The NCS group was then oxidized to a $SO_3H$ group, which was subsequently displaced by a nitro group, finally the 2,4,6-$(O_2N)_3C_6H_2NHNO_2$ being hydrolyzed to picric acid I was nitrated with abs $HNO_3$ at —10° to II, decompg explosively at 70°, II is rather unstable and was converted into a sticky mass on keeping in a bottle for 4 weeks *4-Thiocyanophenetole* (III), m 47 5–8°, was obtained from *p*-phenetidine in the usual way together with some of the isomeric mustard oil to be described later, the ethylation of 4-$NCSC_6H_4OH$

(Söderback *C A* 14, 1808), however, did not give III, but an unknown substance which could not be identified On nitrating III with 65% $HNO_3$, *2 nitro-4 thiocyano-phenetole*, m 85° (IV), is formed, while from the mother liquors of the recrystn of IV, some 4-nitrophenetole, m 58°, was obtained A 2nd by product, formed in this nitration, is picric acid, formed by further nitration and hydrolysis of the 4 nitrophenetole. The constitution of IV was proved by its formation from 2,4 $O_2N(H_2N)C_6H_3OEt$ (Reverdin, *C A* 21, 1451) by the Sandmeyer reaction Nitration of IV with abs $HNO_3$ at 0° gives *4 thiocyano-2,6-dinitrophenetole* (V), m 77°, the constitution of which was established by converting it into picric acid, first the SCN group was oxidized to the $SO_3H$ group with $HNO_3$, then the OEt group was hydrolyzed with alkali to the OH group and the resulting $4,3,5\text{-}HO(O_2N)_2C_6H_2SO_3H$ nitrated to picric acid On warming with alc. $NH_3$, V is converted into *4 thiocyano 2,6-dinitroaniline* (VI), m 180°. On carrying out the Sandmeyer reaction with *p*-anisidine, *4 thiocyanoanisole* (VII), m 35°, is obtained, together with some of the isomeric mustard oil, to be described later In the nitration of VII, *2 nitro-4 thiocyanoanisole* was formed together with some 4-nitroanisole and some picric acid, while further nitration affords *4 thiocyano-2 6-dinitroanisole*, m 93°, which was again converted into VI by means of alc $NH_3$ VI was recovered unchanged after treatment with abs $HNO_3$, while II was not converted into VI on heating with phenol by van Romburgh's method, a substance, m 200–1°, which was not investigated further, being obtained instead of VI. The constitution of II was proved, however, by boiling II with $HNO_3$, hydrolyzing the $SO_3H$ acid with alkali to the corresponding phenol and nitrating the latter to picric acid Finally, a discussion of the m ps of the various thiocyano compds in connection with the m p rules postulated by Franchimont (*Rec trav chim* 16, 126(1897)), is given

C F VAN DUIN

**Hydrogenation of aniline under pressure in presence of activators (cerium and lanthanum).** V S SADIKOV AND A YU SHAGALOV *J. Russ Phys.-Chem Soc.* 62, 1635–42(1930) —In search for a new and cheaper catalyst, a series of expts on hydrogenation of aniline under pressure were carried out by S and S., using as catalysts Os and Ni with addn of activating agents (Ce and La) The results for Os tend to show that addn of Ce has no influence on the duration of hydrogenation, decreases the quantity of benzene 3 times of cyclohexylamine twice, increases twice the quantity of dicyclohexylamine, and by 10% that of non reacting aniline The quantity of H consumed is somewhat smaller With Ni + Ce the addn of Ce renders the catalyst more sensitive to thermal decompn on prolonged heating in the process of its reduction Although the system Ni + Ce cannot substitute Os it is a more efficient catalyst than Ni. For Ni + La a short time of preheating is more important than for Ni La does not possess the condensing properties of Ce and the reaction results in formation of more cyclohexylamine (70 21% compared to 33%) and less dicyclohexylamine (17% against 52%) In general the greater efficiency of Os is based on its ability for reduction at room temp as heating is shown to poison Ce and La J G TOLPIN

**Interaction of alcohols and ethers with aniline hydrochloride.** S A BUSSE AND A I. TRAVIN *J Russ Phys.-Chem Soc* 62, 1685–90(1930) —It has been shown many times that chlorozincaniline with aliphatic alcs gives at high temps and pressures mostly homologs of aniline substituted in the ring Halogen salts of aniline or its homologs give secondary and tertiary bases B and T worked out a method of obtaining benzylaniline and octylaniline and investigated the interaction of benzyl and octyl alc with aniline-HCl and obtained BzH and $C_7H_{15}CHO$ by oxidation of the corresponding anilines Heating at low temp for a short time gave good results It is important to drive off the water as it is formed $PhCH_2OAc$ gives a higher yield than $PhCH_2OH$ For octylaniline the reverse is true Benzylaniline was obtained by heating in an oil bath 10 g benzyl alc with 20 g $PhNH_2$ HCl 4–5 hrs at 180–90°, cooling, treating with NaOH, washing, drying with fused $Na_2SO_4$ and fractionating Yield, 59% By using 20 g $PhCH_2OAc$ and 35 g $PhNH_2$ HCl the yield is 79 3%. Oxidation of benzylaniline to BzH is done most effectively by ferric salts and $ONC_6H_4NMe_2$. To 20 g $PhNHCH_2Ph$ 150 g of $Fe_2(SO_4)_3$ was added in 10 g portions and in presence of $H_2SO_4$. BzH was distd., extd with ether and treated with a satd soln of bisulphite Yield 61 7% $FeCl_3$ gave only a 51 7% yield Oxidation by means of $ONC_6H_4NMe_2$ is effected by adding 8 g of it to 5 g of benzylaniline and slowly heating the mixt. to 150° for 1 hr., using an air condenser An excess of dil $H_2SO_4$ is added and BzH distd Yield, 73 8% $ONC_6H_4NMe_2$ is reduced to azoxydimethylaniline ($PhCH_2NHPh + 2ONC_6H_4NMe_2 = PhCH{:}NPh + (Me_2NC_6H_4)_2N_2O + H_2O$), the latter, m 241°, was isolated from the reaction mixt. by extg the sol part with alc., washing and recrystg from benzene and $CHCl_3$ Octylaniline was prepd

by heating a mixt of 50 g octyl alc and 100 g aniline-HCl on an oil bath 7–8 hrs to 210–40°, treating with NaOH, washing with water, drying with $Na_2SO_4$ and rectifying Yield, 75%, b. 146–8° $C_6H_{17}OAc$ was also used instead of octyl alc at 270–80° The product b. 158–8.5° corresponds to the formula $C_{14}H_{23}N$, gives no cryst. salts and no isonitrile or diazo reaction Oxidation with $Fe_2(SO_4)_3$ and $ONC_6H_4NMe_2$ gives octanal, the semicarbazone of which m. 100°, it is therefore concluded that the compd is $Me(CH_2)_6CH_2NHPh$, $d_{25}^{25}$ 0.9089, $n_D^{20}$ 1.5132 J. G. Tolpin

**Reactions of some carbonyl compounds with phenylhydrazine.** L. Chas. Raiford and Wilbur T. Daddow *J. Am. Chem. Soc.* 53, 1552–8(1931).—The CO radical in HCONHPh does not condense with $PhNHNH_2$ to give a hydrazone under the conditions studied The products are $PhNH_2$ and HCH NNHPh Substitution products of HCONHPh react similarly $(PhNH)_2CO$ reacts with $PhNHNH_2$ to give a semicarbazide and eliminates $PhNH_2$, the corresponding thiourea behaves in the same way *sym* Di(2,5-dibromophenyl)thiourea m. 191° (Dyson, George and Hunter, *C. A.* 21, 1637, give 154°), the *2,4-di Br isomer*, m. 203° The following *thiosemicarbazides* were prepd. by heating the required urea with $PhNHNH_2$ in EtOH for 6 hrs *1-phenyl-4 (4 bromophenyl)*, m. 179–80°, *1 phenyl 4-(2,5-dibromophenyl)*, m. 188°, *2,4-di-Br isomer*, m. 177–8°, 1 pheny-4 (*o* tolyl), m. 170.1°, *m* tolyl isomer, m. 173–4°, *1-phenyl-4-(α-naphthyl)*, m. 192–3°, *1 phenyl-4 (3 nitrophenyl)*, m. 172° Oxidation of thioureas with $PbO_2$ in $C_6H_6$ gives *carbodiimides di m tolyl*, m. 118–9°, *di(2 bromophenyl)*, m. 98–100°, *di 4 bromophenyl*, m. 144°, *di 2,4-dibromophenyl*, m. 156–7°, *di 2,5-dibromophenyl*, m. 172.3° With $PhNHNH_2$ in $C_6H_6$ these compds yield *anilguanidines*, *di o tolyl*, m. 137°, *di m tolyl*, m. 158.9°, *di 2 bromophenyl*, m. 147–8°, *di-3 bromophenyl*, m. 162–3°, *di-4 bromophenyl* m. 202–3°, *di α naphthyl*, m. 157–9°, *di β naphthyl*, m. 181–2° Oxidation of these gives *azo compds di-o tolyl*, pale red, m. 113–4°, *di m tolyl*, brilliant red, m. 107–8°, *di 2-bromophenyl*, brilliant red, m. 132–3°, *3-Br isomer*, dull red, m. 131.2°, *4 Br isomer*, red, m. 163–4° The evidence indicates that these guanidine derivs are not hydrazones C. J. W.

**Reduction of azobenzene, azoxybenzene and nitrosobenzene by the system magnesium + magnesium iodide.** W. E. Bachmann *J. Am. Chem. Soc.* 53, 1524–31 (1931).—$(PhN)_2$ is reduced by the system Mg + $MgI_2$ to $[Ph(MgI)N]_2$ PhNN(O)Ph is reduced by the binary system to $(PhN)_2$ or to $(PhNH)_2$ according to the amt. of reducing agent employed Substituted azobenzenes and azoxybenzenes react in the manner of the unsubstituted compds except that in certain instances reduction proceeds to a considerable extent beyond the hydrazobenzene stage PhNO is reduced principally to $[Ph(MgI)N]_2$, $(PhN)_2$ is formed as an intermediate product in this reaction The reactions of $[Ph(MgI)N]_2$ with I, O, $CO_2$, PhNN(O)Ph, $(PhCO)_2$ and BzH are described The results obtained, in agreement with those of previous studies, lend support to the hypothesis that the active reducing agent is MgX, generated by interaction of Mg and Mg halide C. J. West

**Action of amines on 2-substituted semicarbazones.** James Chapman and Forsyth J. Wilson *J. Chem. Soc.* 1931, 507–14.—$Me_2C$ NNPhCONH$_2$ (I), heated with $PhCH_2NH_2$ until the evolution of $NH_3$ had ceased (1 hr. at 160°), gave a mixt. of $(PhCH_2NH)_2CO$, m. 171°, and $PhCH_2NHCONH_2$, m. 149° With $PhNH_2$ 40 min. at 155–60° it gave $(PhNH)_2CO$ and a small quantity of a compd. m. 133° *p*-$MeC_6H_4NH_2$, heated 40 min. at 145–50°, gives $(p\text{-}MeC_6H_4NH)_2CO$ and a small quantity of a compd. m. 162°. $PhCH_2CH_2NH_2$ at 150–60° gives $(PhCH_2CH_2NH)_2CO$ and a tar. $C_7H_{15}NH_2$ 45 min. at 160° gives $(C_7H_{15}NH)_2CO$, m. 91°, and a tar Heating I at 140–5° for 1 hr. gives cyanuric acid and $Me_2C$ NNHPh Thus the reaction with the amines may be formulated as a thermal decompn., followed by the reaction of the $Me_2C{\cdot}N{\cdot}NHPh$ with the amine to give the $(RNH)_2CO$ and $NH_3$, hence none of the expected *2,4-disubstituted* semicarbazone would be expected PhMeC *NNPhCONH*$_2$, m. 126°, behaves similarly, $PhNH_2$ giving $(PhNH)_2CO$ and PhMeC NNHPh PhCH.N·N(CH$_2$Ph)CONH$_2$ is stable even after 1.5 hrs. heating at 200°, since the reaction with $PhNH_2$ and *p*-$MeC_6H_4NH_2$ occurs at 165–70°, the products are PhCH NN(CH$_2$Ph)CONHPh, m. 152°, and *benzaldehyde 4-p tolyl 2 benzylsemicarbazone*, m. 172°, $PhCH_2NH_2$ at 175° gives some $(PhCH_2NH)_2CO$ and *benzaldehyde 2,4-dibenzylsemicarbazone*, m. 124°. PhCH NNMeCONH$_2$ and $PhNH_2$ at 180° give PhCH NNMeCONHPh, m. 108°; apparently the decompn. temp. of the semicarbazone is above 180°. With $PhCH_2NH_2$ at 165–70° for 1 hr. the main product was $(PhCH_2NH)_2CO$, only a small quantity of *benzaldehyde 4-benzyl-2-methylsemicarbazone* (II), m. 106°, being formed, there also results a minute quantity of a *compd.*, $C_{11}H_{12}O_2N_2$, m. 88–9° Heating for 3 hrs. gives a small quantity of a *compd.*, $C_{17}H_{18}O_2N_2$, m. 63° PhCH NNPhCONHMe

did not react with $PhNH_2$ at 180° II and $PhCH_2NH_2$ at 170° give $(PhCH_2NH)_2CO$ The mechanism of these reactions is discussed C. J. West

**Reactions of nitrosulfonyl chlorides. II. Separation of nitrosulfonyl chlorides by means of hydrazine hydrate.** Wm Davis Frederick R Storrie and Stanley H Tucker *J Chem Soc* 1931, 624-9 cf *C A* 23, 3064.—*o* $O_2NC_6H_4SO_2NHNH_2$ and Me CO give *acetone o nitrobenzenesulfonhydrazone* m 147-8° (decompn), *piperonal deriv* bright yellow m 177-9° (decompn), the prepns were carried out by adding the cold solid to the aldehyde or ketone and boiling 1 min *p* $O_2NC_6H_4SO_2Cl$ (4.43 g) in $C_6H_6$ gradually added to $N_2H_4$, $H_2O$ in abs EtOH at 40°, 0.5 *N* AcONa added and the $C_6H_6$ removed in a stream of air gives 3.7 g *p nitrobenzenesulfonhydrazide*, m 150.2° (decompn), it is decompd by boiling EtOH *Acetone p nitrobenzenesulfonhydrazone*, m 169.71° (decompn), *benzaldehyde deriv*, m 142-4° (decompn), *piperonal deriv*, golden m 189.90° (decompn) The *m isomer* was prepd as above in 90% yield and m 130° (decompn) it is stable in boiling EtOH, *acetone m nitrobenzenesulfonhydrazone*, m 148.50° (decompn) *MeEtCO deriv*, m 124-5° (decompn) *benzaldehyde deriv*, m 150-1° (decompn) *piperonal deriv*, bright yellow, m 173-5° (decompn) *2,4-Dinitrobenzenesulfonhydrazide*, prepd at −10°, light yellow, m 110° (decompn), it is very unstable to heat evolving N heating with aq $N_2H_4$ or dil HCl gives *2,4-dinitrobenzenesulfinic acid*, m 196° either compd, heated in $H_2O$, gives quant *m*-$C_6H_4(NO_2)_2$ The $RSO_2NHNH_2$ may be converted into RSO Cl by passing Cl through a $CHCl_3$ soln *o* and *p* $O_2NC_6H_4SO$ Cl may be sepd by adding the soln in $C_6H_6$ to $N_2H_4$ $H_2O$ in abs EtOH, heating at 35°, adding 0.5 *N* AcONa and crystg the *p*-$O_2NC_6H_4SO_2NHNH_2$ the AcONa soln contains the *o* $O_2NC_6H_4SO_2H$, converted by Cl in $CHCl_3$ to *o* $O_2NC_6H_4SO_2Cl$ Details are given for the sepn of the *o* and *m*, *m* and *p*- and *o*, *m* and *p* isomers, also for the sepn of 2,4,5-$ClMe(O_2N)C_6H_2SO_2H$ from a mixt of 2.4.5- and 2.4.6 $ClMe(O_2N)C_6H_2SO$ Cl C. J. West

**Tertiary arylalkylphosphines. II.** Ivor K Jackson and Wm J Jones *J. Chem Soc* 1931, 575-8, cf *C A* 25, 283.—2.5 $Me_2C_6H_3PCl_2$, $b_{12}$ 129°, $b_{13}$ 140° (20 g), and MeMgI give 14 g of *p-xylyldimethylphosphine*, $b_{12}$ 106°, $d_4^{25}$ 0.9541; boiling in a current of air gives the *oxide*, m 91-5°, distils without decompn · *mercurichloride*, m 225° $CS_2$ gives the *inner anhydride* of *p-xylyldimethylhydroxyphosphinocarbithionic acid* $C_6H_3PMe_2$ CS S deep red, m 76° MeI gives *p-xylyltrimethylphosphonium iodide*, m 204°, the *mercuriiodide* m 152°, the *chloroplatinate*, orange, m 236°; *tri iodide*, dark red, m 91° *p-Xylyldiethylphosphine*, $b_{12}$ 157°, $d_4^{25}$ 0.9392, *mercurichloride*, m 184° the *methylphosphonium iodide*, m 137° (*chloroplatinate*, orange, m 217°, *mercuriiodide*, pale yellow m 105°, *triiodide* chocolate, m 85°) *p-Xylyldipropylphosphine*, $b_{14}$ 161° $d_4^{25}$ 0.9231, *mercurichloride*, m 188°, *methylphosphonium iodide*, m 105° (*chloroplatinate*, orange m 141°, *mercuriiodide*, yellow, m 90°, *tri iodide*, m 76°) *p-Xylyldibutylphosphine* $b_{18}$ 171°, $d_4^{25}$ 0.9124, *mercurichloride*, m 179°, *methylphosphonium iodide* m 93° (*chloroplatinate*, orange, m 215°, *triiodide* m 70°) *p-Xylyldiisobutylphosphine*, $b_{16}$ 184°, *mercurichloride*, m 227°, *methiodide*, m 120° *p-Xylyldiamylphosphine*, $b_{23}$ 214°, *mercurichloride*, m 117°, the *methylphosphonium chloroplatinate*, orange, m 151° C. J. West

**Magnesium derivatives of dichlorotriphenylphosphine and of the pentaphosphines.** V Grignard and J Savard *Compt rend* 192, 592-5(1931).—Dichlorotriphenylphosphine (I), m 176°, was obtained by treating $Ph_3PO$ with $PCl_5$ I with RMgX gave $Ph_3P(MgX)_2$ (II) II with ROH (R alkyl) gave $Ph_3PR_2$, m 163-6°, 172°, 179-82° for R = Me, Et, Pr, resp This is the 1st time that all 5 valences of P have been substituted by hydrocarbon radicals Julius White

**Aromatic tin compounds with halogen in the benzene nucleus.** K A. Kochesikov and A N Nesmeyanov *Ber* 64B, 628-36(1931), cf *C A* 25, 927.—The following new compds were prepd *Dichlorostannanes* $(p\text{-}ClC_6H_4)_2SnCl_2$ (I) (75% yield) by heating $(p\text{-}ClC_6H_4)_2Hg$ (II) (see *C A* 23, 5172) and $SnCl_2$ in abs EtOH, m 86.5°, hydrolyzed by $H_2O$, *p*-Br deriv (III) (85% yield by a similar method), m 103°, *p*-I deriv (IV) (75% yield from $(p\text{-}IC_6H_4)_2Hg$ (V) and $SnCl_2$ in abs $Me_2CO$), m 147°. *Dibromostannanes* $(p\text{-}ClC_6H_4)_2SnBr_2$ (92% yield from II and $SnBr_2$ in EtOH), m 73° (cf Krause and Weinberg, *C A* 24, 349), *p*-Br deriv (96% yield), m 82°, *p*-I deriv (VI) (75% yield from V and $SnBr_2$ in $Me_2CO$), m 102° *Diiodostannanes* $(p\text{-}ClC_6H_4)_2SnI_2$ (almost quant yield from I and a large excess of NaI in hot abs EtOH) m. 46-7°, not hydrolyzed by $H_2O$, *p*-Br deriv, m 79-80°, *p*-I deriv (80% yield from IV and NaI in hot MeOH), m 88.5° *Stannones* $(p\text{-}ClC_6H_4)_2SnO$ (90% yield from I in EtOH treated with an excess of 5% aq KOH) sol in mineral acids giving the corresponding

salts: *p*-Br deriv. (92% yield from III), *p*-I deriv from IV. *Thiostannones:* $(p\text{-}ClC_6H_4)_2SnS$, prepd by dissolving I in EtOH and adding a slight excess of 5% alc KOH satd with $H_2S$, m 179°, *p*-Br deriv., prepd by passing $H_2S$ into a soln of III in abs EtOH, m 228-9°, *p* I deriv., prepd by adding 10% alc KOH satd with $H_2S$ to a soln of IV in abs EtOH, m 248° *Trichlorostannanes* $p\text{-}ClC_6H_4SnCl_3$ (VII), prepd in almost quant yield by heating I and $SnCl_4$ in a bomb tube at 150°, m 39°, insol in $H_2O$ but made sol by the addn of a few drops of concd HCl, hydrolyzed by $H_2O$, *p*-Br deriv (VIII), by heating III and $SnCl_4$ in a bomb tube at 150°, m 64.5–5°, has properties similar to those of the corresponding Cl deriv., *p*-I deriv (IX), by heating IV and $SnCl_4$ in a bomb tube at 165°, m 55-6°, very hygroscopic, decomps in air in a few min *Tribromostannane* $p\text{-}IC_6H_4SnBr_3$, from VI and $SnBr_4$, m 80–80.5°, hydrolyzed by $H_2O$ *Stannonic acids* $p\text{-}ClC_6H_4SnO_2H$, prepd by dissolving VII in petroleum ether and adding an excess of 5% aq KOH, easily sol in aq caustic alkali and in mineral acids with formation of the corresponding salts *p* Br deriv., prepd from VIII; *p* I deriv., prepd from IX, sol in mineral acids and caustic alkali *Thioanhydrides of dithiostannonic acids:* $(p\text{-}ClC_6H_4Sn)_2S_3$, prepd by dissolving VII in $H_2O$ with the addn of a few drops of concd. HCl and satg the soln with $H_2S$, sol in HCl (1 1) with evolution of $H_2S$, *p* Br deriv., prepd from VIII, resembles the Cl deriv., *p*-I deriv., prepd from IX, resembles the Cl deriv Two compds contg multivalent I were prepd $(p\text{-}Cl_2IC_6H_4)_2SnCl_2$, prepd by dissolving IV in $CHCl_3$ at —15° and adding $CHCl_3$ satd with Cl at —15°, bright yellow, m 82-2.5°, *p* $Cl_2IC_6H_4SnCl_3$ prepd by passing Cl at —15° into as concd a soln as possible of IX in $CHCl_3$ bright yellow decomps gradually 50-70° L K

**Piria reaction. I. The over-all reaction.** W H Hunter and Murray M Spruno *J Am Chem Soc* 53, 1432–43(1931) —The Piria reaction is the prepn of aminosulfonic acids from aromatic $NO_2$ compds by heating the latter with m tal sulfites and then boiling with mineral acids (*Ann* 78, 31(1851)) In an attempt to explain the mechanism, a standard procedure has been developed for the reaction which consists in adding a weighed quantity of the $NO_2$ compd to enough of a 5.2 *N* soln of $Na_2SO_3$ to constitute approx a 75% excess over that calcd on the basis of 3 mols of bisulfite per mol of $NO_2$ compd Enough 5 *N* NaOH was then added to neutralize 25% of the bisulfite and to the whole was added $H_2O$ in the ratio of 1250 cc for each mol of $NO_2$ compd The mixt was then refluxed until homogeneous In the acid treatment the mixt. was evapd to about 50% of the original vol and treated while hot with 250 cc concd HCl for each mol of original $NO_2$ compd and boiled for 0.5–2 hrs. The combination of the 2 reactions gives in every case an aminosulfonic acid and an amine (except in the case of *p* $O_2NC_6H_4OH$), it appears that a ring Me group favors the formation of amines, while the presence of a $CO_2H$, a 2nd $NO_2$ or a condensed ring favor the formation of the acids In most cases the yield of the 2 chief products is slightly in excess of 80% The speed of the 1st phase of the reaction (reduction) increased with dilu Using the standard procedure $PhNO_2$ gives 26% of $PhNH_2$ and 27% of *p* $H_2NC_6H_4SO_3H$, α-$C_{10}H_7NH_2$ gives 2% of α $C_{10}H_7NH_2$, 25% of naphthionic acid and 66% of 2,4-$(HO_3S)_2C_{10}H_5NH_2$, *o*-$MeC_6H_4NH_2$ gives 40% of *o* $MeC_6H_4NH_2$, 34% of 2 toluidine 5 sulfonic acid and 12% of Na *o* tolylsulfaminate *p* $MeC_6H_4NH_2$ gives 72% of *p*-$MeC_6H_4NH_2$ and 11% of 4 toluidine 3 sulfonic acid nitro *p* xylene (using 3 times the usual amt of $H_2O$) gives 60% of *p*-xylidine and 16% of 3 amino-1,4 xylene 6 sulfonic acid, *m* $C_6H_4(NO_2)_2$ with a 10% excess of $Na_2SO_3$ gives a trace of *m* $O_2NC_6H_4NH_2$ and 64% *m* nitroaniline-*p*-sulfonic acid, using a 110% excess of $Na_2SO_3$ gives 1% of this acid and 10% of *m*-phenylenediamine *p* sulfonic acid, *p* $O_2NC_6H_4CO_2H$ gives 21% of *p*-$H_2NC_6H_4CO_2H$ and 61% of 4.3 $H_2N(HO_2C)C_6H_3CO_2H$, *p* $O_2NC_6H_4OH$ gives 14% of the same acid These yields are the av of several expts Details are given for the isolation and identification of the reaction products *II. The role of the sulfaminic acids. Ibid* 1443–7 — The *Na salts* of *phenylsulfaminate* (crystg with 1 mol $H_2O$), *p*- and *o tolylsulfaminates* and *p acetamidophenylsulfaminate* (crystg with 2 mols $H_2O$) have been prepd., with HCl concns from 0.5 to 5.35 *N*, these salts hydrolyze quantitatively to $H_2SO_4$ and the corresponding amines, giving absolutely no trace of aminosulfonic acids Hence the aminosulfonic acids which are produced by the 'over all' Piria reaction are certainly not formed by rearrangement of sulfaminic acids C J West

**Preparation and properties of some ethyl arylsulfonates and a comparative investigation of their velocities of hydrolysis with those of the corresponding ethyl arylcarboxylates.** Laslo Demény *Rec trav chim* 50, 60–71(1931) —The velocities of hydrolysis of $PhSO_2Et$ and its *o*, *m* and *p*-nitro derivs have been measured and compared with those of theEt esters of BzOH and the 3 $O_2NC_6H_4CO_2H$. According to Wegscheider (*C A* 13, 2213 *Z physik Chem* 41, 52(1902)) the hydrolysis of sulfonic esters by water is not accelerated by H ions and Olivier and Berger have shown (*C A* 17,

1783) that the same holds for all esters derived from strong acids The difference in behavior between esters of $CO_2H$ acids and of $SO_2H$ acids clearly appears from an investigation of Karlsson (*C A* 20, 690) who showed the velocity of hydrolysis of AcOEt to be largely dependent on the H ion concn and to have a min at *p*H 5.35, while the velocity of hydrolysis of $PhSO_2Et$ (I) was nearly independent of the *p*H The following compds were prepd by the interaction of the sulfonyl chloride and NaOEt in EtOH: *Et benzenesulfonate* (I), $b_{14}$ 153–4°, *Et 3 nitrobenzenesulfonate* (II), m 42°, *4 nitro isomer* (III) m 92°, 2 nitro ester (IV) m 15°, b 163–4° in an abs vacuum Working at 25° and with 30% EtOH (by vol) as a solvent, the following values were obtained for *K* calcd from the equation for a monomol reaction (the values in parentheses represent the mean alky of the soln) I 0.00036 (0.005 *N*) 0.00041 (0.008 *N*) IV 0.0073 (neutral soln) 0.0077 (0.0017 *N*) II 0.0022 (0.0017 *N*), 0.0023 (0.0035 *N*), 0.0026 (0.006 *N*), III 0.0026 (0.0012 *N*) I or *K* calcd from the equation for a bimol reaction were obtained the following figures under the same conditions I 0.46 (in water 1.96), IV 1.23, II 11.4 III 19.0 the alky varying between 0.003 and 0.005 *N* It now follows that the introduction of a $NO_2$ group into the benzene ring exerts an accelerating influence on the hydrolysis of both the sulfonates and the benzoates While, however, a $NO_2$ group in the *m* and *p* positions has a similar effect in both types of esters the effect produced by an *o* nitro group is very different, a slight accelerating effect being observed in BzOEt and a powerfully accelerating effect with I. With *Et p-toluenesulfonate*, *K* = 0.00019 (mean alky 0.0017 *N*) was found under the same conditions, thus showing the retarding influence of a *p*-Me group The difference between $SO_2H$ and $CO_2H$ acids is discussed at length in the original paper, to which reference must be made for details

C F VAN DUIN

**Arylsulfonalkylamides.** LASLO DEMÉNY *Rec trav chim* 50, 51–9(1931), cf. *C A* 24, 835.—This paper deals with the arylsulfonalkylamides derived from $PhSO_2H$, 4 $BrC_6H_4SO_2H$, *p*-$MeC_6H_4SO_2H$ and 2 4 6 $Me_3C_6H_2SO_2H$, which were prepd from the corresponding sulfonyl chlorides and 2 mols of the amines They were purified by pptn from 12% KOH with HCl, followed by recrystn from a suitable solvent *Benzenesulfonbutylamide* was obtained as a viscous oil which did not crystallize even at —30°, but was converted into a vitreous mass at that temp (cf Ssolonina, *Chem Centr* 1899, II 869) *Amylamide* was also obtained as a viscous colorless oil, passing into a vitreous mass at —30°, *heptylamide*, m 20° 4 $BrC_6H_4SO_2H$ was prepd by sulfonation of PhBr with the addn of a trace of I as a catalyst (cf Rây and Dey, *C A* 15, 513), yield 38 g Na salt from 62 g PhBr, the chloride m 75°. *4 Bromobenzenesulfonamyl amide*, m 55° *hexylamide* m 55°, *heptylamide*, m 65° *4 Methylbenzenesulfonbutyl amide*, m 43° *amylamide* did not crystallize on standing for a long time in the ice chest, *hexylamide* m 62° *heptylamide* m 27° 2 4 6 $Me_3C_6H_2SO_2Cl$, m 56°, was prepd by adding 24 g mesitylene with continuous stirring to 42 g $ClSO_2H$ at 0°; yield, 20 g *2 4 6 Trimethylbenzenesulfonpropylamide*, m 54°, *butylamide*, m 41°, *amylamide*, m 42°, *hexylamide*, m 64° *heptylamide*, m 45°. From the graphs constructed with the aid of these m ps it was noted in agreement with other investigators, that the introduction of alkylamine residues into arylsulfonalkylamides brings about a marked lowering of the m p In general, however, a rise in the m ps was observed with the introduction of the 5th $CH_2$ group and onward which was to be expected from Timmermans' law of the convergence of m ps (*C A* 16, 2060) Considering the graphs obtained with 4 bromo- and with 2 4 6 trimethylbenzenesulfonalkylamides a min. in the m p curves of the arylsulfonalkylamides is observed in the $AmNH_2$ derivs In several other cases deviations or anomalous positions with regard to homologs have been noted with a normal alkyl group contg 5 C atoms This is found in the mol vols. of the 5th term of the homologous series (Le Bas *The molecular volumes of liquid chemical compounds*, 24, 146, 148 150(1915)), the velocity of hydrolysis of valeramide (Crocker, *C. A* 1, 2076) the velocity of reaction of AmI on PhONa (cf Segaller, *C A* 7, 3316 8, 1267, Gluud and Kempf, *C A* 7, 3753) and the optical rotatory power of homologous series in which the 5th term shows an abnormal behavior (Pickard and Kenyon, *J Chem Soc* 75, 362(1889)) Thus, besides the ordinary oscillation (cf Nekrassov, *C. A* 22, 56, Verkade *C A* 24, 4204) there appears to be a 2nd type, which shows an anomaly in the 5th term in the homologous series (cf van der Kam, *C A* 21, 2883) C F VAN DUIN

**New derivatives of *p*-arsanilic acid. I. *p*-Arsonosuccinanilic acid and related compounds.** GILBERT T. MORGAN AND ERIC WALTON *J. Chem Soc* 1931, 615–9.—Compds of the type $H_2O_3AsC_6H_4NHCO(CH_2)_xCONR_1R_2$ from which the apparently toxic $NHCH_2$ group is absent, have been examd Atoxyl (12.8 g) and succinic anhydride (12 g), heated 1 hr at 170–80°, give 10 g *p-arsonosuccinanilic acid* (I), silky prisms, if the resulting mass is boiled with $H_2O$ slightly acidified with HCl there results

*succinanilide p p'-diarsonic acid*, ill defined solid, *di Na salt*, amorphous, dissolving in $H_2O$ to give a soln of approx *p*H 7.5. I and $PhNH_2$, heated for 2 min give *succinanilide p-arsonic acid*, small leaflets. Na salt, needles, giving a soln of approx *p*H 8; the *methylamide deriv* prisms. *Na salt*, crystals with 2 mols $H_2O$; the *ethylamide deriv*, silky prisms; yields a *Na salt* leaflets. I and HCl, satd with $SO_2$, give *p-dichloroarsino succinanilic acid*, pale buff, m. 210.1°. Heating I at 210° for 1.5–2 hrs., gives succinanil *p*-arsonic acid, amorphous, which regenerates I on addn of $H_2O$; with 1 tOH $NH_3$ at 75–80° for 3–4 hrs. there results *succinanilamide p-arsonic acid* leaflets whose *$NH_4$ salt* crystallizes with 1 mol $H_2O$. *Na salt*, plates with 1 mol $H_2O$; the corresponding *dimethyl amide* forms leaflets. Na *salt*, crystallizes with 1 mol $H_2O$; the *piperidide* crystallizes as needles. Preliminary pharmacol. reports on the mono Na salts indicate very low toxicities combined with therapeutic activity against trypanosomes in all cases except that of the diarsonic acid. Values are given and compared with tryparsamide.

C. J. West.

**Diphenyl ether series. III. Derivatives of the local anesthetic type.** C. M. Suter and Emer Ohler. *J. Am. Chem. Soc.* 53, 1961–9(1931); *cf. C.* 1, 25, 1818.—*4 (4 Nitrophenoxy)benzaldehyde* (I), m. 104.5°, results in 75% yield from *p*-$KOC_6H_4CHO$ and *p*-$ClC_6H_4NO_2$, after heating 6 hrs. at 190–200°; the *2 $NO_2$ isomer*, m. 84–5°. 4-$O_2NC_6H_4OPh$ and AcCl with $AlCl_3$ in $CS_2$ give 55% of *4 (4 nitrophenoxy)acetophenone* (II), m. 80.1°. Oxidation of I or II gives *p*-$O_2NC_6H_4OC_6H_4CO_2H$, m. 235.6°; *chloride*, m. 79–80°; *amide*, m. 167.8°; *Et ester*, m. 71.5°; reduction gives *Et 4 (4-aminophenoxy)benzoate*, oil; the *HCl salt* decomps. about 165°; *Ac deriv*, m. 122.3°. *Bu 4-(4 nitrophenoxy)benzoate*, yellow oil, $b_3$ 250.5°; the *$NH_2$ deriv* yields a *HCl salt*, decomps. 155–60°; *Ac deriv*, m. 98.9°. *β Diethylaminoethyl 4 (4 nitrophenoxy)benzoate HCl*, decomps. 100–10° (90% yield). *$NH_2$ deriv*, amorphous. Although these derivs. show considerable anesthetic action, they are too toxic to be of practical value.

C. J. W.

**Substitution products of 2-nitro- and 2-acetamidodiphenyl ethers and the corresponding diphenylene oxides.** Hamilton McCombie, Wm. Geo. Macmillan and Harold A. Scarborough. *J. Chem. Soc.* 1931, 529–37.—2 $AcNHC_6H_4OPh$ and $HNO_3$ (d. 1.42) at room temp. for 15 min. give the *Ac deriv*, yellow, m. 180°, of *5 nitro 2 aminodiphenyl ether*, yellow, m. 116°; the diazo soln., dropped into hot 50% $H_2SO_4$, gives 2 nitrodiphenylene oxide, m. 186°. More concd. $HNO_3$ gives *5,4'(?)-dinitro 2-acetamidodiphenyl ether*, pale yellow, m. 190°; the free *base*, yellow, m. 192°. *o*-$ClC_6H_4OK$ and *o*-$ClC_6H_4NO_2$, heated 18 hrs. at 170°, give 2 $ClC_6H_4OC_6H_4NO_2$-2, yellow, m. 49°; the 2'-$NH_2$ deriv., pale yellow, $b_{15}$ 203°, m. 45°. *Ac deriv*, m. 104°; an attempt to prep. the corresponding diphenylene oxide was unsuccessful. $HNO_3$ gives the *5'-$NO_2$ deriv*, yellow, m. 142°; the free *base*, yellow, m. 125°; further nitration gives the *Ac deriv*, orange, m. 176°, of *2 chloro-4(?), 5'-dinitro 2'-aminodiphenyl ether*, yellow, m. 202°. 2,5-$Cl_2C_6H_3NO_2$ and PhONa, heated 5 hrs. at 170–80°, give *4 chloro 2 nitrodiphenyl ether*, pale yellow, $b_{16}$ 211°; $SnCl_2$ in EtOH HCl gives the *2 $NH_2$ deriv*, $b_{16}$ 215°, m. 41°; *HCl salt*, m. 192°; the Ac deriv could not be purified. *3-chlorodiphenylene oxide*, b. 106°. Chlorination of 2 $O_2NC_6H_4OPh$ or condensing *p*-$ClC_6H_4ONa$ and *o*-$ClC_6H_4NO_2$ give 4-$ClC_6H_4OC_6H_4NO_2$-2, m. 46°; the 2 $NH_2$ deriv., $b_{16}$ 215°; *HCl salt*, m. 181°. *4-Chloro-2'-acetamidodiphenyl ether* (I), m. 99°, refluxing with $Ac_2O$ and AcOH gives the *di Ac deriv*, m. 106°. Nitration of I gives the *Ac deriv*, yellow, m. 203°, of *4-chloro-5'-nitro-2'-aminodiphenyl ether*, yellow, m. 123°; there is also formed a small quantity of the *2(?),5'-di-$NO_2$ deriv* of the *Ac deriv*, m. 198°. *3 Chloro 7 nitrodiphenylene oxide*, pale yellow, m. 226°. *p*-$ClC_6H_4OK$ and 2,5-$Cl_2C_6H_3NO_2$ give 4,2 $Cl(O_2N)C_6H_3OC_6H_4Cl$-4, m. 78°; 2 $NH_2$ deriv., $b_{15}$ 235°, m. 66°. *HCl salt*, m. 145°. *Ac deriv*, m. 100°. *3,6-dichlorodiphenylene oxide*, b. 190°. 4,2 $Cl(AcNH)C_6H_3OC_6H_4Cl$-4 on nitration gives the *5-$NO_2$ deriv*, m. 150°, and a small quantity of the *2'(?),5-di $NO_2$ deriv*, m. 212°. Nitration of 4 $BrC_6H_4OC_6H_4NHAc$-2 or bromination of 5,2 $O_2N(AcNH)C_6H_3OPh$ gives the *Ac deriv*, yellow, m. 208°, of *4' bromo-5-nitro 2-aminodiphenyl ether*, yellow, m. 133°. 5,2 $Br(H_2N)C_6H_3OPh$, through the diazo reaction, gives *2 bromodiphenylene oxide*, m. 120°. 5,2 $Br(H_2N)C_6H_3OC_6H_4Br$-4 gives *2,6-dibromodiphenylene oxide*, m. 176°. 4,2-$Br(H_2N)C_6H_3OC_6H_4Br$-4 gives the *7,6 isomer*, m. 195°, also obtained by bromination of $(C_6H_4)_2O$ in $CS_2$. 4,2 $Cl(O_2N)C_6H_3OC_6H_4Br$-4 results from the bromination of 4,2-$Cl(O_2N)C_6H_3OPh$ or by the condensation of *p*-$BrC_6H_4OK$ and 2,5-$Cl_2C_6H_3NO_2$. 2-$O_2NC_6H_4OPh$ and ICl in AcOH give *4-iodo 2'-nitrodiphenyl ether*, pale yellow, m. 86°; Cl in $CCl_4$ gives the *dichloride*, m. 96°. 4-$IC_6H_4OC_6H_4NH_2$-2, $b_{16}$ 210°, gives a *HCl salt*, m. 219°, an *Ac deriv*, m. 115°, and a *di Ac deriv*, m. 94°. The results show that chlorination and iodination of 2 $O_2NC_6H_4OPh$ follow the same path as bromination but that in these cases the introduction of more than 1 substituent atom is not attained.

C. J. West.

part of the I to sol products by $CrO_3$, the amt of such oxidation depending upon the relative amt of oxidant used and the state of dispersion of I. Nevertheless when the above cycle of operations is repeated a large no of times a const. increase in insol material results. Therefore Green's conception of a definite oxidative condensation of I with 3 mols II must be abandoned. LEWIS W. BUTZ

Synthesis of simple and of substituted 2-alkylcinnamic alcohols, including a monomolecular cubebin. MARSTON T. BOGERT AND GARFIELD POWELL. *J. Am. Chem. Soc.* 53, 1605–9(1931).—PhCH:CCl·CHO (30 cc.) is reduced by a soln. of Mg in EtOH-HCl in a N atm. giving 22 cc. of *2 ethylcinnamyl alc.*, $b_4$ 131–2° (cor.), it instantly decolorizes Br in $CCl_4$ and is readily catalytically reduced to $PhCH_2CH(CH_2OH)CHEtMe$, *p nitrobenzoate*, m. 110.1° (cor.). *phenylurethan* m. 63–4° (cor.). *2 Amyl cinnamyl alc.* was similarly prepd. in 50% yield, it $b_4$ 141–3°, *phenylurethan*, m. 61–2°. *2 Methyl 3 p-tolylallyl alc.* $b_{11}$ 142–3° (60% yield). *2-Piperonylideneethanol* (monomol. cubebin") $b_4$ 167–8°, m. 78–8.8° (cor.), results in 20% yield with the Mg reagent and in 30% yield with $Al(OEt)_3$. *benzoate*, m. 96–7° (cor.), *phenylurethan*, m. 96–7° (cor.). C. J. WEST

The oxidation of benzyl alcohol by the three isomeric nitrochlorobenzenes. ROBERT E. LYONS AND GUIDO H. STEMPEL, JR. *Proc. Indiana Acad. Sci.* 38, 197–200 (1929).—I. $p$-$C_6H_4ClNO_2$ and $PhCH_2OH$. The reaction of $PhCH_2OH$ with $p$-$C_6H_4ClNO_2$ gave BzOH and $p,p'$-dichloroazoxybenzene, m. 156°, with a little $(ClC_6H_4N)_2$. The reaction was initiated by dropping the soln. of the nitro compd. in xylene into a 78% NaOH soln. contg. the $PhCH_2OH$. The reduction at 139° was 100%, at 60°, 60.6%. The amt. of NaOH used was not important. When the nitro compd. was introduced in the solid form instead of as a xylene soln. the product was 100% azoxy compd. II. $m$-$C_6H_4ClNO_2$ and $PhCH_2OH$. The reaction took place quantitatively at room temp. yielding ($m$-$ClC_6H_4)_2N_2O$ and $PhCH_2OH$. III. $o$-$C_6H_4ClNO_2$ and $PhCH_2OH$. The conditions used successfully in the reactions of the $p$- and $m$-$ClC_6H_4NO_2$ with $PhCH_2OH$ caused thermal decompn. when the $o$-compd. was used. By using a large amt. of solvent and dropping the alkali in slowly this decompn. was curbed and a yield of 17% obtained. The product could not be identified but contained either a nitroso-, an azoxy or an azo group. H. M. STARK

The formation of thioamides from acylated aldehyde cyanohydrins. VII. JOHN F. OLIN AND TREAT B. JOHNSON. *Rec. trav. chim.* 50, 72–6(1931); cf. *C. A.* 21, 98.—The practical method of synthesizing thiazoles is to allow an $\omega$-halogenated ketone to interact with a thioamide. For the synthesis of certain thiazoles thioamides of HO acids were necessary and the latter were synthesized from acylated aldehyde cyanohydrins and $H_2S$ in the presence of KSH, $NH_4$, triethanolamine or pyridine. The superior action of these bases over $NH_3$ is ascribed by O. and J. to their greater basicity by virtue of which they are able to hold much larger quantities of $H_2S$ in contact with the nitrile. The action of pyridine is not so favorable as that of the other bases mentioned above, which is not surprising in view of the fact that pyridine exerts a desulfurizing action on several org. compds. (Raffo and Rossi, *C. A.* 8, 2683; 9, 1473). On account of its great cheapness and its remarkable influence on this addn. reaction, triethanolamine was found to be the most suitable catalyst. The following compds. were all prepd. on passing a current of $H_2S$ through the EtOH soln. of the acylated aldehyde cyanohydrin to which triethanolamine was added. *Mandelic thioamide benzoate* (cf. Francis and Davis, *C. A.* 3, 2973), m. 139°, *acetate* m. 104°. *Hydroxyacetic thioamide benzoate*, m. 103°, *lactic thioamide benzoate*, m. 104°, *α-hydroxybutyrothioamide benzoate* m. 106°. The acylated aliphatic cyanohydrins could not be prepd. according to Francis and Davis' technic (*loc. cit.*) and were obtained by shaking the aldehyde, equiv. amts. of BzCl, NaCN and cracked ice until the odor of BzCl disappeared. The cyanohydrin was estd. with $CHCl_3$ or $CCl_4$ and purified by distn. *in vacuo*. C. F. VAN DUIN

The nickel salt of benzamidoxime. J. V. DUBSKÝ AND M. KURAŠ. *Chem. Listy* 24, 464(1930).—Benzamidoxime (1.3 g.) in $H_2O$ is mixed with 1.2 g. $NiCl_2·6H_2O$ in $H_2O$ and treated with 3 drops AcOH to prevent the pptn. of $Ni(OH)_2$. Dil. $NH_4OH$ is added until the odor of $NH_3$ is noticeable, and the mixt. is left standing for 12 hrs. Fine, purple red needles are filtered off. The addn. of $NH_4OH$ to the mother liquor yields a 2nd crop of crystals. They are sol. in hot $H_2O$, insol. in cold $H_2O$, sol. in EtOH, forming a red soln., decomp. 90–125° and are stable in air. Analysis shows the structure $\left(\begin{matrix} PhC(-NH_2)=N \\ \diagdown \quad \diagup \\ \quad O \end{matrix}\right)_2Ni$ (I). In the presence of $H_2O_2$ the formation of I is hastened but no further oxidation occurs. With $NH_4OH$ and NaOH an intense blue soln. forms, boiling with $PbO_2$ decolorizes solns. of I. FRANK MARESH

**Action of bromine on acetamidohydroxybenzoic acids and acetamidophenols.** GUSTAV HELLER WITH FRITZ SOLDNER *J prakt Chem* 129, 257–67(1931).—5,2-AcNH(HO)$C_6H_3CO_2H$ (I), m 218°, with 1 or 3 mols Br without or with heating on the water bath, gives the *mono-Br deriv*, m 217°, $FeCl_3$ gives a blue color, only with the excess of Br is a small quantity of bromoanil formed. I and $HNO_3$ in AcOH give a $NO_2$ *deriv*, darkens 270°, does not m 300°, $FeCl_3$ gives a violet color, heating with Br-AcOH gradually causes soln., giving bromoanil. *3-Acetamido-4-hydroxybenzoic acid* (II), by reduction of the $NO_2$ deriv. and acetylation, m 251–2° (decompn.), 2 mols Br in AcOH, heated several hrs. on the water bath, gives the *mono-Br deriv*, m 254° (decompn.), $FeCl_3$ gives a brown color, 5 mols Br gives a *di-Br deriv*, m 219°, $FeCl_3$ gives no color, at a somewhat higher temp., there results a *tri-Br deriv*, pale yellow, m 230° (decompn.), further heating of the reaction mixt. gives *tribromo-2-bromoaminophenol* (?, III), yellow-brown, darkens 190°, m. above 305°. Concd. $HNO_3$ and II give a *2,5,6-trinitro deriv*, yellow, m. 204°. $FeCl_3$ gives a dark red $FeCl_3$ reaction, with Br-AcOH this gives *pentabromoacetanilide*, m. 222°, further heating gives pentabromoaniline, m. 226°. *4-Acetamido-3-hydroxybenzoic acid*, m. 250–1°, 2 mols Br in 10 parts AcOH gives a *mono-Br deriv*, m. 255° (decompn.). $FeCl_3$ gives a blue color. 5 mols Br gives a compd. apparently identical with III. *3-Acetamido-2-hydroxybenzoic acid*, m. 230° (decompn.), $FeCl_3$ gives a deep blue color. 2 mols Br gives a *mono-Br deriv*, m. 255° and giving an indigo blue color with $FeCl_3$. 5 mols Br gives a *tri-Br deriv*, m. 259°. 6,3-AcNH(HO)$C_6H_3CO_2H$ and 2 mols Br give a *mono-Br deriv*, m. 267°. 5 mols Br gives a *compd*, $C_6H_3ONBr_4$, carbonizes about 200°, which resembled III. *5-Acetamido-2,4-dihydroxybenzoic acid*, m. 220° (decompn.). $FeCl_3$ gives a dark blue color. 2 mols Br in 15 parts AcOH gives a *mono-Br deriv*, decomps. 200° and giving a deep blue $FeCl_3$ reaction, excess Br gives a mixt. of products, which could not be sepd. *o*-AcNHC$_6$H$_4$CO$_2$H and 5 mols. Br in 5 parts AcOH, on heating until HBr evolution ceases, give a mixt. of the 5-Br, 3,5-$Br_2$ and *tetra-Br derivs*, m. 228°, further addn. of Br to the reaction mixt. and heating 20 hrs. give BrC$_6$H$_3$NHAc in small yields. *p*-$H_2NC_6H_4OH$ and Br AcOH give bromoanil. *p*-AcNHC$_6$H$_4$OH and 5 mols. Br in AcOH give the *2,6-di-Br deriv*, m. 188°, further heating of the filtrate gives bromoanil and tetrabromohydroquinone. With 10 mols. Br, there results the *tetra-Br deriv*, m. 216–7°, heating with concd. $H_2SO_4$ 3 hrs. on the $H_2O$ bath gives *tetrabromo-4-aminophenol*, m. 215° (decompn.). *o*-AcNHC$_6$H$_4$OH and 5 mols. Br give a *tri-Br deriv*, m. 183° (decompn.), if the reaction mixt. is heated 0.5 hr. there results *tetrabromoacetylbromoaminobenzene*, m. 185°; if the latter is heated with 5 mols. Br in AcOH for 4 hrs., there results a *penta-Br deriv*, m. 207–8°. C. J. WEST

***N*-Methyl-*N*-phenylalkylaminoalkyl benzoates and *p*-aminobenzoates.** ARTHUR C. COPE AND S. M. MCELVAIN *J. Am. Chem. Soc.* 53, 1887–94(1931).—Previous work indicated that it was desirable to prep. and submit for pharmacol. study a series of compds. of the procaine type in which various phenylalkyl groups would be attached to the N atom. This paper reports a series of compds. of the type BzO(CH$_2$)$_x$NMe-(CH$_2$)$_y$Ph, in which *x* is 2 and 3 and *y* is varied from 1 to 4. All b. ps. and m. ps. given are cor. *γ-Phenylpropyl p-toluenesulfonamide*, m. 65.1–5.7°. *δ-phenylbutyl deriv.*, m. 53.5–3.9°. *N-methyl N-γ-phenylpropyl deriv.*, $b_2$ 231–8°, m. 41.8–2.4°. *N-methyl-δ-phenylbutyl deriv.*, $b_7$ 241–5°, m. 60.5–1.1°. *N-phenylpropyldi-p-toluenesulfonamide*, m. 113.3–3.7°. Hydrolysis gives the following products: PhCH$_2$CH$_2$NHMe, whose HCl *salt* m. 164.1–4.9°. PhCH$_2$CH$_2$CH$_2$NHMe, $b_4$ 85.5–6.1°, $d_{25}^{25}$ 0.9205, $n_D^{25}$ 1.50877; *HCl salt*, m. 145.6–6.1°. *δ-phenylbutylmethylamine*, $b_4$ 95.0–5.4°, $d_{25}^{25}$ 0.9126, $n_D^{25}$ 1.50350; *HCl salt*, m. 126.2–6.8°. These amines were condensed with *p*-$O_2NC_6H_4CO_2CH_2CH_2Cl$ *and γ-chloropropyl p-nitrobenzoate*, $b_3$ 168.5–9.5°, $d_{25}^{25}$ 1.3222, $n_D^{25}$ 1.54756, the benzoates were isolated as the HCl salts in 50–75% yields, unreacted sec. amines are removed by treatment with BzCl. The following *N-methyl-N-phenylalkylaminoalkyl benzoate-HCl*, BzO(CH$_2$)$_x$NMe(CH$_2$)$_y$Ph, were prepd. where *x* and *y* are: 2 and 1, m. 145.6–6.4°. 2 and 2, m. 134.2–4.8°. 2 and 3, m. 106.3–7.1°. 2 and 4, m. 106.9–7.5°. 3 and 1, m. 145.4–6.3°. 3 and 2, 128.8–9.4°. 3 and 3, m. 117.5–8.3°. 3 and 4, m. 121.7–3.7°. *N-Methyl-N-phenylalkylaminoalkyl p-nitrobenzoate-HCl*, *p*-$O_2NC_6H_4CO_2(CH_2)_xNMe$(CH$_2$)$_y$Ph, where *x* and *y* are: 2 and 1, m. 216.6–7.6°. 2 and 2, m. 170.9–1.9°; 2 and 3, m. 122.6–3.6°. 2 and 4, m. 120.6–1.6°. 3 and 1, m. 206.6–7.4°. 3 and 2, m. 147.2–8.2°. 3 and 3, m. 99.5–100.3°. 3 and 4, m. 150.3–60.3°. Catalytic reduction gives the *N-methyl-N-phenylalkylaminoalkyl p-aminobenzoate HCl*, *p*-$H_2NC_6H_4CO_2(CH_2)_xNMe$-(CH$_2$)$_y$Ph.2HCl, where *x*, *y* and *z* are: 2, 1 and 2, m. 200.6–10.6°. 2, 2 and 2, m. 245.2–7.4°. 2, 3 and 2, m. 182.3–4.3°; 3, 1 and 2, m. 219.1–20.1°. 3, 2 and 1, m. 190.7–2.2°. 3, 3 and 1, m. 178.8–9.8°. 3, 4 and 1, m. 156–8°. *N-Methyl-N-γ-phenylpropylamino-*

*ethanol* b$_4$ 132.6–3.0° $d_{25}^{25}$ 0.9883 $n_D^{25}$ 1.51723 (75.3% yield) *N-Methyl N-γ-phenyl propylaminopropanol*, b$_4$ 147.3–7.9°, $d_{25}^{25}$ 0.9785, $n_D^{25}$ 1.51337. The *N*-methyl-*N*-phenylalkyl benzoates are much less toxic than procaine, both subcutaneously and intravenously. The corresponding *p*-aminobenzoates show a decidedly different and most unusual toxic effect. Their intravenous toxicities are rather low as a group, certain ones approaching the toxicity of procaine. The subcutaneous toxicities, however, are considerably higher than would be expected from the intravenous values. *N*-Methyl *N*-benzylaminoethyl *p*-aminobenzoate is about 80% as toxic as procaine intravenously but is over twice as toxic subcutaneously. Details of the pharmacol. tests are given.

C. J. West

**Titrimetric and spectrometric analysis of keto-enol mixtures. β-Phenylacetoacetic ester.** Karl v. Auwers. *J. Am. Chem. Soc.* 53, 1496–500(1931).—Polemic with Post and Michalek, *C. A.* 25, 96. The rule that titrimetric and spectrometric detns. of the enol content of tautomeric mixts. gives results in satisfactory agreement holds for α-phenylacetoacetic ester (I). Titrimetrically, the enol content of the ester is found to be 39.2% and spectrometrically 36.7%; therefore materially higher than for α-alkylacetoacetic esters (II). For I, in contrast to II, the direct Br titration is just as applicable as the indirect Br titration.

C. J. West

**Condensation of aromatic aldehydes with phenylacetonitrile.** Theodora de Kiewiet and Henry Stephen. *J. Chem. Soc.* 1931, 639–40.—2,4-(MeO)$_2$C$_6$H$_3$CHO and PhCH$_2$CN in EtOH-EtONa give almost quant. *2,4-dimethoxy-α-phenylcinnamonitrile*, pale yellow, m. 95°; it could not be demethylated. *3,4-di-MeO deriv.*, pale cream, m. 88°. *o*-Vanillin with 6 *N* EtOH-KOH gives almost quant. *8-methoxy-3-phenylcoumarin*, straw-colored, m. 155.5°. 4-HO(MeO)C$_6$H$_3$CHO with EtONa gives *4-hydroxy-2-methoxy-α-phenylcinnamonitrile*, pale yellow, m. 195°; *4-Ac deriv.*, m. 158°. *4-hydroxy-3-methoxy deriv.*, pale cream, m. 99°; the yields of these 2 nitriles is 90% if 6 *N* EtOH-KOH is used. All attempts to hydrolyze the nitriles were unsuccessful, they are thus probably *cis* forms.

C. J. West

**Esculetin dimethyl ether from Artemisia capillaris. II.** Shoichi Sera and Chuzo Shibuya. *J. Agr. Chem. Soc. Japan* 6, 1003–12(1930); cf. *C. A.* 24, 5742.—Esculetin di-Me ether (I) was treated with concd. caustic alkali for several hrs. Dimethoxy-*o*-coumaric acid (II), m. 197.8°, was formed. Ac deriv. (III), m. 211°, was obtained from II. III was saponified by caustic alkali and then acidified with HCl. II was regenerated. I was demethylated by HIO$_3$ and esculetin, m. 268–70°, was obtained. I, m. 145°, was regenerated by methylation. Mono- (IV) and dibromide (V) (m. 235°) were prepd. from I in AcOH or benzene with Br. Sapong. IV by Tilden and Burrow's method colorless needles, m. 245–6°, were obtained. They were dimethoxycoumarilic acid. Colorless needles, m. 220–2°, (MeO)$_2$C$_6$H$_2$BrCO$_2$H were obtained from V. One of the Br atoms may be combined with the side chain and the other with the benzene nucleus. Hence the formula of V should be $C_{11}H_9O_4Br_2$, not $C_{11}H_{10}O_4Br_2$. Y. Kihara

**Action of hydroferrocyanic acid upon bicyclic terpenes; a new partial synthesis of terpene bases and alcohols.** K. Stephan and Th. Hammerich. *J. prakt. Chem.* 129, 283–308(1931).—Camphene and $H_4Fe(CN)_6$ give the *compd.* $(C_{10}H_{16})_2Fe(CN)_6$; heating 160 g. of this compd. in 1.2 l. 15% KOH in an autoclave at 160° (9–10 atm.) for 13 hrs. gives 7% isobornylamine, 50% nearly pure camphene and 43% of a mixt. contg. 74.4% camphene, 23.1% camphene hydrate and 2.5% isoborneol; details of the sepn. of these products and their identification are given. The *compd.* with α-pinene on alkali decompn. at 160° gives 70% of a mixt. of α-terpineol, limonene and dipentene and 30% of a mixt. of isobornyl- and isofenchylamines. The verbenol formed from α-pinene in the air also forms a complex with $H_4Fe(CN)_6$, which is easily decompd. with the reformation of the verbenol. α-Terpineol formed by the action of $H_2O$ on α-pinene behaves in the same way. Nopinene (β-pinene) also gives a mixt. of compds. with $H_4Fe(CN)_6$; the easily decompd. part gives α-terpineol and terpine hydrate, the more difficultly decompd. part gives 45% of isofenchylamine and 55% of α-terpineol and limonene.

C. J. West

**Fixation of hydrogen by acetylene derivatives. XVIII.** Yu. S. Zalkind and V. O. Mokhnach. *J. Russ. Phys. Chem. Soc.* 62, 1043–7(1930).—Dihydroxybornylacetylene $C_{10}H_{16}(OH)C{\equiv}CC_{10}H_{16}OH$, was synthesized by mixing 90 g. camphor in 200 cc. ether with $(CMgBr)_2$ prepd. from 18 g. Mg, 90 g. EtBr and 200 cc. ether. The mixt. was left for several days being heated 4 or 6 hrs. daily or altogether about 20 hrs. After decompn. with water a basic Mg salt was sepd. and dissolved in 20% AcOK, the product, extd. with $Et_2O$ and recrystd. from petr. ether, m. 201–2°, is sol. in $Et_2O$, acetone, $CHCl_3$, benzene. Yield 43%; analysis confirmed the compn. The assigned

ucture was proved by heating with KOH which decompd the compd into camphor $C_9H_{14}$. For H fixation several catalysts were tried. Pd black is more efficient than loidal Pd and that pptd on $BaSO_4$. Pd black (0.6 g.) effects an addn. of 2 H atoms the mol. of the glycol (1.6 g. dissolved in 50 cc. $Et_2O$) in 10–15 min. while the satn. uired 315 min. This difference in time of reaction is characteristic for hydrogenation a triple bond with Pd, as Pt requires for fixation of the first 2 atoms as much time as the 2nd pair. The ethylene glycol crystd. from MeOH + $Me_2CO$ gives crystals 165–7° sol. in ether, benzene, $CHCl_3$, petr. ether, mol. wt. 316–323 (calcd. 332), es a yellow color with concd. $H_2SO_4$, does not decolorize $KMnO_4$ but reacts with Br. e satd. glycol, recrystd. from acetone, m. 204°, sol. in $CHCl_3$, ether, benzene, petr ier, mol. wt. 315 (calcd. 334); the yellow color with $H_2SO_4$ is very slight. Br and $KMnO_4$ are not decolorized. This acetylene glycol is more difficult to synthesize and to drogenate than other acetylene glycols. J. G. Tolpin

**Action of substituted aromatic amines on camphoric anhydride. The rotatory wers of some disubstituted camphoranilic acids.** Maitan Singh and Dara Singh *Chem. Soc.* 1931, 478–82; cf. *C. A.* 24, 4286.—The following substituted *camphoranilic ds* were prepd. by heating camphoric anhydride and the amine with fused AcONa at 5–50° for 3–4 hrs., in no case was there any residue of imide. *2',3'-di Me* (I), m. )–2°, *2',6'-di Me* (II), m. 236–8°, *2',5'-di Me* (III), m. 203–4°, *5'-nitro 2'-methoxy* (), m. 162–3°, *4' nitro 2' methoxy* (V), light brown, m. 185–6°. *5' nitro-2'-methyl* I), straw colored, m. 220–1°. *3' nitro 4' methyl* (VII), light brown, m. 204–5°, *nitro-4'-methyl* (VIII), deep yellow, m. 187°. *4' nitro 2' methyl* (IX), m. 229–30°. e following acids were prepd. by the action of fuming $HNO_3$ in AcOH. *4'-chloro-2'-ro* (X), deep yellow, m. 204–5°. *4' bromo 2' nitro* (XI), deep yellow, m. 212°. *2',6'-nitro-4'-methoxy* (XII), light orange, m. 228–9°. *2',6' dinitro 4' ethoxy* (XIII), orange, 189–90°. Mol. rotatory powers in MeOH, EtOH, $Me_2CO$ and MeCOEt, resp., re detd. as follows: 2'-Me I 51, 144, 98, 91; I 168, 148, 120, 109; III 203, 165, 147, 127, 174, 168, 109, 102; 2'-MeO 30, 28, —16, —10; 4' MeO 163, 153, 123, 100; 4' EtO 9, 154, 116, 104; IV 141, 128, 109, 104; V feeble rotation; XII —306, —412, —270, 255; XIII —263, —353, —211, —192; 4' Me 170, 146, 122, —; VI 214, 219, 154, 4; IX 96, 80, 77, —; VII 141, 123, 111, 101; VIII —167, —202, —161, —138. Two oups of the same polarity reinforce each other when they are in the *p* position with spect to each other, *e. g.*, III and VI exceed any of their resp. isomers in rotatory power oups of opposite polarity neutralize each other's effect. The rotatory power of IV practically the same as that of the unsubstituted compd. The $NO_2$ group in the 4'-sition has a depressing effect on the rotatory power of the original compd.

C. J. West

**Stereochemistry of biphenyl compounds. XIV. Preparation and resolution of 5,3',5'-tetramethyl-2,2'-difluoro-6,6'-diaminobiphenyl.** E. C. Kleiderer and oger Adams. *J. Am. Chem. Soc.* 53, 1575–80(1931); cf. Bock and A., *C. A.* 25, 1.—3,5,2,6-$Me_2(H_2N)(O_2N)C_6HBr$ was transformed into the 2 diazonium borofluoride 7% yield), decomps. about 195°, which decomps. on heating to *3,5-dimethyl-2 fluoro-nitro-1-bromobenzene*, yellow, m. 49–51° (45% yield), with Cu in $PhNO_2$ there results % of *3,5,3',5' tetramethyl 2,2' difluoro-6,6'-dinitrobiphenyl*, m. 231–6°, reduction th Zn and AcOH–HCl gives 68% of the *6,6'-diamino deriv.* (I), m. 154–5° (cor.); esolution of I was effected by *d* camphorsulfonic acid in abs. AcOEt. *l* I, m. 151–2° or.), $[\alpha]_D^{20}$ —4.1° (0.4000 g. in 15 cc. $Me_2CO$). *d camphorsulfonate*, m. 171–3°, $[\alpha]_D^{20}$ 0° (0.1500 g. in 15 cc. abs. EtOH). *d* I, m. 150–1° (cor.), $[\alpha]_D^{20}$ 3.2° (0.1000 g. in 15 $Me_2CO$); *d-camphorsulfonate*, m. 125–30°, $[\alpha]_D^{20}$ 32.5° (EtOH), the active forms are adily racemized by heating in a neutral solvent, such as MeOH or EtOH or more pidly in glacial AcOH. *3,5 Dimethyl 1 bromobenzene-2 diazonium borofluoride*, comps. 161° (60% yield), on heating, gives quant. *3,5-dimethyl-2 fluorobromobenzene*, 87–9°, $d_{20}^{20}$ 1.452, $n_D^{20}$ 1.3100, nitration gives 88% of the *4,6 di-$NO_2$ deriv.*, light llow, m. 86–7°, Cu in $PhNO_2$ gives 69% of *3,5,3',5' tetramethyl 2,2'-difluoro 4,6,4',6'-ranitrobiphenyl*, m. 202–4° (cor.), the *tetra-$NH_2$ deriv.*, yellow, m. 250–3° (74% yield). is could not be resolved by *d*-camphorsulfonic acid, *d*-bromocamphorsulfonic acid or tartaric acid.

C. J. West

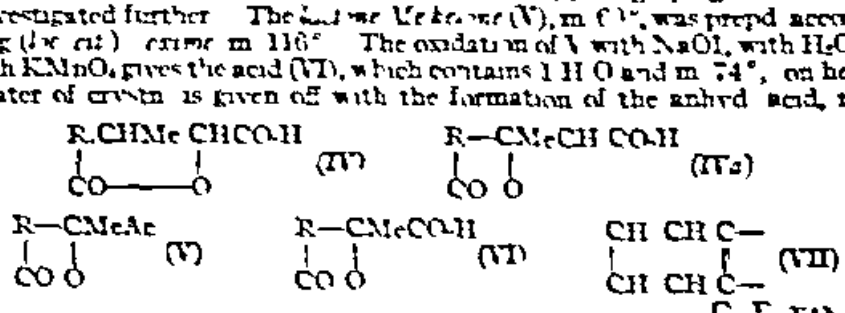
**Monoacetylation and monodiazotization of diaminobiphenyl.** C. Finzi *Gazz. im. ital.* 61, 33–42(1931).—In connection with an investigation in progress on the epn. of derivs. of the $Ph_2$ series, a special study was made of the behavior of *o*-$H_2NC_6H_4C_6H_4NH_2$-*p* (I) when monoacetylated and monodiazotized in order to establish which the 2 $NH_2$ groups first reacts with AcOH and with $HNO_2$, resp. A survey of the erature shows that most $Ph_2$ derivs. known up to now are sym., but since I is unsym.,

it is only by settling the initial reaction mentioned above that the constitution of I derivs obtained by the Sandmeyer reaction can be established. I (5 g.) in hot 60% EtOH (50 cc.) and $Ac_2O$ (2.80 g.) brought almost to boiling, poured into cold water, let stand several days, decanted, the residue (a mixt. of a cryst. compd. and a pitch) washed with $Et_2O$ (to remove the pitch), the cryst. residue digested repeatedly with a large vol. of warm dil. HCl (the insol. residue is the di-Ac deriv., cf. *Ann.* 207, 354), filtered, the filtrate neutralized with $Na_2CO_3$ and the ppt. purified by repeated recrystns. from dil. EtOH and decolorization with animal charcoal, yields *2-amino-4'-acetylaminobiphenyl* (II), m. 176–7°. I (10 g.), dissolved in hot 40% $H_2SO_4$ (50 cc.), cooled (with rapid agitation to assure the formation of fine crystals) to —4° or —5°, aq. $NaNO_2$ (3.7 g. in 15 cc.) added, let stand at room temp., heated until N is no longer evolved, filtered, the filtrate decolorized with animal charcoal, made alk. with aq. $Na_2CO_3$, the ppt. dissolved in 5% aq. KOH, filtered, acidified with excess of HCl, filtered, decolorized again with animal charcoal, reppt'd. with $Na_2CO_3$ and recrystd. from boiling EtOH, yields 2-hydroxy-4'-aminobiphenyl (III), already described but the exact constitution not established by Bamberger (*Ann.* 390, 161), yellowish, m. 181–2°, is readily diazotized at room temp. with formation on heating of 2,4'-dihydroxybiphenyl (cf. *Ber.* 13, 2234, *Ann.* 207, 357). II (5 g.), suspended in 20% $H_2SO_4$ (30 cc.), diazotized at 0° with aq. $NaNO_2$ (2 g.), let stand a short time, heated gently until N is evolved, the ppt. washed with dil. HCl (to remove small quantities of III), and purified by repeated recrystns. from boiling EtOH, yields *2-hydroxy-4'-acetylaminobiphenyl* (IV), pale yellowish, m. 198–9°, sol. in aq. alk. hydroxides and insol. in dil. acids. $Ac_2O$ (2 cc.) added to III (1 g.) (spontaneous heating), let stand a short time, poured into water, let stand until all excess $Ac_2O$ has dissolved, filtered, the residue washed with water and recrystd. from EtOH, yields IV. *III (2 g.) and $Ac_2O$ (7–8 cc.), boiled for a short time, poured into cold water, the pitchy* ppt. washed with $Et_2O$, the residue washed with dil. NaOH, then with HCl, and crystd. from boiling EtOH, yields *2-acetoxy-4'-acetylaminobiphenyl*, m. 138°. Aq. $NaNO_2$ (0.68 g.), added to II (2 g.) suspended in ice-cold water and concd. HCl (2.8 cc.), 50% $H_3PO_2$ (15 cc.) added and the ppt. recrystd. from boiling EtOH, yields *4-acetylaminobiphenyl* (V), m. 170°. If the reduction is carried out with EtOH, a considerable yield of IV and of pitchy substances are also formed. V and excess dil. HCl, boiled a long time, dild. with hot water, cooled, diazotized with $NaNO_2$, heated almost to the b. p. until N is no longer evolved, and the ppt. recrystd. from EtOH, yields 4-hydroxybiphenyl (VII), m. 160° (the highest m. p. in the literature is 164–5°). VII can also be prepd. thus: I (5 g.), dissolved in hot 40% $H_2SO_4$ (40 cc.), cooled to —4° and to —5°, aq. $NaNO_2$ (1.8 g. in 10 cc.) added, EtOH (equal vol.) added, let stand overnight, the soln. sepd. from the pitch, the EtOH evapd. *in vacuo*, the residue made alk. with aq. $Na_2CO_3$, the ppt. (mixt. of 4-aminobiphenyl (VIII) and III) dissolved in 5% KOH, the insol. residue (VIII) dissolved in dil. HCl, decolorized with animal charcoal, diazotized with $NaNO_2$, the diazo deriv. decompd. by heating, and the ppt. recrystd. from EtOH, yields VII, m. 160–1°. III (2 g.) in dil. HCl, diazotized at room temp., 50% $H_3PO_2$ (15 cc.) added, warmed gently until N is no longer evolved, the sepd. oil washed with water and crystd. from petr. ether, yields *2-hydroxybiphenyl*, m. 56°. Other reducing agents were tried, but in all cases the yields were very low. C. C. Davis

Oximes of *o*-hydroxybenzophenone. E. P. Kohler and W. F. Bruce. *J. Am. Chem. Soc.* 53, 1569–74 (1931).—The stereoisomeric oximes of *o* $HOC_6H_4COPh$ cannot be dehydrated to a cyclic compd. Their behavior, therefore, contributes no independent evidence with respect to the proper interpretation of the Beckmann rearrangement, but indicates that this rearrangement is reliable when it is employed with sufficient care. Both of the oximes may be obtained directly from the ketone and $NH_2OH$ in alk. soln., at the ordinary temp. the product is almost pure *h*-oxime (I), in boiling solns., the product is a mixt. in which the quantity of *n*-oxime (II) increases with the time that the soln. is boiled. I crystallizes from $C_6H_6$ in thin plates, m. 142–3°. II is probably obtained most readily by heating I with strong alkalies. II crystallizes in needles, m. 141–2°. II is stable to boiling 20% aq. NaOH for 2 hrs. I sublimes at 175–80°, while II is changed into I at 185–200°, but even at 185–200° the process is exceedingly slow. With $PCl_5$ I gives *o*-$HOC_6H_4CONHPh$, while II gives 2-phenylbenzoxazole (III). Attempts to dehydrate the oximes with dry HCl were unsuccessful. I gives a yellow HCl salt, m. 118–20°, decompn. with EtOH gives I but heating at 140–5° gives III and the ketone. II also gives a HCl salt, m. 132–4°, which likewise gives III on heating. $HCO_2H$ changes II into I and also causes a Beckmann rearrangement. C. J. West

The oxidation of acetylene glycols. An *o*-diketone of the tetrahydrofuran series. T. I. Temnikova and P. A. Tikhomolov. *J. Russ. Phys.-Chem. Soc.* 62, 1217–22

(1930).—*Tetratolylbutinediol* (5 g.) in 25 cc. AcOH with 2.2 g. $CrO_3$ in 25 cc. 95% AcOH gave *2,2,5,5 tetratolyl-3,4-diketotetrahydrofuran* (I), and 2 g. of ditolyl ketone (II). I was obtained in 42% yield as crimson red crystals, m. 182°, sol. in PhH, $CHCl_3$ and AcMe, almost insol. in AcOH and EtOH. At 50–60° I is oxidized to II by $CrO_3$ in AcOH. I gives a phenylhydrazone, orange yellow, m. 184–6°, an oxime, pale yellow, m. 226° (decompn.), and a deriv. with *o* $C_6H_4(NH_2)_2$, m. 220–1°. Only one CO group reacts with $NH_2OH$ or $PhNHNH_2$. I with MeMgI and EtMgBr gave rose crystals, m. 150°, extremely labile and oxidizing rapidly back to I. I was not attacked by PhMgBr nor Zn and HCl. LEWIS W. BUTZ



**The action of halogen acids on acetylene glycols. VI. The action of hydrogen iodide on dimethyldiphenylbutinediol.** YU. S. ZALKIND AND S. V. NEDZVETZKII. *J. Russ. Phys. Chem. Soc.* 62, 1011–19(1930). cf. *C. A.* 21, 56.—*Symmetrical dimethyldiphenylbutinediol* (isomer m. 103°) (I) gives with HI a mixt. of *2,5-dimethyl-2,5-diphenyl-3-iodo-2,5-dihydrofuran* (II) and *2,5-diphenyl-3,4-diiodo-2,4-hexadiene* (III). I with a satd. soln. of HI in AcOH (10 cc. per 2 g. of glycol) at room temp. for 4 hrs. gave a reaction product sepg. as a heavy oil when poured into $H_2O$. The oil was washed by decantation, dissolved in $Et_2O$, washed with $Na_2S_2O_3$, and dried with $CaCl_2$. Vacuum distn. after removal of the $Et_2O$ gave a yellow oil in 80% yield, easily sol. in AcMe, $Et_2O$ and PhH, more difficultly in EtOH and petr. ether. The oil was not further investigated, but the analytical results and mol.-wt. detn. indicated II mixed with III. *I with HI in AcOH (10%) at room temp. after 2.5 hrs. gave crystals of III in 25% yield*, colorless, m. 145–6°, very sol. in AcMe, $Et_2O$, PhH, hot EtOH and petr. ether. The filtrate from III contains II and unchanged I. Increased HI concn. increases the amt. of II. III does not decolorize $KMnO_4$ in the cold, does not add $Br_2$, and is not saponified by heating 20 hrs. with 20% KOH. III with 3% $KMnO_4$ in AcMe at 40–5° or with $CrO_3$ in AcOH at the b. p. is converted to a small extent to AcPh and a small amt. of acids not identified. The isomer of I which m. 126° (IV) gave with 10% HI in AcOH at room temp. after 2.5 hrs. 20% of III together with some I. IV is isomerized to I by HI. *The reverse transformation by HI was not observed. Probably only I gives II and III directly.* III (8.5 g.), refluxed 9 hrs. with 100 g. EtOH and 6 g. Zn dust, gave V, m. 84°, easily sol. in AcMe, $CHCl_3$, $Et_2O$, PhH, EtOH, and petr. ether. Analysis of V corresponded roughly to $C_{14}H_{17}I$. V in the cold decolorizes neither $Br_2$ in $CHCl_3$ nor alk. $KMnO_4$ soln. V did not split out III with alc. KOH nor was it oxidized by heating 8 hrs. at the b. p. with 3% $KMnO_4$ in AcMe. The analysis for V indicated a compd. richer in H than required by the suggested formula, but since V is so stable to oxidants it is not an olefin. Heating III in $Et_2O$ with Mg or in PhH or cumene with Zn leaves it unaltered. *Heating 3 g. III, 1.5 g. Zn, and 15 cc. of freshly distd. quinoline for 1.5 hrs. at the b. p. in $H_2$ or $N_2$ gave VI, m. 103–4°, sol. in AcMe, $CHCl_3$, PhH, petr. ether and EtOH. VI is probably $C_{14}H_{12}O$, the structure was not detd.* LEWIS W. BUTZ

**Hydrogenation of certain branched compounds over nickel.** HOMER ADKINS, WALTER H. ZARTMAN AND HOWARD CRAMER. *J. Am. Chem. Soc.* 53, 1425–8(1931).—Exptl. conditions for the successful hydrogenation over Ni of $Ph_3COH$, $Ph_3CH$, dicyclohexylphenylmethane (I), 1,3,5-$C_6H_3Ph_3$, $Ph_3N$, 1,3,5-$C_6H_3Me_3$ and (2,4,6-$C_6H_2Ph_3$)$_2$ are reported. $H_2O$ and EtOH inhibit the hydrogenation of I. *1,3,5-Tricyclohexylcyclohexane*, $b_{2.5}$ 228–8.5°, m. 159–60°. *2,2',4,4',6,6'-Hexamethylbicyclohexyl*, $b_3$ 123–6°, $d_{25}^{25}$ 0.8932, $n_D^{25}$ 1.4873. Tricyclohexylmethane, $b_3$ 164–5°, m. 58.5–9.5°; tricyclohexylamine, $b_7$ 188–9°, m. 160–1°, HBr salt, m. 267–8°, HCl salt, m. 264°, picrate, m. 172.5–3°. C. J. WEST

**Mixed benzoins. III. The structure of some unsymmetrically substituted desoxybenzoins.** JOHANNES S. BUCK AND WALTER S. IDE. *J. Am. Chem. Soc.* 53, 1530–42(1931). cf. *C. A.* 24, 5748.—The Beckmann transformation has been used to *det. the structures of certain unsymmetrically substituted desoxybenzoins and to assign* configurations to the oximes derived from them. Desoxy compds. of the mixed benzoins formed from the following pairs of aldehydes were investigated: *o*-$ClC_6H_4CHO$ and veratric aldehyde (I), *p*-$MeOC_6H_4CHO$ (II), *p*-$Me_2NC_6H_4CHO$ (III), piperonal (IV), BzH and *p*-$MeOC_6H_4CHO$ (V), piperonal (VI) and *p*-$Me_2NC_6H_4CHO$ (VII). Reduction of I gives $ClC_6H_4CH_2COC_6H_3(OMe)_2$, whose *anti-oxime* m. 137° (64% yield) and yields on the Beckmann rearrangement *1-chlorophenylacet-3,4-dimethoxyanilide*, m. 177°; this was also synthesized by heating the acid and amine at 180–200° for 2 hrs. II gives $ClC_6H_4CH_2COC_6H_4OMe$ *on reduction, whose anti-oxime* m. 97° (86% yield), rearrangement gives *1-chlorophenylacetaniside*, m. 163°. Reduction of III gives *1-chlorobenzyl 4-dimethylaminophenyl ketone*, m. 122°; *anti oxime*, m. 173°, rearrangement gives *1-chlorophenylacet-4-dimethylaminoanilide*, m. 165°, also synthesized by the

Schotten Baumann reaction IV gives *1-chlorophenyl-3,4-methylenedioxyphenyl ketone* m. 105°, *anti-oxime* m. 121° (42% yield); rearrangement gives *1-chlorophenyl-acetyl-3,4-methylenedioxyaniline* buff, m. 175°. V gives 4-MeOC$_6$H$_4$CH$_2$COPh *anti-oxime*, m. 133° (23% yield); rearrangement gives *4-methoxybenzylbenzamide* m. 117°; *syn-oxime*, m. 94° (13% yield); rearrangement gives 4-MeOC$_6$H$_4$CH$_2$NHBz, m. 0°. PhCH$_2$COCl and PhOMe give *benzyl-4-methoxyphenyl ketone* m. 75°, *anti-oxime* m. 114° (34% yield); rearrangement gives *phenylacetanisidide* m. 121°. Reduction of VI gives 64% of *benzyl-4-methoxyphenylcarbinol* m. 80°, *anti-oxime*, m. 103° (60% yield); rearrangement gives *phenylacetyl-3,4-methylenedianisidide*, buff, m. 143°. Reduction of VII gives PhCH$_2$COC$_6$H$_4$NMe$_2$; the *anti-oxime* gives on rearrangement *phenylacetyl-4-dimethylaminoaniline* cream, m. 144°. The above results support the view that the transformation takes place between the vicinal groups of the oximes. C. J. West

**Congo copal oil. II. The oxidative degradation of the naphthalene hydrocarbon $C_{12}H_{14}$ from Congo copal oil.** L. Westenberg and J. P. Wibaut. *Rec. trav. chim.* 50, 185–90 (1931); cf. *C. A.* 23, 3210.—The same hydrocarbon $C_{12}H_{14}$ was obtained by Westenberg (*C. A.* 23, 3210) by dehydrogenation of Congo copal oil with S, by Ruzicka, Steiger and Schinz (*C. A.* 21, 908) by pyrogenetic decomposition of a mixt. of acids from Manila copal, followed by dehydrogenation with S and by Harvey, Heilbron and Kamm (*C. A.* 21, 1112) on dehydrogenating squalene with S. The structure of this hydrocarbon as 1,2,5-$C_{10}H_5Me_3$ was proved by Ruzicka and Hosberg (*C. A.* 25, 1232) and Heilbron and Wilkinson (*C. A.* 25, 684). On oxidizing the hydrocarbon in the way described by Westenberg (*loc. cit.*) with $CrO_3$, the reaction products, sol. in NaHCO$_3$, do not only contain an acid $C_9H_{10}O_4$, but also the ketonic acid 2,6-MeAcC$_6$H$_3$CO$_2$H (I), which can be isolated by boiling out the NaHCO$_3$-sol. reaction products with water and recrystg. the oily residue several times from dil. alc. and water. *1-methyl-3-acetyl-2-benzoic acid* (I), m. 116°, is then obtained in 10% yield. *oxime*, m. 162°. I may be converted easily into its *Me ester*, m. 67–8°, thus showing that the so-called esterification rule of Victor Meyer is only to be used with caution. The oxidation with KMnO$_4$ converts I into hemimellitic acid (m. p. of the anhydride 162° and mixed with an authentic specimen (m. 160°) prepd. from 1,3-$C_{10}H_6$(CO$_2$H)$_2$, m. 190°). With NaOI, I is converted into *3-methylphthalic acid* (II) (m. p. of the anhydride 111°) identical with an authentic specimen prepd. from *m*-toluic acid (Jurgens, *C. A.* 2, 479; Muller, *C. A.* 3, 1018). The oxidation of the hydrocarbon $C_{12}H_{14}$ with less $CrO_3$ gives *trimethyl-3-naphthoquinone* (III) (R = VII) in 6% yield; with *o*-$C_6H_4$(NH$_2$)$_2$ this quinone forms a *quinoxaline* m. 142°, while the oxidation with $CrO_3$ gives the acid IV or IVa, m. 234°, already obtained by Westenberg (*loc. cit.*). The lactone character of the latter acid was proved by the fact that the exactly neutral soln. became alk. in the course of a few min. The oxidation with $CrO_3$ or KMnO$_4$ converts IV into an acid $C_9H_{10}O_4$, m. 205–6°, which was not investigated further. The *lactone Me ketone* (V), m. 60°, was prepd. according to Westenberg (*loc. cit.*); *oxime* m. 116°. The oxidation of V with NaOI, with $H_2O_2$ in alk. soln. or with KMnO$_4$ gives the acid (VI), which contains 1 H$_2$O and m. 74°; on heating at 80° the water of crystn. is given off with the formation of the anhyd. acid, m. 130°.

C. F. van Duin

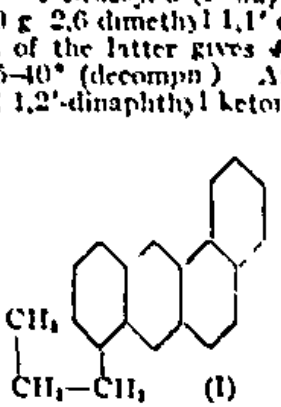
**The dibromonaphthalenes obtained by the action of bromine upon naphthalene.** Yu. S. Zalkind and S. B. Falkman. *J. Russ. Phys. Chem. Soc.* 62, 1021–32 (1930).—Earlier workers did not consider the influence of reaction conditions upon the yields and nature of di-Br isomers obtained by the direct bromination of $C_{10}H_8$ (I). One procedure used in the present work follows. With strong mech. agitation powd. I is added to excess Br$_2$ in 1.6 aq. NaOH. This is followed by the addn. of 1 N HCl when crystals sep. These are washed successively with water, warm NaOH and water, and the product is then recrystd. from EtOH giving 2 fractions, A, m. 81–2°, and B, m. 67–8°. The milder the cond. tions used, *e. g.* taking the I and Br$_2$ in suitable solvents (CS$_2$ or CHCl$_3$), slow addn., cooling, etc., the greater the yield of A, which is shown conclusively to be *1,4-dibromonaphthalene* (II). Addn. of Fe does not affect the yield of II if mild conditions are employed, but at high temps., with undissolved I, the yield of II is greatly reduced in the presence of Fe. By bromination of I at 60–70° with Br$_2$ in alk. soln., a theoretical yield of B is obtained. The highest yield of II obtainable directly from the

bromination mixt was 10%. B was found to be a eutectic mixt of II with *1,5-dibromonaphthalene* (III), m. 131°, in the ratio 3:1. This eutectic mixt is very difficult to resolve into II and III, although by further bromination II can be converted to $C_{10}H_6Br_2$ $Br_4$ and $C_{10}H_6Br_2$ $Br_4$ while III is not affected. It was found possible to obtain III in 10% yield by treating α $C_{10}H_7Br$ at 170–80° for 1–3 hrs. with excess $Br_2$, and recrystg successively from petroleum ether and EtOH. II and III were the only dibromonaphthalenes obtained by direct bromination. LEWIS W. BUTZ

**Derivatives of 1-chloro-2-nitronaphthalene.** A. P. J. HOOGVLIET. *Rec. trav. chim.* 50, 37–40(1931). Previously H. showed that 1,2 $C_{10}H_5ClNHAc$ is readily produced by the action of bleaching powder soln. on β $C_{10}H_7NHAc$ (*C. A.* 25, 911; Backer and Klazsens, *C. A.* 25, 915) and this procedure was used for the prepn. of a larger amt. of this compd., details of which are given in the original paper. On boiling the EtOH soln. with concd. HCl this compd. was hydrolyzed to 1,2 $C_{10}H_5ClNH_2$·HCl which was converted into 1,2 $C_{10}H_5ClNO_2$ according to the directions given by Hantzsch and Blagden (*Ber.* 33, 2544(1900)) for the prepn. of 2 $C_{10}H_7NO_2$ from β $C_{10}H_7NH_2$. The 1,2 $C_{10}H_5ClNO_2$, obtained in this way was identical with a specimen prepd. from 1,2 $C_{10}H_5(NH_2)NO_2$ by the Sandmeyer reaction (Hodgson and Kilner, *C. A.* 20, 1074), it m. 76°. On heating with alc. $NH_3$ for 6 hrs. in a sealed tube at 180°, the $C_{10}H_5ClNO_2$ was converted into *1-amino-2-nitronaphthalene*, m. 111°; on heating with alc. $MeNH_2$, *1-methylamino-2-nitronaphthalene*, m. 114°, was formed and with alc. $EtNH_2$, *1-ethylamino-2-nitronaphthalene*, m. 76°, the amines reacting more easily than $NH_3$, as is usually the case. On heating with alc. $Na_2S_2$, *2,2′-dinitrodinaphthyl disulfide*, m. 204°, is obtained. C. F. VAN DUIN

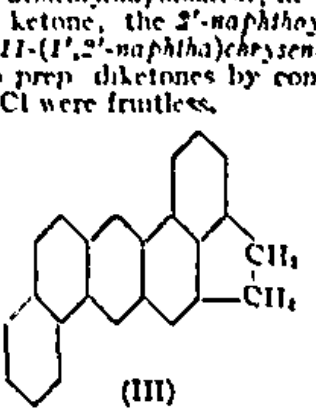
**Condensations of secondary amines with naphthols and aldehydes. II.** WALLACE R. BRODE AND JOSEPH B. LITTMAN. *J. Am. Chem. Soc.* 53, 1531–2(1931); cf. *C. A.* 24, 2155.—1-Naphthol (0.1 mol.) and 0.1 mol. of aldehyde in 10 cc. abs. EtOH were treated with 0.1 to 0.15 mol. of sec. amine and allowed to stand from 2 days to 5 months, the yields varied from 20 to 70%. BzH and $Pr_2NH$ with β $C_{10}H_7OH$ give *1-(α-dipropylaminobenzyl)-2-naphthol*, m. 95°; *p*-$MeOC_6H_4CHO$ and $Me_2NH$ give *1-(α-dimethylamino-p-methoxybenzyl)-2-naphthol*, m. 132°; piperidine gives *1-(p-methoxy-α-1-piperidylbenzyl)-2-naphthol*, m. 131.5°; piperonal and $Me_2NH$ give *1-(α-dimethylaminopiperonyl)-2-naphthol*, m. 120°; α $C_{10}H_7OH$, BzH and piperidine give *2-(α-1-piperidylbenzyl)-1-naphthol*, m. 110°. C. J. WEST

**Optical activity and the polarity of substituent groups. XVII.** *l*-**Menthyl hydrogen naphthalate, its alkali salts and methyl ester.** H. GORDON RULE AND ANDREW MCLEAN. *J. Chem. Soc.* 1931, 669–72; cf. *C. A.* 25, 289.—Menthol (25–30 g.) in 50 cc. hot PhMe contg. 0.04 g. Na, added to a hot soln. of 8 g. naphthalic anhydride in 1000 cc. PhMe and heated 2 hrs. on a steam bath, give 11 g. *l-menthyl II naphthalate* (I), m. 141° (decompn., preheated bath) and then solidifies and m. 271° (m. p. of the anhydride), at room temp. the ester decomps. slowly. *Na salt*, very sparingly sol. in $H_2O$, also slowly *decomps. at room temp.*; *K salt*, *rhombic crystals*, *is less stable than the Na salt*; *Li salt*.—The Ag salt and MeI give the *Me ester* (II), m. 96.5–7° (slight decompn.). In $C_6H_6$, *c* 4.004, II shows $[\alpha]_{6708}$ −89.1°, $[\alpha]_{5893}$ −120.1, $[\alpha]_{5461}$ −147.3, $[\alpha]_{4358}$ −268.2°; in $MeNO_2$, *c* 3.996, the values are −35.3°, −48.3°, −59.1°, −133.8°, in $C_6H_6$, *c* 4.014, I shows the values 117.1°, 165.9°, 203.3° and 397.0°, in MeCN, *c* 4.008, −35.2°, −47.4°, −55.8°, −82.3°. The influence of the $MeO_2C$ substituent raises the rotatory power of the *peri* naphthoate, as well as of the *o*-benzoate, when the rotations are measured for the esters in EtOH soln. A remarkable fall in rotatory power occurs when the $CO_2H$ group in I is modified by salt formation. The Li, Na and K salts all give positive rotations under the conditions of the expt., the values not *differing greatly from* one another and being in the order K < Na < Li ≪ H. In MeOH, *c* 1, the following rotations of *l*-menthyl 8 substituted 1-naphthoates are given $[\alpha]_{5461}^{20}$: $CO_2Me$, −38.3°; H, −30.2°; $CO_2H$, −218°; $CO_2Li$, 0.67°; $CO_2Na$, 4.25°; $CO_2K$, 11.9°. C. J. WEST



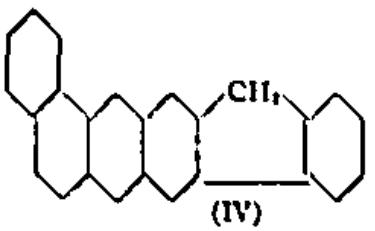
**Dyes derived from acenaphthenequinone. II. Azine and azonium derivatives.** SISIR KUMAR GUHA. *J. Chem. Soc.* 1931, 582–6; cf. Sircar and G., *C. A.* 18, 1202.—3-Bromoacenaphthenequinone, m. 238°, and *o* $C_6H_4(NH_2)_2$ give 3-bromoacenaphthaphenazine, cream, m. 272°; *3-Cl deriv.*, m. 278°, gives a reddish brown soln. in concd. $H_2SO_4$. 3,4-$(H_2N)_2C_6H_3Me$ gives *3-bromoacenaphthalolazine*, cream, m. 270°; *3-Cl deriv.*, cream, m. 250°; $H_2SO_4$ gives a brownish *red color*. *2,3-Diaminophenazine gives 3-bromoacenaphthaphenazinazine*, which does not melt and dyes wool light chocolate shades; *3-Cl deriv.* gives greenish black solns. in concd. $H_2SO_4$ and dyes wool light chocolate shades from an acid soln. 1,2 $C_{10}H_6(NH_2)_2$ gives *3-bromoacenaphthanaphthazine*, lemon yellow, m. 266°, and dyes wool in pleasant lemon-yellow shades; *3-Cl*

*derv*, lemon yellow, m 274°, and dyes wool the same color 1,2,5-$C_{10}H_4(NH_2)SO_3H$ gives *3 bromoacenaphthanaphthazine-5' sulfonic acid*, canary yellow, *3-Cl derv*, brownish yellow, does not m 300°, conced $H_2SO_4$ gives blood red solns., wool is dyed light yellow shades Phenyl 1 amino-β naphthylamine gives *phenyl-3-chloroacenaphthanaphthazonium nitrate*, yellow-orange, m above 300° (decompn), conced $H_2SO_4$ gives a violet color, wool is dyed yellow-orange shades from an acid bath The tinctorial properties of some of these compds are not less developed than those of the available, most nearly corresponding phenanthraquinone derivs. C. J. West



**The anomalous decomposition of the tetrazo derivative of 2,2'-diamino-1,1'-binaphthyl.** A. Corbellini and L. Barbaro *Atti accad Lincei* 12, 445-51(1930).—It has already been shown that tetrazotized 2,2'-diamino-1,1'-binaphthyl decomps giving an acidic deriv (I), m. 250–2° (C and Debenedetti, *C A* 24, 359), from $H_2SO_4$ or HCl solns. With HBr and $Cu_2Br_2$ the normal di Br derivs are formed Purified, I m 269.5° and has the compn $C_{21}H_{14}O_2N_2$ With the Ag salt and MeI or EtI, the resp esters, m 158° and 143°, are formed The formation of a monobasic acid with 2 N atoms and the evolution of $N_2$ during decompn indicate that one N N group behaves differently from the other If it is assumed that one of the N N groups in $(C_{10}H_6NX \cdot N)_2$ reacts normally to the —OH deriv., $HOC_{10}H_6C_{10}H_6NX$ N, while the other as a normal diazohydrate, $HOC_{10}H_6C_{10}H_6N(O)NH$, oxidizes the double bond, then either of the tautomers $HO_2CCH(CHC_6H_4CH)NNC_{10}H_6$ or $HO_2CCH(CHC_6H_4C)NNHC_{10}H_6$ would result The reactions of I show its resemblance to PhCH:CHCO₂H On sublimation, it loses $CO_2$, forming a neutral product m. 154°, its compn being $C_{19}H_{14}N_2$ $KMnO_4$ oxidizes it, producing (1) an aldehyde $C_{13}H_{10}ON_2$, m 230°, (2) an acid which has not been purified but is probably related to benzoic or phenylglycerie acid, and (3) an acid, m 287° On bromination of the esters unstable derivs are obtained which are apparently di Br addn products. A. W. Contieri

**Polycyclic aromatic hydrocarbons. II. The non-existence of 1,2,7,8-dibenzanthracene.** James W Cook. *J Chem Soc* 1931, 457–9; cf *C A* 24, 4020.—By pyrolysis of 2 methyl 1,1' and 1,2'-dinaphthyl ketones Clar (*C. A* 23, 2906) and Fieser and Dietz (*C A* 23, 5472) obtained compds which they believed to be, resp., 1,2,7,8- (I) and 1,2,5,6-dibenzanthracenes (II) A further study of these compds. shows that they have the same fluorescence spectrum (Hieger, *C A* 24, 5369) and yield the same derivs. That the compd is II is shown by its synthesis by Weitzenböck and Klinger (*C A* 13, 423) Homer (*C A* 5, 1076) claimed that I was formed by the action of $AlCl_3$ on $C_{10}H_8$ in $C_2H_2Cl_4$ repetition of the work showed that the product is perylene It appears, therefore that I has not yet been prepd. III. Derivatives of 1,2,5,6-dibenzanthracene. *Ibid* 489–99.—The following compds were prepd in a further effort to identify the carcinogene principle in coal tar 2,6-$C_{10}H_6Me_2$ and α-$C_{10}H_7COCl$ with $AlCl_3$ in $CS_2$ give 50% of *2,6-dimethyl 1,1'-dinaphthyl ketone* (I) yellow, m 162–3°, *2,7-di Me derv* (II), m 161–2° (70% yield), 2,7-$C_{10}H_6Me_2$ and β-$C_{10}H_7COCl$ give 40% of *2,7-dimethyl-1,2'-dinaphthyl ketone* (III), m 113.5–4.5°, 1,6-$C_{10}H_6Me_2$ and BzCl give *4 benzoyl 1,6 dimethylnaphthalene* (IV) m 77–8°, it is scarcely attacked by alk $KMnO_4$ after boiling 10 hrs 2-$C_{10}H_7Me$ and 4-$MeC_{10}H_6COCl$ give a poor yield of *2,4'-dimethyl 1,1'-dinaphthyl ketone* (V), m 120–1°, *2,7,4'-tri Me derv* (VI), m 140°. Heating V at 440–50° until $H_2O$ was no longer eliminated gives 1,2,5,6-dibenzanthracene (VII), I under the same conditions gives the 3' Me deriv of VII, which was also obtained from the crude condensation product of 2,6-$C_{10}H_6Me_2$ and 4-$MeC_{10}H_6COCl$. III, on pyrolysis, gives the *2' Me derv of* VII, m 256–7.5°, as does the pyrolysis of II, of the ketone from 1,6-$C_{10}H_6Me_2$ and 2-$MeC_{10}H_6COCl$ and of VI. In each case the Me group in the α-position to a condensed ring is eliminated The structures of the ketones were not rigidly established but follow from general considerations 1,2,5,6-Dibenzanthraquinone (10.5 g.) and MeMgI in $C_6H_6$ give 10.2 g. of *9,10-dihydroxy 9,10-dimethyl 9,10-dihydro-1,2,5,6-dibenzanthracene* (VIII), m 245–50°, conced $H_2SO_4$ gives an intense cornflower blue color, reduction with Zn and AcOH gives only resinous substances but HI in glacial AcOH gives *9,10-dimethyl 1,2,5,6-dibenzanthracene*, yellow, m. 205.5–6.5°, and gives an intense violet soln in conced $H_2SO_4$ the same compd was obtained from the so-called 1,2,7,8-dibenzanthraquinone of Clar Reduction of VIII with red P and HI in glacial acetic acid gives a mixt. of the *cis* and *trans 9,10-dimethyl 9,10-dihydro derivs*, m 207–9° and 277–8° resp the 2 were sepd by crystn. from $C_6H_6Me_2$, the *cis* form being the more sol the *cis* form shows a feeble fluorescence in ultra violet light The *9,10-di Bu derv* corresponding to VIII, m 214–5°, and gives the same color in $H_2SO_4$, a *Bu ether* (?), m 225–6°, was obtained when HCl was used to decomp the Grignard reagent, reduction of the diol with Zn and AcOH gives the *9,10-di-Bu derv* of



VII, yellow, m. 143.5–4.5°, warm concd. $H_2SO_4$ gives a purple soln. with a dark red fluorescence. The *9,10-dibenzyl deriv. of* VII, m. 195–201° (decompn.), purified through the red picrate, was obtained by reduction of the corresponding *diol*, m. 249–51°, which gives an orange-red soln. in concd. $H_2SO_4$. Reduction of VII with Na and AmOH gives an *octahydro deriv.*, m. 188.9°, also obtained from Clar's compd. A preliminary note is added on the isolation of a hydrocarbon, m. 153.6°, from the high boiling constituents of coal tar, which, on oxidation, gives a mixt. of quinones. IV. **Condensed derivatives of 1,2-benzanthracene.** *Ibid.* 499–507. - This work was for the purpose of prepg. an unsubstituted hydrocarbon having the same fluorescent spectrum as that of the powerful cancer producing mixts. of unknown composition. This was largely realized in the compds. III and IV or V. 2 $MeC_{10}H_5COCl$ and $Ph_2$ give only 1,2-($p$-$PhC_6H_4CO$)$C_{10}H_6Me$ ($m$ $MeC_6H_4$)$_2$ and $\alpha$-$C_{10}H_7COCl$ with $AlCl_3$ give *4,4'-di α-naphthoyl-3,3'-dimethylbiphenyl*, cream, m. 159.5–60.5°; pyrolysis gives *1,2 1',2'-dibenz-6,6' (or 7,7')-bianthryl*, m. and decomps. above 310°, sublimes about 175° at 2 mm.; it may be a mixt. of the 2 isomers. The ketone from hydrindene and 2 $MeC_{10}H_5COCl$ could not be crystd.; pyrolysis gives *cyclopenteno 1,2 benzanthracene* (probably I), m. 199–200°; concd. $H_2SO_4$ gives a crimine soln. This was also obtained by pyrolysis of the crude ketone from hydrindene-5-carboxylyl chloride and 2 $MeC_{10}H_6MgBr$. *2 Methyl-5',6',7',8' tetrahydro-1,2'-dinaphthyl ketone*, m. 122.5–3.5°, results in 70% yield from tetralin and 2 $MeC_{10}H_6COCl$; dehydrogenation with S at 210–20° gave a resin from which 2 methyl 1,2' dinaphthyl ketone was isolated; pyrolysis gave only 1,2 5,6-dibenzanthracene (II). Acenaphthene and 2 $MeC_{10}H_6COCl$ give 65% of *5 (2' methyl 1' naphthoyl)acenaphthene*, m. 184.5°; pyrolysis gives *phenanthra acenaphthene* (III), golden yellow, m. 231–2°, sublimes at 330° and 3.4 mm.; it was purified through the chocolate-brown picrate, concd. $H_2SO_4$ gives a fugitive bluish violet color; distn. gives II, the 5 membered ring being eliminated. Fluorene gives 85% of *2 (2' methyl 1' naphthoyl)fluorene*, m. 169–70°; pyrolysis gives *2,3 phenanthra 5',2' fluorene* or *2,3 phenanthra 1',2' fluorene* (IV or V), pale yellow, m. 302–4°, concd. $H_2SO_4$ gives a pale blue soln. with a pinkish red fluorescence, which becomes emerald green on standing or gentle warming. *3-Phenanthroyl chloride*, m. 110°, from the acid and $SOCl_2$, gives with $o$-$MeC_6H_4MgBr$ a ketone, which could not be crystd. but gave on pyrolysis 2',3' naphtha 2,3 phenanthrene, m. 203–4°; with 2 $MeC_{10}H_6MgBr$ there results *3-(2' methyl-1' naphthoyl)phenanthrene*, m. 145–6°, giving on pyrolysis *2',1'-phenanthra-2,3-phenanthrene* (VI), canary-yellow, m. 311–3°, giving an indigo-blue color in concd. $H_2SO_4$, changing to emerald-green on warming; a small quantity of another *hydrocarbon*, orange, m. 215–8°, is formed, probably isomeric with VI. 2 $MeC_{10}H_6MgBr$ and 1-anthroyl chloride give a ketone as a viscous oil, which, on pyrolysis, gives *2',3'-phenanthra 1,2-anthracene*, canary-yellow, m. 281–2° (decompn.). *1-Benzoyl-5 (1'-naphthoyl) 2,6-dimethylnaphthalene*, m. 206–8°, in 8.9 g. yield from 10 g. 2,6 dimethyl 1,1' dinaphthyl ketone; the *2'-naphthoyl deriv.*, m. 222–3°; pyrolysis of the latter gives *4,5-benz-10,11-(1',2'-naphtha)chrysene* (VII), golden yellow, m. 435–40° (decompn.). Attempts to prep. diketones by condensing 2,7-dimethyl 1,1'- and 1,2'-dinaphthyl ketone with BzCl were fruitless.

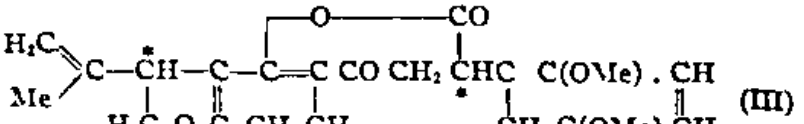
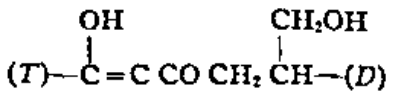
Syntheses of antiseptic derivatives of indan-1,3-dione. II. Interaction of alkylmalonyl chlorides with *p*-tolyl methyl ether. THOMAS K. WALKER, ARTHUR J. SUTHERS LESLIE I. ROE AND HERBERT SHAW. *J. Chem. Soc.* 1931, 514-20; cf. *C. A.* 25, 2140.—*p*-$MeC_6H_4OMe$ (5 g.) and 5.8 g. $CH_2(COCl)_2$ in 50 cc. PhNO treated with 11.5 g. $AlCl_3$ during 30 min. and the mixt. warmed at 60° for 45 min., give 50% (4 g.) of *4-hydroxy-7-methylindan-1,3-dione* (I), lemon yellow, m. 258°. *p*-$MeC_6H_4OH$ (2.4 g.) and 3.4 g. $MeCH(COCl)_2$ give 0.8 g. of the *2,7-di-Me deriv.* (II), m. 253°. *p*-$MeC_6H_4OMe$ and $EtCH(COCl)_2$ give 20% of the *2-Et deriv.* (III), m. 197°. $Et_2C(COCl)_2$ and *p*-$MeC_6H_4OMe$ give the *2,2-di-Et deriv.* (XII), m. 199-200°, if the reaction was carried out in $CS_2$ the main product was the corresponding *4-MeO deriv.*, only. heating with $AlCl_3$ gives a good yield of III. $PrCH(COCl)_2$ and *p*-$MeC_6H_4OMe$ give *4-hydroxy-7-methyl-2-propylindan-1,3-dione* (IV), m. 187°, this was also obtained in quant. yield from *p*-$MeC_6H_4OAc$. $BuCH(COCl)_2$ gives the *2-Bu deriv.* (V), m. 165°. The same compd. was also obtained with *p*-$MeC_6H_4OH$ with $AlCl_3$ or $FeCl_3$ and from $PCl_5$ *p*-$MeC_6H_4OAc$, $BuCH(CO_2H)_2$, and $PhNO_2$, the product finally being treated with $AlCl_3$. *2-Im deriv.* (VI), m. 140° (20% yield). *2-hexyl deriv.* (VII), m. 136° (31% yield); *2-heptyl deriv.* (VIII), m. 124° (50% yield). *2-iso-Pr deriv.* (IX), m. 224° (16% yield). *2-iso-Bu deriv.* (X), m. 152.5° (47% yield). *2-iso-Am deriv.* (XI), m. 142° (44% yield). The following figures were obtained for the equimol. PhOH coeff. of bacteriostatic power: I 64, II 30, III 37, IV 64, V 170, VI 440, VII 1305, VIII 1170, IX 106, X 133, XI 360, XII 89. The concns. of V required to inhibit *S. pyogenes albus*, *B. subtilis* and *B. pyocyaneus* for 48 hrs. at 37° were 1:25,000, 1:25,000 and 1:83,000, resp., the same organisms were inhibited under the same conditions by VIII in resp. concns. of 1:500,000, 1:333,000 and 1:500,000. The attachment of 1 of the lower alkyl groups in place of a H atom, to the C atom in the medial position with respect to the 2 CO groups results in a diminution of antiseptic potency. As the length of the alkyl chain is increased, this effect becomes neutralized, groups higher than Pr giving rise to considerably enhanced activities, the progressive increase of which appears to have reached its limit with the introduction of the $C_5H_{11}$ radical. C. J. WEST



Anthraquinone azo compounds. II. Insoluble disazo dyes from 1,5-diaminoanthraquinone. TOSHIO MAKI. *J. Soc. Chem. Ind., Japan* 34, *Suppl. binding* 51-6 (1931); cf. *C. A.* 24, 4780.—Tetrazotized 1,5-diaminoanthraquinone when coupled gives dyes as follows: with α-$C_{10}H_7NH_2$ violet brown, m. 256°, with β-$C_{10}H_7NH_2$, violet brown, m. 269.9°, $PhNH_2$ orange, m. 248.5°, *m*-$C_6H_4(NH_2)_2$, dark brown, m. 259.6°, α-$C_{10}H_7OH$ violet brown, m. over 300°, PhOH, yellow brown, m. 280.8°, *m*-$C_6H_4(OH)_2$, red brown, m. 400°. V. I. HARRINGTON

Velocity measurements on the opening of the furan ring in hydroxymethylfurfuraldehyde. II. H. P. TEUNISSEN. *Rec. trav. chim.* 50, 1-20 (1931); cf. *C. A.* 24, 4782.—In the 1st. paper measurements of the hydrolysis of hydroxymethylfurfuraldehyde under various conditions were described, water being the solvent, the present paper deals with the same subject, mixts. of water and MeOH or EtOH being used as a solvent. The 1st. series of measurements was carried out with EtOH-water mixts. *at the b. p. of the mixt.*, the following results being obtained with 0.5 *N* HCl as a catalyst: 5% EtOH, $k$ = 0.00129, 10% 0.00106, 15% 0.00083, 25% (b. 90.9-91.2°), 0.00046, 30% (b. 89.9-90.0°), 0.00034, 40% (b. 87.6-87.7°), 0.00023, 50%, 0.000125, 70%, 0.00003. Although these reaction consts. do not refer to the same temp., they show clearly that the velocity of the hydrolysis of hydroxymethylfurfuraldehyde into formic and levulic acids decreases on increasing the EtOH content of the mixt. Moreover, it was observed that the reaction const. always decreases during an expt., most probably alcoholysis taking place simultaneously, in mixts. with the higher EtOH contents the quantity of humus formed is much less than in water and in mixts. with the lower EtOH content. The same results were obtained on carrying out these measurements in a sealed tube or a closed flask at 100°, again a continuous decrease of the reaction const. being observed during the course of each expt. *With 0.5 N HCl as a catalyst, the following results* were obtained at 100°: 10% EtOH $k$ = 0.00159, 15% 0.00131, 25% 0.00090, 35%, 0.00055, 50% 0.00022, 70%, 0. From these results the temp. coeff. of the reaction is calcd. to be about 2.0. With mixts. of MeOH and water again the same phenomena were observed as regards both the continuous decrease of the reaction const. during each expt. and the retarding effect of the alc. in general. With 0.5 *N* HCl as a catalyst the following figures were obtained at 100°: 10% MeOH, $k$ = 0.00111, 20%, 0.00063, 30% 0.00020, 40% about 0. The general retarding effect of the addn. of MeOH or EtOH is in accordance with the researches of Weehuizen who recommends the use of a satd. soln. of HCl in EtOH instead of concd. HCl in both the Selivanov and the Bauduin reactions (*C. A.* 12, 1004, 2029) in order to prevent decompn. of the hydroxymethyl-



furfuraldehyde into levulic and formic acids The side reaction plays a more important role with MeOH than with EtOH and it was found that with MeOH a compd. is formed in the side reaction which easily gives $CHI_3$ with an alk. I KI, the nature of the product could, however, not be elucidated further The hydrolysis of furfuryl alc. with the formation of levulic acid (Pummerer and Gump, *C A* 17, 3163) was also studied in water the alc was prepd from furfuraldehyde by means of the Cannizzaro reaction and the reaction was measured with HCl and with oxalic acid as a catalyst at 100° A real reaction *const* was not obtained in any of these measurements with 0 1 *N* HCl, *k* decreases from 0 00302 to 0 00068 in 0 5 *N* HCl from 0 00307 to 0 00067 in 0 02 *N* HCl from 0 00221 to 0 00048 with 0 4 *N* oxalic acid from 0 00274 to 0 00099 and with 0 02 *N* oxalic acid from 0 00135 to 0 00033 More than 50% of the furfuryl alc resinifies during this process this resinification also takes place on boiling the aq solution, only a small quantity of levulic acid being formed in this case C I VAN DUIN

Syntheses in the thiophene series with the aid of stannic chloride. YA L GOLDFARB *J Russ Phys Chem Soc* 62, 1073–82(1930) —The yields obtained in the acylation of thiophene (I) in the presence of $SnCl_4$ depend upon the solvent used. In benzine (b 120–40°) soln crude $C_4H_3SAc$ (b 200–214 5 ) was obtained in 56% yield, in PhH it was 96% using 1 mol I, 1 mol AcCl and 1 or 0 5 mol $SnCl_4$. With 0.25 mol $SnCl_4$ the yield was cut to 48 6% BzCl I and $SnCl_4$ in PhH gave 82 5% of $C_4H_3SBz$ (m 55°) As indicated above I is more reactive than PhH with regard to acylation in the presence of $SnCl_4$. Condensation with ethers also occurs more rapidly with I than with PhH. $(Ph_2CH)_2O$ (II) gives in the cold in $CS_2$ or PhH soln *dibenzohydrylthiophene*, $C_4H_2S(Ph_2CH)_2$ (III) lemon yellow m 85–85 5 One mol III upon oxidation with $CrO_3$ gave 2 mols BzPh III is sol in PhH Et$_2$O AcMe and warm AcOH, difficultly sol in EtOH It is very photosensitive, deepening in color upon exposure By recrystn in the dark nearly colorless crystals are obtained III reacts energetically with $HNO_3$, dissolves upon gentle heating in $H_2SO_4$ and gives a reddish violet color with isatin and $H_2SO_4$. III is also obtained, in 60% yield, by substituting $Ph_2CHOH$ (IV) for II. AcCl with III and $SnCl_4$ in PhH gave $C_4Ac_2S(Ph_2CH)_2$ m 152° II reacts with PhH only at higher temps and only the mono deriv is produced IV with PhH and $SnCl_4$ gives principally $Ph_2CH$, a cryst. product, m. 165°, was also obtained The exact structure of III was not detd. LEWIS W BUTZ

Rotenone, the effective constituent of derris root. IX. The structure of rotenone. SANKICHI TAKEI, SHIKIRO MIYAJIMA, MINORU ŌNO *Bull Inst Phys-Chem Research* (Tokyo) 10, 211–9(1931). *Abstracts* 19–28(in German) published with *Sci Papers Inst Phys-Chem Research* (Tokyo) 15, Nos 289–91). cf *C A* 25, 1510 —From the formulas of derric acid (I) and tubaic acid (II), a formula for rotenone (III) is derived. This formula explains all the known properties and derivs of III, except the formation of derritol (IV) (*C. A* 22, 3660) On oxidation with $KMnO_4$ IV gives II. It must therefore contain the nucleus of tubaic acid. This is not in agreement with the view of Haller and La Forge (*C A* 25, 105) The reactions of III are discussed critically and an extensive bibliography is added. The name rotenol for the compd. obtained by decarboxylation of rotenic acid has to be changed to roteol, because rotenol is used for another substance (*C A* 22, 3660 *C A* 25, 105) Regarding the structure of IV and its derivs , another paper will follow

(III)

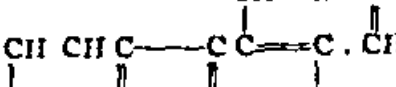
(IV)

In this scheme (*T*) means a part of the tubaic acid group, (*D*) a part of the 2,5-dimethoxyphenyl group of rotenone ALFRED BURGER

Stereoisomeric catechols. R P BIGGS, W L COOPER, EDITH O HAZLETON, M. NIERENSTEIN AND PHYLLIS H PRICE *J Am Chem Soc* 53, 1500–5(1931) —Eight stereoisomeric catechols have been shown to exist in nature, of which *d*-acacatechol (I) and *d* isoacacatechol (II) have been discovered in the present work. The products were identified as the penta-Ac derivs The material was extd. with AcOEt (or $CHCl_3$) and the residue from this solvent extd with Et$_2$O The following yields are reported: 56 kg mahogany wood (South Africa), 12 g I and 3 5 g *dl*-acacatechol (III); 42 kg

mahogany wood (West Indies) 6 g I and 6 g III; 8 kg Australian kino (IV) from *Eucalyptus terminalis* 16 g I and 22 g III; 6 kg IV from *E. leucoxylon*, 5 g I and 10 g III; 9 kg IV from *Angophora intermedia* 14 g I and 8 g III; 86 kg heartwood of *Anacardium occidentale*, 21 g II; 4 kg Malabar kino (V) from *Myristica malabarica*, 3 g *l* acacatechol (VI) and 11 g III; 7 kg V from *Pterocarpus marsupium*, 9 g VI and 17 g III, 6 kg IV from *E. corymbosa*, 4 g VI and 9 g III; 28 kg *Uncaria gambir* leaves, 56 g *d* gambir catechol (VII) and 6 g *dl* isomer (VIII), 2.8 kg *U. acida* leaves, 17 g VII and 3 g VIII, 11 kg Chinese rhubarb, 17 g VII and 3 g VIII; 2 kg Guarana paste, 5 g VII and 8 g VIII, 10 kg kola nuts, 58 g VII and 8 g VIII. C. J. West

Polyhalogenated ketones of indole. G Sanna with Farhadla Massidda *Gazz. chim. ital.* 61, 60-74(1931).—The present paper describes the prepn of 2 polyhalogenated ketone derivs of methylketole and the behavior of these derivs with alkalies and with $NH_4OH$ which differed greatly in the 2 cases. $Cl_3CHCOCl$ in anhyd $Et_2O$ added dropwise to magnesylmethylindole (I) (1 mol.), keeping cold, kept ice-cold several hrs., ice water added, the $Et_2O$ layer sepd., the aq. layer filtered, the residue washed with water, allowed to dry, dissolved in hot MeOH, cooled and the purification repeated several times, yields almost 100% of *β-dichloroacetyl α methylindole* (*α methylindacal chloride*) (II), m. 195°; gives green solns. in cold concd. $H_2SO_4$, and solns. in hot concd. $HNO_3$ which are at first green and then yellow. It is almost insol. in boiling dil. acids. It is slightly sol. in hot aq. NaOH and KOH and these yellow solns. give amorphous red *ppts.* when acids are added. It is far more sol. in alc. KOH, and addn. of water or of dil. acids to these solns. ppts. rose-colored amorphous products. It is insol. in hot $NH_4OH$, but sol. in hot alc. $NH_3$. Its solns. in hot $C_5H_5N$ do not ppt. on cooling, but on addn. of dil. EtOH a ppt. contg. Cl is formed (perhaps II). II reduces hot $NH_3$ $AgNO_3$ and slowly reduces Fehling soln. It gives *ppts.* of various colors with the general reagents of alkaloids. The Cl of II is very stable, and there is no decompn. when a 1% aq. soln. is boiled for several hrs. The Cl can, however, be removed by boiling several hrs. in concd. alc. KOAc. In this latter case the product is amorphous and is difficult to purify, but is probably *β-diacetoacetyl α methylindole*. Fusion with KOH, carried out in the same way as with other monohalogenated derivs., yields α methyl β indolecarboxylic acid. Oxidation is more difficult than with indacyl chloride (III), and it is necessary to boil it for a long time in more concd. $KMnO_4$, the products are, however, the same (cf. *C. A.* 24, 2127) from II and from III. The ease with which III reacts with KBr and KI suggested the same reaction with II. II in MeOH and concd. aq. KBr (2 mols.), refluxed 48 hrs., cooled, filtered, the residue washed with water, dried, fractionally crystd. from MeOH (the greater part is II), gives a small yield of a *compd.* which is probably



*α methylindacal, dibromide*, $C_6H_4\overline{NH\ CMe\ CCOCHBr_2}$, m. 178°. Following the same procedure with KI the yield of the *compd.*, which is probably *α methylindacol diiodide*, is still smaller. This difficulty of substitution of Cl by other halogens is a new example of the great stability of Cl in dihalogenated derivs. II (2 g.) and 5% aq. KOH (2 mols.), refluxed 12 hrs. (60% of II is still unaltered), filtered, the filtrate acidified with dil. HCl extd. with $Et_2O$, the ext. dried with anhyd. $Na_2SO_4$, concd. on a water bath, the yellow oil kept *in vacuo* until crystd. and recrystd. from $Et_2O$, yields *α methyl β indyl glycolic acid* $C_6H_4\overline{NH\ CMe\ CCH(OH)CO_2H}$ (IV), m. 90° (decompn. to $CO_2$ and α methylketoylcarbinol), insol. in dil. acids, its soln. in concd. $H_2SO_4$ is at first yellow but this changes to red, in concd. $HNO_3$ it is rose-yellow, in hot concd. HCl rose, in $NH_4OH$ straw yellow (addn. of HCl ppts. a rose-colored amorphous powder), and in caustic alkalies yellow (reppted. in cryst. form by dil. acids), it reduces Fehling soln. immediately and $NH_3$ $AgNO_3$ without formation of a metal mirror, does not give any color with Schiff reagent. Aq. $BaCl_2$ added to IV in aq. KOH (calcd. quantity) ppts. the *Ba salt* of IV, could not be fused. Dil. aq. $AgNO_3$ added to IV (calcd. quantity) in $NH_4OH$ ppts. the *Ag salt* of IV, turns a rose color in light. m. 247°. $Cl_3CCOCl$ in anhyd. $Et_2O$, added dropwise to I (1 mol.) keeping cold, let stand 2 hrs. at 0°, ice water added, the $Et_2O$ layer sepd., the aq. layer extd. with $Et_2O$, the combined $Et_2O$ exts. dried with anhyd. $Na_2SO_4$, filtered, the $Et_2O$ evapd., the residual oil washed with petr. ether, allowed to crystallize and the product purified by recrystn. successively from boiling $C_6H_6$ and MeOH (with animal charcoal), yields almost 100% of *α methyl β trichloro acetylindole* (*methylketoylchloroform*) $C_6H_4\overline{NH\ CMe\ CCOCCl_3}$ (V), m. 167°, barely sol. in hot dil. acids and in hot concd. HCl, its soln. in hot concd. $HNO_3$ is at first yellow, then rose, in hot caustic alkalies rose (odor of $CHCl_3$) and in $C_5H_5N$ also rose (addn. of dil. EtOH ppts. V again), it is insol. in $NH_4OH$, reduces hot Fehling soln. (this is prob-

ably due to $CHCl_3$ formed by the action of alkali in the reagent, which transforms it into formate), reduces $NH_3$-$AgNO_3$ soln V (1 g) and 5% aq KOH (3 mols), refluxed 6 hrs (most of the V is still undissolved), filtered, the filtrate cooled, acidified with dil $H_2SO_4$, extd with Et$_2$O, the ext dried with anhyd $Na_2SO_4$, concd to a small vol, the residual soln evapd *in vacuo in a desiccator yields a compd* (VI), *red, m approx* 80°, insol in dil acids, slightly sol in hot concd HCl, its soln in concd $H_2SO_4$ is at first yellow but turns red, it is partially sol in $NH_4OH$ (yellow color), slightly sol in cold caustic alkalies, easily sol in hot caustic alkalies and the yellow soln thus formed becomes rose colored on addn of HCl and a rose colored amorphous ppt. is formed VI reduces Fehling soln and $NH_3$ $AgNO_3$ soln (without formation of a mirror) It does not contain Cl, behaves as a weak acid and the closeness of its m p to that of IV suggests that IV and VI are the same compd, but this was not ascertained V (1 g) and dil. alc KOH (3 mols), heated gently, dild with water ($CHCl_3$ is evolved), acidified with HCl, extd with Et$_2$O, the ext dried, concd and let stand *in vacuo*, deposits *α-methyl β indolecarboxylic acid*, $\overline{C_6H_4\ NH\ CMe\ CCO_2H}$, m 174° (decompn) The same reaction occurs with cold concd alc KOH and with hot concd aq KOH A suspension of V (1 g) in 30% aq $K_2CO_3$, refluxed several hrs, filtered, the filtrate cooled, the ppt filtered, dried and recrystd from EtOH, yields *methylketosylformic acid* (*α methyl β indylglyoxylic acid*), $\overline{C_6H_4\ NH\ CMe\ CCOCO_2H}$ (VII), golden yellow, m 186° (decompn. to $CO_2$ and α-methyl β indolic aldehyde), insol in dil acids, its soln in concd $H_2SO_4$ is yellow, it is sol in caustic alkalies and in $NH_4OH$, does not reduce Fehling soln or $NH_3$-$AgNO_3$ Its formation is therefore as follows $2V + 3K_2CO_3 + H_2O \longrightarrow VII + 3CO_2 + 6KCl$ As described for II, attempts were made to substitute the Cl of V with Br and I, to which end alc. V was treated with KBr (3 mols), but there was no reaction even after boiling for several hrs Further expts to obtain the Br and I derivs are in progress II (2 g), suspended in concd $NH_4OH$, heated in a sealed tube for 6 hrs at 100°, cooled, the ppt dissolved in boiling water and cooled, ppts 100% of *α methyl β indolecarboxylic acid amide*, $\overline{C_6H_4\ NH\ CMe\ CCONH_2}$ (VIII), silky, m 218°, its solns in boiling dil acids are yellow-rose, and in concd $H_2SO_4$ yellow, it is insol in cold and only slightly sol in hot aq alkalies. The formation of VIII should be thus $II + NH_3 \longrightarrow VIII + CH_2Cl_2$, and since $CH_2Cl_2$ was not detected in the reaction product it is probably transformed first into HCHO and thence into hexamethylenetetramine. Further expts on this reaction are in progress Under the same conditions, the reaction of V and $NH_3$ did not give definite results The V hardly dissolved even after prolonged heating, and the soln, which turned yellow, deposited, after long standing, a red *powder*, the quantity of which was too small for analysis C. C Davis

Preparation of isatin from isonitrosoacetanilide according to Sandmeyer's method. J. P. Wibaut and M C Geerling *Rec trav chim* 50, 41–3(1931) —On prepg isatin by heating isonitrosoacetanilide and concd $H_2SO_4$ to 70° and pouring the reaction mixt on ice (Sandmeyer, *C A* 13, 1840, Marvel and Hiers, *C A* 20, 193) it is often observed that the isatin seps from the soln only after inoculation or after scratching with a glass rod, while in other cases isatin monoxime, m 201–2°, is obtained instead of isatin, the oxime compd may also be obtained from solns from which isatin itself has already crystd The $NH_4OH$, necessary for the formation of the isatin monoxime, is produced by hydrolysis of the isonitrosoacetanilide, which is not converted into isatin in the dil $H_2SO_4$; it was shown that this hydrolysis does not take place in the concd $H_2SO_4$ C. F. van Duin

Action of hydrogen peroxide on benzo-6,7-diketo-2,3-dihydro-2,3-dithionaphthene in sodium hydroxide solution. R Stollé and W Badstübner *J. prakt Chem* 129, 309–11(1931) —The action of $H_2O_2$ on benzo-6,7-diketo-2 3-dihydro-2,3-thionaphthene in NaOH gives *bis(2-carboxy-1-naphthyl) disulfide*, m 156°, $KMnO_4$ is reduced in the cold. Titration with 0 1 *N* alkali to neutrality gives the di-K salt; if excess KOH is added the acid is apparently decompd into 1,2 $C_{10}H_5(SO_2K)CO_2K$ and 1,2-$C_{10}H_5$-$(SK)CO_2K$. C. J. West

Carbazolic derivatives. E Ghigi *Gazz. chim. ital* 61, 43–6(1931) —In previous expts (cf. *C. A.* 24, 3797) condensation of β tetralone phenylhydrazone (I) with dil. $H_2SO_4$ led to the formation of a compd (II), m. 100°, which may have had either one of two formulas, for a choice between which there were at the time insufficient data. In the present paper, the identity of this compd. is definitely established It was dehydrogenated by the method of Borsche (*C. A.* 2, 1716), *i e*, by heating II (5 g) mixed with PbO (equal vol) in a current of $CO_2$ and purifying the distillate by crystn from ligroin

The product was identified as 3 4 benzocarbazole, and this in turn proved that II is *1,2-dihydro 3 4 benzocarbazole*,  I (25 g) and anhyd $ZnCl_2$ (83 g) in abs EtOH refluxed for 10 hrs., 5% aq HCl added, extd with $Et_2O$, the ext dried with anhyd $Na_2SO_4$, the $Et_2O$ eliminated, distd *in vacuo* and the residue recrystd from $C_6H_6$ yield the *compd* $C_{16}H_{11}N$ (III), m 228°, heated with anhyd $(CO_2H)_2$ it gives the blue color characteristic of carbazole derivs. III (1 g) and picric acid (1 g) in $C_6H_6$, refluxed until clear cooled and the ppt recrystd from $C_6H_6$, yield the *picrate* $C_{16}H_{11}N \cdot C_6H_2(NO_2)_3OH$ red m 184°. III, $Ac_2O$ (4 parts by wt) and anhyd $ZnCl_2$ refluxed 15 min. cooled and the ppt recrystd from EtOH, yield the *Ac deriv.*, m 289–90°. Following the method of Borsche as before (*loc. cit.*), but purifying the product from $C_6H_6$ 1 2 benzo-3 4 dihydrocarbazole (cf. *C. A.* 24, 3797) and PbO form III. III is therefore 1 2 benzocarbazole, obtained by Borsche (*loc. cit.*) by oxidation of 1,2 benzo >6 7 8 tetrahydrocarbazole. C. C. DAVIS

Synthesis of 4-phenylthiazole-2-methanol and some of its derivatives. VIII. JOHN T. OLIN AND TREAT B. JOHNSON. *J. Am. Chem. Soc.* 53, 1470–3(1931).—$BzOCH_2CSNH_2$ (30 g.) 38 g. $BzCH_2Br$ and 20 cc. $C_5H_5N$ in 100 cc. EtOH, heated 1 hr. on the $H_2O$ bath give 80% of the *benzoate*, m. 73–4°, of *4 phenylthiazole 2 methyl alc.* (I), PhC(CH)SC($CH_2OH$)N, b$_4$ 210–5°, m. 88–9°. Similarly, $EtOCH_2CSNH_2$ gives the *Et ether* of I, b$_4$ 187–8°, unchanged by 40% HBr for 4 hrs. heating with 80% $H_2SO_4$ at 145–50° for 0.5 hr. gives 65% of I. The *acetate* of I b$_4$ 193°, m. 40°. Bubbling HBr through I in $Ac_2O$ while warming on the $H_2O$ bath gives 90% of the *bromide*, b$_{14}$ 195°, the *chloride* b$_{14}$ 184°. Oxidation of I with $Na_2Cr_2O_7$ in AcOH gives *4 phenylthiazole 2 aldehyde*, b$_{14}$ 160–2°. *phenylhydrazone*, canary yellow, m. 131–2°. KCN in EtOH gives *4 phenylthiazole 2-aldoin*, yellow, m. 256°. C. J. WEST

Synthesis of 4-phenyl-2-acetylthiazole. IX. JOHN T. OLIN AND TREAT B. JOHNSON. *J. Am. Chem. Soc.* 53, 1473–5(1931).—Benzoyl lactic thioamide (53 g.) and 50 g. $BzCH_2Br$ in 150 cc. EtOH, heated 1.5 hrs. on a steam bath, give 35 g. of the *benzoate*, b$_4$ 252–4°, of *4 phenylthiazole 2 α ethanol*, PhC(CH)SC[CH(OH)Me]N, yellow, b$_4$ 191–4°, m. 76°; this could not be dehydrated by $P_2O_5$. Oxidation of the alc. with $Na_2Cr_2O_7$ in AcOH gives a nearly quant. yield of *4 phenyl 2-acetylthiazole* PhC(CH)SCAcN, yellow, m. 78–9°. *phenylhydrazone*, yellow, m. 208–9°. Br in $CCl_4$ gives the *2 bromo acetyl deriv.* buff, m. 106–7°, when warmed in dil. alk. soln. or with an amine, it readily lost Br, indicating that the halogen occupies a reactive position in the Me radical of the ketone group. C. J. WEST

Synthesis of some new thiazole amines containing the catechol group. X. JOHN F. OLIN AND TREAT B. JOHNSON. *J. Am. Chem. Soc.* 53, 1475–7(1931).—$ClCH_2CH_2CH_2CN$ is converted into the phthalimido deriv., m. 81°, in 80% yields with EtOH-$(NH_4)_2S$, after standing 72 hrs., there results *γ phthalimidobutyrothioamide*, m. 181–2°, with chloroacetocatechol this gives *4 (3,4-dihydroxyphenyl) 2 γ phthalimidopropylthiazole*, yellow, m. 114–5°, heating with $N_2H_4 \cdot H_2O$ gives *4 (3,4-dihydroxyphenyl)-2 γ-aminopropylthiazole*, isolated as the *sulfate*, $C_{12}H_{14}O_2N_2S \cdot H_2SO_4$, m. 226–8°; it crystallizes with 3.5 mols $H_2O$ m. 120–40° (decompn.). *Phthalimidopropionitrile*, m. 147–8° (the yield is small owing to the formation of acrylic nitrile). *phthalimidopropionic thioamide*, m. 187–9°. *4 (3,4-dihydroxyphenyl) 2 β phthalimidoethylthiazole*, m. 203–5°. $N_2H_4 \cdot H_2O$ gives *4 (3,4-dihydroxyphenyl) 2 β-aminoethylthiazole*, whose *sulfate* crystallizes as needles. The pharmacol. study is in progress. C. J. WEST

Anthracene derivatives. V. 2,1-Thioindigoids of the anthraquinone series. PAUL RUGGLI AND WALTER HEITZ. *Helv. Chim. Acta* 14, 257–75(1931). cf. *C. A.* 25, 947.—The starting material for these syntheses was *1-amino 2 mercaptoanthraquinone* (I) (cf. Ger. pat. 290,084. *Friedl.* 12, 439(1916)), prepd. by adding rapidly with stirring 40 g. 1 aminoanthraquinone to 800 g. technical crystd. Na S previously heated in a paraffin bath and allowed to cool to 70°; the temp. was increased to 140° during 4 hrs. and kept at 140° for 5 hrs.; the mixt. was then poured into a porcelain dish, leached with 2 l. of boiling $H_2O$, filtered through cotton to remove unchanged aminoanthraquinone and $Na_2SO_4$, the filtrate evapd. to 0.5 vol., allowed to crystallize by standing overnight, it yielded 36–41 g. I. When 3 g. I was dissolved in 150 cc. hot $H_2O$, then cooled to 40°,

12 cc 30% NaOH added, then 9 cc $Me_2SO_4$ added slowly with shaking, allowed to stand 0.75 hr at 70°, an equal vol of $H_2O$ added, warmed 15 min on the water bath, filtered, the ppt washed with $H_2O$ and EtOH, it gave 2.2 g of *1-amino-2 (methylthio)anthraquinone*, red needles, m. 186° Treatment of 3 g I in 30 cc warm $H_2O$ with $BrCH_2COPh$ in 10 cc EtOH gave a ppt of 3.6 g *1-aminoanthraquinone 2-(thiomethyl) Ph ketone* (II), $C_{14}H_6O_2(SCH_2COPh)(NH_2)$ red needles decompg with ring closure at 130°, the same ring closure of II with loss of $H_2O$ to form *1-aminoanthraquinone-2-thiomethyl phenyl ketimide*, $C_{14}H_6O_2S\,CH_2\,CPh\,N$, occurs when II is heated with AcOH, $PhNO_2$ or on dissolving in concd $H_2SO_4$ and pptg with $H_2O$, it forms blue black crystals, m. 262° A soln of 10 g of the Na salt of I in 120 cc $H_2O$ at 80° was treated with 12 g $ClCH_2CO_2H$ (neutralized with $Na_2CO_3$) in 40 cc $H_2O$, allowed to stand 1.5 hr on the water bath, filtered while hot and the filtrate on the addn of NaCl gave 10.5 g of *Na 1-aminoanthraquinone 2 thioglycolate* (III). 4 g III on boiling with 20 cc $Ac_2O$ gave 3.5 g *1-aminoanthraquinone-2 thioglycolic lactam* (IV), $C_{14}H_6O_2S\,CH_2\,CO\,NH$, IV is also formed from III on heating with concd $H_2SO_4$ or on boiling with AcOH *Et 1-aminoanthraquinone 2-thioglycolate* (V), prepd in 75% yield by adding $BrCH_2CO_2Et$ to 1,2 $C_6H_4(CO)_2C_6H_2(NH_2)SNa$, red m. 116.5°, when warmed with concd $H_2SO_4$ it forms the lactam IV. Diazotization of V (20 g.) in 300 cc cold, concd $H_2SO_4$ with 6 g $NaNO_2$ in 40 cc $H_2SO_4$ with continued stirring 2 hrs after all of the $NaNO_2$ was added, then pouring into 1 l. ice water, rapidly filtering, treating the filtrate with a cold, satd $KClO_4$ soln., filtering off the pptd diazonium perchlorate (which is remarkably stable) suspending the latter in $H_2O$, adding a KCN CuCN soln warmed to 70° (from 24.5 g $CuSO_4$ in 200 cc $H_2O$ and 27 g KCN in 100 cc $H_2O$), heating 2 hrs on the water bath, filtering while hot, washing successively with boiling $H_2O$, dil $HNO_3$ and boiling $H_2O$, gave 16.4–18.6 g of *Et 1-cyanoanthraquinone 2 thioglycolate*, brown, m. 222°, the corresponding *Me ester* similarly prepd., m. 217° hydrolysis of these esters by boiling with a mixt of concd HCl and AcOH gave an almost quant yield of *1-cyanoanthraquinone 2 thioglycolic acid* (VI), gray brown, m. 260–70° (decompn.), and on boiling with $C_5H_5N$ forms the pyridine salt Hydrolysis of 23 g VI by boiling with a mixt. of 184 cc. concd $H_2SO_4$ and 112 cc $H_2O$, then pouring into $H_2O$, gave 14.1 g of crude *anthraquinone 1 carboxamide-2-thioglycolic acid* (VII), which was purified by recrystn from $C_5H_5N$ in which the pyridine salt is formed and from which it is regenerated by warming with 5% HCl and recrystg from $PhNO_2$ forming olive-green needles, m. 276° Boiling 31.5 g VII for 1.5 hrs with 1 l. 2% NaOH, cooling, and adding HCl until acid, gave 29 g. *anthraquinone-1-carboxylic-2-thioglycolic acid* (VIII), yellow, m. 244–50°. When 42 g VIII was boiled for 15 min with 9 g NaOAc and 150 cc $Ac_2O$, cooled, 150 cc. AcOH added, poured into $H_2O$, warmed, filtered and recrystd from AmOH it gave brown needles of *acetylanthraquinone-2,1-(β hydroxythiophene)*, $C_{14}H_6O_2S\,CH\,COAc$, m. 154°, removal of the Ac group by boiling with 5% NaOH gave anthraquinone 2,1-(β hydroxythiophene) (IX), $C_{14}H_6O_2S\,CH_2\,CO$, violet-black, m. 230–40° (decompn.), when boiled with *p*-$BrC_6H_4COCl$ in $C_5H_5N$ it forms the *p-bromobenzoyl deriv.*, $C_{14}H_6O\,S\,CH\,CO_2CC_6H_4Br$, yellow, m. 228°. *Anthraquinone 2,1-(α bromo-β-hydroxythiophene)* (X), obtained by adding $Br_2$ to IX in $PhNO_2$, violet blue, m. 220° (decompn.) A *benzylidene deriv.* (XI) of IX, $C_{14}H_6O_2S\,C(\,CHPh)\,CO$ prepd by condensation with BzH at 130°, golden brown, m. 257–61° *Anthraquinone 2,1-thiophene-2'-indoleindigo* (XII), $C_{14}H_6O_2S\,C(\,C_8H_4ON)\,CO$, which was prepd in 51% yield by heating 2 g. IX, 2 g isatin α-anil and 7 cc $Ac_2O$ for 8 hrs. at 130°, violet brown, m. 290° (decompn.). Similarly, 2 g IX, 1.8 g acenaphthaquinone, 20 cc. $PhNO_2$ and 2 cc. $Ac_2O$, heated for 2.5 hrs at 130°, yield 1.4 g. *anthraquinone-2,1 thiopheneacenaphtheneindigo* (XIII), $C_{14}H_6O_2S\,C(.C_{12}H_6O)\,CO$, violet brown, m. 320° (decompn.). Condensation of IX and thionaphthenequinone gave *anthraquinone 2,1 thiophenethionaphtheneindigo* (XIV), $C_{14}H_6O_2S\,C(.C_8H_4OS)\,CO$, brown violet, m. 360° (decompn.) XI, XII, XIII and XIV form green solns in concd. $H_2SO_4$, which is characteristic of most of the anthraquinonethioindigoids; they are not technically useful because of a lack of fastness for cotton and the poor shades of color Oxidation of IX to *bis-2,1-anthraquinonethiophenindigo*, ($C_6H_4$-

$(CO)_2C_6H_2\langle^{CO}_{S}\rangle C$ )$_2$ with persulfates in $C_5H_5N$ or $K_4Fe(CN)_6$ in alk. soln. was not successful an impure product, m above 440°, was obtained by boiling X in $C_5H_5N$ with piperidine or KOH (cf Ger pat. 461,503(1926)) VL Derivatives of anthraquinone-2,1-thiazole and other products from 1-amino-2-mercaptoanthraquinone and halogen compounds. *Ibid* 275–85.—A 63% yield of *(m-nitrophenyl)anthraquinone 2,1-thiazole* (I) $C_{14}H_6O_2S\,C(C_6H_4NO_2)\,N$ was obtained by adding slowly with stirring 50 g *m*-$O_2NC_6H_4COCl$ to 20 g 1,2 $C_6H_4(CO)_2C_6H_2(NH_2)SH$ (II) in 200 g $PhNO_2$ at 170–5°, continuing heating and stirring for 1 hr., cooling, filtering, washing the ppt. with hot $H_2O$ then extg with EtOH and recrystg from $PhNO_2$, it forms green crystals m. 318–20° when nitrated in $H_2SO_4$ with fuming $HNO_3$ it forms *dinitroanthraquinone 2,1-thiazole*, m 350–5° (decompn.) Reduction of 2 g I on boiling for 3 hrs. with 30 g Na$_2$S in 200 cc. $H_2O$ and 10 cc. 30% NaOH, filtering, washing with hot $H_2O$ and extg with PhMe gave 1.3 g *(m-aminophenyl)anthraquinone 2,1 thiazole* (III), red, m. 241°. reduction of 3 g I with $Na_2S_2O_4$ in dil. EtOH and 30% NaOH gave 2.9 g crude III. Red azo dyes were prepd. by diazotization of III and coupling with β $C_{10}H_7OH$, with 2,6-$C_{10}H_4(OH)SO_3H$ and with 1,3,8-$C_{14}H_5(OH)(SO_3H)_2$ Acetylation of III with $Ac_2O$ gave *(m-acetamidophenyl)anthraquinone 2,1 thiazole* light yellow, m 296°. When COCl$_2$ was passed for 30 min. in a slow stream into 4 g III in 450 cc. dry PhMe at 90–5°, cooled, filtered, washed with gasoline and dried *in vacuo* over paraffin, the crude *isocyanate deriv* (IV), $C_{14}H_6O_2S\,C(C_6H_4NCO)\,N$ was obtained, m. 350–60°, the identification as an isocyanate was established by conversion to the very insol. *urea deriv*, $[C_6H_4(CO)_2C_6H\langle^{N}_{S}\rangle CC_6H_4NH]_2CO$ (by heating IV with III in $PhNO_2$ for 2 hrs. at 150–60°, washing with hot AmOH and EtOH), m. above 300°. boiling IV with AmOH gave the *amylurethan deriv*, $C_{14}H_6O_2S.C(C_6H_4NHCO_2Am)\,N$, yellow, m. 221°, boiling IV with $PhNH_2$ gave the *phenylurea deriv*, $C_{14}H_6O_2S.C(C_6H_4NHCONHPh)\,N$, which could not be recrystd. and m. above 300°. A soln. of 2 g II in 10 cc. $PhNO_2$ at 120° was treated with 0.3 g cyanuric chloride in 4 cc. $PhNO_2$, cooled, filtered, the ppt. washed successively with warm EtOH, $H_2O$, 1% NaOH, EtOH and gave 0.8 g of the *cyanuric deriv*., $(NH_2C_{14}H_6O_2S)_3C_3N_3$, red cryst. product which could not be recrystd. and m. above 210° (decompn.) Condensation of 20 g II in 50 cc. $H_2O$, 50 cc. EtOH and 6 g NaOH with the gradual addn. of 7 cc. $(CH_2Cl)_2$ to the boiling soln., continuing the heating and stirring on the water bath for 2 hrs., filtering, washing the ppt. with warm $H_2O$ and alc., gave 16 g crude *bis(1-amino-2-mercaptoanthraquinonyl)ethylene* (V), $(NH_2C_{14}H_6O_2SCH)_2$, red, m. 270° (decompn.). Addn. of 5 g II to a boiling soln. of 50 cc. $C_6H_4Cl_2$, 25 cc. $H_2O$, 25 cc. EtOH and 1.5 g NaOH similarly gave 3.5 g of a crude product from which 1.8 g V was extd. with AmOH and the residue, which was recrystd. from $PhNO_2$, is the β-chlorovinyl ether of II, $NH_2C_{14}H_6O_2SCH\,CHCl$, red, m. 180°.

N. A. Lange

Derivatives of 1,2-dihydroxythioxanthone. Alfred A Levi and Samuel Smiles *J. Chem. Soc* 1931, 529–8.—4,1,2-$BrC_6H_2(OMe)_3$ and $ClSO_3H$ give the 5-sulfonyl chloride, characterized as the *amide*, m. 226°, reduction of the chloride with Sn and HCl gives a thiol, oxidized to *diveratryl 4-disulfide*, m. 94°, with $Na_2SO_3$ the chloride gives the *sulfinic acid*, m. 122°, with concd. HI and $SO_2$ there results *di-4-bromoveratryl 5-disulfide*, m. 118–9° 2-$HSC_6H_4CO_2H$ and *p*-$MeC_6H_4OH$ with $H_2SO_4$ give *4-hydroxy-1-methylthioxanthone*, yellow, m. 245° it does not yield a diacetoborate. *1 Hydroxy-4-methylthioxanthone*, deep yellow, m. 160°, results from the 1-MeO deriv and concd. HCl, the red *diacetoborate* m. 226° and is decompd. by hot $H_2O$, this is also obtained from the 1 $NH_2$ deriv through the diazo reaction and in small yields from 2 $HSC_6H_4CO_2H$ and *p*-$MeC_6H_4CO_2H$. 4,1,2 $Br$-$C_6H_2(OMe)_3$ and $HSC_6H_4CO_2H$ with $H_2SO_4$ give 40% of *4-bromo-1,2-dimethoxythioxanthone* (I) yellow, m. 159°, HCl gives a bright red soln. 4,5 1,2-$Br(HS)C_6H_2(OMe)_2$ and 2 $BrC_6H_4CO_2H$ with $K_2CO_3$ in AmOH give *2-bromo-4,5-dimethoxy-2'-carboxydiphenyl sulfide*, m. 211–2°, concd. $H_2SO_4$ gives the above thioxanthone. 5,2-$Br(MeO)_2C_6H_2OH$ and 2-$HSC_6H_4CO_2H$ with concd. $H_2SO_4$ give 25% of *4-bromo-2 hydroxy-1-methoxythioxanthone*, yellow, m. 208°, it does not give a diacetoborate, concd. HCl gives the *1,2-di-HO deriv*., orange, m. 212°, the Ac deriv. yields a red diacetoborate, the purple Na salt is sparingly sol. in $H_2O$ Hydrolysis of I with

concd HCl gives *4 bromo-1 hydroxy 2-methoxythioxanthone* (II), orange, m 191°, also obtained from 4,2 Br(MeO)$C_6H_3OH$ and 2-$HSC_6H_4CO_2H$, the red *diacetoborate* is hydrolyzed by hot $H_2O$ Creosol and 2 $HSC_6H_4CO_2H$ give 20% of *1-hydroxy 2 methoxy-4-methylthioxanthone* (III), red, m. 173–4°, the purple *diacetoborate* is hydrolyzed with difficulty The *1,2-di MeO deriv* (IV), yellow, m 125°, dry HCl gives the deep red *di-HCl salt* II and $H_2O_2$ in AcOH give the *dioxide*, yellow, m 243°, which gives an unstable *diacetoborate* III gives a *dioxide, yellow, m* 190°, *the red diacetoborate*, m 222°, was sufficiently stable for isolation IV gives a *dioxide*, yellow, m 154° The *dioxide* of I, yellow, m 165°, was obtained by methylation of the K salt of the 1-HO deriv Attempts to oxidize I with $H_2O_2$ gave *1,2-dimethoxythioxanthone dioxide* (?), pale yellow, m 246° The study of the basic strength of these derivs confirms the conclusions previously attained from other materials Derivs contg the 1-HO group gave no evidence of basic character either with dry HCl or with the aq reagent. The selective attack of the 1 MeO group in demethylation is adequately explained by the structure assigned to the cation of the salts. This interpretation suggests that the 1-HO compds formed contain a similar chelate structure, which is also indicated by the insoly of all of the 1-hydroxythioxanthones examd in aq NaOH C J West

*Derivatives of pyridine.* A Binz and C Räth IX. *A new method for the* preparation of 2-chloropyridines. C Räth *Ann* 486, 71–80(1931), cf *C A* 25, 953—2 Hydroxy 5-chloropyridine and KOH in abs EtOH, treated gradually with MeI, give 80% of *N methyl 2-keto 5 chloropyridine* (I), $b_{15}$ 153–5°, m 44–5°, *5-Br deriv*, $b_{12}$ 157°, m 53° (75% yield), *3,5-di-Cl deriv*, m 142° (80% yield), *3,5-di-Br deriv*, m 182° (90% yield), *3,5-di I deriv*, m 227° (quant. yield) I and $COCl_2$ in PhMe, heated 4 5 hrs at 170°, give 75% of *2-chloropyridine*, b 168°. *N*-methyl 2 thiopyridone gives 50% of the Cl deriv *2 Chloroquinoline*, m 37–8°, is formed in 70% yields by the same method at 180° 2 Chloro-5-nitropyridine (II), m 107°, is obtained in nearly quant yield from *N* methyl 2 keto-5-nitropyridine, in 90% yield from the *N* Et deriv and in nearly quant yield from the *N* benzyl deriv *2,5-Dichloropyridine*, m 60° (40% yield), *2-chloro-5-bromo deriv*, *m* 71° (50% yield), *2-chloro-5-iodo deriv*, *m* 98° (60% yield), *2,3,5-tri Cl deriv*, m 49–50° (90% yield), *2 chloro 3,5-dibromo deriv*, m 43° (90% yield), *2 chloro-3,5-diiodo deriv*, m 72–3° (50% yield) II is obtained in 25% yield by the use of $SOCl_2$ C J. West

The preparation of 2,2′-bipyridyl by catalytic dehydrogenation of pyridine under pressure. J P Wibaut and H D Tjeenk Willink. *Rec trav chim* 50, 287–90 (1931) —In the course of expts on the action of $NH_3$ on pyridine at 300° under pressure and in the presence of dehydrogenation catalysts (cf *C A* 23, 5184) the formation of 2,2′-bipyridyl together with 2-aminopyridine was observed The formation of 2,2′-bipyridyl by pyrogenic decompn of pyridine was already noticed by Meyer (*C A* 15, 3845) while Thate observed the formation of this compd. on heating pyridine under *high pressure at 500° The reaction temp. may therefore be lowered by suitable de*hydrogenation catalysts and it was now found that both the Ni-$Al_2O_3$ catalysts described by Zelinskii and Kommarevski (*C A*. 18, 2885) give good results The prepn of 2,2′-bipyridyl may be carried out also by the method of Hein and Retter (*C A* 23, 143), by heating pyridine with anhyd $FeCl_3$ at 300°. The method described in the present paper, however, gives better results, a yield of 14–20% (relative to the pyridine which was used up) being obtained on heating 300 g pyridine with 30 g catalyst at 320–5° for 5–6 hrs. The catalyst can be used only once. W and W recommend using the catalyst described by Z and K (*loc. cit*, p 669 of original), which is much more easily prepd than the catalyst described on p 667 and gives about the same results On carrying out the same expt without the catalyst, no trace of 2,2′-bipyridyl is obtained C. F v. D

The catalytic synthesis of phenylated pyridines from aldehydes and ketones with ammonia. A E Chichibabin and D I. Orochko *J Russ Phys-Chem Soc* 62, 1201–6(1930), cf *C A* 18, 2495—BzH (I) and PhCH CHCHO (II) react with AcH and $NH_3$ *at 305–10° with alumina or kaolin catalyst to give a mixt. of α phenylpyridine* (III) and *γ-phenylpyridine* (IV), I with AcMe and AcCH CHPh (V) with AcMe give *α,α′-dimethyl-γ phenylpyridine* (VI) I and II with AcH and $NH_3$ in sealed tubes at 150–220° give only tar and no $C_5H_5N$ derivs The alumina catalyst was prepd by pptg a boiling $Al_2(SO_4)_3$ soln with $NH_4OH$, washing, drying and heating the product slightly The kaolin should be of dense structure, low in Fe and of glistening rather than greasy fracture. The syntheses are carried out in a porcelain tube 100 cm long and 16 mm in diam, filled up to 50 cm. with catalyst In the prepn of III and IV from I and II the following procedure was used· Add 10% HCl to the reaction mixt. consisting of an oily and an aq layer, ext. the neutral products with $Et_2O$, add $NaNO_2$ to the residue, decomp the nitroso derivs with NaOH, dissolve the free bases in $Et_2O$, dry, evap. the

$Et_2O$ and fractionate Fraction A, b 270 80°, yielded some IV by spontaneous crystn which was recrystd twice from petr ether The combined mother liquors were evapd to remove the solvent and again fractionally distd The distillate was dissolved in EtOH from which III and IV were isolated as picrates, and recrystd from boiling AcMe. Fraction B, b 285–340°, yielded a small quantity of IV isolated through the picrate The yield of III from I was 3 5%, from II, 1% of IV from I, 11%, from II, 19% The procedure for the prepn of VI follows The reaction mixt was acidified with 15% HCl, the neutral products were extd with $Et_2O$, and the residue was cooled for 2 hrs Sepn of crystals and a viscous oil followed The crystals are sol in EtOH and AcMe, insol in PhH and $Et_2O$ Upon addn of AcOEt to the EtOH soln to slight turbidity the HCl salt of VI was obtained and recrystd from boiling $H_2O$ The acid mother liquors were made alk and extd with $Et_2O$ After drying and evapg the $Et_2O$, the free base was fractionated The fraction b 280–95° was treated with 15% HCl in EtOH, and AcOEt added Recovery of VI from the combined HCl salts with recrystn from petr ether gave a product m 62–63 5° The yield of VI from I was 13%, from V, 15 5%

LEWIS W BUTZ

The hydrogenation of pyridine with hydrogen under pressure by the Bergius process. H THATE *Rec trav chim* 50, 77–90(1931) —Since pyridine occurs in coal tar, while it is not present in the tar produced from coal hydrogenated with H under pressure by the Bergius process (Heyn and Dunkel, *Brennstoff Chem* 7, 208(1926); cf *C A*. 20, 2738, 3071 Tropsch and Tat Nedden, *C A* 19, 2739, Bergius, *C A* 22, 1027, 15, 3390 *Z angew Chem* 37, 400(1924), Bube, *C A* 15, 3198) the question arose as to how pyridine behaves when submitted to this treatment The only N compds so far hydrogenated under pressure are carbazole, which is quite stable (Ipat'ev and Orlov, *C A* 23, 3697 Spilker and Zerke *C A* 21, 166), quinoline, which was converted into $NH_3$ and a mixt of hydrocarbons, b 80–150° (I and O, *loc cit*), aniline, which gave benzene and $NH_3$ (I and O, *loc cit*) The hydrogenation of pyridine with H under pressure was carried out in a rotating Fe autoclave as described by Bowen and Nash (*C A* 20, 2241), the temp being raised to 500° and the initial pressure being 50–100 atm the heating was continued for 1–5 hrs The gases obtained consisted of a mixt of $CH_4$, $C_2H_6$ $C_2H_2$ $C_4H_{10}$, $C_2H_4$, $C_4H_8$, $C_4H_6$ (cf Tropsch and Dittrich, *C A* 19, 2793), the residue was first acidified and distd with steam and gave pentane, b 40°, BuCN, b 125–50°, a colorless liquid hydrocarbon $C_{14}H_{14}$, which however, is only present when Al or Fe chlorides are used as a catalyst, and a mixt of high boiling nitriles, b 220–60°. Finally, this soln was distd with steam after the addn of alkali and then gave $AmNH_2$, unchanged pyridine homologs of piperidine, $\alpha,\alpha'$-bipyridyl and $\alpha\gamma$-bipyridyl In the mouth of the manometer connection $NH_4CN$ was deposited in the form of white platelets, further, a deposit of C was noticed Modification of the expts gave the following results (*a*) heating with H under 50 atm at 500° for 1 hr, hydrocarbons 10%, amines and nitriles 2 5%, (*b*) under 50 atm at 500° for 4 hrs, hydrocarbons 29%, nitriles and amines 2 5%, (*c*) heating under 100 atm at 500° for 1 hr, hydrocarbons 25%, nitriles 4–6% amines very little Pyridine was also heated at 500° under its own vapor pressure or in N or CO, with and without Al or ferric chloride as a catalyst, but no change was observed except for the formation of a trace of $\alpha,\alpha'$ bipyridyl From these expts the conclusion was drawn that the mechanism of the hydrogenation of pyridine under high pressure is similar to the berginization of aromatic hydrocarbons and that hydrogenation precedes the cracking process It thus follows that piperidine must be formed in the first stages of the process and as a matter of fact the same products were obtained by the berginization of piperidine In the original paper the hydrogenation of pyridine in general and the berginization of several classes of org compds are discussed briefly

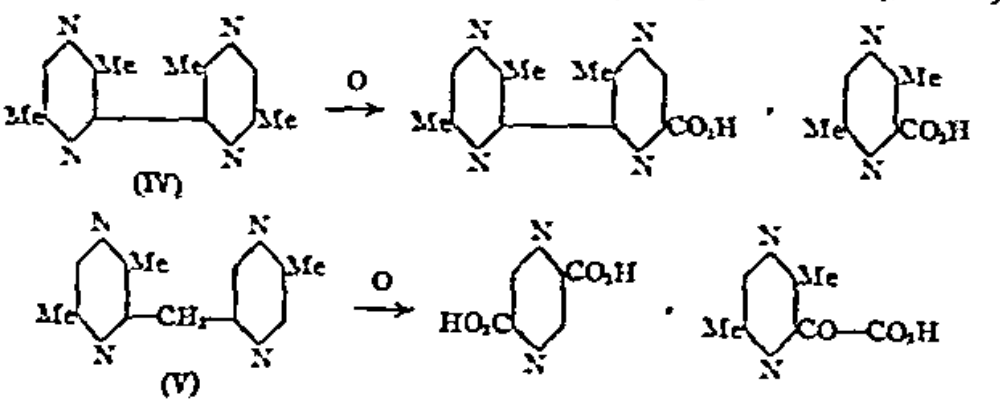
C F VAN DUIN

Interaction of sulfonates and sulfonamides with piperidine. FRANK BELL *J Chem Soc* 1931, 609 15 —Turner and coworkers (*C A* 23, 2957, 24, 4006) have shown that *aryl sulfonates can be very neatly severed* by piperidine according to the general equation $ROSO_2R' + HNC_5H_{10} = ROH + C_5H_{10}NSO_2R'$ It is now found that, although this type of reaction occurs with the mononitrophenyl sulfonates, with 2,4 $(O_2N)_2C_6H_3SO_2C_6H_4Me$-*p* the nuclear link is severed, and 2',4'-dinitro-1-phenylpiperidine results 2 4 $(O_2N)_2C_6H_3OH$ gives a *piperidine salt*, bright yellow, m about 85° and a *pyridine salt*, golden yellow, m about 85° 2',4'-Dinitro-1-phenylpyridinium *p*-toluenesulfonate is recovered unchanged after soln in AcOH but reacts vigorously with piperidine, giving 2 4 $(O_2N)_2C_6H_3NH_2$ 2 $O_2NC_6H_3SO_2C_6H_4Me$ has no tendency to form a pyridinium compd even when boiled with $C_5H_5N$ for several hrs Picric acid and piperidine, boiled 1 hr, give a piperidine compd., orange, m about 135°, of piperidine picrate, m 150°, the picrate was recovered unchanged after boiling with *p*-$MeC_6H_4SO_3$-

Cl for 2 hrs A soln of mol amts of picric acid and *p*-$MeC_6H_4SO_2Cl$ after 12 hrs gives *picrylpyridinium p-toluenesulfonate* (I), pale yellow, m 197° (decompn), the $Me_2CO$ mother liquor contained picrylpyridinium picrate (II) I dissolves easily in cold AcOH but $H_2O$ ppts. II. The warm aq soln of I deposits II on cooling II in EtOH HCl gives picrylpyridinium chloride and picryl chloride I undergoes vigorous reaction with piperidine but no definite product was isolated II evolves $C_5H_5N$ with warm NaOH and when boiled with AcOH gives pyridine picrate 4′ Nitro-4 *p*-toluenesulfonoxybiphenyl, the 3,4′-dinitro deriv., di *p*- and *p*-toluenesulfon *p*′-nitroanilide and di-*p*-toluenesulfon-*o*′ nitroanilide are recovered unchanged after boiling with $C_5H_5N$. 3-bromo-5,4′-dinitro-4-hydroxybiphenyl gives only an unstable red $C_5H_5N$ salt, which decomps in the air and immediately in AcOH 3 5 4 trinitro-4 hydroxybiphenyl gives a red *$C_5H_5N$ salt*, m 198° *p*-Toluenesulfon *p*′ nitroanilide gives a bright yellow *piperidine salt*, m 138° The di *p*-toluenesulfone deriv gives a thick liquid, contg the *p*-toluenesulfone deriv and *p*-toluenesulfonylpiperidine, m 103° 3-O-$NC_6H_4N(SO_2C_7H_7)SO_2C_6H_4NO_2$-*m*, on soln in piperidine, gives *m* O-$NC_6H_4NHSO_2C_6H_4NO_2$ and $C_5H_{10}NSO_2C_7H_7$ 2,4 (O-N)-$C_6H_3N_2HSO_2C_7H_7$ (III) and *p*-$MeC_6H_4SO_2Cl$ in $C_5H_5N$ give *di p-toluenesulfon-2,4-dinitroanilide*, m 217° soln in piperidine gives *p*-toluenesulfonylpiperidine (IV) and III. *3,5-Dinitro-4-di p-toluenesulfoamidobiphenyl*, m 249°, this is decomped by piperidine, giving IV. *3,5-Dibromo-4 p-toluenesulfoamidobiphenyl*, m 196°. C. J. West

The synthesis of α-hydroxy derivatives of quinoline. A. E. Chichibabin and A. I. Kursanova *J. Russ. Phys.-Chem. Soc.* 62, 1211–16(1930).—α-Toluquinoline (I), β-toluquinoline (II), α-naphthoquinoline (III), and β naphthoquinoline (IV) react with dry, fused KOH at 250–60° to give the corresponding α-OH derivs. (carbostyrils) and $H_2$. Isoquinoline (V) reacts at 220° I (6.7 g.) gave 3.1 g. *α-methylcarbostyril* (VI), m. 219–20° The reaction time was 3 hrs. and increasing the time to 9 hrs. did not increase the yield II (8 g.) and 8.6 g. KOH reacted 5 hrs. to give 3.3 g. *β-methylcarbostyril* (VII), m. 232–3° IV (13.6 g.) and 10.6 g. KOH reacted at 265° (9 hrs.), then at 270–80° (5 hrs.), to give 7.3 g. *β naphthocarbostyril* (VIII), slightly yellow, m. 285–6° VIII is difficultly sol. in $H_2O$, sol. in cold AcOH, EtOH and $CHCl_3$. III (8.7 g.) and 10 g. KOH, reacted at 270–80° for 3.5 hrs., gave 5.1 g. *α-naphthocarbostyril* (IX), m. 252–3°, sol. in EtOH, $CHCl_3$, AcOEt, cold AcOH, insol. in $Et_2O$, PhH and petroleum ether V (2 g.) and 4.7 g. KOH after 4.5 hrs. gave 1.4 g. *isocarbostyril*, m. 209–10° Oxidation of VI and VII with alk. $KMnO_4$ gave the corresponding *methylisatin* and *oxalylmethylanthranilic acid* Similar oxidation of IX gave only a small amt. of a red ppt. which is not colored violet by alkali Lewis W. Butz

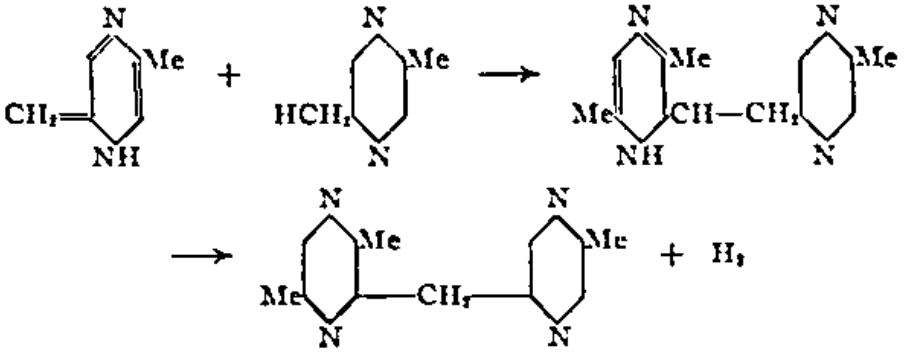
Beckmann rearrangement with quinoline compounds. Komonu Matsumura and Chusaburo Sone *J. Am. Chem. Soc.* 53, 1493–6(1931).—*5-Benzoyl-8-hydroxyquinoline oxime* (I) and $SOCl_2$ in Et O give the *anilide* (II), yellowish white with silky luster, m. 211–2° (*sulfate*, yellow, decomps. 211–3°), of 8-hydroxyquinoline-5-carboxylic acid (III), egg-yellow, m. 273° (Lippmann and Fleissner, *Ber.* 19, 2467(1886), obtained this acid from 8-hydroxyquinoline, $CCl_4$ and KOH in EtOH) the HCl salt m. 259° (decompn.) and deposits the free base on pouring into $H_2O$ *Ba salt*, yellow needles crystg with 5.5 mols. of $H_2O$, *Ac deriv.*, light yellow, decomps. 312°, *Me ether*, yellow, m. 225–6° (decompn.) I and concd. $H_2SO_4$, heated at 100° for 1 hr., give a sulfonated II, yellowish white, m. above 300°, gives a green color with $FeCl_3$ and a red color with *p*-$ClN_3C_6H_4CO_2H$, hydrolyzes with 20% HCl gives III. The Beckmann rearrangement of 5-acetyl-8-hydroxyquinoline oxime with $SOCl_2$ or concd. $H_2SO_4$ gives 5-acetamido-8-hydroxyquinoline, m. 217–8° C. J. West



Condensation between formaldehyde and monoketones. I. Condensation of 5-acetyl-8-hydroxyquinoline with aldehydes. Konomu Matsumura and Chusaburo Sone. *J. Am. Chem. Soc.* 53, 1490–2(1930).—5-Acetyl-8-hydroxyquinoline (I) and 40% HCHO (contg. an appreciable amt. of a ppt. of paraformaldehyde), refluxed 2 hrs., give *α-methylenebis-5-acetyl-8-hydroxyquinoline* (II), m. above 315°, $FeCl_3$ gives a green color. *HCl salt*, yellow needles, does not m. 300°. *monoxime*, m. 295–300° (decompn.) Warming II, $Ac_2O$ and AcONa on the $H_2O$ bath 2.5 hrs. gives *α-methylenebis-5-acetyl-8-acetoxyquinoline*, m. 234–5° I yields a *Bz deriv.*, m. 168°, with HCHO this gives *α-methylenebis-5-acetyl-8-benzoyloxyquinoline*, m. above 315° I and piperonal in dil. NaOH EtOH give *5-piperonylidene-5-acetyl-8 hydroxyquinoline*, yellow, m. 178–9°. BzMe and HCHO, with or without $C_5H_5N$, do not give a condensation product, thus the presence of an $NH_2$ group in the mol. may serve to facilitate the condensation. C. J. West

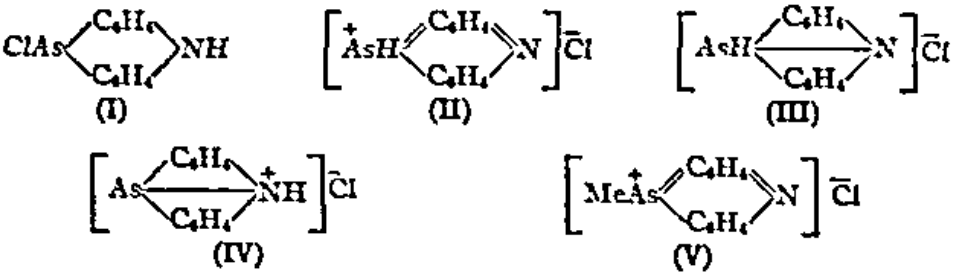
Reduction of nitrosophenol by iron and hydrochloric acid. Konomu Matsumura and Chusaburo Sone. *J. Am. Chem. Soc.* 53, 1406–8(1931).—5-Acetyl-8-hydroxy-

quinol ne and $NaNO_2$ in AcOH and $H_2O$ at 0° give the *7-NO deriv* (I), yellowish brown, decomps 190–5°, $FeCl_3$ gives a light brown color, reduction of I with $SnCl_2$ and HCl-AcOH gives a very small yield (0 7 g. from 2.5 g I) of the *7-$NH_2$ deriv*, light yellow, m. 148–9° (decompn.), *picrate*, orange, decomps. 201–22°; *HCl salt*, orange, sinters 145°. Reduction of 3 75 g of I with Fe and dil. HCl gives 3.25 g of the *HCl salt*, lemon yellow, m 280–305° (decompn.), *of 5-acetyl-7,8-dihydroquinoline*, m. 235–6°, pptn. from dil. HCl soln. gives deep red prisms, m. 241–2° (decompn.), the colorless form crystallizes with 1 5 mols $H_2O$, $FeCl_3$ gives a deep green color, *oxime*, red, decomps. 215–20°; *di 1c deriv*, m 121–2°. 5-Nitroso-8-hydroxyquinoline (2.85 g.), reduced with Fe and HCl gives 2.85 g of the *HCl salt*, orange, of *5,8-dihydroxyquinoline*, m. 181–3°; *sulfate*, orange, decomps 250° Reduction of 2 g *p*-$ONC_6H_4OH$ gives 1 g *p*-$C_6H_4(OH)_2$ and 0 02 g *p*-$H_2NC_6H_4OH$ *p*-$O_2NC_6H_4OH$ (2.8 g.) and Fe in HCl give 0 45 g. *p*-$C_6H_4(OH)_2$ and 0 90 g of *p*-$H_2NC_6H_4OH$, *o*-$O_2NC_6H_4OH$ (2.8 g.) gives 1 65 g. *o*-$H_2NC_6H_4OH$ but no other product. C. J West



Pseudo bases. II. Equilibria and rate of change of tautomeric bases in the pyrazine series. The effect of conjugation. John G Aston *J Am Chem Soc* 53, 1448–70(1931); cf *C A* 25, 516.—The conductivities of 1,2,5-trimethylpyrazinium hydroxide (I) and 1,2,2 3,5-pentamethyld.hydropyrazinium hydroxide (II) have been measured at 25° Their $\Lambda/\Lambda_0$ values are the same at equiv. concns. and almost the same as those of LiIO₃. The disappearance of strong base from the mixt. of I and NaOH has been found to take place by 2 reactions. One reaction takes place at a rate proportional to the square of the concn. of pyrazinium ion and the first power of the HO-ion concn. and the other at a rate proportional to the squares of the concn of both of these ions, when allowance is made for a salt effect according to the Brönsted theory. The same primary equil. between the quaternary base and the pseudo base hypothesized in both cases is shown to be inappreciably in favor of the pseudo base Evidence is brought out to show that the final product is the ether of the pseudo base. The similarity between these reactions and those of pseudo bases in the pyridine and quinoline series is discussed. The equil. between II and 1,2,2,5,5-pentamethyl-6-hydroxytetrahydropyrazine has been found to be in favor of the latter The equil. is established at a rate too rapid to measure even at 0° The basic dissocn. const. of the equil mixt. is $K_b < 10^{-4}$ The equil. between 1,2,2,3,5,5,6-heptamethyldihydropyraziniun hydroxide and 1,2,2,3,5,5-hexamethyl-6-methylenetetrahydropyrazine is established at an unmeasurable rate at 25° The over-all base strength of the system is $K_b = 4 \times 10^{-4}$. A decompn. takes place at a rate proportional to the 1st power of the concns. of the pyrazinium and HO ions The rate of formation of the pseudo base is hypothesized as the controlling step in this reaction. The soly of 5-phenyl 10-methylacridinium hydroxide has been found to be $1 \times 10^{-4}$ mol./L at room temp and solns. of the base appear to be highly ionized. The initial high value of the cond. on mixing 5-phenyl-10-methylacridinium chloride and NaOH is shown to be due to supersatn. The significance of the results is discussed in the light of ring conjugation, which seems to be the detg factor in the quaternary base-pseudo base equil. C. J West

The action of sodium amide on 2,5-dimethylpyrazine. A. E Chichibabin and M. N Shchukina. *J Russ Phys-Chem Soc* 62, 1183–99(1930).—Amination of *2,5-dimethylpyrazine* (I) proceeds very slowly with $NaNH_2$. Only with strong heating in solvents is an evolution of $H_2$ observed, and a small quantity of *3-amino-2,5-dimethyl-*



*pyrazine* (II) isolated. Most of the I is recovered unchanged. When the solvent is omitted, higher mol. products are obtained, the reaction takes place at lower temps.

and no $H_2$ is evolved Under these conditions were isolated from the reaction mixt. some unchanged I, a small quantity of *dimethylpiperazine* (III), and 2 cryst bases of the same empirical compn (IV), m 68°, and (V), m 135° The structures were detd by oxidation with $KMnO_4$ In the formation of the homologous bipyrazyls, polymerization to tetramethylbipyrazyl occurs first, as is shown by the blue color of the salts formed by adding acids As in the case of the analogous biquinolyls the color is destroyed by atm. $O_2$ The formation of V has no analogy in the pyridine and quinoline series. It probably arises according to the following mechanism, involving the tautomeric form of I:

Some of the $H_2$ evidently goes to reduce I to III. The $NaNH_2$ either serves to produce the tautomer of I or else brings about the formation of intermediary addn products to the pyrazine nucleus. In solvents, *e. g.*, xylene above 145°, II was obtained in 10% yield and I was recovered to the extent of 80%. II, recrystd from PhH, formed colorless needles, m 111°, $b_{18}$ 119°, sol in $H_2O$, EtOH, $Et_2O$, $CHCl_3$, PhH and PhMe Bz deriv., m 109° In 1 expt without solvent, 20 g I and 14.5 g $NaNH_2$ gave after $Et_2O$ extn of the reaction products (4 hrs on the $H_2O$ bath) a red oil This was fractionated, giving a low boiling fraction consisting of I and II, and 8 g of a mixt of IV and V, $b_{16}$ 160–75°. Further fractionation and crystn from EtOH gave IV, sol in EtOH, and V, sol only in boiling EtOH. IV was recrystd from petr ether as colorless needles, m 67.5–68.5°, $b_{16}$ 167°, easily sol in $H_2O$, EtOH, $Et_2O$, PhH, and $CHCl_3$, difficultly sol in cold petr. ether The aq soln is alk to litmus The soln in strong HCl or $H_2SO_4$ is bright red The $HgCl_2$ compd was obtained as yellow prisms, m 184° (decompn.) V crystd from EtOH in long, colorless needles, m 135°, $b_5$ 156–7°. It dissolves less easily in cold $H_2O$, EtOH, $Et_2O$, PhH and ligroin than IV, but is easily sol in $CHCl_3$ V gives no color with acids, and is neutral to litmus The $HgCl_2$ compd m 224° (decompn.), and the $AgNO_3$ compd m 253° (decompn.). LEWIS W. BUTZ

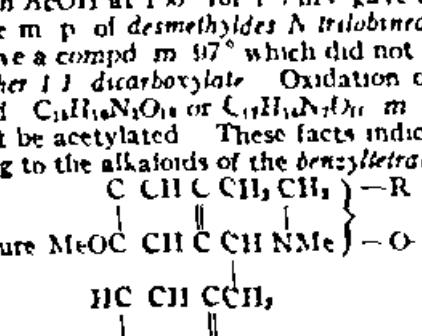
The constitution of phenarsazine chloride. C P A KAPPELMEIER *Rec trav chim* 50, 44–50(1931).—Previously K showed (*C A* 24, 2438) that the formulation of the reaction product of $AsCl_3$ and $NHPh_2$ as 10-chloro-5,10-dihydrophenarsazine (I) is not in accordance with the salt like properties and the color of this substance, the formula II, which gives an adequate account of these properties, was therefore preferred. Gibson and Johnson (*C A* 25, 107), however, prefer a formulation as a salt but with a bridge between the As and N atoms (III) and (IV) and it is now pointed out that a decision on this point cannot be obtained from the synthesis, the sudden formation of a colored compd at the end of the reaction pointing to an intramol change. K. does not agree with G and J either on the question whether the color is to be ascribed to a ter- or to a quinquevalent As atom, whereas G and J ascribe the color to the tervalent

As atom, K. holds the opinion that tervalent as well as quinquevalent As compds. may be colored or colorless, examples of both cases being known. The easy formation of colorless *N*-acyl derivs., which, according to G. and J., points to the existence or easy forma-

tion of an NH group is explained by K by primary addn to the N atom followed by splitting off of HCl The *o*-quinonoid formulation is preferred by K in view of the greater reactivity of the compd as compared with $Ph_2AsCl$ moreover, in analogous compds., such as anthracene and acridine, the *o*-quinonoid formulation (von Auwers, *C A* **14**, 3250 **19**, 2054) has been preferred in recent years to the bridged formula For the compd obtained by Wieland and Rheinheimer (*C A* **15**, 2633) from $AsCl_3$ and $Ph_2NMe$, the formula V is proposed The whole subject is discussed in detail in the original paper, to which reference must be made for details C F VAN DUIN

Derivatives of the arsenic analog of 9,10-dihydroacridine. I. WM GUMP AND HUGO STOLTZENBERG *J Am Chem Soc* **53**, 1428-32(1931) —*o* $H_2NC_6H_4CH_2Ph$ (37 g.) and $As_2O_3$ in the Bart reaction give 16 g. *of diphenylmethane-o-arsonic acid*, m 161 2° dehydration by heating 10 g acid in 40 cc. concd $H_2SO_4$ 5 min on the $H_2O$ bath and pouring into 500 cc $H_2O$ gives quant. *acridarsinic acid*, $C_6H_4\langle^{CH_2}_{AsO_2H}\rangle C_6H_4$, m 235–6° reduction of 10 g with $SO_2$ and HCl gives 9 g *10-chloro-9,10-dihydro acridarsine* yellow, m 114–5°, when dusted in the air in the smallest amts., it causes severe burning of the face, the lips and the tongue, in addn to this, the tervalent As strongly irritates the mucous surfaces of the bronchial organs. C. J WEST

The γ-triazines. Synthesis of two aralkylaminothioltriazines. A OSTROGOVICH AND V GALEA *Atti accad Lincei* **12**, 162-5(1930).—Benzylaminothioltriazine, $PhCH_2C\underline{N\,C(NH_2)\,N\,C(SH)\,N}$, is prepd like its isomers, the tolylaminothioltriazines (cf. *C A* **25**, 705), by condensation with heating Recrystd from dil. EtOH, it m 270–1° It is sol in alkalies and $NH_4OH$, from the latter, salts of the heavy metals readily ppt., such as the Ag and Cu salts It is also sol in mineral acids, and gives a *picrate*, yellow, m 187–8°. This compd of all the γ-triazines prepd gave a $N_2$ analysis which agreed most closely to the theoretical, *i. e.*, 21.68% vs. 21.92% calcd Styrylaminothioltriazine is prepd best by condensing the reactants *cold*, and m 284–5°; yield, very low It has not been possible to prep a Ag salt of this compd., but the Cu salt may *be obtained from $NH_4OH$ soln by addn of $CuSO_4$ and AcOH, or even by addn* of Fehling soln. The picrate m 221–2° A W CONTIERI



Oxonitine THOMAS A HENRY AND THOMAS M SHARP *J Chem Soc.* 1931, 581–2.—Oxonitine obtained by decompn of aconitine permanganate with $H_2SO_4$, m 277° (decompn.) $[\alpha]_D^{15}$ −48.18° ($CHCl_3$, *c* 0.4048), gives figures on analysis agreeing best with the formula $C_{31}H_{39}O_{12}N$, the loss of the 3 C and 6 H atoms are accounted for by the loss of AcH and the Me group attached to N C. J WEST

Yohimbine. II. F MENDLIK AND J P WIBAUT *Rec trav chim* **50**, 91–111 (1931), cf. *C A* **23**, 1905.—Previously M and W found that yohimbine can be *dehydrogenated by means of Se* (*C. A* **23**, 1905), *in the present communication the* compds. formed in this reaction are investigated more fully The expts. were carried out with yohimbine, which had been purified especially by Hoffman La Roche Hahn and Schuch (*C. A* **24**, 5039), however, communicate that com. preps of yohimbine always contain isoyohimbine and, therefore, it is not certain that a chemically pure compd has been used An intimate mixt. of 40 g yohimbine and 30 g Se was heated for 30 mins at 300°, cooled down pulverized, mixed with an equal amt. of pure sand and first extd. with benzene for 30 min in a Soxhlet app and then with EtOH until the latter showed no fluorescence The benzene ext. on cooling gave *yobirine*, $C_{11}H_{12}N_2$, m 217°, after several crystns. from EtOH although the compd itself is colorless, the salts and the methiodide, which show a blue fluorescence, are yellow, all these compds are optically inactive After sepn of the yobirine, the benzene soln was concd to a sirup from which *dihydroyobirine*, m 170°, was obtained in colorless crystals by the addn of hot EtOH The alc ext gave the *ketoyobirine* $C_{20}H_{16}ON_2$, in yellow crystals, m. 328° giving in EtOH and AcOH solns. characterized by a bluish green fluorescence Probably ketoyobirine contains a CO group between 2 rings, for it does not react with $PhNHNH_2$ or $NH_2OH$ The dehydrogenation of diacetylyohimbine gives only yobirine and dihydroyobirine, not even a trace of ketoyobirine being obtained From 40 g yohimbine were obtained 8 g yobirine, 7 g dihydroyobirine and 1.5 g ketoyobirine On methylating yobirine a yellow methosulfate was obtained, which, on boiling with alkali gave a yellow compd $C_{21}H_{18}ON_2$, m 192.5° which, from its insoly in $H_2O$, did not consist of the quaternary $NH_4$ base, but was formed most probably by simultaneous reduction and oxidation, such as is known to occur with quinolinium and acridinium bases On melting 1 g ketoyobirine with 5 g KOH at 345–50°, 2 compds. are obtained,

one may be isolated by extn of the aq soln of the reaction mixt. to which $NH_4Cl$ has been added, with ether it m 258°, dissolves in hot concd HCl as well as in concd KOH, but could not be investigated further, only the formula was established as $C_{11}H_{11}O_2N$. The alk soln was then acidified and again extd with ether after evapn of the latter a residue was obtained, which, on sublimation, gave pure *hemellitylic acid*, m. 142–4°. An authentic specimen of the latter acid was synthesized according to the method of Scholl (*Ber* 32, 3492(1900) 36, 10, 329(1903)) from *o*-xylene, Hg fulminate and $AlCl_3$; in this way a mixture of 2,3 and 3,4 $Me{\cdot}C_6H_3CN$ was obtained, which was saponif. to the mixt. of the corresponding acids The latter were converted into the Ca salts, which were first sepd by the lower solv of the Ca salt of $3,4\text{-}Me_2C_6H_3CO_2H$ and then gave a soln which, on boiling gave a ppt. of the pure Ca salt of hemellitylic acid, the solv of which *decreases* at higher temps Further investigations were carried out on the dimethylindole obtained by Barger and Field (*C A* 9, 2888) on heating yohimboaic acid with soda lime which was not identical with any of the dimethyl or ethylindoles then known The odor of this indole deriv resembling that of scatole, 3 dimethylindoles were synthesized from EtCHO and the 3 tolylhydrazines according to Fischer's method *p*-tolylhydrazine gave in this way *3,5-dimethylindole*, m 74.5–5° (*picrate*, m 179–80° (cf Arbuzov and Tschwinsky *C A* 4, 3218)) and *o*-tolylhydrazine, *3,7-dimethylindole*, b 281.2 (*picrate*, m 142–3 ) *m* Tolylhydrazine can give the 3,4- or the 3,6-$Me_2$ compd the 3,6-compd being obtained in the case of the *m*-phenetidine (Kermack, Perkin and Robinson, *C A* 16, 98), it is assumed that the dimethylindole obtained, m 116–7° (picrate, m 179–80 ) is the 3,6-deriv None of these compds. is, however, identical with the indole deriv obtained from yohimbine The possible structures of yohimbine are fully discussed in the original paper in view of the many uncertainties and the hypothetical character of several assumptions, the original paper is to be consulted in this respect. C. F VAN DUIN

Alkaloids of Sinomenium and Cocculus. XXXI. Trilobine and homotrilobine. H KONDO AND M TOMITA *J Pharm Soc Japan* 50, 1035–59(1930), German abstr 127–9, cf *C A* 21, 2090 24, 5301–2.—In the previous paper K and T proposed the formula, $C_{17}H_{13}(NMe)(OMe)(—O—)_2$ and $C_{18}H_{15}(NMe)(OMe)(—O—)_2$, for *trilobine* (I) and *homotrilobine* (II), resp The present paper deals with the study of the properties of I and II. Oxidation of I with $KMnO_4$ gave a dibasic acid, $C_{17}H_{14}O_8$ (III) (*des-N-trilobinedicarboxylic acid*), m 302°, which did not depress the m. p of the *4 methoxy-3,4'-diphenyl ether-1,1'-dicarboxylic acid*, m 303–5°, of K. and Yano (*C A* 23, 4475) (III was previously described as $C_{18}H_{14}O_8$, m 288°) III on boiling with HBr in AcOH gave *des N-desmethyltrilobinedicarboxylic acid*, $C_{16}H_{12}O_8$ (IV), m 180–1°, which did not depress the m p of *4 hydroxy-3,4'-diphenyl ether 1,1'-dicarboxylic acid*, m 280–5° (IV was previously reported as *des N-desmethyltrilobinedicarboxylic acid*, m 278–9°). Methylation of IV with $Me_2SO_4$ gave a compd m. 302° which did not depress the m. p. of III. III when treated with $CH_2N_2$ gave a compd. m 93–5° which did not depress the m p. of *di Me 4-methoxy-3,4'-diphenyl ether 1,1'-dicarboxylate* (m 97°) Acetylation of IV gave a compd., $C_{16}H_{11}O_8COMe$, m 234° Alk. fusion of III gave *p*-$HOC_6H_4CO_2H$ (m 213°) and protocatechuic acid (m 196°) *Desmethyltrilobine* (cf K. and Y., *loc cit.*) when treated with $CH_2N_2$ gave *monomethyltrilobine I*, $C_{17}H_{13}NO_2(OMe)_2$, m 150°, $[\alpha]_D^{14}$ 245.3° When treated with $Me_2SO_4$ in alk. soln. followed by KI gave *monomethyltrilobine-MeI*, $C_{17}H_{13}NO_2MeI$, decomps. 259° *Monomethyltrilobine-Me$_2$SO$_4$* when treated with KOH at 100° gave *monomethyltrilobinemethinemethine*, $C_{19}H_{17}NO_3$ (VI), m. 106°. *HCl salt* decomps. 260°, methin MeI (VII), m 257–8° Oxidation of VI with $KMnO_4$ gave $C_{11}H_{12}O_4$, m. 305–8°, which did not depress the m p of III. VII when treated with alc. KOH gave $Me_2N$, $C_{18}H_{11}O_3$, m above 300°, and $C_{17}H_{13}O_4H{\cdot}O$, m. 192–5°. *Trilobine-Me$_2$SO$_4$* (prepd by treating I (5 g.) with $Me_2SO_4$ (5 g.) in $CHCl_3$) when treated with KOH (25 g.) gave VI, m 106°. *HCl salt*, decomps 259°. *methin MeI* (VII), m. 259–60°. On treating with KOH VII gave $C_{17}H_{13}O_4H{\cdot}O$ (VIII), m. 192°, and $Me_2N$. Oxidation of VIII with $KMnO_4$ gave III. Methylation of VIII with $Me_2SO_4$ gave $C_{17}H_{12}O_2(OMe)_2$, m 90–100°. *Trilobine-MeI* (IX) when treated with KOH for two hrs. gave *trilobinemethylmethin* (X), $C_{19}H_{15}NO_4$, m 191°. On treating with MeI X gave *trilobinemethinmethin-MeI* (XI), m. 206–7° When treated with KOH XI gave $C_{18}H_{11}O_3$ (?), m. 105°, $Me_2N$, and $C_{18}H_{11}O_3H_2O$, decomps. 214° (*Ac deriv*, $C_{22}H_{20}O_7$, m. above 300°) X or *trilobine-MeCl* when reduced with Na-Hg gave *dihydrotrilobinemethylmethin* (XII), $C_{19}H_{17}NO_4$, m. 98°, $[\alpha]_D^{13}$ 195.7° On treating with MeI XII gave VII (m. 259°) which gave when reduced with Na-Hg *tetrahydro-des N-trilobine*, $C_{18}H_{16}O_4H_2O$, m. 206°, $[\alpha]_D^{13}$ 126.3° (in $CHCl_3$); *Ac deriv*, decomps. 144–7°, $[\alpha]_D^{13}$ 58.7°. Oxidation of II with $KMnO_4$ gave III. *Homotrilobine-MeI* when treated with alc. KOH gave *homo-*

*trilobinemethylmethin* $C_{21}H_{23}NO_3$, m 115° *HCl salt* decomps 265°. *Homotrilobinemethylmethin Me I* (prepd as before) when treated with KOH gave *des N-homotrilobine* (XIII) $C_{19}H_{21}O_3$, m 385–8° Oxidation of XIII with $KMnO_4$ gave a compd (XIV) which did not depress the m p of *des N trilobinedicarboxylic acid* (m 300°) XIV when *treated with* HBr in AcOH at 150° for 1 5 hrs gave a compd (XV), m 270–81° which did not depress the m p of *desmethyldes N trilobinedicarboxylic acid* Methylation of XV with $CH_2N_2$ gave a *compd* m 97° which did not depress the m p of *di Me 4-methoxy 3 4-diphenyl ether 1 1 dicarboxylate* Oxidation of I, II and VI with concd $HNO_3$ each gave a compd $C_{19}H_{18}N_2O_{10}$ or $C_{19}H_{19}N_3O_{11}$ m 272°, contains 1 OMe and 2 C O groups, and cannot be acetylated These facts indicate that I and II, like *tetrandrine* or *daurscine* belong to the alkaloids of the *benzyltetrahydroisoquinoline type* K. and T suggest the structure

for I (R = Me) and II (R = Et)

(II)

The position of R and the nature of —O— linkage are not clear This is under further investigation P I. NAKAMURA

**Cannabis indica resin. II.** ROBERT S CAHN *J Chem Soc* 1931, 630–8. cf *C A* 24, 4015.—The $Et_2O$ ext. of hashish of Eastern Mediterranean origin (*400 g*, 33%) on distn according to Wood, Spivey and Easterfield (*J Chem Soc* 69, 539(1896)) gives 90–100 g of atm distillate, the portion non volatile in steam $b_{18}$ 150–270°, 147–56 g vacuum distillate, 90–130 g undistillable pitch, the 2nd fraction gives 1 4–2 0 g of hydrocarbon (I), 35–42 g, $b_{18}$ 190–250°, 95–110 g $b_{18}$ 250–85° (II) and 5–15 g residue The *fraction* II simulated a pure substance, 75% of which $b_{18}$ 263–8° but it was impossible to eliminate the head and tail fractions The green resin from the LtOH ext. of *Cannabis indica of Indian origin* gave *similar results on distn* Portions of all fractions except that volatile in steam were separately heated at 200° for 4 5 hrs in an atm of $CO_2$ but showed no evidence of *polymerization* The *hashish resin yielded only about 5% to* alkali and the green resin even less II and AcCl in dry $C_5H_5N$ give 27–8.4% of acetyl cannabinol (III), m 75°, substitution of quinoline for $C_5H_5N$ greatly reduced the yield of III, refluxing 3 g of II with $Ac_2O$ and AcONa for 1 hr gives only 0 1 g cryst III after but not before crystals for seeding became available III was unchanged by refluxing with $Ac_2O$ addn of fused $ZnCl_2$ caused decompn, bromination and nitration take place readily but cryst. derivs. have not been obtained The only residues after sepn of the cryst III are much more mobile than II, reacetylation with AcCl and $C_5H_5N$ gave no further yield of cryst material Oxidation of the higher boiling fraction with $HNO_3$ gave *nitrocannabinolactone* (*0 2 g m 170–7°, from 110 g of residues*) By heating 20 g III with 6 4 g KOH in 120 cc 90% EtOH for 2 hrs, gives 90% of cannabinol (IV), $b_{18}$ 263–4° $Ac_2O$ gives quant *III* Nitration of *II* (*17 7 g*) and of pure *IV* (5 g) gives the tri $NO_2$ deriv (V) (19 5 g and 3 3 g, resp) which, once recrystd, never m above 150°, a purified specimen m 158°, still contained an appreciable amt of lower nitration products or other impurities, this is similar to the product of W, S and E, except that the Ag salt was slowly decompd by EtOH and the Na salt appeared to exist in a bright orange and a paler yellow form, the former passing into the latter in contact with $H_2O$ slowly in the cold, rapidly on heating Analyses of III indicate the formula $C_{21}H_{22}O_4Ac$, of the $NO_2$ deriv, $C_{21}H_{22}O_4(NO_2)_2$ V as the Ag salt and MeI give 95 5% of the *Me ether* (VI), pale greenish yellow, m 150°, in MeOH only 35% of the ether is formed, 60% of V being recovered VI *is unchanged after being refluxed with* EtOH-concd HCl and boiled 2 min with concd $HNO_3$, *it was unaffected by III* under Zeisel conditions but is hydrolyzed under the *conditions* for the detn of NMe When its soln in $C_5H_5N$ or piperidine is heated on the water bath, it rapidly assumes the red dish orange color of solns of V salts. V *and* $PhSO_2Cl$ in dry $C_5H_5N$ give *benzenesulfonyl trinitrocannabinol* m 196–7° stable to acids but very readily hydrolyzed by NaOH or $C_5H_5N$ The *hydrocarbon* I, $C_{21}H_{44}$, m 63°, it appears highly probable that the main constituent is nonacosane but some other substance is also present. C J W.

*Barbaloin.* Á GERECS. *Magyar Chem Folyóirat* 36, 121–8, 137–42(1930).—Léger (cf *C A* 11, 2454, 2599) stated that barbaloin is a glucoside of aloe-emodin and *d* arabinose in which, to account for the reducing capacity of barbaloin, the point of union could not be the 1st C atom of *d* arabinose However, the presence of a free aldehyde sugar group could not be proved by expts and the glucoside linking could not be split in any way Léger's statement is *therefore* incorrect. S S DE FINÁLY

Plant pigments. XXIX. The symmetrical lycopin formula. Perhydrolycopin. P. KARRER, A HELFENSTEIN, B PIEPER AND A WETTSTEIN. *Helv. Chim. Acta* 14, 435–8(1931); cf. *C. A.* 25, 520.—The recently proposed sym structure for lycopin has received further confirmation by $O_2$ treatment of the hydrocarbon, which yields 80% of the theoretical amt. of acetone, detd iodimetrically. Squalene, for which a related structure has been suggested, on similar treatment yields 90% of the acetone expected. Complete hydrogenation of lycopin should, therefore, yield the $C_{40}H_{82}$, previously prepd by a Wurtz reaction from dihydrophytyl bromide. A comparison of the substances resulting from these 2 indicated sources proved the validity of this supposition. The hydrocarbon is 2,6,10,14,19,23,27,31-octamethyldotriacontane. G. ALBERT HILL.

Allomerization of chlorophyll. J. B. CONANT, S. E. KAMERLING AND C. C. STEELE. *J. Am. Chem. Soc.* 53, 1615–6(1931).—Facts are presented which indicate that allomerization of chlorophyll is dehydrogenation brought about by the O of the air. C. J. WEST.

Ergostenol chloroacetate. MERRILL C. HART AND FREDERICK W. HEYL. *J. Am. Chem. Soc.* 53, 1413–6(1931).—α Ergostenol, prepd by the catalytic reduction of ergosterol acetate in AcOH with Pt oxide as a catalyst, contains small quantities of *allo* α-ergostanol. Ergostenol chloroacetate is very largely α-ergostenol chloroacetate with smaller quantities of the chloroacetates of β ergostenol and of *allo* α-ergostanol. Ergostenol and $ClCH_2COCl$ form a small quantity of an *addn. product*, $C_{31}H_{49}O_2Cl_3$, m. 129–30°, $[\alpha]_D$ 8.7°. Ergostenol chloroacetate forms neither a bromide nor a peroxide nor does it react with $KMnO_4$. Upon reduction evidence of some degree of isomerization is found in the increased yield of the reduction product, *allo* α ergostanol. C. J. WEST.

Butadiene hydrocarbons. I. G. FARBENIND. A.-G. Fr. 696,706, June 6, 1930. Butadiene hydrocarbons are prepd by cracking higher hydrocarbons such as mineral oils, gas oils, benzine fractions and tar oils, sepg. the butadienes and transforming the other products resulting from the cracking into compds. such as acetone, AcH, $C_6H_6$, etc., which are then used for the production of butadiene hydrocarbons. Cf. *C. A.* 25, 525.

Distillation products of polymeric hydrocarbons. HENRY ARIAS. Fr. 696,812, Sept. 20, 1929. Polymeric hydrocarbons such as balata, gutta-percha, gayule, rubber, Borneo gum, etc., are distd. to obtain isoprene and substitutes for linseed oil and turpentine oil.

Absorption of olefins. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Fr. 695,707, May 15, 1930. Olefins contg. 3 or more C atoms and one or more double bonds in the mol. or their polymerization products are absorbed by strong acids in the presence of catalysts composed of one or more of the following metals, Fe, Cu, Co, Ni, Ag or metals of the Pt group or compds. of any of these metals.

Absorbing olefins with sulfuric acid. H. E. BUC (to Standard Oil Development Co.). Brit. 340,098, Nov. 15, 1928. Fr. 684,567 (*C. A.* 24, 5305).

Absorbing double-bonded hydrocarbons in sulfuric acid. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 339,592, Aug. 6, 1929. Cyclic hydrocarbons having one double bond in a non aromatic nucleus, such as cyclohexene, are absorbed in

or combined with $H_2SO_4$ in the presence of catalysts such as those described in Brit 323,748 (*C A* 24, 824) Brit 336,603 (*C A* 25, 1813), Brit 336,604 (*C A* 25, 1813) and Brit 336,633 (*C A* 25, 1813) and the products may be hydrolyzed, distd or otherwise treated for the production of esters ales or ethers An example is given of the use of cyclohexene and final production of cyclohexanol

Recovery of liquids from gelatinized materials. I G Farbenind A G Brit 339,610 July 10 1929 Neutral org liquids which have been solidified by reaction in them between $NH_3$ or other base and abietic or pimaric acid as described in Brit 340,575 (following abs) are recovered by pressing the solid against a filter which may be assocd with a purifier for the liquid (among which latter porous products may be used as described in Brit 340,575) Numerous details and examples are given, and among the uses to which the process may be applied is the expression of volatile combustible liquid such as pentane ether acetone or the like into the intake manifold of an internal combustion engine to facilitate starting of the engine

Gelatinizing organic liquids to facilitate storage, transport, etc I G Farbenind A G Brit 340,575 Neutral org liquids such as cyclohexane benzene and its homologs benzine and other paraffine hydrocarbon materials EtOAc ether, $CCl_4$, $CHCl_3$, $C_2HCl_3$ or acetone etc are gelatinized by forming in them a voluminous "framework" by the action of a base such as $NH_3$ on abietic or pimaric acid in the material to be gelatinized The liquids can be recovered by pressing by heating or by passing a current of gases over the material Several examples are given Cf *C A* 25, 2136

Putting up organic liquids in powder form. Chem Fab von Heyden A G Ger 519,448 Nov 24, 1929 Org water sol liquids or semi liquids are mixed with water-sol salts which have become porous on account of loss of water of crystn The org liquid and the salt must be chemically inert to one another Thus, pyridine 10 may be mixed with anhyd $Na_2CO_3$ 30 parts

Nitrogenous derivatives of paraffins. I G Farbenind A-G Brit 339,962, Sept 11, 1929 Halogenated paraffins contg more then 8 C atoms are treated with aq or alc $NH_3$ or an $NH_3$-yielding agent such as $(NH_4)_2CO_3$ or urea and pressure and catalysts such as Cu or a Cu compd may be used to assist the reaction The halogen atoms are in part replaced by amino groups and in part split off with formation of double bonds while others remain in the mol When alc solns are used, the alc may enter into the reaction with production of ether groups Various examples are given.

Alcoholates. Alexander Wacker Ges für elektrochem Ind G. m. b H (Paul Halbig and Felix Kaufler inventors) Ger 519,443, Jan 22, 1928 Alkali metal compds of monohydric ales contg more than 3 C atoms in the mol are prepd. by distg an excess of the alc with alkali metal hydroxide until the production of alcoholate is completed Examples are given

Aromatic aldehydes. I G Farbenind A G (Georg Kalischer, Heinz Scheyer and Karl Keller, inventors) Ger 519,444, Feb 26, 1927 Addn to 514,415 (*C A* 25, 1536) The method of Ger 514,415 is used to introduce the aldehyde group into aromatic hydrocarbons contg a mobile H atom Thus, an anthracenealdehyde can be prepd by warming $C_{14}H_{10}$ with a mixt of formylmethylaniline and $POCl_3$ to about 80° Cf *C A* 25, 710

Aromatic hydroxyaldehydes. J D Riedel-E de Haën A G. Ger 517,539 Feb 18, 1927 Aromatic *o* and *p*-hydroxyaldehydes are prepd by oxidizing the alkali compds of the corresponding propenyl derivs in presence of excess of $PhNO_2$ Thus, the *m*-ethyl ether of 1,2 dihydroxy-4 propenylbenzene is treated with NaOH and dried The Na salt is then treated with excess of $PhNO_2$ at 120–125° The $PhNH_2$ and azobenzene formed is blown out with steam and the excess $PhNO_2$ removed Pptn by HCl gives the *m* ethyl ether of protocatechualdehyde Further examples are given Cf *C A* 25, 522

Aldehyde bases Carl Mannich Fr 696,637, June 4, 1930 $CH_2O$ and primary or secondary aliphatic amines are condensed with aldehydes of the general formula $R \diagdown R' \diagup CHCHO$ or their compds giving rise to such aldehydes, in which R is an alkyl radical, R′ an alkyl radical or H, or R and R′ together represent a hydroaromatic ring Examples are given of the prepn of $\alpha,\alpha$-dimethyl $\beta$-dimethylamino- ($b_{11}$ 82°), $\alpha\alpha$ dimethyl $\beta$ diethylamino- (b 175–177°)-, $\alpha$ isopropyl $\beta$ dimethylamino-propionic aldehyde ($b_{21}$ 66–68°) and others.

Ketones. Rheinische Kampfer-Fabrik G m b H Fr 696,653, June 4, 1930 Ketones are prepd by passing secondary ales in vapor form at 120–300° and in the presence of steam over dehydrogenating catalysts Examples are given of the prepn.

of menthone, cyclohexanone, camphor and acetophenone from menthol, cyclohexanol isoborneol and methylphenylcarbinol, resp

Carbocyclic ketones. Soc. anon M Naef & Cie Ger 519,446, Dec. 7, 1926 Addn to 441,273 See Brit 263,153 (*C A* 22, 91)

Esters. Commercial Solvents Corp Fr 696,496, May 17, 1930 Fatty acids are recovered from dild solns from esterification reactions by extg the acid from the aq soln by means of the alc which is used for the subsequent esterification

Ethanol esters Holzverkohlungs Industrie A G Fr 696,361, May 31 1930 Esters of EtOH are made by introducing, directly or after sepn of impurities such as aldehydes, the mixt of alc and steam coming from the distn of wort and acids (particularly AcOH) in a column system where esterification is effected The ester and alc in excess are sepd and the alc returned to the system A suitable app is described

Ethers of 1,2,3,4-tetrahydro-6-naphthylmethyl alcohol. I G Farbenind A-G (*Gustav Reddelien and Hans Lange, inventors*) Ger 521,033, July 30, 1929 Addn to 516,280 (*C A* 25, 1841) These are prepd by the action of aliphatic or aromatic alcs or alcoholates on 6-chloromethyl 1 2 3,4 tetrahydronaphthalene, which is prepd from tetrahydronaphthalene by the method of Ger 508,890 (*C A* 25, 716) Examples are given of the prepn of the Me, Et and benzyl ethers $b_{11}$ 133–4°, 141–3°, and 214–5°, resp

Nitriles. I G Farbenind A G (Heinrich Hopff, inventor) Ger 517,760 Dec 16, 1928 Benzotrichloride or its substitution products is caused to react on amides of monobasic unsatd or satd acids Catalyzers may be present Thus, benzotrichloride and acetamide are heated to 150–160° to give $CH_3CN$ more $ZnCl_2$ may be present as a catalyzer Several further examples are given

Replacing the amino group by the thiocyano group in organic compounds. Richard Kuhn and Ernst Lichenberger Swiss 143,015, Oct 30, 1928 Amines of aliphatic or aromatic compds are diazotized and the N atom of the diazo group split off in the presence of a concd soln of thiocyanate In the example, *o* toluidine is diazotized and the resulting soln treated with a satd soln of NaCNS or $NH_4CNS$ to give *o* thiocyanotoluene as a yellow oil, $b_{11}$ 120°

Trithionates of secondary amines. I G Farbenind A-G (Hans Lecher, Theodor Weigel and Max Wittner, inventors) Ger 517,995, Oct. 27, 1927 These are obtained by treating *N* monothio derivs of secondary amines (obtained from the amine by the action of $SCl_2$) with aq $H_2SO_3$ Thus, *N*-thiodiethylamine and $H_2SO_3$ give *the trithionate* m 148° *Further examples are given.*

*N*-Substitution products of 2,6-diaminonaphthalene. I G Farbenind A G (Richard Herz and Wilhelm Hechtenberg, inventors) Ger 517,996, Sept 14, 1928 6-Arylamino-2 hydroxynaphthalene-3-carboxylic acid is treated with aminohydroxy compds. of the $C_6H_6$ series in the presence of sulfite soln. Thus, 6-phenylamino-2-hydroxynaphthalene-3 carboxylic acid, *p*-aminophenol and bisulfite soln. are heated in a reflux condenser to give 2-(4′ hydroxyphenylamino)-6-phenylaminonaphthalene, m. 205° Further examples are given

Haloalkoxybenzanthrones. Scottish Dyes, Ltd Ger 516,535, Jan 27, 1926. See Brit 256,281 (*C A* 21, 2989)

Decomposition of castor oil. Maurice Devaux and René Sornet Fr. 696,237, Sept 6, 1929 Castor oil is decomposed to give a high yield of enanthaldehyde and undecylenic acid without loss of enanthaldehyde and without risk of solidification of the residual oil, by stirring the oil, heated to about 300–320°, by means of dry or superheated steam or by hot inert gases or both, which carry off the condensable gaseous products

*Aromatic halogen derivatives.* I G Farbenind A-G Fr 695,477, May 12, 1930 Aromatic condensation products contg a halogenated Me group besides an alkoxy or alkylthio group are prepd by the reaction of $CH_2O$ and hydracids such as HCl on aromatic alkoxy or alkylthio compds, resp A large no of new compds can be formed from the products as the halogen in the Me group enters easily into reaction

Vinyl halides. I G Farbenind A-G Brit 339,727, Dec 7, 1928 *In effecting* reaction between gaseous halogen hydrides and $C_2H_2$ at about 180°, a catalyst is used consisting of active C from which the activating agent has been removed, or an active C prepd by use of $H_3PO_4$ and still contg the $H_3PO_4$.

Basic bismuth salts of organic mercury compounds. I G Farbenind A-G Brit. 339,760, Nov 15, 1929 Examples are given of the formation of reaction products from Bi nitrate and mercurisalicylallylamide-*O* acetic acid, 4-mercuriallyoxy-3 acetylaminobenzene 1 arsonic acid, 3,4-mercurythiobenzimidazole-1-arsonic acid, 3,4-

mercurythiobenzimidazole 1-carboxylic acid 1,2 mercurythiobenzimidazole-4 sulfonic acid and *m* mercuryallylthioureabenzoic acid (and the manuf of various of these initial Hg compds also is described)

**Metal carbamates** I G Farbenind A G Fr 696,374, June 2, 1930 Finely divided metallic oxides preferably in the dry state, are treated by $NH_2COONH_4$, advantageously with heat The production of the Zn and Ca compds is described Cf. C A 25, 1842

**Allyl alcohol derivatives.** Schering Kahlbaum A.-G Brit. 339,882, Feb 23, 1929 Condensation products of glycerol monohalohydrins with aliphatic ketones such as acetone are distd over alk media such as caustic lime or in the presence of an org base such as quinoline or diethylaniline to split off halogen hydride and form corresponding derivs of α hydroxyallylalc The same products also can be obtained from compds of aliphatic ketones with other mono-esters of glycerol such as the benzene- or toluene sulfonate An example is given of the production of the acetone compd of α oxyallyl alc from the acetone compd of glycerol α-chlorohydrin.

**Anthraquinone derivatives** Imperial Chemical Industries, Ltd. Fr 696,611, June 3 1930 Halogenated phthalic acids or their salts or anhydrides are condensed with phenols in the presence of $H_2SO_4$ and with or without $H_3BO_3$ The halogen atoms in the products obtained may be hydrolyzed or replaced by OH groups Examples given include the prepn of 5 6-dichloro 2,6,7 trichloro- and 6,7-dichloro-quinizarin

**Benzanthrone derivatives** I G Farbenind A G (Willy Eichholz, inventor) Ger 521 032 Mar 13, 1928 Addn to 501,083 (C A 24, 4791) Benzanthrone derivs substituted in the 2-position with a group $—CH_2R_1$, where $R_1$ is H or an alkyl, aryl or other indifferent group, are prepd by the action of alk. sapong agents on benzanthrone derivs substituted in the 2 position with a group $—SCH(R_1)COR$, where $R_1$ is an alkyl, aryl, aralkyl or cycloalkyl group Thus 2 methylbenzanthrone can be prepd by heating acetonyl 2 benzanthronyl sulfide with KOH at 125–130°. Other examples are given also Cf C A 25, 2438

**Isatin derivatives** I G Farbenind A.-G (Karl Thiess, Ernst Runne, Karl Moldaenke and Theodor Meissner, inventors) Ger 519,139, Jan 31, 1926 Addn to 451,856 Isatin derivs trisubstituted in the benzene ring are prepd. by halogenating 6,7- or 4,7 disubstituted isatins or their bisulfite compds. The treatment of 4 (or 6)-halo-7-alkylisatins is excluded Examples are given of the prepn of *4,7-dimethyl 5-chloroisatin*, m 277–9°, *4 methyl 5-chloro 7 methoxyisatin*, m 251–3°, *4,5-dichloro 7-methoxyisatin*, m 274–5°, and *4,7-dimethyl-5 bromoisatin*, m 290–2°.

**Lupinane derivatives** Karl Winterfeld and Fritz Holschneider. Ger. 521,454 Mar 26, 1930 Bromolupinane cyanamide is prepd by treating lupinane, $(C_{11}H_{19})N$, with CNBr Dibromolupinane cyanamide is prepd similarly from lupinine, $(C_{11}H_{21}ON)$ Examples are given

**Naphthimidazole derivatives** I G Farbenind A G (Wilhelm Neelmeier and Wilhelm Meiser, inventors) Ger 519,052, July 24, 1928 Hydroxy-1′,8′ naphthoylenenaphthimidazoles and their derivs are prepd. by fusing with alkali the 1′,8′-naphthoylenenaphthimidazole sulfonic acids obtained by condensing naphthalic anhydride or its derivs with *o*-naphthylenediaminesulfonic acids Examples are given

**Pyridine derivatives.** I G Farbenind A.-G Fr 696,425, April 10, 1930 *N* Methyl compds of the pyridine series are prepd by the reaction of MeCl on bases of the pyridine series or its homologs, advantageously below 200° and with or without pressure and with or without catalysts, such as a chloride of Cu or Fe, and diluents such as water, ether, $C_6H_6$, benzine, tetralin or decalin Examples are given including the prepn of the *N* methyl chloride of α- and γ picoline, chloropicoline and β methoxypyridine

**Quinoline derivatives.** I G Farbenind A G Fr 696 438, April 25, 1930 *Bz* Nitro-*Py*-chloromethylquinoline and its derivs are prepd by treating *Py*-chloromethylquinoline or its derivs with nitrating agents Examples are given of the nitration of the 2,4 dichloro- 2-chloro-4 methyl and 4-chloro-2,8-dimethyl-quinoline. Cf C A 25, 966

**Sterol derivatives.** Bruno Rewald Ger 520,077, Aug 29, 1928 Sterol monophosphates are prepd by warming ethereal solns of sterols with $P_2O_5$. Examples are given of the prepn of the cholesteryl and sitosteryl esters

**Thioamino compounds.** Imperial Chemical Industries, Ltd Ger 519,449, Mar 30, 1930 See Brit 331,016 (C A 24, 5765)

**Condensation products from resorcinol, etc.** J D. Riedel-E de Haën A.-G Ger 521,458, Oct 30, 1928 Resorcinol is heated with acids of the formula $(CH_2)_n(COOH)_2$, where *n* is more than 2, in the presence of a condensing agent, *e g*, $ZnCl_2$

Ketonic acids of the formula (1)(3)$(HO)_2C_6H_2CO(CH_2)_nCOOH(4)$ are thus obtained, together with (1) benzeins of the formula $\overline{O\,C(O)\,(CH_2)_n\,C\,C\,CH\,CH\,C(OH)\,CH\,C}$-$\overline{O\,C\,CH\,C(OH)\,CH\,CH\,C}$, when $n$ is 3–5, or (2) diketones of the formula $(HO)_2C_6H_2CO(CH_2)_nCOC_6H_2(OH)_2$, when $n$ is more than 5. The ketonic acids can be sepd. from the other products with $Na_2CO_3$ soln., and can be reduced to acids of the formula $(HO)_2C_6H_2(CH_2)_nCOOH$. Homologs of these products can be obtained by starting from C alkyl resorcinols or from alkyl derivs. of the aliphatic acids. In an example, resorcinol (2 mols.) and adipic acid (1 mol.), heated to 110° with $ZnCl_2$ for 3 hrs., with stirring, yield a benzein and $(HO)_2C_6H_2CO(CH_2)_4COOH$, m. 169°, which is reducible to $(HO)_2C_6H_2(CH_2)_4COOH$, m. 92°. Examples of the prepn. of the following compds. are also given: $(HO)_2C_6H_2CO(CH_2)_2COOH$, m. 126–7°, $(HO)_2C_6H_2(CH_2)_2COOH$, $(HO)_2C_6H_2CO(CH_2)_3COOH$, m. 141°, $(HO)_2C_6H_2CO(CH_2)_4COC_6H_2(OH)_2$, m. 186–7°, $(HO)_2C_6H_2CO(CH_2)_5COOH$, m. 122°, and $(HO)_2C_6H_2CO(CH_2)_5COC_6H_2(OH)_2$, m. 170°.

**Colored condensation products.** I. G. Farbenind. A.-G. (Hans Grotowsky, inventor). Ger. 519,051, June 7, 1928. Addn. to 514,121 (*C. A.* **25**, 1084). In the process of Ger. 514,121, the 1-phenyl-3-methyl-5-pyrazolone is replaced by other pyrazolones or by other heterocyclic compds. having a reactive $CH_2$ group, *e. g.*, barbituric acid, rhodanic acid, sulfazone or indoxyl. Such of the products as contain COOH or $SO_3H$ groups may be used as *wool dyes*; others are useful as *intermediates for dyes and drugs*. Examples are given. Cf. *C. A.* **24**, 6030.

**Reduction products of indoxyls.** I. G. Farbenind. A.-G. (Curt Schumann, Eduard Mönch and Bruno Christ, inventors). Ger. 516,676, Sept. 9, 1928. Addn. to 515,544. The method of 515,544 (*C. A.* **25**, 2139) for producing *N*-acetyldihydroindoxyl or *N*-acetyldihydroindole is modified by treating indoxyl with H in presence of catalyzers, instead of *N*-acylated indoxyl. The $p_H$ value should be between the limits 7–9.5. Examples are given.

**Lead salts of 2-nitroresorcinol.** Imperial Chemical Industries, Ltd. Ger. 521,457, Feb. 2, 1929. See Brit. 312,052 (*C. A.* **24**, 967) and 328,277 (*C. A.* **24**, 5499).

**Triphenylstibine sulfides and selenides.** Ludwig Kaufmann. Ger. 520,306, June 11, 1927. Triphenylstibine or its homologs or derivs. are heated with S or Se, in the presence or absence of a solvent, to a temp. above the m. p. of the substituted stibine. The reaction may be promoted by addn. of a catalyst such as glycerol or cholesterol, and also by actinic rays.

**Thiuram monosulfides.** I. G. Farbenind. A.-G. (Ludwig Orthner, inventor). Ger. 519,445, Feb. 16, 1930. Metal salts of *N*-disubstituted dithiocarbamic acids (2 mols.) are caused to react with $COCl_2$ (1 mol.). An example is given.

**Esters of phosphoric acid.** I. G. Farbenind. A.-G. Ger. 517,538, July 1, 1927. Triesters of $H_3PO_4$ and aliphatic or hydroaromatic alcs. are prepd. by treating the alcs. with $POCl_3$ and a solvent in the presence of sufficient amine to combine with the HCl produced. Thus, a cooled mixt. of isopropyl alc. is mixed with pyridine and $C_6H_6$, and added to $POCl_3$. Pyridine-HCl sepd. out and can be filtered off leaving a 95% yield of triisopropyl phosphate. Further examples describe the prepn. of tributyl and tricyclohexyl phosphate.

**Acid chlorides of aminonaphtholsulfonic acids.** I. G. Farbenind. A.-G. (Hugo Schweitzer and Karl Burr, inventors). Ger. 516,678, Oct. 27, 1928. Acid chlorides of 2-amino-5-hydroxynaphthalene-7-sulfonic acid and 2-amino-8-hydroxynaphthalene-6-sulfonic acid, which contain a substituent in the amino group, are prepd. by treating them with $ClSO_3H$. Thus, 2-acetylamino-5-hydroxynaphthalene-7-sulfonic acid is treated with $ClSO_3H$ with cooling to give 2-acetylamino-5-hydroxynaphthalene-7-sulfonyl chloride. Further examples are given.

**Aliphatic acids.** Herbert Langwell. Fr. 695,721, May 16, 1930. In the manuf. of aliphatic acids and other products obtained by the fermentation of suitable substances such as cellulosic materials, the acid is neutralized as it is formed by $NH_3$ which is afterwards liberated by decompn. of the salt by a non-volatile base.

**Fatty acid derivatives.** I. G. Farbenind. A.-G. Brit. 310,011, Sept. 11, 1929. The polyhalogenated fatty acids prepd. as described in Brit. 306,623 (*C. A.*, **25**, 1842) which contain over 8 C atoms and over 2 halogen atoms in their mol. are treated with aq. or alc. solns. of the fixed caustic alkalies or with aq. solns. of weakly alk. reaction such as $NH_3$, $Na_2CO_3$, Na phosphate, NaOAc, $NH_4$ formate or urea. Halogen atoms are at least partially removed, forming compds. with double bonds and may be replaced

wholly or partly by OH groups When caustic alkalies are used in the reaction, the products are sol in alkali and yield salts which are *cleansing and emulsifying agents* When weak alkalies are employed the products are insol in alkalies, and on boiling with NaOH polymerization occurs with possible esterification of the carboxy group, and elastic rubber like products are produced. Numerous examples are given

Higher fatty acid derivatives containing sulfur I G Farbenind A G Brit 340,012 Sept 11, 1929 Solns of sulfides or polysulfides are caused to react on polyhalogenated fatty acids contg more than 8 C atoms in the mol or their esters or amides or conversion products still contg halogen obtained as described in Brit 339,675 (cf following abstr ) or Brit 340,011 (preceding abstr ) The halogens are in part replaced by mercapto and hydroxy groups and in part are split off with formation of double bonds The reaction may be effected under pressure, and the products yield salts on being salted out which are typical sulfonated soaps. Various examples are given in volving the treatment of trichloropalmitic acid, hexachlorostearic acid, tetrachloroöleic acid and similar derivs. Cf *C A* 25, 712

Fatty acid derivatives containing nitrogen. I G Farbenind A G Brit 339,675, Sept 11, 1929 Halogenated fatty acids contg more than 8 C atoms in the mol and which may contain hydroxy groups and be satd or unsatd are treated with solns of $NH_3$ in org solvents such as MeOH, EtOH, BuOH or acetone, and Cu or a Cu compd may be used as catalyst and pressure employed to facilitate the reaction Carboxamides are first formed and in part esters, when alcs are present The halogen atoms are gradually replaced by amino groups and may also be split off with formation of double bonds Examples are given of the treatment of hexachlororicinoleic acid, tetrachlororicinoleic acid, hexachlorostearic acid and a chlorinated linoleic acid.

Reducing nitroarylarsonic acids. Carl Oechslin (to Etablissements Poulenc Freres) U S 1,798,030, March 24 Aminobenzenearsonic acids are produced by reducing a nitrobenzenearsonic acid compd such as *p*-hydroxy-*m* nitrobenzenearsonic acid with Zn in an aq soln of a caustic alkali at temps of 40–70°, removing excess Zn, neutralizing the soln and sepg the pptd aminobenzenearsonic acid

Concentrating acetic acid Soc des produits chim de Clamecy and Ernest Charles. Fr 676,803, Sept 18, 1929 AcOH in aq soln is concd by using 2 solvents, A and B, for the AcOH A permits extn of AcOH from water, this solvent being slightly sol in water and dissolving only slight quantities of water B is insol in A and can dissolve the AcOH in A and give by distn a concd AcOH. Solvent A may be $C_6H_4$ xylene, $CCl_4$ or a mixt. of these with $CHCl_3$, PhOH, castor oil or $PhNO_2$ B may be $H_2SO_4$, $H_3PO_4$, a mixt of these or a concd soln of $CaCl_2$

*p*-Sulfobenzoylbenzoic acid Scottish Dyes, Ltd Ger 516,674, Dec. 1, 1926 4'-Halogen 2 benzoylbenzoic acid or its salts is treated with a neutral or acid soln of sulfite above 100° A small quantity of Cu salt may be added Thus, Na 4'-chlorobenzoyl 2 benzoate is mixed with $Na_2SO_3$ and water in an autoclave and heated under pressure to about 180° After some hours, the contents of the autoclave are filtered, and 4'-sulfobenzoyl 2 benzoic acid can be obtained from the filtrate A yield of 95–100% is obtained A further example is given

*N*-Methyl- and *N* ethyl-5,5-alkylphenylbarbituric acids. I G Farbenind A-G Brit 339,037, Aug 14, 1929 Compds of this class are prepd by treating alkylphenylmalonic or -cyanoacetic esters or their derivs such as esters, amides, amide-acid esters, chlorides and nitriles, with *N* methyl or *N*-ethyl urea or its derivs. such as *N*-methyl or *N*-ethyl thioureas, guanidines and isothiourea ethers, together with other customary treatments The same products can also be prepd by methylating or ethylating 5-phenyl or 5,5-alkylphenylbarbituric acids, or by alkylating a *N*-methyl or *N*-ethyl 5 phenylbarbituric acid, or by first alkylating a deriv of the latter compd and then converting it into the desired acid Examples are given of the production of *N*-methyl and *N*-ethyl-5,5-phenylethylbarbituric acids, and *N*-methyl 5,5-phenylmethylbarbituric acid, and mention is also made of *N* methyl-5,5-phenylpropylbarbituric acid

Sulfonic acids of 1-ω-aminomethylnaphthalene I G Farbenind A G (Wilhelm Herzberg and Hans Lange, inventors) Ger 472,823, Mar 25, 1927 See U S 1,785,955 (*C A* 25, 524)

Sulfur derivatives of fatty acids I G Farbenind A G Fr 696,560, June 2, 1930 Derivs of higher fatty acids contg S are made by the reaction of solns of sulfides or polysulfides on polyhalogen fatty acids and their derivs, if necessary with heat and pressure and with or without catalysts Examples are given of the treatment of hexachlororicinoleic acid (cf Fr 678,856, *C A* 24, 3517), heptachlorostearic acid, etc. The products are very reactive and are used for the prepn of new products

Aliphatic anhydrides. Henry Dreyfus Fr 695,969, May 22, 1930 Aliphatic

acids, particularly AcOH at 350–700°, are decompd in the presence of a catalyst deposited or spread on an asbestos support. The catalysts described in Fr 613,841, 634,167 (*C A* 22, 3892), 667,553 (*C A* 24, 1124), 667,500 (*C A*. 24, 1124) and 674,988 (*C A* 24, 2759) can be used Cf *C A* 25, 1538.

Aliphatic anhydrides. C F Boehringer & Soehne G m b H Fr 696,530, May 26, 1930 Aliphatic anhydrides and AcH are prepd by dissocg with heat, in the presence of catalysts, the products of the action of the corresponding fatty acids or their salts on α,α'-dichlorodiethyl ether Examples are given of the production of $Ac_2O$ and propionic anhydride using $ZnCl_2$ or $SnCl_2$ as catalyst

Acetic anhydride. C F Boehringer & Soehne G m b H Fr 696,154, May 27, 1930 $Ac_2O$ is prepd by submitting AcOH to a pyrogenic decompn in the presence of a catalyst presenting an incomplete development of its surface, *e g*, a gel of $SiO_2$ or $Al_2O_3$ having an incomplete development of its surface The porosity of the surface of the catalyst can be reduced by the action of $NH_3$ or HCl or by introducing C into the pores of the catalyst, or by heating it to a temp at which it begins to agglutinate

Acetic anhydride. Imperial Chemical Industries Ltd Fr 696,711, June 6, 1930 $Ac_2O$ is prepd by a pyrogenic treatment of AcOH followed by a sepn of the $Ac_2O$ by means of a solid absorbent such as wood charcoal

Benzoic anhydride I G Farbenind A G Ger 520,153 Aug 30, 1928. Two mols. of benzoyl chloride are caused to react with 1 mol of $H_2O$, better yields are obtained by completing the reaction at 260–280° A catalyst, *e g*, a metal or a chloride of P, may be present Examples are given

Acetylene. Dennis A Brading (one-third to Mayme Brading). U S. 1,797,400 March 24 Solid carbon is passed in finely divided state in an angular direction past an elec. arc in an atm of separately introduced H App is described.

Ethylene. N V de Bataafsche Petroleum Maatschappij Fr 696,561, June 2, 1930 Ethylene is absorbed in strong acids in the presence of catalysts contg one or more metals or compds of the Pt group in a finely divided state and preferably disposed on a support, or compds. of Cu, Fe, Co or Ni which if insol are solubilized by bubbling CO or NO through the liquid or if sol are converted into complex compds by means of CO or NO.

Alcohols from olefins. N V de Bataafsche Petroleum Maatschappij Fr. 695,849, May 19, 1930 See 335,551 (*C A* 25, 1536)

Methanol synthesis. Wm J Edmonds and Leonard A Stengel (to Commercial Solvents Corp) U S 1,797,569, March 24 In effecting catalytic reaction of H with C oxides, substantially pure H is first circulated over a catalyst such as oxides of Zn and Cr and there is then added to the circulating gas a mixt. of H and C oxides in proportions required to produce MeOH and effect continuance of the reaction under suitable pressure.

Butanol and higher alcohols. N V de Bataafsche Petroleum Maatschappij Fr 695,765, May 16, 1930 See Brit. 336,811 (*C A* 25, 1844)

Amino alcohols. Helmut Legerlotz Fr 695,675, May 15, 1930. Aromatic amino alcs. and their derivs. of the type $XOC_6H_4CH(OH)CHYNRR'$, in which X, Y and R denote an atom of H, a univalent hydrocarbon group or an acyl group and R' a univalent hydrocarbon group, are prepd. by the reaction of H under ordinary or increased pressure on the corresponding ketonic compds. as a soln of the base or its salts in an appropriate solvent such as water, EtOH or MeOH and in the presence of a catalyst such as metals of the Pt group, Ni, etc.

Ethylene glycol. Albert Maier Fr 697,171, June 10, 1930. Polyalcs., particularly ethylene glycol, are prepd by sapong org esters, preferably acetates, isolated after prepn in known manner from appropriate halogenated hydrocarbons, by water in excess, under pressure, at temps. above the b p

Acetaldehyde from acetylene. Consortium für elektrochemische Industrie G m b H (Erich Baum and Martin Mugdan, inventors) Ger. 517,893, July 16, 1914 $CH_2O$ is formed by the action of a hot soln of 6 to 35% $H_2SO_4$ on $C_2H_2$ in the presence of Hg compds as catalyzers The $C_2H_2$ is circulated in excess through the app, the proportion of absorbed $C_2H_2$ to unabsorbed $C_2H_2$ being kept so that no material alteration of temp occurs during the reaction. Agents to absorb or polymerize the formed $CH_2O$ are present. An example is given Cf *C A* 25, 2441.

Monoethanolamine dinitrate. Dynamit A G vorm Alfred Nobel & Co (Phokion Naûom and R. von Sommerfeld inventors) Ger 514,955, Dec. 6, 1929. A soln. of monoethanolamine or monoethanolamine mononitrate in concd $HNO_3$ is introduced into alc. with cooling Examples are given stating that 76–90% yields are obtained

Monoethanolamine dinitrate. Dynamit A G vorm Alfred Nobel & Co (Hokuon Nauom and Robert von Sommerfeld, inventors) Ger 517,832, Apr 12, 1930 Addn to 514,955 (preceding abstr.) $NH_2C_2H_4OH$ is dissolved in excess of concd $HNO_3$ and the excess acid distd off *in vacuo* The residue is added to alc. or alc.-ether mixt with cooling, to ppt the dinitrate. Examples are given in which 88 and 97% yields are claimed

Hexamethylenetetramine. S Karpen & Bros. Ger 521,476 April 21, 1927 A mixt of $(CH_2)_6N_4$ and $NH_4Cl$, such as is obtained by reacting $CH_2Cl_2$ with $NH_3$, is sepd into its components by extn with a satd soln of $NH_4Cl$ $(CH_2)_6N_4$ is ppted from the ext by means of $NH_3$, and washed with a concd soln of $NH_3$ The extn with $NH_4Cl$ soln is effected in a series of containers, the ext from one batch of mixt being passed to the container for the next batch

Hexamethylenetetramine S Karpen & Bros. Ger 521,475, Oct 29, 1925. See Brit 240,416 (*C A* 21, 414)

Oxidizing tetrahydronaphthalene J D Riedel-E de Haën A G (Ludwig Hess and Simon Felser inventors). Ger 520,201, Apr 21, 1925 α-Ketotetrahydronaphthalene and other oxidation products of tetrahydronaphthalene are prepd by treating the latter at a temp below 130° with O or gases contg O, preferably in the presence of a catalyst, *e g*, a salt or oxide of Mn or Cu. Examples are given

1-Alkoxybenzene-3-thioglycol-4-carboxylic amide I G Farbenind A G. (Norbert Steiger, Erwin Hoffa and Hans Heyna, inventors). Ger 516,904, Apr 13, 1927 Addn. to 514,505 (*C A* 25, 2156) The method of 514,505, is used for the prepn of the above, using 1-alkoxybenzene-4-cyano-3-sulfonyl chloride as the starting material This is treated with a metallic reducing agent in the presence of a strong mineral acid and an indifferent org solvent, and condensing the resulting 1-alkoxybenzene-4-carboxylic amide-3 mercaptan with $ClCH_2COOH$ In an example, 1-methoxybenzene-4-cyanobenzene-3-sulfonyl chloride is reduced by Zn dust and HCl to give the corresponding mercaptan which is then treated with $CH_2ClCOOH$ to give 1-methoxybenzene-3 thioglycol-4-carboxylic amide, m. 208° A further example is given.

Oils containing cineole. Rheinische Kampfer-Fabrik G m b H Fr 696,424 Apr 9, 1930 Ger 519,447, Apr 16, 1929 Mixts of oils contg cineole are prepd by treating terpinol hydrate, terpinol, terpineol or like compds which have the same empirical compn as cineole, or a higher water content, at temps. below 80° with dehydrating agents such as $H_2SO_4$, $H_3PO_4$, sulfonic acids, etc. The mixt. of oils can be extd by indifferent agents such as $CHCl_3$, PhMe, etc.

Camphor. I G Farbenind A.-G (Otto Schmidt, inventor) Ger 520,224, June 25 1927 Camphor is prepd by treating borneols at a raised temp. with mixts of dehydrogenating catalysts with metal oxides other than alkali or alk. earth oxides Thus, vaporized borneol and isoborneol can be passed at 350° over a contact mass prepd by heating a mixt. of $NiCO_3$ and MnO in H.

Menthol. Hans Jordan (to Schering Kahlbaum A.-G.) U S. 1,797,612, March 24 See Ger 512,719 (*C A* 25, 1260) and 514,594 (*C A* 25, 2157)

Inactive menthol Rheinische Kampfer Fabrik G m b H (Karl Schöllkopf, inventor) Ger 516,651, Oct 11, 1922 Addn to 489,819 (*C A*, 24, 2145) The racemic liquid mixt of isomeric menthol is sepd. by direct treatment with H under pressure in the presence of catalyzers. In the example, the liquid mixt is heated to 200° with H under a pressure of 5–30 atm in an autoclave, in the presence of a Ni catalyzer The catalyzer is removed by distn or filtration and the inactive menthol (of higher m. p.) is sepd by freezing and centrifuging Mixts of thymol isomers can be sepd by the same method

Acrolein Schering-Kahlbaum A G Fr 695,931, May 21, 1930 Acrolein is made from glycerol using as catalysts salts of acids having at least 3 acid functions or mixts. of these salts Examples are given of the use of phosphates of Fe and La

Polyglucosans. Karl Freudenberg and Burckhardt Helferich Ger 521,340, July 14, 1929 Mono- or di saccharides are treated with practically anhyd HF. Examples are given

Morpholines. Imperial Chemical Industries Ltd Ger 520,156, July 6, 1928. See Brit 298,336 (*C A* 23, 2723)

Styrenes and polymers. The Naugatuck Chemical Co Fr 695,575 May 14 1930 A halogenated alkylbenzene and an org base such as pyridine are heated together under a pressure not above normal Examples are given Fr 695,576 describes the prepn of compact non friable polymers of styrenes by heating the styrene at atm pressure in soln., in the presence of a substance chosen from among a group contg alkali hydroxides, alkali salts, org bases and water Cf *C A* 25, 1538.

The solubility of phosphatides. BRUNO REWALD *Allgem Öl Fettztg* 27, 363–4(1930).—After fresh egg yolk was extd. with acetone, it was found that the ext was richer in lecithin than the residue The solv of the lecithin is probably due to the complex mixt. of acetone, egg oil, lecithin and water For a true estn. of lecithin, the acetone ext. must be analyzed for P as well as the alc. ext. of the residue W F BOLLENS

Temperature and life and death. A T CAMERON *Trans Roy Soc Can* 24, Sec V, 53–93 1930.—A review A T C.

Action of proteolytic enzymes on crystalline insulin. A F CHARLES AND D A SCOTT *Trans Roy Soc Can* 24, Sect. V, 95–9(1930).—Cryst insulin cannot be broken down into a simpler physiol active substance by the proteolytic action of pepsin or trypsin. A. T CAMERON

Studies in cholam diastase. I. Electrodialysis and electroösmosis of cholam diastase D NARAYANAMURTI AND ROLAND V NORRIS. *Proc 15th Indian Sci Congr* 1928, 166.—By electrodialysis cholam malt diastase can be purified and considerably increased in activity The ash and protein contents are much reduced by this method. An attempt was made to test the two-enzyme theory of diastase by electroösmotic expts. *Preliminary expts. conducted in a 5-celled app indicate some evidence in favor* of the theory, the ratio, liquefaction power and saccharification power being different in the different fractions. E J C

Kinetics of diastatic action. D NARAYANAMURTI AND ROLAND V NORRIS. *Proc 15th Indian Sci Congr* 1928, 166.—In expts. on the hydrolysis of potato, rice and cholam starches and oyster glycogen by cholam diastase, glycogen, in agreement with other observers, is found to be the most resistant. E J. C.

The behavior of polypeptides built up of glycine and alanine toward polypeptidases and normal alkali. EMIL ABDERHALDEN AND ELLA VON FIRNENWALL *Fermentforschung* 12, 376–410(1931).—Evidence thus far obtained seems to indicate that the simple amino acids, glycine and alanine, *do not occur successively but alternately in the peptide* chains of proteins. Polypeptides built up exclusively of glycine are more or less resistant to trypsin kinase and erepsin, depending on the length of the chain. Di- and tri-peptides of alanine are amenable to erepsin but not to trypsin kinase, and longer chains have not yet been tested. The present paper deals with polypeptides in which there is an alternation of glycine and alanine The usual method of synthesis was employed, and a no of the peptides were converted into the PhNCO, β-$C_{10}H_7SO_2$ and Bz derivs The products were subjected to the hydrolytic action of erepsin, trypsin-kinase and *N* NaOH Chloroacetyl-*d*-alanine (I) ⟶ glycyl-*d*-alanine (II), $[\alpha]_D^{20}$ −42° ($NH_4Cl$ double salt, $[\alpha]_D^{20}$ −9.4°) ⟶ *d-α-bromopropionylglycyl-d-alanine*, decompg 192°, ⟶ *d-alanylglycyl-d-alanine* (III), decompg above 259°, ⟶ *chloroacetyl-d-alanylglycyl-d-alanine* (IV), sinters 191°, ⟶ *glycyl-d-alanylglycyl-d-alanine* (V), browns 231°. *dl-Alanylglycine* (VI) ⟶ *chloroacetyl-dl-alanylglycine* (VII), decompg 180–7°, ⟶ *glycyl-dl-alanylglycine* (VIII), m. 243°, ⟶ *dl-α-bromopropionylglycyl-dl-alanylglycine* (IX), decompg 183°, ⟶ *dl-alanylglycyl-dl-alanylglycine* (X), decompg 260°. II ⟶ *chloroacetylglycyl-d-alanine* (XI), m. 157°, ⟶ *glycylglycyl-d-alanine* (XII), browns 215°, ⟶ *dl-α-bromopropionylglycylglycyl-d-alanine* (XIII), m. 166–9°, ⟶ *dl-alanylglycylglycyl-d-alanine* (XIV), m. 203°. Similar syntheses through the amino acid chlorides also were undertaken, but with poorer yields. I + $PCl_5$ ⟶ *chloroacetyl-d-alanyl chloride* (XV) + II ⟶ V. $NH_4$ salt of I in $Et_2O$ + $POCl_3$ ⟶ XV + II ⟶ V. II in AcCl + $PCl_5$ ⟶ XV + II ⟶ V. *d*-Alanine ⟶ *d*-alanyl chloride + II ⟶ III ⟶ IV, $[\alpha]_D^{20}$ −119°, ⟶ V. The Bz deriv of V m. 174°, the PhNCO deriv. of: II m. 151°, III m. 148°, V m. 178° (decompn.), VI m. 203°, VIII decomposes 208°, X m. 144°, XII m. 176° (decompn.), XIV m. 162°, the β-$C_{10}H_7SO_2$ deriv of III m. 182° (decompn.), V decomps. 215°, VI m. 175°, VIII m. 213° (decompn.), X sinters 202°, XII sinters 222°, browns 245°, XIV decomposes above 257°; the di-β-$C_{10}H_7SO_2$ deriv of II decomposes 250°. Cu salts were prepd. from II, III and V and their optical rotations detd with a quartz-Hg lamp The 2 dipeptides II and VI were hydrolyzed at practically the same rate by *N* NaOH at 37°, and the tripeptides III, VIII and XII at different rates; the last was hydrolyzed the most

centrifuge it is necessary to know the partial sp. vol. A graphic method is described which is an extension of the method of Lewis and Randall for the calcn. of partial molar vol. from pycnometric data. N. A. LANGE

Studies in iodized casein. I. Preparation of iodized casein. SHIGEKI MASUI *Acta Schol. Med. Univ. Imp. Kanto* 13, 254–70(1931).—To obtain iodized casein with the max. content of I, M. treated an alk. soln. of casein with a soln. of $I_2$-KI in NaOH, $Na_2CO_3$, $KHCO_3$ and $NaHCO_3$ solns. at 0, 18, 35–40, 60–65 and 80–85°. The iodized casein was dissolved in an excess of NaOH and ppted. with $NaHSO_3$ and $H_2SO_4$. It was purified by ppts. and dried with the aid of alc. and ether. The final product was tested for protein reaction and I content. The KI and $Na_2CO_3$ method at 18–40° proved most appropriate for M.'s purpose. II. The behavior of iodized casein toward proteolytic enzymes. *Ibid.* 271–83.—The iodized casein was hydrolyzed by pepsin, trypsin and tissue proteases; afterward half of its I could be ppted. by $AgNO_3$. III. The behavior of iodized casein in the dog. *Ibid.* 284–6.—When the iodized casein was fed to dogs, (2.9–6.9)% of the I was recovered in the urine in the form of inorg. iodides. Org. compds. contg. I, if present in the urine, were so scarce that they could not be isolated. B. S. LEVINE

The lipoids with a special review of the newer developments in lipoid research. HUGO MAGNUS. *Ergeb. Physiol.* 31, 165–355(1931).—A review. C. M. M.

Potential differences across natural membranes separating unlike salt solutions. S. C. BROOKS, A. C. GIESE AND R. J. GIESE. *J. Exptl. Biol.* 8, 124–32(1931).—When the lower epidermis of the bulb scale of the onion is used as a membrane to sep. 0.1*M* and 0.01*M* solns. of KCl, NaCl or LiCl a transient p. d. occurs. The magnitude decreases in the order K > Na > Li. The p. d. of 0.1*M*–0.01*M* $CaCl_2$ is small and opposite in sign. If the epidermis seps. like concns. of K, Na and Li a low potential arises. When K salts with different anions are used in the cells, little p. d. is observed. The epidermis seems to be a mosaic of anion and cation permeable areas. C. M. M.

The arginase law and the formation of urea in the autolysis of the liver of vertebrates. A. CLEMENTI. *Boll. soc. ital. biol. sper.* 5, 1142–4 1930).—The aim was to see whether a close parallelism existed between the presence of arginase in the liver and the formation of urea during the autolysis of the liver of various classes of vertebrates. Only in the liver of those vertebrates in which arginase is absent (birds, Ophidiidae) was there a const. and defin. te lack of urea, whereas in the liver of those vertebrates in which arginase is present (mammals, Chelonidae, amphibians, fishes), urea was formed during the autolysis. These results indicate that in the absence of the "arginine-arginase" system, the formation of urea in the liver does not take place, a fact, which supports the hypothesis that the formation of urea in the autolysis of liver is basically bound to the "arginine-arginase" system and not to other factors. PETER MASUCCI

Biochemical investigations on the cerebrospinal lipoids. GISELDA LEANCALANI AND RENATA SOCAL. *Arch. fisiol.* 28, 282–8(1930). *Physiol. Abstracts* 15, 593, cf. *C. A.* 24, 4071.—The influence of species, age and alimentation on the cerebrospinal lipoids has been studied. A. D. MEYER

The optical alterability of bilirubin solutions. EMILIO BROCART. *Arch. fisiol.* 28, 452–60(1930), cf. *C. A.* 24, 3235.—The changes (fading) are due to O, light, $p_H$ and enzymes. It is never observed in pure solns. A. E. MAYER

The catalase in human blood in its relation to the season. MARIO RIGONI. *Arch. fisiol.* 28, 462–9(1930).—The catalase content in the blood has a max. in spring and in fall. The temp. is not the only influencing factor. A. E. MAYER

The presence of urease in the human gastric mucosa. MARIO RIGONI. *Arch. ital. biol.* 84, 74–8(1931), cf. *C. A.* 24, 2787.—Urease is found in the human gastric mucosa where it is supposed its function is to liberate $NH_3$ which is changed to $NH_4Cl$ in the blood and serves as the material out of which HCl is then produced by the gastric glands. S. MORGULIS

Biological oxidoreduction. H. VON EULER AND R. NILSSON. *Skand. Arch. Physiol.* 59, 201–16(1930).—The transformation of polysaccharide and hexose to hexose diphosphate ester in buffered mixts. is discussed and the role played in this process by the coferment is pointed out, as well as the effect of adding AcH to the system. The possible action of coferment in the synthesis of higher carbohydrates is considered. The carbohydrate stored by yeast living on galactose has been studied specially and it was found that it probably yields Robison's ester on hydrolysis. S. MORGULIS

Reciprocal relationship between cholesterol and some protein fractions. V. N. NEKRITOV. *Biochem. Z.* 232, 50–7(1931).—A certain portion of the cholesterol of normal horse and dog plasma is firmly bound to the globulin fraction and to a part of the fibrin. A similar combination has been found in certain fractions of hen egg pro-

tein and in a part of the horse serum fractions precipitable by tungstic acid after preliminary removal of the globulin and albumin fractions Cholesterol forms a less firm combination with the albumins, a portion of the fibrin, of the egg protein and of the same horse serum fractions S. MORGULIS

Behavior of phosphate buffer mixtures with different cations. S M NEUSCHLOSS AND R PÉREZ IBÁÑEZ *Biochem Z* 232, 106–22(1931) —It is shown that the classical formula does not correctly express the H-ion concn of phosphate mixtures, and a different formula is suggested which reproduces more closely the exptl values In mixts of $NH_4H_2PO_4$ and $(NH_4)_2HPO_4$ the $p_H$ is always less than in corresponding mixts of the K salts This difference is due, for one thing, to the diminished activity of the $HPO_4^{--}$ ions in the presence of $NH_4$ ions and secondly, to the hydrolysis which $NH_4H_2PO_4$ undergoes in relatively alk solns A buffer equation is proposed which gives satisfactory results with mixts of the $NH_4$ salts The difference between the $p_H$ of K or $NH_4$ phosphate mixts increases with rising concn of the phosphate or with the addn of NaCl to the mixts The osmotic pressure and conductivity factors of $(NH_4)_2HPO_4$ are less than those of $K_2HPO_4$ of the same concn S MORGULIS

Further studies on amylosyntheases S NISHIMURA *Biochem Z* 232, 150–61 (1931), cf *C A* 25, 2149 —The higher dextrins can be synthesized enzymically, the synthetic product being more easily hydrolyzed by malt amylase than the simple dextrins from which the higher form was synthesized The more highly the dextrins are polymerized, the closer does their hydrolysis resemble that of starch S M

The absorption spectrum of bilirubin in chloroform, alcohol and alkalies. LUDWIG HEILMEYER *Biochem Z* 232, 229–39(1931) —Bilirubin in soln in $CHCl_3$ or in EtOH shows a very definite absorption band with a max at 450 $\mu\mu$, diminishing continually from this point even into the ultra violet range of the spectrum In alkali bilirubin manifests continuous absorption in the visible range, but the absorption curve cannot actually be detd on account of the extreme instability of the alk soln This is due not to an oxidative alteration of the bilirubin but simply to the alk solvent S M

Glucoseoxidase. IV. Glucoseoxidase from Aspergillus niger. Behavior toward disaccharides (maltoseoxidase), glucuronic acid and ethyl alcohol, experiments with methylene blue and monoiodoacetic acid. D MÜLLER *Biochem Z* 232, 123–31 (1931), cf *C A* 24, 2769 —Prepns of glucoseoxidase do not act on lactose, but they do affect sucrose, the glucose formed from its hydrolysis being oxidized to glucuronic acid When the enzyme prepn is heated for 30 min at 70° the sucrase is destroyed but not the glucoseoxidase, and it no longer acts upon the sucrose The effect upon maltose is direct, the maltose actually being oxidized by the prepn, but this is due not to the glucoseoxidase but to a different enzyme, maltoseoxidase, which is more thermostable than the former and oxidizes maltose with atmospheric $O_2$ to a non reducing substance Glucoseoxidase does not act either upon glucuronic acid or EtOH, its oxidative function being apparently limited to compds with the same configuration on the C atoms 1 and 6 as in glucose $CH_2ICO_2H$ injures the activity of the glucoseoxidase much less than that of zymase Prepns of glucoseoxidase contain only malic acid dehydrase, as they promote the reduction of methylene blue only by malic acid This reductase action is inhibited by glucose, fructose, glucuronic acid, etc S M.

*Methylglyoxalylacetic acid and its dismutation by Bacillus coli.* STIG VESTIN. *Biochem Z* 232, 435–41(1931) —Evidence is brought forward to show that *B coli* accomplishes almost quantitatively the dismutation of methylglyoxalylacetic acid to *d α hydroxyglutaric acid This is an asym biosynthesis, since exclusively the* dextrorotatory acid, in a practically pure condition, appears S MORGULIS

Comment on Lustig's paper—"Studies on the concentration of pepsin and chemistry of its action." I A SMORODINTZEV AND A N ADOVA *Biochem Z* 224, 471–3 (1930) —It is shown that Lustig's results (*C A*. 24, 636) do not contradict, but on the contrary corroborate, the previous findings of S and A S MORGULIS

*The order of death of organisms larger than bacteria.* OTTO RAHN. *J. Gen Physiol* 14, 315–37(1931), cf *C A* 24, 2489, 3530 —In a previous publication, R. showed that the logarithmic order of death of bacteria can be accounted for by assuming the presence of some very unstable mols so essential for reproduction that the inactivation of a single one of these mols prevents cell reproduction and makes the cell appear dead according to the standard method of counting bacteria In the present paper the motile alga, *Chalmydomonas*, is the only one of the larger organisms dealt with which has a logarithmic order of death. Probably more than 1 mol must be destroyed to kill a yeast cell The following cells or organisms give curves (log of survivors plotted against time) which suggest that the no. of essential reacting mols is

1/6 *N* alkali The diazo reagent is about 1/6 *N* acid because of HCl On mixing equal vols of the 2 a weakly acid soln is obtained buffered by $NaH_2PO_4$ The method was tested with a standard bilirubin soln in chloroform with 1 0 to 0 1 cc of the bilirubin soln Ninety six % alc. was added to make each vol 10 cc and to this 2 5 cc of the phosphate buffered diazo reagent was added The color produced from each was read in a Duboscq colorimeter against a standard contg 0 05 mg bilirubin A graph from the results shows a strict linear proportionality between the amt of bilirubin present and the amt of color produced from it by the diazo reagent For routine work in examg serum for bilirubin to 1 cc of serum is added 0 5 cc of diazo reagent and 2 8 cc of 96% alc., giving a dilu of approx 1 in 4 It is preferable to express the concn of bilirubin in the serum as mg per 100 cc HARRIET F. HOLMES

A method for the cataphoresis of biological materials. F C SMITH AND J MARRACK *Brit J Exptl Path* 11, 492–4(1930).—An app for the cataphoresis of biol materials is described It was designed to afford (1) a continuous path of buffer soln for the current passing between the electrodes, so that no agar bridges need be employed, (2) uniformity of the bore of the tube connecting the vessels contg the electrodes, so that the potential gradient across the moving boundary can be easily measured, (3) ease of filling and forming a sharp boundary with small vols (2 or 3 cc.) of the suspensions to be tested, (4) ability to withdraw the whole sample should it be needed for other investigations, (5) a method of obtaining small samples during cataphoresis without disturbing the boundary, so that the effect of the reversal of polarity could be studied when the boundary is invisible (*e g*, virus suspensions), (6) ease of washing out with cleaning fluids HARRIET F. HOLMES

Studies on the biochemistry of sulfur. IV. Colorimetric estimation of cystine in casein by means of the β naphthoquinone reaction. M X SULLIVAN *U S Pub Health Repts Suppl* No 78, 13 pp (1929), cf *C. A.* 20, 2086, 23, 3941, 4445.—*Procedure for the hydrolyzate*.—Various amts of casein from 1 to 10 g have been hydrolyzed The 5 g samples are best, in general, since the final vol of soln prepd for colorimetric work is sufficient to give several tests and to allow comparison with the Okuda (cf *C A* 18, 2014, 3013, 3400, 20, 1094, 1252) and the Folin-Looney methods (cf *C A.* 16, 1790) The 5 g of casein and 15 to 20 cc. of 20% HCl are put into a small acetylation flask, fitted with a ground glass reflux The flask is then placed in a crisco bath, the heating started and hydrolysis run for 6 hrs , the count begins at the time the bath reaches 125° The inside temp of the hydrolyzate runs about 106°. The black mixt is poured out into a 100 cc. beaker, and, by washing with distd water, made to about a 10% acid The combined mixt. is decolorized by warming with purified (acid extd ) decolorizing C, 2 g in case norite is used, as was S 's practice, or, better, 0 3 g carboraffin, which is now his practice The mixt. is filtered on a small Buchner funnel, and the residue on the paper is extd with 15 cc of hot *N* HCl and then washed with 15 cc. of cold *N* acid The combined filtrates are neutralized with 5 *N* NaOH added dropwise with stirring until the $p_H$ is about 3 5 (that is, yellow to thymol blue) and made to 50 cc by means of 0 1 *N* HCl With small amts of material, only 1 g of casein has been used The sample is mixed with 5 cc of 20% HCl and put into the oil bath and hydrolyzed 6 hrs The mixt is poured out and, by washing with distd. water, made to 10 cc , decolorized, neutralized and brought to about 25 cc with 0 1 *N* HCl, and the colorimetric detn made as soon as possible. Later, work with 1 g samples, with and without the formation of humin, will be reported *Colorimetric estn*.—To 5 cc. of the neutralized hydrolyzate, brought to a definite vol and with the temp of the soln not under 20°, add (*A*) 2 cc of 5% aq NaCN, mix, and wait 10 min ; then add (*B*) 1 cc. of 0 5% aq sodium 1,2-naphthoquinone-4-sulfonate and mix by shaking for 10 min ; next add (*C*) 5 cc. 10% $Na_2SO_3$ in 0 5 *N* NaOH, mix, let stand 30 min , add (*D*) 2 cc. 5 *N* NaOH, mix and finally add (*E*) 1 cc. of a 2% $Na_2S_2O_4$ in 0 5 *N* NaOH Compare with 5 cc of a cystine standard, 100 to 200 p p m in 0 1 *N* HCl, similarly treated The standard and unknown should be close together in colorimetric reading On adding the $Na_2S_2O_4$ the brown red color developed in the cystine-contg soln is changed to a more vivid red, if cystine is present to the extent of 100 p p m or over Weaker solns tend toward orange Other substances in protein hydrolyzates may show color in the first stages of the reaction, but this color in the absence of cystine or cysteine is discharged to yellow by the hyposulfite When the standard was pure cystine directly dissolved in 0 1 *N* HCl, the cystine content of casein purified by heating with dil $CH_3COOH$ was found to be 0 28% (uncorrected for moisture or ash) When the standard was cystine put through the same procedure of heat treatment with decolorizing agent, neutralizing, etc., that the casein went through, the cystine content of the casein was found to approximate 0.30% (uncorrected for moisture and ash). Crude casein and casein

ifferent treatments were found to vary greatly The loss of cystine in the ordi- ocedure of hydrolyzing decolorizing, etc., is mainly in the use of decolorizing The formation of the dark colored humin, acid sol and acid insol, was checked ucting the hydrolysis in a reducing atm such as furnished by $SnCl_2$ and $TiCl_3$ ems more useful for the prevention of humin, since it can be pptd out by neu- on The findings with Ti are slightly higher than without its use; but pend- study of the effects of high salt content, traces of Ti, etc., on the color develop- hese findings are left open to future interpretation There are 39 references literature IX. Estimation of cysteine in the presence of glutathione. M IVAN AND WALTER C HESS *U S Pub Health Repts* 46, 390–3(1931), cf 5, 2470 —Meldrum and Dixon (cf *C A* 24, 5315) found that the Sullivan for cysteine (cf *C A* 20, 2686) was markedly inhibited by the presence thione in the proportion of 9 0 mg of glutathione to 1 0 mg of cysteine If ivan procedure detailed in a later paper (cf *C A* 23, 3941) had been followed author they would have found that reduced glutathione in the proportion g to 1 0 mg of cysteine has no inhibiting effect on the estn of cysteine. To each soln and standard add 1 cc. of a freshly prepd aq soln of NaCN, shake, 1 1 cc of a freshly prepd 0 5% aq soln of sodium 1,2-naphthoquinone-4 sul- shake at 1 sec ), add 5 cc. of 10–20% soln of anhyd $Na_2SO_3$ in 0 5 *N* NaOH, l and wait min at about 20° A reddish brown color appears. Then add a 2% soln of $Na_2S_2O_4$ in 0 5 *N* NaOH The brown red color in the presence ine is convert l into a purer red The reaction is given by no other compd not even thione or cysteine amine or even isocysteine. Even at the S mg of glut ne to 1 0 mg of cysteine, the colorimetric reading of the 1 0 the mixt was when matched against 1 0 mg of cysteine similarly treated at 20 Higher lutathione content calls for more naphthoquinone When to tathione cysteine mixt 36 mg to 1 and to standard cysteine soln 1 0 mg in 5 1 *N* HCl there were added 1 cc of 1% aq NaCN and 1 cc. of a 1% soln. of the oquinone followed by the regular $Na_2SO_3$ in the 0 5 *N* NaOH and then after color development by 1 cc. of the $Na_2S_2O_4$ in 0 5 *N* NaOH, no inhibition oc-

For glutathione cysteine mixt 100 to 1 the following procedure is recom- d To 5 cc. of the mixt and standard add 1 cc of 1% aq NaCN, 2 cc. of 1% aq a 1,2 naphthoquinone-4 sulfonate, followed by 5 cc. of 10% $Na_2SO_3$ in *N* NaOH fter 30 min standing, by 1 cc. of a 2% soln of $Na_2S_2O_4$ in *N* NaOH J. A. K.

A semi-micromethod for the rapid and complete analysis of human milk. MICHAEL ORSKI AND A LESPAGNOL. *Bull soc chim biol* 12, 1195–1211(1930) —Details en for the detn of total solids and Cl on 1 cc., casein and reducing value on 2 se of $K_2HgI_4$ pptn, and fat and sugars on 1 cc. after silicotungstic pptn and ith ether (Bang method) C. determined carbon and glucidic carbon in normal urine. PAUL FLEURY AND AMBERT. *Bull soc chim. biol.* 12, 1255–68(1930).—See *C. A.* 25, 1862. C. G KING

ethods of determining bile salts in bile and duodenal juice. L. CUNY. *Bull m biol* 12, 1298–1318(1930), cf *C. A* 25, 1862–3 —A crit discussion is given of ls in general use C. G. KING

e quantitative limits of the Gerhardt and Legal reactions for the estimation of compounds. ADOLF PSCUDERO *Rev facultad ciene quim* (*Univ La Plata*) 7, 7–52(1930) —Legal's reaction as applied to urine is pos when acetone or diacetic ceeds 0.25 g per 1000 cc. The reaction of Gerhardt is pos. when diacetic acid 0.2 g per 1000 B. S. LEVINE

e preparation of a secretin concentrate. A. C. IVY, G KLOSTER, G. E. DREW- D H C. LUETH. *Am J. Physiol.* 95, 35–9(1930) —An improved method which ble, rapid and relatively inexpensive is described. The NaCl ppt. (*C. A.* 24, s extd with alc. at a concn. of 70–85%, which dissolves about 50 to 75% of the . The exts. are evapd to dryness over a water bath with addn. of water oc- lly to prevent inactivation of secretin The residue is suspended in water and id for 10 to 12 hrs. Then NaOH is added to $p_H$ 5 3 to 5 7 when max floccula- curs. To the clear filtrate add enough 20% trichloroacetic acid to give 5% in the mix and let stand 4 to 12 hrs in a cold place, centrifuge and wash the ith anhyd, aldehyde-free acetone and ether. The av. effective dose of the ppt g is 0 7 mg It contains 1 dose of cholecystokinin for 7 to 10 doses of secretin ot. from the isoelec. pptn contains secretin which can be extd by 0 4% HCl, with $CCl_3CO_2H$ at 5% concn, sepd by the centrifuge and washed with acetone

and ether This prepn is free from cholecystokinin Its effective dose per dog is 0 61 mg J F. Lyman

Cardiac output in normal men. I Starr, Jr., and L. H Collins, Jr *Am J Physiol* 96, 228–42(1931) —Expts on the fundamental assumptions of the improved Ftl method for the detn of cardiac output were repeated with results that give greater confidence in the method The cardiac output under various conditions was detd J F. Lyman

The measurement of the red-cell volume. E Ponder and G Saslow *J. Physiol* 70, 18–37(1930) —This is a colorimetric method requiring about 35 cc of blood and giving results agreeing closely with those calcd from cell measurements Some values obtained by the method for man, rabbit and sheep, resp., are: 87, 58 and 30 $\mu^3$ The refractometric method of measuring red-cell vol led to erroneous results J F. L

Measurement of red-cell volume. II. Alterations in cell volume in solutions of various tonicities. E Ponder and G Saslow *J Physiol* 70, 169–81(1930) —The addn to rabbit blood and plasma of NaCl or glucose, of which $\Delta$ is approx the same as that of rabbit plasma (i. e., 1.2 g NaCl per 100 g water), does not alter the mean vol of the red cells The cell vol increases in hypotonic solns of NaCl and plasma approx as would be expected on the assumptions that the red cells are simple osmometers contg 33% $H_2O$ by vol In hypotonic media, produced by the addition of KCl or glucose, the swelling is greater than can be accounted for in this way The cell vol does not decrease in hypertonic media, produced by the addn of NaCl, KCl or glucose, but rather it steadily increases as time goes on, indicating that the added substances penetrate into the cell Crenation is not necessarily associated with a decrease in red cell vol, but is regarded as a failure of the cell to maintain its shape J F Lyman

Recording of respiration of small animals. G Enders *J. Physiol* 70, 218–20 (1930) —The app consists of a small covered box in which the animal is fastened, the animal breathes outside air through a breathing mask and an arrangement of valves Changes in the vol. of the animal, due to breathing, are traced by the corresponding movements of a recording pen J F. Lyman

The carbon dioxide of the mixed venous blood of men. W. F. Hamilton, M C Spradlin and H. G Saam, Jr *J. Physiol* 70, 244–52(1930) —There is no valid evidence in the exptl work reported in this paper that rebreathed air comes to equil with mixed venous blood; hence there is doubt as to the justification for using any of the indirect applications of the principle of Fick in detg. the circulation rate in man J F. Lyman

A method of ultra-filtration in vivo A Geiger *J Physiol* 71, 111–20(1931) — A specially constructed ultra filter is joined to an artery or vein; the blood circulates continuously through the app., and returns to the same blood vessel The filter membranes are of collodion, and under negative pressure at their outer faces The blood in passing through the app retains its natural velocity, pressure and gas tension a choice of membranes, filtrates contg. crystalloids only or a plasma which contains the whole or a part of its proteins may be obtained J F. Lyman

The measurement of the circulation rate in man by the acetylene method. A Grollman Proc. Physiol Soc., *J. Physiol* 70, xxxix(1930), cf *C. A* 24, 5050 — $C_2H_2$ is sufficiently sol in blood and can be detd very easily by alk $Hg(CN)_2$, making it possible to complete a detn of the cardiac output in less than 1 hr The cardiac output of normal young individuals is a function of the surface area, hence it is predictable with a high degree of accuracy J F Lyman

Development and present status of some problems and the goal of vital staining Josef Gicklhorn *Ergeb Physiol* 31, 388–420(1931) —A review C M M

A clinical method for the quantitative determination of pancreatic enzymes in duodenal contents. Edward Hollander *J. Lab Clin Med* 16, 460–5(1931) —The activity of the steapsin and trypsin present in the duodenal contents may be estd from a detn of the length of time required for the neutralization of 1 cc of 0 1 *N* NaOH by the fatty or amino acids formed by the action of 1 cc of duodenal contents upon olive oil or gelatin, resp The time required is *normally 5 min* The amylopsin activity may be estd from a detn of the amt of substrate required to reduce 5 cc of Benedict's quant sugar reagent after the action of 1 cc of duodenal contents upon sol starch The reduction normally requires 1 9 cc or less A decrease in the activity of the enzymes is usually assocd with disease of the gall bladder E R M

$p_H$ Values in routine urinalysis O B Pratt and H O Swartout *J Lab Clin Med* 16, 471–5(1931) —Misleading values for urinary $p_H$ may be the result of dietary changes or medication before and during collection periods, or of detg the $p_H$ of a single specimen rather than a collection over a 24 hr. period For colorimetric

detns, deeply colored urines should be dild more than those that are slightly colored
E. R. MAIN

A simplification of the Osgood-Haskins hemoglobin method. EDWIN E OSGOOD AND HOWARD D HASKINS *J Lab Clin Med* 16, 482–6(1931); cf *C A* 17, 3517.—A soln. of acid hematin may be used as a standard in place of the permanent standards prepd from inorg salts E R MAIN

A rapid method for determination of the sedimentation rate of the red cells with results in health and disease. HOWARD D HASKINS FRANK E TROTSMAN, EDWIN E OSGOOD AND ALBERT MATHIEU *J Lab Clin Med* 16, 487–94(1931)—A method is described for use with oxalated blood in which the sedimentation rate may be expressed as the max settling in a 15 min period The rate is normally 5 mm. but may become increased in pneumonia, acute inflammations and infections, acute rheumatic fever, infectious arthritis and malignancy E R MAIN

The determination of blood proteins by a direct micro Kjeldahl method. ROGER S HUBBARD *J Lab Clin Med* 16, 500–3(1931)—A micro Kjeldahl method is described which is adapted to the detn of total N and the N of the protein fractions of the blood The digested material is nesslerized directly Pptn. of the Nessler's reagent is prevented by the use of Rochelle salt. E R MAIN

A note on the Gunther-Greenberg method for determining inorganic phosphorus on the filtrate from calcium analysis. RUTH P BOLTON *J Lab Clin Med* 16, 503–4 (1931), cf. *C A* 23, 3942.—The inorg P content of the filtrates from Ca analyses may be detd by the Benedict-Theis method (*C A* 18, 3398), as well as by the Fiske-Subbarow method E R MAIN

The use of the interferometer for serum protein and protein fraction determinations. WM J DIECKMANN *J Lab Clin Med* 16, 513–9(1931)—Methods are described for the detn of serum protein, fibrin and the albumin-globulin ratio by means of the interferometer. E R MAIN

Determination of cholesterol in blood plasma and serum. J C FORBES. *J Lab Clin Med* 16, 520–1(1931)—A modification of Bloor's method is described in which the cholesterol is extd. in the presence of Doucil (a com prepn for softening water) No application of heat is required E R MAIN

Phenol test for urinary albumin. WM B CLAPP AND BENJAMIN COHEN *New Engl. J. Med* 203, 1237–8(1930)—A method is described for the detection of albumin in the urine in which a ring test is obtained with a soln of $C_6H_5OH$ The reagent is prepd by treating a satd aq soln of $C_6H_5OH$ with sufficient glycerol to adjust the sp gr. to 1 045 Albumin present in the urine may be detected in a concn of 0 004%.
E. R. MAIN

Bilirubin liver-function test. I. Modification of the method. I. R JANKELSON AND S. L. GARGILL. *New Engl. J Med* 204, 547–9(1931)—A liver-function test may be carried out by detn of the concn of bilirubin in the blood at 5-min and 3-hr. intervals following intravenous injections of bilirubin. It is rapidly excreted through the liver in normal individuals but is definitely retained in diffuse disease of the liver.
E. R. MAIN

Separation of the male sex hormone from the female hormone, menformone. E. DINGEMANSE, J FREUD, S KOBER, E LAQUEUR, A. LUCIS AND A W. P. MÜNCH. *Biochem. Z.* 231, 1–5(1931)—Menformone behaves somewhat like an acid and in a diphasic system, benzene-alk. 70% alc., it passes almost quantitatively into the latter phase In extg the male hormone from male urine it is found to proceed more rapidly in a weakly alk medium. The method of sepn. depends upon extg with benzene 2 portions of the urine, one made alk., the other acid S MORGULIS

The use of colloidal zirconic acid as a protein precipitant. JÓZEF ERDÖS AND JÁNOS SÜRÜ *Biochem Z* 231, 6–12(1931)—Powd $ZrCl_4$ is rubbed up well with 4–5 times its wt. of anhyd AcOH and dried on a sand bath The residue is digested for several hrs with warm $H_2O$ and the turbid soln is filtered. The filtrate is evapd at 60°, the residue is moistened with $H_2O$ and the evapn repeated until no more AcOH fumes are given off The dry residue is rubbed up with a little $H_2O$ and is placed in a vacuum desiccator contg KOH sticks The resulting $Zr(OH)_2$ is practically free from Cl or AcOH and can be used in 5% soln. for deproteinizing serum plasma or protein solns.
S. MORGULIS

Methodical contributions. XIII. Determination of ferric ions, ferrous ions and of organically bound iron in biological material. L PINCUSSEN AND W ROMAN *Biochem Z.* 231, 54–8(1931)—A g of fresh organ is quickly weighed and is finely rubbed up with sand in an ice-cold mortar The material is washed twice with 5 cc. 20% $H_2SO_4$ into a centrifuge tube contg a little paraffin. In case of blood, 1 cc. of fresh blood

is measured under paraffin oil and treated with 5 cc 20% $H_2SO_4$. The mixt is left for 3 hrs during which it is frequently stirred, and is sharply centrifuged. The supernatant fluid is quantitatively removed and is titrated with $TiCl_3$, KSCN being used. The ferrous ions are oxidized with $HNO_3$ and after driving off the $HNO_3$ excess the titration is repeated. The difference between the first and second titration measures the amt. of ferrous ions present. To det the organically bound Fe the residue is transferred from the centrifuge tube to a Kjeldahl flask by dissolving it carefully in $HNO_3$. The material is ashed by boiling with $HNO_3$-$H_2O_2$, the excess of reagents being driven off. The residue dissolved in dil $H_2SO_4$ is titrated with $TiCl_3$, giving the total ferric ion content and the organically bound Fe is calcd by difference. The $TiCl_3$ soln is prepd by boiling 2 cc. of com $TiCl_3$ with 4 cc. concd HCl to drive off $H_2S$ and dilg to 300 cc. The soln is kept in a container with a special automatic buret attachment (figured in the text) designed for titrating in a current of $N_2$ or $CO_2$ under complete exclusion of air. The $TiCl_3$ soln is standardized against a known $FeCl_3$ soln contg 10 mg $Fe^{+++}$ in 1 cc. To 0.1 cc. of this soln are added dil $H_2SO_4$ and a few drops of 15% KSCN and the mixt. is titrated until the color disappears. S. Morgulis

Studies on cholesterol metabolism. I. A gravimetric method for the determination of free and combined cholesterol in small amounts of blood. Rudolf Mancke *Biochem. Z.* 231, 103–9(1931).—The extn is carried out by pouring 2.5 cc. serum in a fine stream into a 50 cc. vol flask contg 30 cc of a mixt of 3 parts abs. alc. and 1 part abs. ether. Under const. stirring the flask is submerged in a boiling water bath and is removed as soon as the contents begin to boil. After cooling the vol is made up with the alc.-ether mixt. and the material is filtered. Twenty cc. of the filtrate (in 2 portions) is cautiously evapd in a test tube, the temp being gradually raised to 90° to boil off the alc. until there is only 2 cc. of soln. In case the material is turbid, it should be shaken with 10 cc. ether, filtered, washed and again evapd to 2 cc. To the still hot soln. 1 cc. of hot 1% digitonin in 90% alc is added and after 1 hr the ppt is collected in a filter tube (Jena filter G 154, No. 1). The ppt is washed with ice-cooled acetone, and the filter is dried at 100° and weighed, 1/4 of the pptd compd being cholesterol. For the total cholesterol detn 10 cc. of the original filtrate in 2 portions is boiled down to 3 cc. in a 8-cc. round bottom flask provided with a reflux condenser. To this is added 3 drops 80% KOH, and the material is saponified 6 hrs. over a water bath. The alc. soap soln is neutralized with a few drops of alc satd with gaseous HCl (phenolphthalein is used as indicator), mixed with 3 cc. abs. ether and the pptd KCl is filtered off. The ppt is washed with abs. ether, the combined filtrates being condensed to 2 cc. The pptn with digitonin and weighing are made as before. The difference between the 2 detns. gives the cholesterol esters. S. Morgulis

Method of metabolism studies in tissue cultures. I. Respiratory measurements in tissue cultures. Rolf Meiff *Biochem. Z.* 231, 247–52(1931).—The Carrel tissue culture flask is adapted for the detn of respiration by means of a specially constructed manometer inserted into the flask. II. Weight determination on single tissue cultures. Increase in weight and area. *Ibid* 253–9.—A method is discussed for measuring the wt. of a tissue culture after the removal of the plasma coagulum. These studies show that the increase in surface must be due partly to cellular migration. In rapidly growing fibroblast cultures the daily lactic acid production is 2½ times the dry wt. and in slowly growing cultures 3 times the dry wt. S. Morgulis

Determination of urobilin and urobilinogen with the Zeiss step photometer. L. Heilmeyer and W. Krebs *Biochem. Z.* 231, 393–8(1931).—The Zeiss step photometer has been employed to det urobilin and urobilinogen in urine and feces according to Terwen's procedure. This yielded greater precision, especially with small urobilin concns., and dispenses with the need for a comparison soln. which also saves much time in carrying out the detn. S. Morgulis

An apparatus for the rapid, accurate analysis of the gases in a respiration chamber. Thorne M. Carpenter, Robert C. Lee and Anna E. Finnerty. *Wiss. Arch. Landw. Abt. B Tierernähr. Tierzucht* 4, 1–20(1930).—The app described by Carpenter, Fox and Sereque (*C. A.* 23, 4718) has been provided with a bellows to circulate the pyrogallic acid soln., thus reducing the time required for the analysis. The app is described, and directions are given for its use. W. Gordon Rose

Micro chloride determination in blood. J. A. Filedt Kok. *Arch. néerland. physiol.* 16, 132–5(1931).—Dil the blood with an equal vol of $H_2O$; to 0.2 cc. add 1 cc. $H_2O$ plus 0.4 cc. of 10% sulfosalicylic acid, shake thoroughly and centrifuge. To 0.8 cc. of filtrate add 1 drop of Na nitroprusside and then titrate with 1/40 *N* $Hg(NO_3)_2$. A correction is made according to the tables of Kolthoff and Bak for the quantity of $Hg(NO_3)_2$ in excess necessary for the formation of the turbidity. M. H. Soule

Determination of calcium in blood. CH O GUILLAUMIN *J pharm chim* [8], 13, 65–76(1931) —Detn is made of *total* Ca in plasma or serum regardless of the mode of physico-chem combinations of Ca in the plasma Precautions in taking samples are discussed, and the technic of detg Ca in plasma is given in detail S W.

Dichlorofluorescein as an adsorption indicator for the estimation of chlorides in the blood. A F OSTERBERG *Proc Staff Meetings Mayo Clinic* 5, 300(1930) —Plasma or serum, 2 cc , is added, with shaking, to 7 cc acetone contained in a centrifuge tube graduated a t10 cc The vol is made accurately to 10 cc , the tube is then stoppered, shaken well and the blood proteins are thrown down in the centrifuge Five cc. of the acetone soln corresponding to 1 cc of plasma is pipetted into a small Erlenmeyer flask, and to this is added 0 25 cc of the indicator soln prepd as described by Kolthoff, Lauer and Sunde The soln is then titrated with $N/3540$ soln of $AgNO_3$ until the end point is reached This manifests itself by the pptn of brick-red silver dichlorofluorescein on the silver halide ppt One cc $AgNO_3$ soln is equiv to 1 mg Cl This method checks closely with the Wilson and Ball procedure, the maximal difference being 1 6%

## C—BACTERIOLOGY

CHARLES B MORREY

Variability of the diphtheria bacillus. M A KUSHNARYEV *Z Immunitäts* 68, 210–7(1930) —The addn of minute quantities of $MnSO_4$, $ZnSO_4$, LiCl and $NaNH_4HPO_4$ to the medium enhances the growth of diphtheria bacilli and causes a dissocn of the original strain into toxigenic and atoxigenic forms, as well as the production of coccus-like forms H EAGLE

Microflora of processed cheese. J CSISZÁR *Kísérlet Közlemények* 33, 391–401 (1930) —Processed cheese contains chiefly lactic acid bacteria (streptococci and lactobacilli) and very often anaerobic butyric acid-producing organisms, accompanied by aerobic spore-forming bacilli (*B. mesentericus* and *subtilis*), indifferent, heat resistant cocci and bacilli, molds and yeasts and sometimes *Act odorifera* The variety of the flora and the no of bacteria depend on the raw cheese, on the time and temp of melting and finally on the age of the processed cheese The germ content averaged 19,500,000; the highest no was 310,400,000 per g of cheese Two samples were found to be sterile. Heating to 65–80° for 5–25 min decreased the no of germs by 99 9–100%; processed cheese is thus quasi pasteurized The germ content of ready-made cheeses increased from 5–27,000 to 1,800,000–258,900,000 organisms in 40 days S S DE FINÁLY

Bactericidal action of "Rohchloramin" and "Streuchloramin." N KERBLER *Mezögazdasgái Kutatások* 2, 319–24(1929) —The action is about the same as that of $HgCl_2$ A 0 1% soln of "Rohchloramin" proved to be effective "Streuchloramin" killed in less than 5 min : *B. abortus* inf. Bang, *B. gallinarum*, *B. coli*, *B cholerae gallinarum*, *B erysipelatis suis* and *B suipestifer;* within 20 min. it killed *Staphylococcus pyog. aureus* Spores of *B anthracis* were killed in 60 min S. S. DE FINÁLY

Observations on the value of a copper sulfate tellurite medium for the isolation of diphtheria bacilli. V D ALLISON *Brit J. Exptl Path* 11, 244–8(1930) —Tables are given to compare the results obtained in the isolation of *Corynebacterium diphtheriae* and diphtheroid bacilli from nasal, throat and ear swabs, with Douglas's medium and the copper sulfate tellurite serum agar medium of V. D Allison and Ayling (*C. A.* 23, 3949). The results show a well-marked difference in the percentage of organisms isolated on the 2 media, the differences in all cases being in favor of the $CuSO_4$ medium This medium consists of 2% nutrient agar to which is added 10% of trypsinized horse serum, 0 02% of K tellurite and 0 05% of $CuSO_4$ The trypsinized serum enhances the growth of the diphtheria bacilli, while the K tellurite darkens the colonies and gives them a characteristic appearance The growth of staphylococci, streptococci, pneumococci and *Micrococcus catarrhalis* is completely prevented by the presence in the medium of the small quantity of $CuSO_4$, which also inhibits completely the spread of *B. proteus* The nutrient agar should not be more acid than $p_H$ 8 0 previous to the addn of trypsinized tellurite serum and $CuSO_4$, as it is impossible to measure the $p_H$ with indicators after the $CuSO_4$ has been added HARRIET F. HOLMES

Virulence of hemolytic streptococci. II. The influence of oxygen on the maintenance of virulence in broth cultures. E W TODD *Brit J. Exptl Path* 11, 469–79

(1930), cf C A 25, 1273.—Virulent hemolytic streptococci maintain their virulence after subcultivation in aerated broth and they change to the mat attenuated form after subculture in anaerobic broth The effect of aeration is increased if peroxide accumulation is prevented by catalase Mat attenuated cultures are not reverted to the virulent form by subcultivation in aerated catalase broth III The influence of oxygen on the restoration of virulence to mat attenuated cultures *Ibid* 480–8.—The increase of virulence which occurs when mat attenuated cultures of hemolytic streptococci are subcultured in 50% normal horse serum is dependent on the O tension of the serum The optimum condition for increasing virulence is the highest O tension which can be obtained without peroxide formation The effect of normal serum on virulence appears to depend on its O-carrying capacity HARRIET F HOLMES

Investigations of the biologic, serologic and colloid-chemical behavior of the paratyphus bacillus under changed living conditions. W D SUTLIFF *Arch Hyg* 104, 239–54(1930).—Continued cultivation of the paratyphus bacillus upon agar contg 0.15% phenol or 3–5% NaCl appears to produce changes in colony form and reductions in acid flocculability, cataphoresis, tendency to be pptd by $HgCl_2$ and capillarity. E R MAIN

Bacteriology of nauseous and bitter tasting milk (CSISZÁR) 12. Syntheses of antiseptic derivatives of indan 1,3 dione WALKER *et al.*) 10. The correlation of the oxidation of certain phenols and of dimethyl *p* phenylenediamine by bacterial suspensions (HAPPOLD) 10.

THOMAS G PHILLIPS

The pigment of Vellela spirans and Fiona marina BENJAMIN KROTT *Biol Bull* 60, 120–2(1931).—The pigment consists, apparently, of a complex protein combination There are as yet, no data as to its true structure FREDERICK G GERMUTH

Recent advances in science plant physiology J C. WALTER STILES *Science Progress* 25, 500–4 1931) A review of recent work on photosynthesis J S H.

The composition of some green forage and fertilizing plants. F HASELHOFF, F HAUN AND W ELBERT *Landw Vers Sta* 110, 268–83(1930).—Analyses of several varieties of clover show that the amt of N in the part of the plant above ground is much higher than that in the roots JOHN R HILL

The ether extract of white leaves of cabbage. III. The unsaponifiable matters. JUNICHI OZAKI *J Agr Chem Soc Japan* 6, 773–82(1930), cf *C A* 25, 984.—The oil of white leaves of cabbage was sapond. and extd with ether The ether ext was washed with water The waxy substance appeared between the ether and water layers It was crystd from acetone, m. 81.5–2°, sol in $CHCl_3$ It shows no sterol reactions Analysis of the cryst substance and of its oxime were made It is presumed to be palmitone From the mother liquid of palmitone an amorphous ppt was obtained It m. 68° and is sol in alc. and acetone It coincides with *n* hentriacontane O presumes the following changes Palmitic acid —(condensation)→ palmitone —(reduction)→ hentriacontane From the ether ext of the unsaponifiable matters a kind of phytosterol was isolated Carotene and xanthophyll appear to be present Y KIHARA

The saponin of soy bean II YISUKE SUMIKI *J Agr Chem Soc Japan* 6, 783–90, *Bull Agr Chem Soc Japan* 6, 49–51(1930) cf *C A* 24, 3813.—The Na salt of the saponin (decompg at 259–60°) was prepd as hexagonal plates by neutralization with NaOH from a 70% alc. soln of free saponin The hemolytic power of soy-bean saponin was observed in a concn of 1/2000 and that of the Na salt in a concn of 1/50,000 Merck's saponin (from the root of *Saponaria*) shows hemolytic power in a concn of 1/50 000 The toxic power of soy bean saponin (free and the Na salt) is very weak for pigeons while Merck s saponin is very toxic Y KIHARA

The chlorophyll content of the leaves of rice plant. KENKICHI SATO *J Sci Agr Soc (Japan)* No 326, 24–36(1931).—Willstatter s colorimetric method for the detn of chlorophyll was used The chlorophyll content does not vary greatly with the species It increased rapidly in the earlier stage of the growth, reached a max in July and then decreased gradually The greater the growth rate of the plant the greater the pigment content The amt of fertilizers seems to be approx proportional to the chlorophyll content Deficiency of N significantly inhibits the formation of chlorophyll, while that of K or P inhibits it less or negligibly Y KIHARA

The relation of the various physiological changes of plants and their vegetation periods to pigment formation II. Assimilation rate and anthocyanin synthesis in

Abutilon avicennae. HIROSI KOSAKA. *J Dept Agr Kyushu Imp Univ* 3, No. 2, 29–45(1931), cf *C A* 24, 2159–60.—Anthocyanin synthesis in stems and leaves of *Abutilon avicennae* is parallel to the content of assimilation products and in inverse relation to the rate of growth H. R. KRAYBILL

Culture and nutritional physiology of the genus Pilobolus. EGON BEHSA *Sitzb Akad Wiss Wien*, Abt. I, 139, 355–71(1930).—*Pilobolus kleinii* and *Sphaerosporus* can be cultivated easily upon horse-manure-decoction agar. Despite favorable culture conditions and frequent transplantations some of the mold cultures die, the reasons for this are not known. Content of the horse-manure-decoction-agar favors the mold growth. Metabolic expts. upon pure cultures proved that the materials used as sources for N are divisible into (*a*) favorable peptone, albumin, leucine, asparagine, (*b*) barely sufficient casein, glycocoll, alanine, glutamine, (*c*) insufficient urea, glucosamine, $NH_4$ salts. Materials used as sources of C are divisible into (*a*) those favoring development of growth to the point of sporangia formation xylan, gum arabic, arabinose, galactose, (*b*) those impeding or arresting the micellar development. starches, inulin, fructose, glucose, saccharose, lactose, mannitol. Boiled wheat straw, with or without peptone, or its exts. forms a favorable medium, pectins, from the cortex of apples, are not favorable. Nuclein and Liebig's beef ext. favor the mold development. This would indicate that nucleic acid contains pentosan and that split products of nuclein occur in the beef ext. The pos. phloroglucinol-HCl reaction appears to substantiate such an assumption. *P sphaerosporus* differs from *P kleinii* Tiegh only in its manner of germination, but not in its process of metabolism. It is possible that *P heterosporus* Palla, found only on cow manure, behaves differently as regards its nutritional physiology. B. S. LEVINE

A preliminary report upon the results of field experiments with substituted products for sugar beets. J. PAILER. *Listy Cukrovar* 49, 390(1931).—A criticism is given of the study in which 40 expts. with sugar beets are compared with 30 expts. with edible carrots. *P* considers the statistical analysis used as inadequate. FRANK MARESH

The evaluation of the roots of fodder beets for eugenic purposes. K. KOČNAR, J. HAMPL AND VL. ŠMERDA. *Sborník Čsl Akad Zemědělské* 6, 95(1930), *Listy Cukrovar* 49, No. 26, Rozhledy 22.—Chem. analysis was found of little value in studying eugenic expts. with fodder beets, polarization did not give the true sucrose content, for inversion occurs readily, and the content of invertase is increased, the refractometric detn. can be used only for roots of the same dimensions and variety in order to have comparable results. The beets are mashed, weighed and digested with hot water; the *n* is then read and the sucrose content computed. The margin of error is ±1%, but the results are more accurate than with a polarimeter. The distribution of sol. nutritional elements varies in the same species and is altered by the shape of the root, removal of greens, depth of root in the ground and accessory rows. The instructions for cutting cylinders for sugar detns. from sugar beets do not hold for fodder beets, and a trial detn. of the distribution of sugar must be made on each variety before making dependable analyses for the whole plot. The superficial strata were richer in sugar than the inner ones. FRANK MARESH

Formation of the anthocyanic pigment in the etiolated plants of buckwheat and wheat. ST. JONESCO. *Compt. rend.* 192, 438–40(1931).—Using the same method of extn. of pigment (*C. A.* 17, 792; 22, 102) J. studied exts. of buckwheat and wheat to det. whether they contain a substance, similar to that obtained from *Ampelopsis heterophylla*, which can be transformed into an anthocyanin. From buckwheat, a chromogen is obtained as a yellow powder which, when hydrolyzed, forms galactose, when the chromogen is oxidized or dissolved in alc. and heated with HCl, a cerise-red cryst. pigment is obtained which shows the reactions characteristic of a natural anthocyanidine. From wheat, the chromogen is a yellow powder, sol. in water, not sol. in alc., has a sweet odor, reduces Fehlings soln. and hydrolyzes to form arabinose. Oxidation of the chromogen with $Ba_2O_2$ or $MnO_2$ in $H_2SO_4$ soln. forms a violet red pigment characteristic of the natural pigment of wheat plants. N. M. NAYLOR

The presence of allantoinase in a number of fungi. A. BRUNEL. *Compt. rend.* 192, 442–4(1931).—In 67 different fungi, a study was made of the enzyme which changes allantoin to allantoic acid. The allantoic acid is recognized by its products of hydrolysis, glyoxylic acid and urea; or by the formation of the Ag allantoate. The enzyme action is tested as follows. The macerated vegetable tissue is extd. with glycerol and water. The ext. is added to a medium contg. allantoin, basic $NH_4$ carbonate and a few drops of chloroform. After 12 hrs. of digestion, the mixt. is made acid and heated to 100°. The product is tested for glyoxylic acid by noting a red coloration in the

presence of phenylhydrazine and $K_4FeCN_6$, it is tested for urea by the addn. of methyle xanthydrol which forms a ppt. of xanthylurea. N. M. Naylor

The accumulation of electrolytes. II. Suggestions as to the nature of accumulation in Valonia. W. J. V. Osterhout. *J. Gen. Physiol.* 14, 583-90 (1931). —In a living cell like that of the marine *V. macrophysa* K probably enters chiefly as KOH, the thermodynamic potential of which is greater outside than within. The energy necessary to produce the accumulation of K inside the cell is furnished by metabolism, whereby a weak org. acid, HA, is produced in the cell. HA is exchanged for HCl of the external soln. (or A for Cl) and this results in a continual maintenance of HCl at $p_H$ 5.5, whereas the $p_H$ of the sea water is about 8. KOH diffuses in to neutralize the acid within the cell, and hence KCl accumulates in the cell sap. Na enters more slowly and does not reach an internal concn. as high as that of K. Cell penetration is chiefly in ionic form. The system is not in equil. but depends upon the continual expenditure of energy to produce acid within the cell. III. Behavior of sodium, potassium and ammonium in Valonia. A. G. Jacques and W. J. V. Osterhout. *Ibid* 591-14. —When 0.001 *M* $NH_4Cl$ is added to sea water containing cells of *V. macrophysa*, undissocd. $NH_3$ or $NH_4OH$ penetrates rapidly, increasing the internal $p_H$ value so that the thermodynamic potential of KOH becomes greater inside than outside the cell. K therefore leaves the cell, but NaOH continues to pass in because its outside thermodynamic potential is greater than the inside potential. $NH_4Cl$ accumulates in the cell, reaching a much higher concn. inside than in the outside soln. After entering, $NH_3$ probably combines with a weak org. acid produced in the cell. The anion of this acid is exchanged for Cl of the sea water (or the org. acid is exchanged for HCl). Methods are described. C. H. Richardson

Aluminum content of plants, chiefly food plants. Gabriel Bertrand and Georgette Levy. *Compt. rend.* 192, 825-9 (1931). —The plant is ashed and Al detd. gravimetrically as Al phosphate, the details of analyses not being given. The Al content passes through a max. during the first period of the growth of the plants. Of the values given, expressed as mg. Al per kg. dry weight, are young carrot 30, old carrot 22, potatoes 76, onion 56, apple 13, tomato 25, apricot 10, peach 14, maize 5, white rice 14, coffee 46, Elaeis 74, tea 85, Ceylon tea 465, rhubarb 166. Green leaves are rich in Al. Al may play some part in plant synthesis. D. S. Searle

A study of twenty-three octyl alcohols on growth of *Lupinus* seedlings. David I. Macht. *Am. J. Botany* 17, 572-8 (1930), cf. *C. A.* 24, 5884. —Twenty three isomeric octyl alcs. were found to have different degrees of toxicity for *Lupinus albus* seedlings. A definite difference in toxicity was found between the primary, secondary and tertiary octyl alcohols, the primary being the most toxic and the tertiary being the least toxic. Differences in toxicity between the individual members of each group were also noted. Combinations of the various octyl alcs. exhibited synergistic effects. The results of the investigation emphasize the importance of employing pure chemicals in pharmacol. research. J. J. Skinner

The use of carbon dioxide for prolonging the life of cut flowers, with special reference to roses. Norwood C. Thornton. *Am. J. Botany* 17, 614-9 (1930). cf. *C. A.* 25, 504.—$CO_2$ treatment was effective in prolonging the life of cut roses when they were stored for 3 to 7 days at 38° and at 50° in a concn. of $CO_2$ between 5 and 20%, when they were subjected to an alternated $CO_2$-air treatment for 3, 8 or 14 days. $CO_2$ retarded the opening of rose buds. This effect was more pronounced as the concn. of $CO_2$ was increased. $CO_2$ treatment appeared to be more effective for flowers in the bud stage than for those which were already open. J. J. Skinner

The taxonomic and climatic distribution of oil and starch in seeds in relation to the physical and chemical properties of both substances. James B. Mcllvaine. *Am. J. Botany* 17, 662(1930), cf. *C. A.* 24, 4077. —Oil is more abundant than starch in seeds and in the seed embryos and albumens. In the seeds of temperate plant families starch is present less frequently than in the seeds of tropical plant families. The large proportion of oil in the seeds of tropical and temperate plants may indicate its function as a protection against rapid temperature changes in accordance with its heat cond. which is lower than that of starch. The larger proportion of oil to starch in the seeds of temperate plants is in agreement with the greater fuel value of oil. J. J. S.

Sucrose and starch in potatoes treated with chemicals that break the rest period. F. E. Denny. *Am. J. Botany* 17, 806-37(1930). cf. *C. A.* 24, 399. —Freshly harvested potatoes were treated with $CH_2ClCH_2OH$, NaSCN and thiourea, the concns. of the chemicals being decreased from the optimum by steps to form a graded series. Press-juices from the treated potatoes obtained from the various lots at a subsequent interval, usually 4-7 days before sprouting became visible, were compared with juices from the

checks with reference to sugar content Sucrose was found to be higher in the treated than in the check lots and to give a graded series of values corresponding to the series of concns of chemicals used in treating the potatoes The reducing-sugar values did not form such a series, and no consistent effect of the treatments in either increasing or decreasing the reducing-sugar content was found When samples were taken at intervals of 24, 48 and 72 hrs after treatment it was found that the time after treatment at which the sucrose content of the treated lots became higher than that of the checks differed in different expts from 24 to 72 hrs Samples of entire tissue which had been dried, powdered and analyzed for starch showed that concns of chemicals favorable for breaking the dormancy of the sprouts caused decreases in the starch
J J Skinner

Light and permeability of protoplasm. V V Leepshkin *Am J Botany* 17, 953–70(1930) —The influence of light upon the permeability of protoplasm for aniline dyes was investigated The permeability was measured according to the amt of dye accumulated in the cell sap of *Elodea* leaves, detd by a colorimetric method especially worked out for *Elodea* The difference in absorption of dyes by plant cells in light and in the dark is caused by the change of permeability of protoplasm The absorptive power of the cell sap and the adsorption of dye on the cell walls or in dead protoplasm *are not changed by light dead cells absorb dyes with the same speed in light as in the* dark The max amt of dye absorbed by the cell does not depend upon the illumination The solns of dyes fade in light, and must be changed during the expt or flow through the vessels contg the object If this condition is fulfilled, the permeability of protoplasm is found to be greater in light to all dyes which penetrate protoplasm and do not absorb violet rays The increase of permeability is observed only in the leaves or their parts which are illuminated The increase of permeability does not spread from the cells affected by light even to neighboring cells J J Skinner

The swelling of citrus fruits. Howard S Reed *Am J Botany* 17, 971 82 (1930) —*The structure of citrus fruits presents certain unique problems pertaining* to water absorption and conductance since the fibrovascular system is mainly restricted to the mesocarp Orange and lemon fruits absorbed water and various solns with resulting increase in vol Both acid and base were absorbed, but with lemons the latter produced somewhat greater swelling than the acid Oranges in $CuSO_4$ solns swelled promptly and showed no reversibility Solns of compds which coagulate pectins caused incipient swelling, but it was followed by shrinkage The translocation of liquids appears to depend upon their passage through the layers of hydrophilic colloids on the walls of the mesocarp cells and only to a small degree upon the participation of living cells J J Skinner

A microchemical study of soy beans during germination. Floyd W von Ohlen *Am. J. Botany* 18, 30–49(1931) —The cotyledons of mature Manchu soy-bean seeds contain a large amt of protein oil, some nonreducing sugar and a small quantity of starch Transformation and translocation of these reserve foods were followed microchemically *during the germination and growth of soy-bean seedlings in darkness During* germination the first changes found were the appearance of reducing sugar, an increase of starch in the hypocotyl, appearance of starch in the root cap and an increase of starch in the cotyledons During the first 3 days of germination there was a large accumulation of starch in the apex of the hypocotyl, and of reducing sugar in the base of the hypocotyl and root The amt of starch in the cotyledons increased until the 5th day and then remained nearly const until the 9th day, after which there was a rapid decrease It disappeared from the palisade last The starch disappeared from the different parts of the seedling in the following order: root, hypocotyl, epicotyl and cotyledons Reducing sugar disappeared from the seedling in the same order, but 2 days later, except in the cotyledons where only a slight test for it was obtained Nonreducing sugar was not detected in the hypocotyl, plumule and cotyledons after the 3rd, 4th and 7th days, respectively Asparagine appeared in the hypocotyl on the 3rd day. It gradually increased during the development of the seedling, until on the 29th day *it was abundant in the hypocotyl, and fair amts occurred in the* base of the root and epicotyl Asparagine was not detected in the plumule or cotyledons or at the root tip The depletion of the oil of the cotyledons began at the base and progressed toward the opposite end There was a gradual change of the organically bound P and Mg of the cotyledons to the inorganically bound Although both inorganically bound P and Mg moved quite rapidly toward the growing points, they gradually increased in amt in the cotyledons K moved out of the cotyledons more rapidly than did P and Mg J J. Skinner

Studies on the sensitivity of Mimosa pudica. II. The effect of animal anesthetics

and certain other compounds upon sensitive sensitivity. RAYMOND H. WALLACE. *Am. J. Botany* 18, 215–35(1931).—In expts. with *Mimosa pudica* concns. of ether vapor from 13 to 25% prevented the movement of leaflets and petioles in 10–45 min. after exposure. The leaflets regained their sensitivity within a few min. after removal from the ether vapor, but a period of 2 or more hrs. was required for the primary petioles to become normal. $CHCl_3$ vapor in concns. of 2.5% or greater was lethal and lower concns. caused injury after long exposures. A concn. of 3% $CHCl_3$ vapor reduced the angle of movement of the primary petiole less than 40%. Chloroform vapor of a wide range of concns. induced a strong characteristic response in the leaflets and petioles of *Mimosa*. $CCl_4$ induced a reaction very similar to that of chloroform. The physiologically significant range of concns. was similar to that of chloroform. *Mimosa* plants retained their sensitivity 1–4 hrs. in very high concns. of $N_2O$ and ethylene. Concns. of approx. 100% acetylene made the plants insensitive, while 90% made them only partially insensitive, and 95% seemed to have little or no effect. Repeated anesthetization with ether, or repeated exposures to $N_2O$, ethylene and acetylene had no harmful effects on the plants. A 10% concn. of $CO_2$ made the plants completely insensitive in 10 min. Longer exposures caused serious injury or death. MeOH and EtOH seem to have only a slight effect upon sensitivity; the former decreases it slightly and the latter increases it slightly. The different compds. tested affected the position of the petiole in various ways. Some caused an elevation, some a depression and some seemed to be without effect.

J. J. SKINNER

The natural coloring matter of raw silk fiber of the domestic cocoon. II. Xanthophyll of mulberry leaves as a source of yellow cocoon xanthophyll. MASAMI ONO. *J. Agr. Chem. Soc. Japan* 6, 1103–8(1930); *Bull. Agr. Chem. Soc. Japan* 6, 104–5(1930). cf. *C. A.* 24, 3554.—Fresh mulberry leaves were finely chopped and soaked in 5 l. of 90% EtOH and digested with 90% EtOH under 15 lbs. pressure for ½ hr. The treatment was repeated. All the alc. ext. of the chloroplast pigments was concd. and ether was added. After concn. and sapon. with KOH methanol soln., the ether soln. was washed with water to remove K chlorophyllines. The ether soln. was dehydrated by anhyd. $Na_2SO_4$ and evapd. to dryness. 600 cc. of petroleum ether (b. 40–60°) was added. Xanthophyll was pptd. It was recryst. from boiling MeOH. The yield was 0.165 g. from 1 kg. of leaves. It was identified with xanthophyll (m. 175°) from the domestic yellow cocoon. The origin of xanthophyll of the domestic yellow cocoon may be that of the mulberry leaves.

PHILIP B. HAWK

Carotene from lettuce and its relation to vitamin A. H. S. OLCOTT AND H. A. MATTILL. *Proc. Soc. Exptl. Biol. Med.* 28, 240–1(1930).—Carotene was obtained from a MeOH soln. of the unsaponifiable fraction of the lipoids of lettuce. After recrystn. from petroleum ether the m. p. was 179.5–180°. The yield from approx. 150 kg. of lettuce was 200 mg. On long standing at room temp. or on heating for 24 hrs. at 105° the hexagonal crystals assumed an isometric form, they bleached without change in wt. and lost their physiol. activity. Carotene is best preserved in Et laurate contg. 0.1% hydroquinone. Vitamin-A-deficient rats were cured of xerophthalmia and their growth increment was restored by daily doses of 0.005 mg. of carotene. C. V. B.

Hematopoietic function in avitaminosis. IV. Further studies of vitamin A deficiency. BARNETT SURE, M. C. KIK AND DOROTHY J. WALKER. *Proc. Soc. Exptl. Biol. Med.* 28, 405–6 (1931). cf. *C. A.* 23, 4724.—The red-cell count, the hemoglobin concn. and the differential leucocyte count of the rat remained unchanged during the development of, and the recovery from, the severe ophthalmia and loss of body wt. associated with vitamin A deficiency. V. Vitamin D deficiency. BARNETT SURE AND M. C. KIK. *Ibid.* 406–8.—The hematopoietic function was unaffected by vitamin D deficiency induced in the rat by feeding the Steenbock Black ration No. 2965.

C. V. BAILEY

Mineral metabolism in infancy. III. The substitution of cow milk for human milk in infant feeding. S. V. TELFER. *Glasgow Med. J.* 113, 283–84(1930). cf. *C. A.* 24, 4809.—The changes in retention value and mode of excretion of the mineral elements

when whole cow milk is substituted for human milk have been studied by metabolic expts The proportion of the total mineral intake retained is reduced although the actual quantity of bone-forming elements is substantially increased while that of Fe is diminished On cow milk the intake of Ca, Mg and P is 4 times greater than on human and the increased retention is due to the larger quantities available for adsorption and fixation by the growing tissues The fat intake is less effectively utilized than in natural feeding because of increased soap formation in the intestines The concn of fat and mineral constituents is increased, the rise in the percentage of fat being due to combined fatty acids The fecal wt and the output of phosphoric acid by the urine are greater than on human milk These changes depend mainly on the differences in mineral compn of the 2 milks RACHEL BROWN

The local calcification of tissue after subcutaneous administration of irradiated ergosterol. TH v BRAND AND F HOLTZ *Z physiol Chem* 195, 241–7(1931) —Daily subcutaneous injections of soy-bean oil and of non-irradiated ergosterol over a period of several weeks caused abscesses at the site of injection but no local calcification in the rats Irradiated ergosterol, on the other hand, produced local calcification in the subcutaneous tissue Calcification in the kidneys was much less with subcutaneous than with oral administration of the same dosage The same effect was obtained with prepns in which vitamin D had been destroyed by heating It is due to the specific action of a calcinosis factor previously discussed (cf Holtz and Schreiber, *C A* 24, 5799) A W DOX

Experimental production of xerophthalmia and keratomalacia by the feeding of bread. I ABELIN *Arch exptl Path Pharmakol* 155, 46–50(1930) H EAGLE

The isolation and the chemical and phys cal nature of vitamin A. HANS SEEL AND F DANNMEYER *Strahlentherapie* 39, 449–51(1931) —The authors isolated vitamin A from the whale-liver oil, which has 10 times more vitamin A than cod liver oil and compared its physical and chemical properties with those of a substance obtained by careful oxidation of cholesterol On careful oxidation of cholesterol, a different product is obtained from the well-known crystallized oxidation products of cholesterol, which showed a distinct vitamin A action The identity of the natural and the synthetic vitamin A was demonstrated by the authors in the following way (1) Both are amorphous masses of honey-like consistency (2) Both will give the usual cholesterol reaction (3) Both will give the Rosenheim and Drummond reaction of vitamin A with $SbCl_3$ in a very intense degree (4) They show almost identical absorption of ultraviolet light. (5) The natural vitamin A shows an antixerophthalmic and a growth-promoting effect in a dose of 0 0001 mg The synthetic product shows similar effect, but only up to a dose of 0 1 mg This would indicate that on oxidation of cholesterol only a part of the cholesterol has been transformed into vitamin A. There is no doubt that vitamin A also possesses a sterol character F. R GREENBAUM

Alcohol solubility of the antidermatitis, more heat-stable vitamin $B_2$ constituent of the vitamin B complex. HARRIETTE CHICK AND ALICE MARY COPPING *Biochem J* 24, 1744–7(1930) —The addn of 56% alc. to a soln of vitamin $B_2$ at $p_H$ 1 5 (prepd from brewer's yeast) gave an inactive ppt, and the filtrate was $^1/_3$ as active as the original material With 70% alc., a filtrate was obtained that was completely inactive At $p_H$ 3 2 the filtrate was inactive when 56% alc was used BENJAMIN HARROW

Egg white as a source of the antidermatitis vitamin $B_2$. HARRIETTE CHICK, ALICE MARY COPPING AND MARGARET HONORA ROSCOE *Biochem J* 24, 1748–53 (1930) —Egg white (from hen eggs) contains no vitamin $B_1$ but is rich in vitamin $B_2$ By removing the coagulable proteins, a rich ext of vitamin $B_2$ may be obtained. BENJAMIN HARROW

*Distribution of the vitamin B complex. I. Leafy vegetables* MARGARET HONORA ROSCOE *Biochem J* 24, 1754–63(1930) —Watercress, lettuce, spinach and cabbage (dry weights) have a content of $B_1$ and $B_2$ about $^1/_4$ that of dried brewer's yeast Their content of $B_1$ is lower than that of wheat germ or ox-liver and higher than that of egg yolk or ox muscle Their $B_2$ content is lower than that of ox liver, equal to that of milk, ox muscle or egg yolk and higher than that of the pulses or cereals $B_1$ is more concd in dark-green leaves than in the paler ones On the whole, the vegetables tested were richer in $B_1$ than in $B_2$ BENJAMIN HARROW

Composite nature of the water-soluble vitamin B. *III.* Dietary factors in addition to the antineuritic vitamin $B_1$ and the antidermatitis vitamin $B_2$. HARRIETTE CHICK AND ALICE MARY COPPING *Biochem J.* 24, 1764–79(1930), cf *C A.* 24, 5801 —Yeast and watery yeast extracts contain, in addition to vitamins $B_1$ and $B_2$ another dietary factor ("factor Y") which withstands prolonged heating in alkaline solution B H.

Biological values of proteins. I. *A method for measuring the nitrogenous ex-*

change of rats for the purpose of determining the biological value of proteins. HARRIETTE CHICK AND MARGARET HOYORA ROSCOE *Biochem J* 24, 1780–2(1930).—The av. daily nitrogenous balance sheet is detd on a diet contg a definite amt. of the protein to be examd. Two adult male rats (about 250 g) were placed in each cage, and detns made of the total N ingested and of that excreted in the urine and feces, during a period of 4–5 days. To det. the biol. value of the protein, one dets. the min. quantity of nitrogen ($M$) which must be absorbed to compensate the daily nitrogenous expenditure ($E$) on a N free diet. The biol. value is $100 \times E/N$. II. *Biological value of purified caseinogen and the influence of vitamin $B_2$ upon biological values, determined by the balance sheet method.* MARGARET AVERY, BOAS FIRSEN *Ibid* 1794–1804.—If purified casein was used and the B vitamins were added to the diet in the form of concentrates, the biol. value of casein was found to be 45—much lower than that found by previous workers. BENJAMIN HARROW

*Heart block in pigeons—curative factor.* CYRIL WM. CARTER. *Biochem J* 24, 1811–9(1930).—Whole wheat and yeast contain a factor essential for the nutrition of the pigeon the absence of which from polished rice leads to heart block. B. H.

A quantitative comparison of the curative activity of torulin (vitamin $B_1$) upon the adult pigeon and the adult white rat. HENRY W. KINNERSLEY, RUDOLF A. PETERS AND VERA READER *Biochem J* 24, 1829–3(1930).—The $B_1$ factor for pigeons and rats is identical. The dose of $B_1$ required by each animal is about the same. B. H.

*Curative activity of the antineuritic vitamin of rice.* BARD C. P. JANSEN, HENRY W. KINNERSLEY, RUDOLF A. PETERS AND VERA READER *Biochem J*, 24, 1824–6(1930).—Using the Jansen and Donath rice vitamin crystals (*Proc. Akad. Wetensch. Amsterdam* 29, 1390(1926); cf. *C. A.* 21, 2150), the authors find the following activity (curative tests) per day dose of vitamin: pigeon 0.007 mg. by injection, 0.060 mg. by mouth; rat 0.005 mg. This is a higher activity than that obtained for torulin concentrates. BENJAMIN HARROW

Assay of vitamin $B_2$. VERA READER *Biochem J* 24, 1827–31(1930); cf. *C. A.* 24, 402.—Rats are deprived of the alkali labile vitamins $B_1$ and $B_3$ until polyneuritis occurs (3–4 weeks). The addn. of $B_1$ cures polyneuritis, but does not restore weight. The animal remains in a weak condition with swollen red paws, spastic gait, loss of coordination, etc.—apparently because of lack of $B_2$. BENJAMIN HARROW

Maintenance nutrition in the adult pigeon and its relation to torulin (vitamin $B_1$). I. CYRIL W. CARTER, HENRY W. KINNERSLEY AND RUDOLF A. PETERS *Biochem J* 24, 1832–43(1930).—$B_1$ from yeast will not give maintenance nutrition in pigeons unless supplemented by some undefined factor. II. *Ibid* 1844–51.—Three B factors are necessary for nutrition in the pigeon. The factor which supplements $B_1$ is present in 50% alc. exts. of the charcoal process for concg. $B_2$ (*C. A.* 24, 2771) and also in alkalized marmite. It is not identical with $B_2$, $B_3$ or $B_4$ and can be termed $B_5$. B. H.

Relation of hydrogen-ion concentration to the precipitation of purified torulin yeast vitamin B by phosphotungstic acid. HENRY W. KINNERSLEY AND RUDOLF A. PETERS. *Biochem J* 24, 1850–63(1930).—By the use of fractional ppts. by phosphotungstic acid at varying $p_H$ values, $B_2$ concentrate with an effective action at 0.012 mg. is obtained. BENJAMIN HARROW

Reaction of antimony trichloride with cod-liver oil and its unsaponifiable fraction. ERNEST L. SMITH AND VIOLET HAILEY *Biochem J* 24, 1942–51(1930).—The unsaponifiable fraction gives with $SbCl_3$ in $CHCl_3$ a blue color proportional to its content. This fraction can be completely extd. with $Et_2O$, AcOEt, $CHCl_3$ or light petroleum. BENJAMIN HARROW

*Some contributing factors to the degenerative diseases, with special consideration of the role of dental focal infections and seasonal tides in defensive vitamins.* WESTON A. PRICE. *Dental Cosmos* 72, 1049–60, 1119–31(1930).—A study of the relationship between focal infections, dental caries and the vitamin content of the diet. JOSEPH S. HEPBURN

*Metabolism of carbohydrates.* BERNARD F. BADANES. *Dental Cosmos* 73, 49–56(1931).—A review with bibliography. JOSEPH S. HEPBURN

*Diet and dentition.* WALTER H. FOOS. *Dental Cosmos* 73, 349–52(1931).—A review devoted chiefly to the influence of the vitamins on the teeth. JOSEPH S. HEPBURN

*Studies, in the rat, of susceptibility to dental caries. I. Bacteriological and nutritional factors.* THEODOR ROSEBURY AND MAXWELL KARSHAN. *J. Dental Research* 11, 121–35(1931).—Three synthetic rations, (*a*) low in Ca, (*b*) vitamin D-free, (*c*) vitamin-C free, were fed to young rats. Each ration was fed both with and without the addn. of human oral lactobacilli. Dental caries did not develop in any of the expti.

animals, even though organisms similar to *Lactobacillus acidophilus* occur normally in the rat mouth A bibliography of 26 references is appended J S. H.

Pathological changes in the teeth of rats produced by synthetic diets. Theodor Rosebury and Maxwell Karshan *J Dental Research* 11, 137-48(1931) —A synthetic ration low in Ca and free from vitamin D, produced in rat teeth histological changes ascribable to deficient calcification The odontogenic zone was unusually broad in the dentine of both molars and incisors, large calcified globules appeared in the body of the dentine The odontoblasts, the pulps, the enamel of the molars and the fully formed enamel of the incisors appeared normal, but the youngest enamel of the incisors and the ameloblasts appeared deformed The staining quality of the alveolar bone was affected Changes, similar in certain respects to those of latent scurvy in guinea pig teeth, were produced in the pulps and dentine of rat molars by a synthetic vitamin C free ration, and by other synthetic diets in which a supply of vitamin C was given daily as orange juice, the sp cause of these changes was not as certained, but apparently was not a deficiency of vitamin C Joseph S Hepburn

Relation between vitamin C and some phases of reproduction in the guinea pig. Marianne Goettsch *Am J Physiol* 95, 64-70(1930) —Female guinea pigs, gradually deprived of vitamin C, continued the estrous rhythm until they began to lose wt. Male guinea pigs, deprived of vitamin C, probably as a result of general vigor, lose the ability to sire litters, although motile sperms are present J F Lyman

Physiology of exercise IV. Exercise and basal metabolism in dogs. A H Steinhaus and T A Jenkins *Am J Physiol* 95, 202-9(1930) —Conclusion Exercise is without effect on basal metabolism The high degree of relaxation which is acquired by the trained animal may explain why it is possible to have muscle hypertrophy without an increased metabolic rate J F Lyman

The physiology of vitamins. XIV. The effect of administration of large amounts of water on the time required for development of the anorexia characteristic of a deficiency of the vitamin-B complex. G R Cowgill, H A Rosenberg and J Rogoff *Am J Physiol* 95, 537-41(1930), cf *C A* 24, 4537 —Large vols of fluid given by mouth to dogs subsisting on vitamin B-free diets shortened by about one half the time of appearance of the anorexia characteristic of starvation for the vitamin B complex The hypothesis that the symptoms of lack of vitamin B are due to an accumulation of abnormal intermediary metabolites is unsupported by these expts J F Lyman

Metabolism in pregnancy. IV. The nitrogen metabolism. A W Rowe, Dorothy Gallivan and Helen Matthews *Am J Physiol* 95, 592-600(1930), cf *C. A.* 18, 3644 —Urinary N during pregnancy is lowered, urea N diminishes, $NH_4$, uric acid and undetermined N compds of the urine increase In the first few months after delivery the same general picture persists, except that uric acid elimination returns to normal Non protein N, urea and residual N of the blood are all lower during pregnancy than at an equal non pregnant nutritional level J. F. Lyman

The effect of intravenous and intraperitoneal injections of irradiated ergosterol. C. I. Reed and E A Thacker *Am J. Physiol* 96, 21-7(1931) —Irradiated ergosterol, administered to dogs intravenously or intraperitoneally, is more effective than comparable doses by mouth. Toxicity and hypercalcemia are not parallel; hence the toxic factor may be something other than the vitamin D factor. There was no const effect of the irradiated ergosterol dosage on the concn of inorg P of the blood. J. F. Lyman

The metabolism in pregnancy. V. The carbohydrate metabolism. A W Rowe, Dorothy E. Gallivan and Helen Matthews *Am. J Physiol* 96, 94-100(1931) —*Glucosuria is a common finding during the course of normal pregnancy. Lactosuria* supervenes within a few days of delivery and may continue throughout the period of lactation or even beyond Blood sugars are at low normal or slightly subnormal levels throughout pregnancy The tolerance limit of 40 g of galactose for the adult female declines to 20 g during pregnancy, and sinks after delivery for 2 weeks or more to 10 g With the cessation of lactation, or even before, the normal tolerance of 40 g is regained VI. The respiratory metabolism and acid elimination. *Ibid* 101-11 —Pregnancy produces an increase in basal metabolism during the last 24 weeks of 13% more than that predicted from the change in wt *Following delivery there is* a downward trend of significant proportions which reaches a min value somewhere between the 3d and 5th week and then rapidly rises to normal Alveolar $CO_2$ values indicate acid intoxication. Such a condition cannot be demonstrated with certainty, although there are minor evidences of possible acid retention VII. The blood morphology. A W. Rowe *Ibid* 112-4 —*Hemoglobin shows a relative and abs depression* of moderate

degree during normal pregnancy There is a moderate secondary anemia with lowered color index J F. LYMAN

Differential response of male and female ring doves to metabolism measurement at higher and lower temperatures. O RIDDLE GUINEVERE CHRISTMAN AND F G BENEDICT *Am J Physiol* 95, 111–20(1930).—With an increase of external temp from 20° to 30° the metabolism of male ring doves increased 28.1% and of females 20.3%. The differential response of the normal metabolism of the sexes to temp is of consequence not only in metabolism studies, but in growth, vitamin and nutritional research. J. F. LYMAN

The relation between anorexia, anhydremia and gastric atony in dogs deprived of water W B ROSE C J STUCKY, L B MENDEL AND G R COWGILL. *Am J Physiol* 96, 132–8(1931).—Dogs fed an artificial ration complete in every respect were deprived of water for 6-day periods. A moderate increase in blood concn with an increase in the hemoglobin value of less than 20% was assocd with a definite decrease in the motor activity of the empty stomach and partial or complete loss of appetite When atony of the stomach was recorded, there was a complete loss of appetite Since anhydremia is a systemic disturbance other organs, particularly muscles, may fail to function with optimum efficiency in the presence of a moderate degree of anhydremia. J. F LYMAN

Diet in relation to reproduction and lactation. III. P D WILKINSON AND V E. NELSON *Am J Physiol* 96, 139–45(1931).—Rats grew at a normal rate with 10, 20, 40 and 73.3% of cooked dried soy bean as the only source of vitamin B and G Reproduction was normal on the lower levels of soy bean, but on the higher levels the rats were not so prolific. Satisfactory lactation was not obtained on any level of soy bean feeding unless a further supplement was added. When the soy bean made up 15% of the ration, liver from hogs and cattle and hog kidney, added to the diet, gave very marked improvement in lactation Hog pancreas and beef pancreas, brain and heart gave some improvement while hog lung and spleen and beef thymus gave no appreciable improvement. The galactagog factor was destroyed in liver by drying for 12 hrs. in air at 120° Ether ext. of liver possessed no galactagog properties. J F. L.

Metabolic studies during pregnancy and menstruation. IRENE SANDIFORD, THEODORA WHEELER AND W W BOOTHBY *Am J Physiol* 96, 191–202(1931).—There is a gradual increase in the total heat production during pregnancy, amounting at term to 25%, and probably all accounted for by the added metabolism of the fetus, placenta and accessory structures. On an adequate protein intake of over 85 g per day there is a pos. N balance varying between 0.5 and 1.1 g daily There is no evidence that the fetus grows at the expense of the mother's tissue if the diet is adequate N retention results in a slight decrease in the % of total N eliminated in the urine as urea. There is also a slight increase in the uric acid and ammo acid N, an increase in creatine and no change in the creatinine eliminated until the ninth month when there is a sudden increase Urinary $NH_4$ increases slightly There are no significant changes in the inorg substances eliminated nor any changes in the chemistry of the blood The mean value of 336 basal detns. of the heat production on a normal woman between 34 and 41 years of age is 33.1 ± 0.06 Cal per sq m J F LYMAN

Composition of a new diet for the study of B avitaminosis, a diet relatively poor in carbohydrate and rich in fat. MME L. RANDOIN AND R. LECOQ *Compt rend* 192, 444–7(1931).—Basing their work on previous expts. (*C. A.* 17, 1494; 18, 1322), R and L. show the influence upon the development of polyneuritis in pigeons due to the feeding of a variety of carbohydrates and glucosides as a certain percentage of the diet. The compn of the diet is purified casein 8, purified fibrin 8, ovalbumin 8, butter fat 8, lard 18, carbohydrate 35, Osborne and Mendel salt mixt. 5, agar agar 8, filter paper 2. Comparative tests were made on diets differing only in the nature of the natural or purified carbohydrate, the following being used glucose, levulose, maltose, saccharose, dextrin, corn starch, galactose, lactose and potato starch All the pigeons submitted to this diet contg glucose, levulose, maltose, saccharose or dextrin showed satisfactory temp., digestion and food absorption up to 20–30 days when acute polyneuritis and death occurred On the diets contg lactose, galactose and the starches, the onset of polyneuritis was delayed N. M NAYLOR

A direct quantitative relationship between vitamin A in corn and the number of genes for yellow pigmentation P C. MANGELSDORF AND G S. FRAPS. *Science* 73, 241–2(1931).—Yellow corn is known to be much richer in vitamin A than white corn, and a similar assocn. between A and carotenoid pigments has been discovered in many other plant materials Inheritance of seed color in corn follows definite Mendelian ratios resulting in the production of four classes of seeds, *e. g.*, white, pale yellow, dilute

yellow and deep yellow, representing 0, 1, 2 or 3 genes for yellow pigment. Corn with these 4 genetic factors was bred and the seed was fed to rats in an appropriate diet. The following av units of vitamin A per g were found in seed grown in 2 different years when tested for A by the method of Sherman and Munsell (*C. A.* 19, 2517): 0 genes for yellow, 0.05 unit, 1 gene for yellow, 2.25 units, 2 genes for yellow, 5.00 units; 3 genes for yellow, 7.50 units. The results show (1) that a white-seeded variety of corn with little or no vitamin A in the endosperm is capable of forming A in its seeds if the genes for yellow pigmentation are introduced, (2) that there is a direct quant relationship between the no. of genes for pigmentation in the cells of the endosperm and the amt. of A in the seed. Each gene for yellow pigmentation causes the formation of approx. 2.5 units of A per g. of seed. The genes for yellow pigmentation are directly, or indirectly, responsible for the formation of A, with the production of carotenoid pigments as an intermediate step. This is the first case in which a direct relationship between different doses of the same gene and their chem. effect has been definitely established. It is improbable that this gene functions as an enzyme, as the total reaction resulting from enzyme activity is seldom related to the concn. of the enzyme. Each gene for yellow pigmentation, however, seems to govern the formation of a definite quantity of A. The straight line relationship between no. of genes and amts. of A is indicative of a direct chem. relationship between the genes and some other substance which is present in the endosperm of both white-seeded and yellow-seeded varieties of corn. C. H. Richardson

**Liver extracts as a source of vitamins B and G.** W. D. Salmon and N. B. Guerrant. *Science* 73, 243–4(1931).—*Early investigations of the distribution of vitamins* showed that the livers of animals were a good source of vitamin B (vitamin G + B). The present expts. were made primarily to det. whether com. liver exts. afforded a good source of vitamin G for further concn. of the active factor. Growth studies on *rats fed an appropriate diet in which various amts. of liver ext. were added indicated* that the liver exts. are an excellent source of vitamin G, 0.10 g. per day furnishing sufficient of this factor for normal growth of a rat for a period of 9 weeks. Liver ext. is not such a good source of vitamin B. The ext. tested apparently contains 4–5 times as much G, *but only about* ¹/₄ *as much B as a sample of brewer's yeast. The vitamin* B content of the ext. compared favorably with that of pure dry baker's yeast. C. H. Richardson

**Vitamins in sugar-cane juice and in some cane-juice products.** E. M. Nelson and D. Breese Jones. *J. Agr. Research* 41, 749–59(1930).—*Sugar-cane juice is a poor* source of vitamin B. The juice from the upper portions of cane stalks is richer in this vitamin than juice from the lower portions. Juice obtained from bagasse by using high pressure is richer in vitamin B than ordinary cane juice. Sugar-cane juice contains a *small* amt. of vitamin A *but little, if any,* vitamin D. Cane sirup, Louisiana and Porto Rico blackstrap molasses and cane cream, products made from sugar-cane juice, are devoid of demonstrable quantities of vitamin B. W. H. Ross

**The calcifying and toxic action of large doses of irradiated ergosterol in animals. Attempt to separate the two actions.** H. Simonnet and G. Tanret. *Compt. rend.* 192, 586–8(1931), cf. *C. A.* 25, 156.—The calcifying and toxic principles of irradiated ergosterol are resistant to oxidation and hydrogenation. Certain rabbits exhibit great ergosterol resistance, living several months, while other rabbits on the same dose die in a few days. Death resulted in 15–25 days on daily feeding of 20 mg. ergosterol irradiated 45 min. If irradiated ergosterol is administered in large doses 4 days a week, followed by 3 days rest, too rapid calcification is avoided, and a rabbit may live several *months instead of a few weeks. The feeding 4 days a week of 0.2 g. of KI with 20 mg.* ergosterol inhibited calcification and maintained a healthy condition in rabbits, while the omission of KI caused death in a rabbit in 228 days with intense calcification. Feeding 0.1–0.2 g. of irradiated ergosterol produced death in 6–8 days without appreciable calcification. This indicates that a toxic factor other than calcification exists and massive doses may kill the animal before any calcifying action appears. D. S. Searle

Chemical analysis and vitamin B determination in unpolished rice grains kept in tightly closed vessels (Kondo, Okamura) 12.

*Handbuch der biologischen Arbeitsmethoden.* Edited by Emil Abderhalden. Abt. 4, Tl. 14 (Lfg. 344). Wilhelm Plücker. Tabellen- und Rechenbuch für Nahrungsmittelchemiker. Berlin: Urban & Schwarzenberg. 231 pp. M. 20, bound, M. 22.

McLester, James S. Nutrition and Diet in Health and Disease. 2nd ed. Philadelphia: W. B. Saunders Co. 891 pp. $8.50.

determining the rate at which a salt may penetrate the enamel. HENRY KLEIN *J Dental Research* 10, 727–31(1930), cf *C A* 24, 5343.—The cond changes in a tooth were followed by means of a cond app in which a vacuum tube amplifier was substituted for the usual telephone. The velocity with which a salt penetrated the enamel depended on the existing osmotic gradient, and was relatively slow in the canine tooth of the dog; thus 1.0 *N* KCl soln required 8 hrs., and 0.1 *N* KCl soln 24 hrs. J. S. H.

Basal metabolism. JOSEPH S. HEPBURN AND HARRY M. EBERHARD *Hahnemannian Monthly* 65, 850–63(1930).—The theory and the technic of the basal metabolic rate detn. are considered, and an account is given of the clinical application of this test in gastrointestinal and related diseases. JOSEPH S. HEPBURN

Observations on certain physiological processes of the marmot. II. Respiration. G. ENDRES AND H. TAYLOR *Proc. Roy. Soc.* (London) *B107*, 231–40(1930).—$CO_2$ produced little increase in either the rate, the depth or the minute vol. of respiration of both hibernating and normal marmots, unless the $CO_2$ content of the inspired air exceeded 5%. Higher concns. of $CO_2$ augmented the respiration, more markedly in normal (awake) marmots than in those hibernating. III. Oxygen saturation of the arterial blood. G. ENDRES. *Ibid.* 241–5.—In 2 hibernating marmots, the $O_2$ satn. of arterial blood ranged between 93.5 and 96.4%. The temp. coeff. of the $O_2$ equil. of the erythrocytes was 1.8 on exposure to a partial pressure of 40 mm. $CO_2$, and 2.7 at a $p_H$ of approx. 7.76. IV. Blood sugar. *Ibid.* 245–6.—Blood was obtained by cardiac puncture. During hibernation the blood sugar of 5 marmots ranged between 0.071 and 0.096%, during summer, its range in 3 marmots was between 0.97 (a misprint for 0.097?) and 0.162%. JOSEPH S. HEPBURN

Isolation by cataphoresis of two different oxyhemoglobins from the blood of some animals. ALEXANDER GEIGER *Proc. Roy. Soc.* (London) B107, 368–80(1931).—Two different oxyhemoglobins have been isolated from blood of the ox, sheep, ass, dog and man. They are best sepd. by electrodialysis followed by cataphoresis, and differ with respect to the O dissocn. curve. JOSEPH S. HEPBURN

Relation between the anterior pituitary body and the gonads. III. Fractionation and dilution of ovary-stimulating extracts. MARGARET HILL AND A. S. PARKES *Proc. Roy. Soc.* (London) B107, 455–63(1931), cf *C A* 24, 5819.—Two types of reaction, (*a*) *follicular luteinization and formation of atretic corpora lutea without ovulation*, and (*b*) normal follicular maturation and ovulation, were produced in mice, rats, rabbits and ferrets by saline suspensions of pituitary tissue, alk. ext. of the anterior lobe of ox *pituitary, and exts. prepd. from the urine of pregnancy. Extensive dilu. expts. with* the urine exts. indicated that the 2 reactions could not be ascribed to the activity of a single hormone producing different responses at different concns. Some evidence of sepn. *of the luteinizing and the maturing activity was obtained by alc. fractionation of urine* exts. Material sol. in 50% alc. was predominatingly luteinizing, that sol. in 30% alc. mainly produced follicular maturation. JOSEPH S. HEPBURN

*Regulation of the ovarian cycle.* MARGARET HILL. *Science Progress* 25, 449–64 (1931).—A comprehensive survey of the evidence that the hormone of the anterior pituitary body actually controls the ovarian cycle. JOSEPH S. HEPBURN

*Influence of alteration in the vegetative system on the phosphorus metabolism.* KÄTHE HESSE *Z. klin. Med.* 111, 729–41(1929).—In a series of metabolic balance expts., made in part on human beings and in part on dogs, it was shown that ergot amine and acetylcholine decreased both the $P_2O_5$ and the org. P content of the urine and both the inorg. P and the total acid sol. P content of the blood, while atropine and ephetonine had the reverse effect. No distinct influence was exerted on the Ca content of the urine, its vol. or its acidity. A relationship was thus found between the P metabolism and the functioning of the vegetative nervous system. J. S. H.

Biochemistry in relation to intelligence. H. D. POWERS *Science* 73, 316(1931).—Blood tests from a group of normal adults and one of idiots showed the Ca content within normal range in all cases. The phosphate content in the normal group ranged between 3.25 mg. and 8 mg. per 100 cc. blood, usually below 5.88 mg. and averaged 4.36 mg. The idiots had a high phosphate content, 5.98–12.45 mg., averaging 8.95 mg. per 100 cc. There was no reciprocal relation between the quantities of Ca and phosphate. MARY E. LEAR

The inhibiting power of plasma from old animals on the growth of tissue culture. Gino Bergami and G Fachini *Boll soc ital biol sper.* 5, 1073-5(1930) —Under the exptl conditions used and within the limits of accuracy of the method, the inhibiting action of plasma from old animals on the growth of tissue culture *in vitro* has been confirmed The transplanting of the testicle of a young animal to an old animal reduces the inhibiting action of the plasma from the old animal, without causing it to disappear in its entirety When the testicular tissue has been completely absorbed, the inhibiting action of the plasma returns to normal Peter Mastbaum

The presence of an estrus-producing substance in the male sexual gland. M Marro and B Frattini *Boll soc ital biol sper* 5, 1065-8(1930) —Five kg testicular glands was macerated in acidified water and pptd repeatedly with salts of heavy metals at the isoelec. point. Five mg of a cryst. substance was obtained which showed morphological characteristics identical with the pure follicular hormone. The needle-shaped crystals grouped themselves in the form of a tree, they were sol. in alc. and ether and somewhat less sol in water The cryst. substance in aq soln in doses corresponding to 250-500 g of fresh gland was injected during a period of 3 days into 4 castrated rats. The animals were killed on the 5th day The results were all pos.; all the prepns. showed the 4 phases of the development of vesicular activity Cross injections were then made the activity of the testicular cryst. substance was tested on spayed female rats and the activity of cryst. folliculin on castrated male rats. All the female animals presented the typical estrus reaction, and all the male animals treated for 4 consecutive days with 5 units of folliculin gave typical pos. seminal vesicle tests. The hypothesis is advanced that the 2 hormones are either identical or have certain physiol properties in common Peter Mastbaum

The total sulfur content in human blood. Serafino Dezani *Biochim. terap sper* 18, 34-7(1931) —In 20 individuals, the highest value of S in blood was 2314 g per l the lowest 1648 g and the av 1928. A. E. Meyer

The internal secretion of the thyroid gland and the development of the plumage in pigeons. I. Regeneration and moulting in hyperthyroidism. W Th. Lakhovsky and N Kosarina *Biol Zentr* 51, 81-104(1931) —In pigeons fed with thyroid substance, the regeneration of removed feathers takes place in a shorter time. Moulting could be induced Changes in the thyroid gland of the birds were observed, presenting a transition to hypofunction A. E. Meyer

## G—PATHOLOGY

H. Gideon Wells

The iodine content of the blood of patients suffering from cancer. F S. Fowweather *Brit J Exptl Path* 11, 400-7(1930) —The claim has been made that the blood of patients suffering from cancer always contains notably less I than that of healthy persons By use of the method of Leitch and Henderson (*C. A* 21, 2339) the I content of the blood was detd in 12 normal individuals and in 24 cancer patients In the normal cases the results obtained varied from 3.6 to 5.1 γ (γ = one-millionth of a g per 100 cc.) Out of 24 cancer cases exam'd only 11 show values below what may be considered as normal This failure to find a const. assocn between low blood I and cancer is definite evidence against the view that I deficiency is a cause of cancer While there may perhaps be a tendency toward lowered blood I in cancer, there is at least as much justification for assuming that the reduction is the result of the cancerous condition as there is for assuming it to be the cause of such a condition Further, since in rather less than half of the cases exam'd was any reduction of blood I indicated, the detn. of blood I as a diagnostic test for the presence of malignant disease can have no value whatever Harriet F. Holmes

A study of the blood pigment in obstructive jaundice, with observations on the van den Bergh reaction. W J Griffiths and G Kaye *Brit J Exptl Path* 11, 441-6 (1930), cf *C A* 25, 720.—Direct reaction human serum and the serum of rabbits after bile-duct ligation resemble in their properties a soln. in serum of the "direct-reaction" pigment shown to be present in bile. Human indirect reaction serum resembles in its properties a suspension in serum of pure bilirubin. The "direct reaction" pigment yields a diazo reaction over a wide range of $p_H$ vals., when the $p_H$ of the mixt. after addn. of the reagent lies between 1.2 and 5.0 approx., on the other hand, the pigment of indirect reaction serum, like bilirubin, yields no prompt direct reaction until the final $p_H$ of the reaction mixt. is adjusted to about 6.0 by addn. of alkali to the serum before mixing with diazo reagent. Harriet F Holmes

Normal flocculating H- and granulating O-agglutinins for Bacillus typhosus in sera of different species. W A Timmerman *Brit J Exptl Path* 11, 447-55 1930.—Normal agglutinins for *B typhosus* in sera of man, guinea pig, rabbit, horse, sheep, goat and buffalo can be of the finely granulating O-type and the coarse flocculating H-type. It appears that in man and ruminants normal H-agglutinins occur more frequently than normal O-agglutinins, contrary to what has been observed in horses and rabbits. Sera of guinea pigs show the lowest content of normal typhoid agglutinins. In the ascending scale sera of rabbits and man follow, reaching to horses and ruminants at the apex. After electroösmotic fractionation of the serum, both types of normal agglutinins for *B typhosus* are found in the euglobulin fraction exclusively. Harriet F Holmes

The response of grain-fed pigeons to substances effective in pernicious anemia. J M. Vaughan, G L. Muller and L. Zetzel. *Brit J Exptl Path* 11, 456-68(1930).—The group of anemias characterized by megaloblastic hyperplasia must be regarded as due to the deficiency of some substance or substances essential for the normal function of the bone marrow. The bone marrow of the healthy grain fed pigeon is likewise characterized by the predominance of megaloblastic tissue. Such pigeons were used therefore as testing material for various substances capable of relieving conditions in man, assocd. with megaloblastic bone marrow. The oral or intravenous administration of liver prepns. effective in anemia produced a consistent pronounced response of the reticulocytes and 2 subfractions prepd. from it which had received clinical tests also caused a similar response. Beefsteak was as effective as potent liver prepns. in causing a rise of the reticulocytes. No reticulocyte response was obtained to a liver prepn. which was inert for pernicious anemia, a liver ext., in which the active principle had been destroyed, vitamin B 1 and 2, histamine, NaCl and casein. Substances capable of influencing the reticulocyte level are without effect on the total red blood-cell count. The grain-fed pigeon may perhaps suffer from a mild dietary deficiency, which is possibly a factor of importance in permitting its bone marrow to respond to certain substances. Harriet F. Holmes

Diphtheria toxin-antitoxin floccules. F C. Smith and J Marrack. *Brit J Exptl Path* 11, 494-502(1930).—The expts. described give further support to the authors' contentions that diphtheria antitoxin consists of slightly modified pseudoglobulin mols., and forms the greater part of toxin-antitoxin floccules. There is no evidence that acid or base-binding groups are involved in the flocculation process, or that any appreciable amt. of heat is evolved. The amt. of protein in the flocculates obtained from a balanced mixt. of diphtheria toxin and antitoxin is unaffected by the addn. of non-specific proteins, even when a special antitoxin soln., of which 1.3 was pptd. in the flocculates, was used. Diphtheria antitoxin (horse serum) is pptd. by an antiserum to horse pseudoglobulin, the ppt. so formed combines with diphtheria toxin. No change of H-ion concn. occurred when purified and concd. toxin combined with a concd. and specially pure antitoxin soln. The isoelec. point of diphtheria toxin antitoxin flocculates lies between $p_H$ 5.1 and 5.6. The heat of reaction of diphtheria toxin and antitoxin is not of the order found by Bayne-Jones (*C. A.* 19, 3109). H. F. Holmes

The concentration of the protective substance in antipoliomyelitis serum. W. T. J. Morgan and R. W. Fairbrother. *Brit J. Exptl Path.* 11, 512-22(1930).—From the exptl. results obtained with the immune serum from one horse immunized with living poliomyelitis virus, it would appear that the protein pptd. at a relatively low concn. of $(NH_4)_2SO_4$ is uniformly much more potent in antiviral action per unit weight of protein than that pptd at higher concns. of this salt; and in conformity with this result the protein thrown out of soln. by dialysis of the immune serum, and the serum protein that is insol. in satd. NaCl soln., have been shown to possess potent antiviral properties. The evidence indicates that in this serum there was a general distribution of the antibody throughout the serum proteins, since carefully fractionated prepns.

a the pseudoglobulin and albumin possess definite although slight properties for neutralizing virus HARRIET F HOLMES

The appearance and development of certain antibodies in horses immunized with diphtheria anatoxin A BESSEMANS, G RAMON AND F DUPOTTER *Arch intern med exptl* 5, 505–55(1930) —A Schick pos horse immunized with diphtheria anatoxin developed a max antitoxin titer more rapidly but produced a smaller quantity of antitoxin than a Schick neg horse No agglutinins for the diphtheria bacillus were formed The max concn of complement fixation antibodies was reached rapidly, but was maintained for only a short period Complement fixation cannot be used as an index of the degree of immunity since there appears to be no correlation between the production of antitoxin and fixation antibodies F R MAIN

The role of serum globulins in the Wassermann reaction S T WALTON *J Lab Clin Med* 16, 451–9(1931) —Normal human serum or solns of serum globulins obtained by salt pptn and dialysis appear to increase hemolysis in the complement titration of the Kolmer Wassermann procedure The addn of a small quantity of normal human serum to the tubes employed in the titration of the complement allows for the affinity which the serum proteins may have for complement and makes possible a more delicate adjustment of the hemolytic system F R MAIN

## H—PHARMACOLOGY

A N RICHARDS

The physicochemical properties of tissues in relation to the normal state and the pathological state of the organism VII. The action of certain amino acids on tar carcinoma of mice F VLÈS AND A DE COULON *Arch phys biol* 7, 183–206(1930); cf C A 24, 2501–2 5867 —Various amino acids were injected into mice in which tar carcinoma had been produced In the first series of expts. 13 mice received the following combinations of amino acids aspartic acid *l* leucine, glycine, *dl* proline, *l*-cystine and *dl* alanine in equal quantities and in equimol quantities Then a mixt. of *dl* proline and *l* cystine in equimol quantities and one of equal quantities of *dl* proline, *l*-cystine and *dl* alanine were given and finally aspartic acid was used alone In the great majority of cases an improvement was noticeable As this series served only for orientation, 3 more series were studied, each one with 10 mice. These received equal quantities of *dl* proline and *l*-cystine and equimol quantities of *dl* alanine, *dl*-proline and *l*-cystine. In no case did aggravation of the cancer occur, in a great number of cases improvement was noted The improvement was strictly regression of the histologic type Proline and cystine are undoubtedly of fundamental importance in this action The favorable influence of *l*-cystine and *dl* proline as well as of *dl*-alanine is attributed to the fact that their isoelec. points lie within a certain range F R G

Use of phenobarbital in infant feeding ORVILLE HARBOTH *Arch Pediatrics* 48, 53–60(1931) —Phenobarbital in doses of 1/8 to 1/4 grain at intervals of 4 or more hrs has been administered to 76 infants between the ages of 1 week and 8 months for periods of 1 to 6 months No cumulative or deleterious effects, mental or physical, resulted. Phenobarbital is safe and effective for the control of infantile vomiting, and more satisfactory than atropine JOSEPH S HEPBURN

Biological estimation of some cardiotonic glucosides ouabain, digitalin, scillarenes and cymarin JEANNE LÉVY AND RAYMOND CAHEN *Bull sci pharmacol* 38, 23–37, 85–108(1931) —The method of Hatcher Magnus on the dog was used for the comparison of samples of the cardiotonics Three samples of ouabain proved to be equiv if referred to the anhyd substance or to crystals with $9H_2O$ The min lethal dose is given for the following compds ouabain with $9H_2O$ (anhyd product shows $[\alpha]_D = -30.6°$), 0.173 mg per kg animal, g strophanthin of 20.07% $H_2O$ ($[\alpha]_D = -28.88°$), 0.1725, ouabain U S P X with an av of 11.1% $H_2O$ ($[\alpha]_D = -30.6°$), 0.1585 mg, equiv to 0.178 of the crystd compd The international standard of strophanthin of $9H_2O$ has 0.173 mg and the original contg 19.94% $H_2O$ has the value 0.1705. For tincture of strophanthus, used in a dilu of 1:100, it is between 0.0.04285 and 0.0047575 g

strophanthus, the activity of 1 cc. corresponding to 3.50–3.97 mg. ouabain standard. The min. lethal dose of digitalin Nativelle is 1.69, of digitoxin Merck 1.75, of digitaligenin 7.1 mg., of scillarene A (tested in 0.04% soln.) 0.353, scillarene B 0.167, com. scillarene C 0.288, tincture of squill 0.214 cc. (equiv. to 42.8 mg. of squill) and of cymarine 0.2302.

## I—ZOOLOGY

R. A. GORTNER

A method for determining basal metabolism of fishes. MAZIE ADKINS. *Proc. Soc. Exptl. Biol. Med.* 28, 259–63(1930).—A technic is described whereby fish can be kept at a fairly const. rate of metabolism while undergoing physiol. experimentation.
C. V. B.

The role of bacteria in the nutrition of protozoa. J. MURRAY LUCK, GRACE SHEETS AND JOHN O. THOMAS. *Quart. Rev. Biol.* 6, 47–58(1931).—A review with extensive bibliography.
J. B. BROWN

Evidence from the effects of potassium cyanide for linkage between polar growth, electric potentials and cell oxidation on Obelia. HILDA F. ROSENE AND E. J. LUND. *Pub. Puget Sound Biol. Sta.* 7, 337–44(1930).—The growth of isolated internodes of the hydroid, *Obelia*, can be reversibly inhibited by cyanide. The effect is similar to the effect of HCN on cell oxidation and elec. potentials in the stem. An appropriate application of cyanide tends to reverse the polar sequence of growth of individual internodes. The effect of the KCN in a quant. way corresponds to the effect of an elec. current on growth. The continuous application of KCN will decrease the rate of growth, the magnitude of this depression being greater in young tissue. Additional evidence is presented for the quant. linkage between mechanisms of cell oxidations, bioelec. currents and the mechanisms of growth.
C. R. FELLERS

Investigations on the physicochemical properties of the hemocyanins of the octopus and of the horse-shoe crab. JEAN ROCHE. *Arch. phys. biol.* 7, 207–20(1930).—No difference was found between the physicochem. properties of the natural hemocyanins and their decompn. products deprived of Cu by treatment with dil. acids. It is therefore not necessary to admit the presence of a special (prosthetic) group like the hematin in hemoglobin. The opinion of Heinze that hemocyanin is a Cu proteinate is probably nearer the truth. The isoelec. point of the hemocyanin of the octopus is $p_H$ 4.8 which is close to that of the crab, the lobster and the shrimp. The hemocyanin of the horse-shoe crab, however, has an isoelec. point of $p_H$ 6.2–6.4.
F. R. G.

Metabolic changes associated with pigmentary effector activity and pituitary removal in Xenopus laevis. I. Respiratory exchange. ENID CHARLES. *Proc. Roy. Soc.* (London) B107, 486–503(1931).—The rate of respiratory exchange in the amphibian *Xenopus laevis* in air increases with a rise in the external temp., the O consumption per unit surface decreases as the body wt. increases. Females apparently have a lower respiratory rate than males. The respiratory rate is higher in unanesthetized eyeless animals than in eyed animals, and is lower in animals kept in total darkness prior to experimentation than in those kept in the light. Partial or total hypophysectomy considerably decreases the rate of respiratory exchange, this effect is more marked on the pulmonary rate than on the dermal rate. Hypophysectomy increases the R. Q. The rate of O absorption is from 2.5 to 3 times greater by way of the lungs than by way of the skin. II. Calcium and magnesium content of the serum. *Ibid.* 504–10.—The serum Ca and serum Mg were higher in females than in males and were not influenced definitely by pigmentary effector activity. Removal of either the anterior lobe or both lobes of the pituitary produced a persistent decrease in the Ca content of the serum.
JOSEPH S. HEPBURN

Osmotic changes in some marine animals. R. MARGARIA. *Proc. Roy. Soc.* (London) B107, 606–24(1931).—In the crabs, *Maia squinado*, *Portunus depurator* and

(1929)), or from treatment for 48 hrs with 1% $HgCl_2$, 2% cresol, 5% phenol or 5% I suspensoid Merck Acid or alkali was almost without effect K. V THIMANN

Change of vitality with age as based on the living unit of organism. I. Oxygen consumption in the daphnid, Simocephalus exspinosus. ARATA TERAO *Proc Imp Acad* (Tokyo) 7, 23-5(1931).—By use of the data of Obreshkove (*C. A* 25, 543), the following formula is obtained, $y = 65.855\ e^{0.112x}$, where $y$ represents the % rate of O consumption compared with the first instar young (size considered), $x$ age in days and $e$ base of Napierian logs C. J WEST

## 12—FOODS

F C BLANCK AND H A LEPPER

The reciprocal action between metal utensils and foodstuffs. II. A study of the biological value of metals J SCHWAIBOLD AND F FISCHLER *Biochem Z.* 232, 240-53(1931), cf *C A* 25, 1913.—The method of this investigation consists in studying the effect on frog tadpoles of being reared in dishes made from different materials No effect of any sort was observed with Al Expts with Zn dishes show that under the influence of the natural corrosion products of Zn the growth and development of the tadpoles may be completely inhibited, however, if the action is not too far gone the condition is reversible Expts with iron receptacles show that loading the tadpoles with corrosion products of this metal during the entire life span has had no deleterious effect and there is even some indication of a possible favorable action The expts with tin utensils were very few but they suggest that this metal is either without action or its effect upon the organism is very slight, in consequence of its poor soly and absorption into the organism Copper, in these tadpole expts, has shown a surprisingly serious effect, even very minute quantities of its corrosion products being so toxic that the animals invariably died in a short time S MORGULIS

The use of aluminum for kitchen utensils VICENTE COLOMBARO *Rev farm* (Buenos Aires) 73, 75-87(1931).—The quantity of Al dissolved from an Al container of 1400 cc capacity, when 1000 cc of substance was boiled for 1 hr., was detd In 100 g of substance the following values for Al (in mg.) were found distd $H_2O$ none, tap water 0.94, 7% AcOH 15.66, 0.25% tartaric acid 6.11, 3% citric acid 6.47, 4% NaCl soln 2.35, 4% NaCl and 7% AcOH 13.15 milk 1.69, olive oil 5, sugar soln 2, compote 0.54, tomato preserves 45.6, broth 1.2, and white wine 1.83 The present knowledge of the toxicity of Al does not permit conclusions concerning the innocuousness of its use in the kitchen A E MEYER

Cichorium intybus L. as food. I FLEISCHNER *Kisérlet Közlemények* 31, 253-9 (1928).—Its use and composition are discussed S S DE FINÁLY

Hungarian rye flours. Z DE SÁNDOR *Kisérlet Közlemények* 31, 470-9(1928).—Ryes showed 13.62-14.21% water, 1.58-1.69% ash, 1.60-1.69% total N, 3.36-3.66 acidity no and 9.12-9.63% albumins Flours from these ryes contained 10.80-13.96% water, 0.44-3.18% ash and 0.78-2.85% total N and had acid no 1.68-10.01 S S DE FINÁLY

Studies on improved Hungarian wheats. S GÖMÖRY AND L PAP *Mezögazdasági Kutatások* 2, 116-39(1929).—The $H_2O$ content was 9.21-10.61%; hl wt., 79.45-85.10 kg. No connection was found between hl wt., wt of 1000 grains and quality and quantity of gluten The best sample contained 56.5% gluten S S DE FINÁLY

Testing new wheat varieties. R C SHERWOOD *Cereal Chemistry* 8, 168-75 (1931).—Several new wheat varieties have appeared in recent years which have not been entirely acceptable to millers and chemists Marquis is a variety of spring wheat that has met with great favor, though it is frequently grown under conditions which result in low flour yield, poor color, high ash and small loaf vol Environmental conditions are liable to cause greater variations in water absorption than the differences between varieties grown under comparable conditions Kota wheat yields well under dry conditions, but lodges badly and is susceptible to smut Quality wheat is not equal to Marquis in baking properties Garnet yields large loaves with only fair texture and color Ceres is resistant to rust but susceptible to scab and smut Reliance, Supreme and Renard are not resistant to stem rust Minhardi and Minturki have winter hardiness Marquillo is a rust resistant variety, which seems to be better adapted to conditions in northern Minnesota than farther south L H. BAILEY

Apparatus to determine quality of wheat. K KONOPI *Mezogazdasági Kutatások* 3, 426-31(1930).—Wheat is ground to flour, then stored for 8-10 days and worked

into a pulp which is examined in a machine on the principle of Rejtö's pulp-examg app. Numbers obtained should be compared with data for standard wheat types
S S DE FINLY

Hygroscopicity of wheat. L. PAP *Mezogazdasagi Kutatasok* 3, 349–54(1930).—200 Hungarian and 86 other wheat samples were examd Two g of sample placed on a surface of 25 sq cm showed 1 23% change in water content after remaining there for 4 weeks The influence of hysteresis is excluded by producing a sample of 12–13% water content and keeping this hermetically sealed The change in water content averaged 0 45–0 41% Variations of hygroscopicity depend chiefly on climate Drying or moistening has no influence on hygroscopicity S S DE FINLY

Wheat and flour studies. XVIII. A study of the nature of the acid responsible for the increase in acidity which occurs in flours during storage. ARNOLD H. JOHNSON AND JESSE GREEN *Cereal Chemistry* 8, 134–45(1931) cf *C A* 25, 1506.—The H ion concns. of water exts of stored flours extd with ether were the same as those of the ext. of freshly milled flours The idea is expressed that ether-extractable acids are alone responsible for the changes in H-ion concn or in acidity (as measured by any method) which occur in flours during storage under proper conditions The acids removed from flour by extn with ether must, on the average, have rather long C chains, as their coeff of distribution between water and ether was of the order 0 014 to 1 Only relatively insignificant quantities of lactic acid can be present in flour L H B

Natural chlorine content of wheat flours. L. PAP *Kiserl Kozlemenyek* 31, 480–6(1928).—The Cl content was detd by dissolving flour or ground cereals in 20% $H_2SO_4$ and pptg Cl with $AgNO_3$ The amount of Cl varied between 0 0002 and 0 0738% in 32 Hungarian samples Chlorinated flour can be identified by detg the Cl content of a petrol-ether ext. The fat of untreated flours contained 2 5–3 5 parts Cl per million parts of flour, the fat of flours treated with Cl contained about 38% of the Cl used for the treatment. S S. DE FINLY

A study of some methods of examining flour with special reference to the effects of heat. I. Effect of heat on flour proteins. C. W HERD *Cereal Chemistry* 8, 1–23 (1931).—Kent Jones' viscosity curves in 1 10,000 auramine are confirmed, but it is shown that bacterial development and increase in acidity take place, and, therefore, no measurement is afforded of the proteolytic activity of the flour itself. Viscosity changes, however, may give a measurement of the resistance of the proteins to proteolytic attack. Incubation in $p_H$ 3 0 lactic acid did not completely inhibit bacterial growth, the viscosity curves are very different from those in water. Incubation in the presence of 1% $NH_4F$ soln. gave apparently no bacterial growth, the viscosity decrease in the untreated flour was less and the viscosity increase in the strongly heated flour was also less Viscosity acidity curves show interesting differences in the unheated and the strongly overheated flours, giving evidence of marked phys. changes in the flour proteins. Many of the well-known bactericidal substances were found to be insufficient for inhibiting the growth of bacteria in flour water suspensions. Various methods for the estn of glutenin gave fairly good agreement among one another The sum of the 3 fractions of proteins by recognized methods of analysis did not agree in many cases with the total protein figure detd directly on the flour; in good-grade flours the sum is usually lower than the total, whereas in the lower grade flours the sum is frequently higher than the total. Different salts have different peptizing effects on some of the flour proteins, a subsequent alc. extn. will vary according to the preliminary salt treatment, indicating increased resistance to peptization. Ultra-violet radiations do not apparently fulfill any useful purpose in cereal analysis. If a large proportion of the natural moisture of a flour be removed at a low temp and the heating then performed, the effects on the flour proteins will be produced but at a very much slower rate. II. Effects of heat on flour enzymes. *Ibid* 145–61.—The diminution in phosphatase activity observed by Berliner and Rüter (*Z ges. muhlenwesen* 4, 209–16(1928)) was not confirmed in flour heated for 10 hrs. at 180° F. or less. Proteoclastic activity of flour itself, as evidenced by amino N produced in an incubating ext., is of small value and can have little influence in a fermenting dough The addn. of 0.2 g. yeast to 100 cc. ext. increased the proteoclastic activity Heating may increase the resistance of proteins to enzymic attack. Catalase activity of flour suspensions is reduced by severe heating Confirmation is obtained that the change in H-ion concn. of a dough during fermentation is of small magnitude. It is suggested that the $p_H$ of the aqueous phase, however, may alter and thus affect the enzymic activity. If a large proportion of the natural moisture of a flour is removed at a low temp and then the heating performed, the enzymic activity appears to be inhibited at practically a normal rate.
L. H. BAILEY

A study of commercially milled flours dealing with protein and its relation to peptization and baking strength. R. H. Harris. *Cereal Chemistry* 8, 113–33(1931).—A series of 31 commercially milled flours of different baking strengths was baked and analyzed. The proteins of these flours were peptized by 0.5 *N* solns. of $MgSO_4$ and KBr. Two methods of baking were used: the basic method, employing flour, sugar, salt, yeast and water, and a method which included 1% malt and 0.001% $KBrO_3$ for the weaker flours, and 3% malt and 0.5% Arkady for the stronger flours in addn. to the basic formula. Total and nonpeptized protein gave very high relationships when correlated with loaf vol. and would appear to be equally useful as a means of forecasting baking strength for this series. The percentage of total protein peptized was less significantly related to loaf vol. than total or nonpeptized protein and would be of less value in predicting baking strength. Peptized protein did not appear to be of any great practical importance in its relation to baking strength. These conclusions are similar to those obtained in a previous study (*cf. C. A.* 25, 1596). A series of 20 mill stream flours was baked by the basic method and by a method which included 3% malt and 0.5% Arkady. These flours were analyzed and peptized by 0.5 *N* $MgSO_4$, KBr and KI. The results were considered in 2 groups: one comprising 12 millstreams which appeared to be of good baking quality and the other the whole group of 20 mill streams. The use of an improver method did not seem to be justified in evaluating the strength of millstream flours. Total protein is not a reliable index of baking strength when low grade millstreams are concerned. Nonpeptized protein is more significant in its relation to baking strength than total protein in millstream flours including the low-grade streams. The percentage of total protein peptized appears to be equal to, or better than, total protein or nonpeptized protein for purposes of predicting baking strength of millstream flours which include the lower grade streams. The "optimum coagulation" theory appears to be supported by the peptization data from the millstream flours.
L. H. Bailey

Effect of moisture content of flour on heat of imbibition developed during the mixing of bread dough. Emily Grewe. *Cereal Chemistry* 8, 162–5(1931).—The heat of imbibition of suspensions and bread doughs varies with the moisture content of the flour. Flours with moisture contents of 13.1 and 8.7% produced finished doughs which differed 3.3° in temp., a difference of sufficient magnitude to be important in bread making.
L. H. Bailey

The variability of loaf volume in experimental baking. Alan E. Treloar and R. K. Larmour. *Cereal Chemistry* 8, 95–113(1931).—A statistical study of factors that may cause variations in loaf vols. in expti. baking. "Molding personality" may be one cause of variation, and variation in molding technic may possibly be another cause. The absence of sugar from a dough of a standard flour resulted in loaves of approx. 1/6 lower vol., but of good texture. The variability of the replicates was, however, doubled. The addn. of 1 cc. of 0.1% $KBrO_3$ soln. to the mixt. in the absence of sugar increased the loaf vol., reduced the loaf wt. and reduced the variability of replicates. Range of temp. of the dough from 28° to 32° as it came from the mixer had no measurable effect upon the vol. of the loaves. At least 3 times the av. difference between duplicates should be taken as the min. difference to be regarded as significant between vols. of single loaves baked from different flours.
L. H. Bailey

The behavior of bread under the influence of some volatile substances. L. Karácsonyi. *Mezogazdasági Kutatások* 3, 192–7(1930).—Aldehydes, *i. e.*, HCHO, AcH, propionaldehyde, butyraldehyde, valeraldehyde, crotonaldehyde, BzH, salicylaldehyde, cinnamaldehyde and 2-furaldehyde, retarded staling of bread. The retarding action is proportional to the volatility and solv. in $H_2O$. Some aldehydes change the consistency of the crumb, others color it. Proteins chiefly are colored, starch and probably fat remain unchanged. Aldehydes cannot be removed from proteins as easily as from starches.
S. S. de Finály

Refrigeration in the bakery. A. R. Fayed. *Refrigerating Eng.* 21, 251–5(1931).—The applications of refrigeration and air conditioning to the baking industry are explained. The process of bread making in a standard plant is described in detail.
A. H. Johnson

The quantitative measurement of carbon dioxide evolved in and lost from simplified muffin batters. Isabel T. Noble and Evelyn G. Halliday. *Cereal Chemistry* 8, 165–7(1931).—Four types of baking powder were used in this study: tartrate, phosphate and 2 combination powders contg. different relative proportions of S. A. S. (Na Al sulfate) and phosphate. When combined with flour, fat and water into a smooth batter, all the types of baking powder evolved less $CO_2$ than when combined with water only. The difference was greater in the case of the tartrate than with the other powders.

All types of powders also evolved slightly more gas when water was used in prepg the batter than when milk was used The addn of sugar up to 0 8% of the ingredients did not have any consistent effect upon the evolution of gas Flour, fat, baking powder and water mixts lost between 1/3 and 2/3 as much $CO_2$ during their prepn as did the corresponding baking powder and water mixt When the tartrate and phosphate powders were used the batters lost more gas than when the combination powders were used L H Bailey

**Quality of Hungarian milks in 1928.** I Szanyi *Kis rlet Kozlem nyek* 32, 162–76 (1929) —Average values for 4148 samples of market milk from counties Moson, Vas and Zala were d 1 0310, dry matter 12 50% and fat 3 64% S S dr Finály

**Composition of Hungarian market milks.** I Szanyi *Kis rlet Közlemények* 31, 309 20(1928) The av of 1304 samples of market milks from counties Moson, Vas and Zala was d 1 0313 dry matter content 12 5% and fat content 3.77% S S dr Finály

**Composition of milk of Hungarian Kammwoll sheep.** J Csiszár *Kisérlet Kozlemenyek* 31, 287 94(1928) Dry matter averaged 20 11, fat 8 71, albumin 6 36, galactose 4 23 and ash 0 89% The ratio of casein to albumin averaged 1 1 74. The milk is very similar to that of Merino sheep in compn S S dr Finály

**Composition of milk of Hungarian Allgäuer cows.** I Szanyi *Kisérlet Közlemények* 31, 241 51(1928) The av of 739 samples was sp gr 1 0330, dry matter content 12 7% and fat content 3 3–3 5% *Ibid* 32, 99 111(1929) —The quantity of milk and its fat content show larger fluctuations than those of Simmenthal cows 3 1 to 26 3 l milk contg 2 5 to 5% fat was obtained per day and cow Morning milks contain less than 3.3% fat and therefore could only be sold after mixing with the evening milk S S dr Finály

**Some analyses of milk from Indian cows.** Th W J van Marle *Pharm. Tijdschr Nederland Indië* 7, 276–8(1930) —The milk from 55 cows of different breeds, of 5 stables in the neighborhood of Batavia, had an av sp gr of 1 0310, acid value 6 9, fat 4 0 (Gerber), milk sugar 4 51, Cl 97, albumin 3 7, f p 0 528, $n_D$ 1 3435 D R Koolhaas

**Seasonal changes of characteristics of milk fats of cows and of sheep.** A Faltin and G Debinszky *Kisérlet Közlemények* 33, 62 76(1930) —In the milk fat of cows the Reichert Meissl no varies between 22 56 and 31 71 with an av of 26 91 Its max. is reached in winter and the min in summer The butyric acid no of Kuhlmann-Grossfeld is 17 9 20 9 The xylene no of Raalte averages 18 27 The Polenske no varies from 1 8 to 5 8, it is about 6 to 8 times as much as the R.-M no, depending on the seasons Hungarian butters seem to contain more caprylic acid The milk fats of sheep show Reichert Meissl no 22 16 39 14, butyric acid no 15 77–21 04, Polenske no 2 2 6 0 Milk fats cannot be identified on the basis of these data S S dr Finály

**The effect of dilution on the titratable acidity of cow milk.** H H Sommer and Julps Menos *J Dairy Sci* 14, 136 55(1931) —Diln of the milk with $H_2O$ lowers the titratable acidity, diln with an equal vol of $H_2O$ causes an av decrease of 0 0211%, diln with 9 vols, 0 0623% In solns contg Ca and phosphates in amts representative of milk, pptn of $Ca_3(PO_4)_2$ will occur during titration with NaOH, increasing the titer A similar pptn must be expected in the titration of milk. The greater part of the diln effect is attributed to a decrease in the amt of $Ca_3(PO_4)_2$ pptd during the titration There are indications that a relationship of Ca to casein, similar to that of Ca to phosphates, is involved in the diln effect A lower $p_H$ was observed at the phenol phthalein end point in the titration of dild milk This is attributed to a "protein effect" on the indicator, while the rapid fading of the end point is due to the pptn of $Ca_3(PO_4)_2$ The fact that the titratable acidity of the coned milk is higher than calcd from the acidity of the original milk and the ratio of concn, in spite of the loss of $CO_2$, is attributed to the reverse of the same factors in the diln effect. The neutralization of milk or cream with lime of known alky does not lower the acidity to the calcd point because the increased Ca ion concn causes greater pptn. of $Ca_3(PO_4)_2$ in subsequent titration J C Jurrjens

**A test for the detection of milk unstable to heat.** Guy A. Ramsdell, Wm T. Johnson, Jr, and Frid R Evans *J Dairy Sci* 14, 93-106(1931) —A rapid test, also applicable to factory routine, for the detection of milk unstable to heat has been developed from the results obtained in making comparisons between heat stability values of the coned products and the pptg actions of numerous acids and salts on the whole milk samples when heated to the temp of boiling water The most satisfactory pptg. agent was found to be $KH_2PO_4$. The actual coagulation was brought about through

the combined action of the added acid salt and heat Data are also given showing the relationship between heat stability and min concn of phosphate soln necessary to produce initial coagulation when added to milk in the manner described in the test Milk that coagulates in the test is invariably of low heat resistance, as are also composites of this class In grading on the basis of the phosphate test the elimination of the phosphate positive milk often results in obtaining a milk of higher stability toward heat The phosphate no is defined and its relation to coagulation time shown There is no apparent relationship between *p*H and phosphate no Milks from single herds are reasonably const in phosphate no J C Jurrjens

**Data on the bacteriology of nauseous and bitter-tasting milk.** J Csiszár *Kisérlet Kozlemenyek* 33, 272–8(1930) —The bitter taste is caused by *Bact fluorescens*, the nauseous taste by *Micr pituitoparus* and *Bact aerogenes* The origin of such microorganisms is probably the wash water of bottles and machines S S de Finály

**Casein plastics—milk in industry.** Robert Dodd *The Times Trade and Eng Suppl* 28, No 664, 9(1931) —A review E M Symmes

**The effect of feeding menhaden fish oil on the secretion of milk and the composition of butter fat in the dairy cow.** J B Brown and T S. Sutton *J. Dairy Sci* 14, 125–35(1931) —The feeding of menhaden fish oil lowered milk production, the % and total butter fat After resumption of control diet recovery to normal took place slowly The characteristic highly unsatd acids of the menhaden oil passed into the butter fat in small quantities The analytical consts of the butter changed to those of a mixt of butter with menhaden oil Several specimens of normal butter have been shown to contain small quantities (0 3%) of a highly unsatd acid similar to arachidonic acid J C Jurrjens

**Why fat tests vary.** D H Bailey *Creamery and Milk Plant Monthly* 20, No 2, 72(1931) —The fat content of milk may vary because of breed of cattle, stage of lactation, health of the animals, time of milking, weather and season of freshening Excitement of the cows at milking time may also cause sudden variations in the fat content of the milk A H Johnson

**The feathering of evaporated milk in hot coffee.** Randall Whitaker *J. Dairy Sci* 14, 177–88(1931) —The feathering of evapd milk in hot coffee is promoted by (*a*) characteristics of the milk, especially the salt balance, (*b*) coffee which is coned., (*c*) prolonged extn of the coffee grounds, (*d*) the use of small quantities of milk in the coffee, (*e*) the slow, rather than fast, addn of milk An empirical feathering test was developed Examn of 52 cans of commercial evapd milk indicated that feathering in hot coffee is not a common defect of the milk now offered to the public J C J

**Iron content of liquid and reconstituted dry milk: a comparison.** Esther B Hardisty *Arch Pediatrics* 48, 108–16(1931) —A review of recent researches with a bibliography (12 references) Joseph S Hepburn

**Manufacture, microflora and chemical composition of "tarhó."** O Gratz. *Kisérlet Kozlemények* 33, 27–34(1930) —Tarhó is a kind of sour milk made in Hungary at 40–50° Its microflora consists chiefly of *Thermobact lactis* Orla Jensen and *Streptococcus thermophylus* Orla Jensen It is somewhat similar to yoghurt, etc Analyses give water 88 25 dry matter 11 75, fat 1 40, casein 3 99, albumin 0 14, albumose peptone 0 34, milk sugar 4 50, lactic acid 2 00, ale 0 37 and ash 0 85% S S de Finály

**Composition of creams from Miskolc and environment.** I Pásztor *Kisérlet Kozlemények* 32, 317–26(1929) —188 cream samples of Miskolc (Hungary) were analyzed They averaged 18–20% fat and 6 8–7 0% dry matter content S S de F

**Composition of Hungarian curds, butters and creams.** J Kupits. *Kisérlet Kozlemények* 32, 179–84(1929) —Water content of curds of Dunántul was 69–73% in 1927 and 68–73% in 1928, 56 and 35%, resp., of samples were adulterated Butters contained water 15 8–29.23 and 39%, resp., 71% of samples were found adulterated with water Creams contained fat 12 5–19 5 and 17 2%, resp., 23 7% were adulterated S S de Finály

**Ice-cream standards.** Wm C Geagley. *Ice Cream Trade J* 27, No 3, 34(1931)—The possibility is considered of standardizing ice cream in regard to fat, total solids, sucrose and various flavors and colors A H Johnson

**How temperatures should be used to insure quality ice cream.** H F Judkins. *Ice Cream Trade J* 27, No 2, 31–2(1931) —The manner in which temp affects ice-cream mix and ice cream in relation to the quality of the finished product is discussed Defects in quality caused mainly by improper temp are coarseness, iciness and sandiness A H Johnson

**The selection and use of flavor in making chocolate ice cream.** W. H Martin *Ice Cream Trade J.* 27, No 4, 39–41(1931) —Several com chocolate sirups were analyzed

and found to vary in their content of moisture, fat, starch, ash and sugar. The variations in these constituents of the com chocolate sirups had considerable influence on the properties of ice-cream mix and ice cream Ice creams prepd with cocoa or chocolate liquor were superior in flavor to those prepd. with the com chocolate sirups
A H JOHNSON

**What effect has pasteurization on the freezing of mix?** E L. REICKART. *Ice Cream Trade J* 27, No 2, 35(1931) —Pasteurization time and temp are shown to have considerable influence on the freezing and whipping properties of ice-cream mix
A. H JOHNSON

**Recent developments in refrigerating equipment.** R S WHEATON. *Creamery and Milk Plant Monthly* 20, No 4, 71(1931) — A review is given of the application to the dairy industry of developments in refrigerating research and equipment
A H JOHNSON

**Data on the composition of Hungarian butters.** I SZANYI *Kisérlet Közlemenyek* 31, 45-52(1928) —Twenty seven samples of Dunántul (Hungary) butter were analyzed in 1927 The water content averaged 14 4%, fat 83 6%, R M. no 26 26, I no 40 8 sapon no 216 2 and $[\alpha]_D$ 43 2
S S DE FINÁLY

**Data on the estimation of butter pastries.** Á MILLIG AND I KORPÁCZY *Kisérlet Kozlemenyek* 33, 349-58(1930) The estn of butter pastries on the basis of fat analysis is very difficult since the quantity of fat is very small and contamination by the fat of wheat flour and by the greasing oils of the distributing machines and baking plates may influence the results Nineteen different pastries were baked with various quantities (1–4%) of different fats and fat mixts The fat content on the basis of the dry material, *n*, I no., Reichert Meissl no and Polenske no were detd in the product The *n*s of butter, margarine, lard, coconut oil, table oil and wheat oil increased as a result of the baking The I no also increased except for table oil and wheat oil The Reichert Meissl and Polenske nos decreased in each case Expts were carried out to det how much greasing oil can get into the pastries 0 22% grease was taken up in case of very liberal greasing This amt in relation to about 1–2% butter content may influence very strongly the fat characteristics 352 butter and margarine pastries were examd by the Food Control Station of Budapest in 1928–29, and it is proposed that at least 5% butter should be prescribed for butter pastries The Reichert-Meissl no is the most important characteristic, but larger amts of fat are needed for its detn A new method is being worked out to make possible detns for 0 5–1 g fat S S DE F

**Bacillus amylobacter interferes with the manufacture of cheese from pasteurized milk.** O. GRATZ. *Kisérlet Kozlemények* 33, 260-8(1930) —The manuf. of Emmenthal cheese may be greatly interfered with by swelling if the milk is contaminated with anaerobic, gas producing, spore forming bacteria, since they and their spores are not killed by heating to 60° for 30 min Contaminated milk cannot be purified by pasteurization
S S DE FINÁLY

**The manufacture of processed cheeses. I. Change of water content during melting.** I. PÁSZTOR. *Kiserlet. Közlemények* 32, 492-4(1929) —The water content of Emmenthal cheese increased 8 8%, that of Romadour cheese 6 3%, during melting The av water content of first-class Emmenthal processed cheese is 42–46%; that of Romadour cheese, 50–55% **II. Controlling the hardness of processed cheeses.** *Ibid* 33, 268-71(1930) —The hardness is mainly influenced by the water content Citrate, citric acid and $Na_2HPO_4$ play only insignificant roles The hardness of processed cheese is greater than that of the original cheese if the water content is under 40%, it is about the same at 40–43% water content, and the product is soft cheese over 46% water content **III. Determination of $p_H$ of processed cheese by means of a quinhydrone electrode.** *Ibid* 307-16 —Dilu of a cheese soln greatly increases the $p_H$ value Cheese, therefore, should be mixed with only 1–2 parts water. Filtering is not necessary The potential is const for only 5–20 min after addn of the quinhydrone the detn should be made at once
S S DE FINÁLY

**Why stanniol paper turns black from processed cheeses.** I. PÁSZTOR. *Kisérlet. Kozlemények* 33, 316-24(1930) —Expts made with *Bac amylobacter, B putrificus* and with $H_2S$ water proved that $H_2S$ did not cause any blackening Investigations showed that the blackening has 2 phases: (1) Sn is dissolved under the influence of the chemicals used to produce processed cheese, *e g*, citrates. Soln is helped by air and higher temps; (2) Sn-Sb galvanic elements are formed and SnO produced by anodic oxidation causes the black color This process seems to take place at a higher $p_H$, mostly above 5 8
S S DE FINÁLY

**The specific gravity and water content of coagulated cheese. The object of subsequent stirring in the manufacture of Emmenthal cheeses.** K. VAS. *Kisérlet*

*Kozlemenyek* 33, 377–85(1930).—The detn of sp gr in salt soln is interfered with by diffusion. A mixt of $CHCl_3$ and $C_6H_6$ evaporates quickly. A mixt of paraffin oil and $CCl_4$ is very viscous and retains air bubbles. Rapid sp gr detns can be made with the hydrometer scales of Nicholson. Investigations proved that the sp gr increased (from 1.076 to 1.073) and the water content decreased (from 58.88 to 40.03%) during subsequent heating and stirring. The object of the subsequent stirring is not to dry the cheese, but to bring about such a phys. state that the excess whey could be filtered off the cheese particles. The measurement of sp gr is therefore not enough for the evaluation of coagulated cheese. S. S. DE FINÁLY

**Analytical microscopy of commercial egg albumin.** S. MENDELSOHN. *Chemist-Analyst* 20, No. 3, 4–5(1931).—Desiccated, com. egg white may contain dried milk, casein, starch, $H_3BO_3$ or $Na_2B_4O_7$. The turmeric test will detect borate and the I test starch. Examn. under the microscope will show, first, the amorphous particles of albumin as translucent, irregular masses bounded by rounded edges. A drop of clove oil will obliterate these outlines. Red, yellow, black or brownish particles will reveal the presence of coagulated residues. By heating over a low flame the albumin will be fixed and colored yellow by the clove oil. In the absence of coagulated albumin, any dried milk particles will be observed in bold relief in contrast to a nearly clear field. Comparison under the microscope with samples of known purity is advisable. W. T. H.

**Chemical analysis and vitamin B determination in unpolished rice grains kept in tightly closed vessels.** M. KONDO AND T. OKAMURA. *J. Sci. Agr. Soc.* (Japan) 1929, 183–204 (in German 205); cf. *C. A.* 23, 3493.—Rice kept 4 years in straw sacks showed marked decrease in the content of ash, fats and proteins, whereas rice kept 4 years in sealed tin cans filled with either $CO_2$ or air did not show any decrease in those constituents. The vitamin B content of the rice kept for 4 years in sealed tin cans was the same as that of rice half a year old. Unpolished rice kept in sealed tin cans is free from insect attack and keeps its germinating power with little change in its phys. and chem. nature even after several years. K. SHINOHARA

**The use of benzoic acid in chopped meat.** TJADEN. *Arch. Hyg.* 104, 184–96 (1930).—Prepns. contg. benzoic acid or Na benzoate can be used only with fresh meats since the prepns. do not remove evidences of decay nor inhibit bacterial growth already at its height. The addn. of the prepns. to fresh meat tends to prevent the development of bacteria and appears to be a harmless practice. E. R. MAIN

**Composition of Hungarian honeys in 1928.** J. STITZ. *Kisérlet. Közlemények* 32, 536–45(1929).—Thirty two samples from counties Baranya and Somogy showed an av. water content of 14–22.5%. Glucose and fructose contents were also detd. S. S. DE FINÁLY

**Albumin content of Hungarian honey.** J. STITZ. *Mezogazdasági Kutatások* 3, 25–8(1930).—Peptones and globulin were present and some albumin. Protamines, alc.-sol. albumins, histones, albumoses and albuminoids could not be detected. Diastase, invertase and catalase were present. There were traces of A, B and C vitamins. S. S. DE FINÁLY

**Studies of methods used to detect heated honeys.** G. H. VANSELL AND S. B. FREEBORN. *J. Econ. Entomol.* 23, 428–41(1930).—Heat produces chem. changes in extd. honey. Overheating renders the honey undesirable and it is often condemned by European importers. Methods used to detect heated honeys are based upon (1) destruction of diastatic activity and (2) the production of furfural derivs. from levulose by heating. If diastatic activity is absent and furfural derivs. are present in small amts., the honey is declared to be overheated. The *diastase test* is of doubtful value (*C. A.* 24, 898) because the diastase of honey is not a product of the metabolism of the bee but is derived from flower pollen. Some honeys are so lacking in pollen that they are deficient in diastase and would be rated as overheated. The Fiehe test as used in Germany for hydroxymethylfurfural is made as follows: grind 5 g. honey and dissolve in anhyd. $Et_2O$. Evap. the $Et_2O$ ext. at room temp. and moisten the residue with a freshly prepd. soln. of HCl (d. 1.19), 100 g. contg. 1 g. resorcinol. A strong cherry red color lasting at least 1 hr. indicates the presence of artificial invert sugar, a weak, quickly disappearing orange to pink color is considered to indicate overheating. Lampitt, Hughes and Rooke (*C. A.* 24, 1162) find that the Fiehe test is not positive until sufficient heat has been applied to the honey to change its color and flavor. V. and F. obtain the same results with freshly extd. honeys, but extd. honeys 1–3 yrs. old that have been allowed to crystallize give a positive Fiehe test (German method) before heat has been applied. When honey crystallizes the levulose concn. of material in soln. increases 40–60%, it is assumed that the acid content also increases. This

greater concn of levulose may account for the increased formation of furfural The increase in time to give the reaction depends somewhat upon the levulose dextrose ratio It may be hastened by increasing the acid concn even when the honey has not crystallized Conclusion The diastase and Liebe tests are not reliable tests for overheating unless the pollen count is taken into consideration If the pollen count is 3000 pollen grains or more per g honey and the diastase test is negative, the honey has been overheated C H Richardson

**Further observations on the deterioration and spoilage of honey in storage.** George I Marvin *J Econ Entomol* 23, 431–8(1930).—Fermentation of honey caused by sugar tolerant yeasts is one cause of its deterioration Granulation of honey offers conditions conducive to the growth of the yeasts The by products of fermentations which cause off flavor are $CO_2$ alc (which rarely exceeds 5%) and a non volatile acid Honey which is to be sold in small containers should be heated to 71° and sealed while hot, then cooled quickly It should be stored below 12° C H Richardson

**Freezing and melting points of fruits and vegetables.** Aubrey L Smith *Refrigerating Eng* 21, 272–3(1931) The f ps of the juices expressed from 10 fruits and 14 vegetables are given The lowest f p found was 28.40° F for grape juice and the highest f p was 31.82 F for lettuce juice A H Johnson

**Abnormalities in the composition of oranges.** P R v d R Coetzee *South African J Sci* 27, 310–6(1930); cf *C A* 24, 2208 To det the compn of a "normal" orange, analysis was made each week for 3 months of 24–30 oranges selected from different trees in the same orchard Detns were made for sol solid, sugar and acid Detns of d, were made and converted to sol solid (Cf *C A* 19, 1881; 23, 3487) As the fruit develops, sol solid and sugar content increase, while acidity decreases It was thought that oranges from different trees would not show large deviation from the mean values, but the results indicated a wide variation in the compn and hence the difficulty of obtaining a fruit of normal compn The oranges from 2 of the trees gave very different analyses from those of the other trees with respect to (1) rate of change of sol solids with time, and (2) av values for sol solids, sugar and acidity By using the method of analysis of variance by Fisher, it was shown that the data obtained on oranges from these 2 trees should be omitted because of the deviation from the mean values. The results show the importance of analysis of the oranges in order to eliminate trees bearing abnormal fruit and thus insure the uniformity of the crop N. M. N.

**Hungarian condensed tomato juices.** I Iványi. *Kísérlet Közlemények* 33, 82–8 (1930).—*Samples in 1928 contained 14–31% dry matter, in 1929 15–35% dry matter,* with an av. of 24–25%. 50–61% of this consisted of invert sugar and 4.6–5.9% of oxalic acid Hungarian juices are not salted or oiled artificially. S S de Tináy

**The analysis of ground coffee, in connection with the requirement of the Dutch food law.** W F Donath *Pharm Tijdschr Nederland-Indië* 7, 310–2(1930).—Several samples of ground coffee with good chem consts were shown by microscopic examn after boiling with $HNO_3$ and then with KOH to be roasted Indian corn The most adulterated coffee had the highest ext, but the requirement of a max ext value does not insure purity Besides chem analysis, a microscopic examn should be required, for this the app of Ezedam is recommended D R Koolhaas

*Bleaching almonds.* A A Ramsay and G W. Norris. *Agr Gaz N. S Wales* 42, 153–4(1931).—Almonds off in color, but not stained black, were successfully bleached by immersing the nuts in 1% $H_2SO_3$ for 2–5 min., or in a 0.5% soln for 5–10 min., followed by drying the nuts in thin layers *Almonds badly stained (black at the base* of the nut) were successfully treated by the following methods: (*A*) The nuts were immersed for 20 min in chloride of lime (1 oz per gallon) acidified with AcOH, and after drying for 1 day were dipped in 1% $H_2SO_3$ for 5 min and again dried (*B*) Similar treatment to (*A*), but after drying the 2nd time the nuts were washed in several changes of water and dried as before (*C*) The nuts were immersed for 5 min in 1% $H_2SO_3$, dried for 1 day and spread out in thin layers They were washed with water and again dried, then dipped for 20 min in chloride of lime acidified with AcOH and dried as before K D Jacob

**Determination of essential oils in spices according to Griebel.** L. Benedek. *Kisérlet Közlemények* 33, 99–102(1930).—A modification of the method of Griebel (*C. A* 20, 3516) A 500-cc shaking cylinder with glass stopper is used instead of a separatory funnel Data agree to 0.1% S S de Tináy

**Experiences on the quality of powdered pepper.** I Horváth. *Kisérlet Közlemények* 32, 546–54(1929).—Contents of ash, sand, sandless ash, crude fibers and $CaCO_3$ and microscopic examn. were used as the basis of evaluation A modification of the

method permits extn with alc in 3 hrs instead of 30 hrs The ash content varied from 4 60 to 8 96%, sand 0 14 2 88%, alc ext 7 10 10 70% S S DE FINÁLY

**Capsaicin reaction and evaluation of paprika.** K FODOR *Kisérlet Közlemények* 33, 155–78(1930) —With NOCl, capsaicin gives a blue color in solns of acetone, of ether or of chloroform and gives a green color in oil solns This reaction can be used for the detn of capsaicin in paprika Shake 2 g dry paprika with 10 cc. acetone, then centrifuge and filter Treat 5 g of filtrate with 0 45 g coned HCl and 0 1 g $NH_4VO_3$ The color must be detd within 20–30 sec., as troublesome reactions take place Another method is an ether ext is made according to the method of Rozsényi and the ext is dropped in a soln of NOCl, Evaluation of paprika should be made on the following basis (1) color and taste, (2) microscopic examn., (3) content of capsaicin, (4) content of sand and ash and (5) ether ext S S DE FINÁLY

**Rapid determination of ether extract of paprika.** I HORVÁTH *Kisérlet Közlemények* 33, 102–5(1930) —A modification of the method of Domötör (*C. A.* 23, 4979) Shaking is done with a machine for 1 min and sedimentation is hastened by centrifuging for 15 min The method is quite as reliable as that of Rozsényi, which is now in use S S DE FINÁLY

**Composition and use of "Old Hickory Smoked Salt."** O. VÁRGA *Kisérlet. Közlemények* 33, 197–200(1930) —The product of a factory at Cincinnati, Ohio, was examd It consisted of water 0 1, NaCl 98 5, $Na_2SO_4$ 0 4, sand 0 1 and org matter 0 9% The taste of the product made with this salt was not so good as that made by actual smoking The drying of the product required 4 days, during which microorganisms multiplied Cocci and yeasts belonging to the genus *Torula* were found, further rod like bacteria were in the flesh near the bones Expts made in a large smokehouse showed that such salt mixts cannot quite substitute for actual smoking S S DE FINÁLY

**Possible uses for plant lecithin.** G HENTZE *Z. Ernähr.* 1, 53–61(1931) —Corn lecithin obtained by the Bollmann method (*C. A.* 17, 3234) from soy beans consists of 60 lecithin and 40% fat. The plant product has the same chem and phys. properties as that from eggs and is cheaper It is possible to use this soy lecithin in place of egg yolk in baking Five tablespoonfuls of a 20% soln correspond to 1 egg F F G

**Composition and forage value of Sudan grass hay.** A ZAITSCHEK AND L. DÖRNER *Kisérlet Közlemények* 31, 336–9(1928) —The compn., digestibility and starch values of Sudan grass hay were not less than those of other Hungarian grasses The digestible albumin content was as high as that of first-class hays S S DE FINÁLY

**Quality of alfalfa hay in relation to curing practice.** T. A KIESSELBACH AND ARTHUR ANDERSON U S Dept Agr., *Tech. Bull* 235, 25 pp (1931) —Approx 75% of the protein of alfalfa is in the leaves, hence N conservation in the curing process is concerned principally in leaf conservation Field expts in Neb showed that the more rapidly the hay can be cured, the better will be the quality The internal moisture of alfalfa stems is lost by direct evapn through the stem epidermis rather than by bleeding at the cut end or by continued transpiration after cutting Turning or scattering the windrows of semi-cured alfalfa had little or no effect on color, leafiness or protein content. In a poultry feeding comparison, field-cured and artificially dried alfalfa hays showed no significant differences in *vitamin A content* C R FELLERS

**The conservation of fodder.** ALOIS KROCZEK. *Listy Cukrovar.* 49, 290–4(1931) —Beet greens were ensiled and deposited in ground pits The tightest packing did not exclude the presence of air, which leads to the formation of AcOH Increase in temp increased the butyric acid content Four regions in the country were selected for the storage, only one expt. was highly successful The beet greens in this instance were deposited in pits very rapidly and without interruptions so that the exposure to air was very short Beet greens stored in concrete silos showed 1 7% lactic acid, beet greens from ground pits, 0 7% Very small quantities of butyric acid formed in silage from concrete silos In cases where the beet greens were exposed to air during a prolonged harvest, the AcOH increased to 1 8% in concrete silos FRANK MARESH

**The use of denatured sugar, molasses, molasses-fodder and sugared cossettes in agriculture** K ŠANDERA *Listy Cukrovar* 49, 302(1931) —The feeding expts at Rostock, Germany, are reviewed briefly FRANK MARESH

**Mahua waste as food for milch cattle.** K. HABIB HASAN AND S R. BHATE. *Proc. 15th Indian Sci. Congr.* 1928, 48–9 —Mahua flowers after fermentation and distn. are fed to milch cattle in India Feeding expts to det. their food value, their effect on the health of the animals and the quality of milk gave on the whole favorable results E J C.

**Manufacture and quality of Hungarian fish meal.** K. LUKÁCS. *Természettud Kozlony* 63, 115–20(1931) —Fish caught in Lake Balaton are dried in a vacuum at about 50° and ground to a meal contg about 8% moisture, 6–8% fat, 3% calcium phosphate and 62 to 68% raw albumin The meal can be used as forage without extg. the fat. S S DE FINÁLY

**Forage value of washed and dried beets with leaves.** V KURELEC. *Kisérlet. Közlemények* 33, 229–33(1930) —Digestibility of forage is greatly increased by a previous washing and drying of beets Data of metabolism are given on the basis of expts with 2 sheep S S DE FINÁLY

**An interpretation of the feeding standards for growing dairy cattle.** J. B. FITCH AND R H LUSH *J Dairy Sci* 14, 116–24(1931) —The Morrison standard for growing dairy animals can be readily used in the majority of exptl trials A table is presented that enables this standard to be interpreted more quickly J C JURRJENS

**"Cereal coffee."** H OHLHAVER. Brit. 339,821, Jan. 2, 1930. The cereal used is caused to undergo "self fermentation" during soaking, and is then roasted. Wheat may be soaked for 20 hrs in cold water or for 8–10 hrs in water at a temp of 25°

**Pipe-system heater for preheating milk before filtering, etc.** RALPH B. BAGBY. U S 1,797,312, March 24 Structural features

**Apparatus for treatment of fruit with volatile agents such as sulfur dioxide.** FREDERIC A EUSTIS (to Virginia Fruit Fumigating Co) U. S 1,797,680, March 24 Structural features

**Apparatus for treating food products (as in sterilizing milk) by direct contact with steam.** GEORGE GRINDROD (to Grindrod Process Corp.) U. S. 1,797,769, March 24. Structural features of app with steam jets for direct injection of steam into the material treated U S 1,798,120 relates to a similar treatment for sterilizing various food products, some of which, such as ice cream mixts and gelatin solns, may be coned after sterilization to a hydrated jelly like condition App is described Cf. *C A*. 24, 4101.

**Treating citrus fruits to prevent stem-end rot and blue-mold rot, etc.** HARRY R. FULTON and JOHN J BOWMAN U S 1,797,572, March 24 An aq soln. of Na aluminate (suitably of about 3% strength) is used at a temp. such as that commonly used for washing fruit, and the fruit is allowed to remain in contact with the soln for 1–10 min and then sprayed to remove most or all of the adhering soln. U. S 1,797,573 relates to the similar use of a Mn sulfate soln

**Margarine, etc.** EINAR LANGFELDT and INTERNATIONALE GRADIN A.-G. Fr. 696,506, May 20, 1930 In processes for the manuf. of margarine, artificial creams or other emulsions rich in fats, the milk or other aq soln. is submitted to a pasteurization at temps between 50° and 90°, preferably about 65°, in the presence of $CO_2$, the liquid being heated to pasteurization temp after absorption of the $CO_2$ or the liquid heated to pasteurization temp is submitted to the action of gaseous $CO_2$ by bubbling, by agitation or by contact with thin layers of the liquid

**Smoking meat and fish.** THE ATLANTIC COAST FISHERIES Co Ger. 520,193, Mar 28, 1929 See Brit 309,405 (*C A* 24, 668).

**Analytical apparatus for washing out starch from flour.** "MIAG" MÜHLENBAU UND INDUSTRIE A.-G Ger 519,370, Oct. 18, 1929.

**Dough ingredients for bread, etc.** A. D. BLANK, H. A. KOHMAN and A. SCHULTZ (to Standard Brands, Inc) Brit. 340,072, Oct. 22, 1928 A prepn. suitable for use in making leavened products without making a sponge comprises a material of acid reaction such as $H_3PO_4$ or Ca acid phosphate, an $NH_4$ salt such as the chloride or phosphate, an oxidizing salt such as $KBrO_3$ or $KIO_3$, an enzymatic agent such as papain, pepsin, Taka diastase or a diastatically active malt ext, and soda for neutralizing acidity during baking These ingredients may be mixed with a diluent such as flour to facilitate uniform distribution with the dough materials.

**Flavoring agent for confectionery.** Deutsche Gold und Silber-Scheideanstalt vorm Roessler Fr 696,872, June 10, 1930. A flavoring material, particularly for confectionery, is made by the reaction of salts of glutaminic acid, *e. g.*, Na glutaminate, with appropriate org. acids such as HCOOH, if necessary in the presence of solvents.

**Drying fruits, etc.** Brinch & Speir Fr 696,910, April 15, 1930. The vitamins are preserved in dried fruits, vegetables etc., by treating the fruit, etc., with acids and salts before drying, *e. g.* with $H_3PO_4$ and NaCl.

**Confectionery cream.** Willy Britschi Swiss 143,006, Feb. 20, 1930. A stable confectionery cream consists of a hot concd. soln. of sugar, grape sugar, eggs and vegetable fat. Harmless aromatic and coloring agents may be added.

**Flue-gas heated roller driers for the manufacture of potato flakes.** Bernhard Schmidt Ger. 517,717, May 5, 1928.

**Radioactivated foods.** Georg Senftner Fr. 695,729, May 16, 1930. Sugar crystd. from radioactive water is added to the usual ingredients and finished in the usual manner.

**Cheese.** Jean M. Dagand Fr. 695,760, May 16, 1930. Cheese is made by curdling milk, breaking it up into a large no. of particles, stirring, heating and afterward placing it in a mold to drain and finally pressing.

**Table salt.** Jean A. Allégre Fr. 695,565, May 14, 1930. A mixt. of NaCl and Mg salts suitable for table use is made by adding a water absorbing substance which tends to adhere to the Mg salt and render it deliquescent, whereby the mixt. does not become damp on exposure to the air. $MgSO_4$ is preferably used, but $Na_2SO_4$ may be used.

**Testing milk.** N. Gerber Co. m. b. H. Ger. 518,978, Aug. 27, 1929. Addn. to 516,423 (*C. A.* 25, 1922). The method of Ger. 516,423 is modified by adding a peroxide to the indicator employed. The test described in the prior patent is thus combined with the detection of colostrum through the evolution of gas due to its content of catalase.

## 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Research in industry—what it is and what it is not—application of knowledge of scientific principles to commercial production.** P. Dunsheath *Electrician* 106, 543–5 (1931).—A discussion emphasizing the need of responsibility and of definite conclusions. W. H. B.

**What's patentable in industrial and chemical engineering?** Charles W. Riviss *Ind. Eng. Chem.* 23, 589–8(1931). G. G.

**Cheaper power for the chemical industry.** W. S. Johnston *Ind. Eng. Chem.* 23, 474–6(1931).—A description of the facilities for the generation of steam and electricity possessed by 2 modern plants. B. A. Soule.

**Electricity and the plastic industry insulating materials.** Wm. D. Owen *The Times Trade and Eng. Suppl.* 28, No. 664, 22–3(1931).—Examples, with illustrations, are given. E. M. Symmes.

**The Bakelite Corporation.** L. V. Redman and A. V. H. Mory *Ind. Eng. Chem.* 23, 595–7(1931). G. G.

**Water as absorption material.** L. Piatti *Kunststoffe* 20, 2–5(1930).—A discussion of absorption by water of various materials including alc., cresol and acetone both in liquid and vaporous phases, with vapor pressure and boiling curves of binary mixts., *e. g.*, EtOH $H_2O$ and acetone water. The literature is reviewed. B. H.

**Evaporation of water by hot dry air.** R. H. Newton and T. C. Lloyd *Ind. Eng. Chem.* 23, 530–2(1931).—Graphs show the relative importance of water flow, air flow and air temp. Water flow was found to be the most important variable. L. A. Pridgeon.

**Drying by spraying in the chemical industries.** W. Kühles. *Chem. Rundschau Mitteleuropa u. Balkan* 6, No. 14, 100–1(1929).—Liquid is sprayed and dried very quickly with warm air. The solvent evaps. instantly. The app. is described. S. S. de F.

**Chemical industry of Bulgaria.** E. Petzall. *Chem. Rundschau Mitteleuropa u. Balkan* 6, No. 14, 91–3(1929).—General review with numerical and statistical data. S. S. de Finály.

**A general algebraic and graphical calculation of the technical work-processes with**

mixtures of two substances. A Weise. *Z ges Kälte-Ind* 38, 17–20, 33–37(1931) — The method is applied to the absorption refrigeration process F D Rossini

Study of methods of determining moisture in sand. S H Grap and R H Johnson *Proc Am Soc Testing Materials* 30, Pt I, 578–9(1930) —Thirteen different methods were studied For total moisture it was found that the oven drying method was most accurate, the gasoline distn method 2nd and drying to const weight with denatured alc 3rd In simplicity of operation the distn method is 1st oven drying 2nd and the alc method 3rd From the standpoint of equipment needed the alc method is 1st and the oven method and the distn method are about equal For surface moisture only, the sp gr method with $ZnCl_2$, $MgSO_4$, $CaCl_2$ and NaCl rank in the order named The A S T M flask is more accurate than the sp gr method with NaCl The colorimetric methods using a weak acid soln of $CuSO_4$ are more accurate than the elec method, but not accurate enough for general use In simplicity the sp gr and A S T M flask methods are about equal The alc method is adapted for use where app for the distn. or oven method is not available To det the point at which the sand is surface dry, the Pearson glass jar method is most simple and is satisfactory enough for control work Everything considered the tests appear to favor the A S T M flask The various methods are briefly described H C Parish

Standardized sieving methods. Alan Probert *Eng Mining J* 131, 311–2 (1931) — Lack of uniformity in sieving data has always handicapped milling operations ' A method is described which promises consistent, reliable results and easy and rapid manipulation W H B

Economics of recovering by-product carbon dioxide. C L Jones. *Ind Eng Chem* 23, 519–23(1931) —The evaluation of by product $CO_2$ as a raw material for the manuf of solid $CO_2$ is governed by the following factors purity, pressure, location, seasonal value, safety factor and time value R D Rumbacher

Analyses of smoke gases. Karl Wollin. *Die Gasmaske* 3, 1–5(Feb., 1931) — In connection with the development of gas masks suitable for firemen a large no of smokes likely to be met in fighting fires were analyzed for their gas contents Some smoke samples were prepd under lab conditions and others were taken from industrial plants and actual fires Air mixed with blast furnace gas varied in CO content from about 1% to about 33%, the latter being practically pure blast furnace gas Smokes from cellar fires varied in CO content from 0.04 to 0.4%, in $CO_2$ content from 0.05 to 3.4%, and in $O_2$ content from 17 to 21%. Smokes from roof fires varied in CO content from a trace to 0.2%, in $CO_2$ content from 0.1 to 2.7%, and in $O_2$ content from 17.7 to 20.7% Smokes from miscellaneous fires varied in CO content from 0.01 to 1.4%, in $CO_2$ from 0.0 to 10.1%, and in $O_2$ from 9.9 to 20.8% There was, of course, a wide variation in the compn of smokes produced under exptl conditions A. L Kibler

Poison gases in industry and in fires. E Smolczyk. *Die Gasmaske* 3, 9–12 (Feb., 1931).—A discussion from the standpoint of the protection of firemen. A. L. Kibler

Furfural as an industrial poison and its determination in air. I. M. Korenman and J B Resnik. *Arch Hyg* 104, 344–56(1930) —The presence of small concns of furfural in the air may be detected by the red coloration produced upon strips of paper treated with a reagent consisting of a mixt. of equal vols of $C_6H_5NH_2$ and 80% AcOH A quant estn may be made by passing the air through $H_2O$ contg the reagent and comparing the resulting color with that produced by a known concn of furfural E. R Main

Antifreeze methanol hazard. Max Trumper. *International Clinics* [41], 1, 85–9 (1931) —From a crit. study of the literature, the conclusion is drawn that "a max permissible concn of methanol for this new use in the radiators of automobiles should be established, such concn being detd by thorough studies made with reference to all types of persons likely to be exposed to its vapors The general public should not constitute an exptl lab for the testing out of a hazard new for the sake of a new industry." A bibliography is appended Joseph S Hepburn

Methanol antifreeze and methanol poisoning. W. P. Yant, H. H Schrenk and R. R. Sayers *Ind. Eng Chem* 23, 551–5(1931) —A status report on an investigation to det the hazards accompanying the use of methanol as an antifreeze Expts limited to breathing of vapors and absorption of liquid through the skin indicate that there is no hazard to health from the reasonable use of methanol for antifreeze purposes. Warning agents to protect against the use of methanol for beverage purposes are recommended A. L. Kibler

**Ocular hygiene in industry.** V. Dr Lieva. *Folia Med.* 11, 290–2(1930). *Bull. Hyg.* 6, 20–1(1931). A brief description of interest to ophthalmologists in industry. Effect of lighting, certain irritating gases from chem. factories, dust from metal or stone, intoxication from Hg, P, nitrobenzene and As are described. The preventive aspect is barely touched. GEORGE R. GREENBANK

**Commercial and war gases and the chemistry of protection against them.** J. Erdos. *Chem. Rundschau Mitteleuropa u. Balkan* 7, No. 15, 28–33(1930).—A detailed account of different noxious gases, of methods of preventing their toxic action and of the compn. of gas mask filters. S. S. DE FINLAY

**Behavior of the catalyst in the canister of the carbon monoxide gas mask.** G. Stampi and J. R. Bancert. *Z. ges. Schuss Sprengst. Wes.* 26, 24–6(1931).—Gas mask canisters for all gases except CO depend upon the principle of phys. or chem. sorption and their useful life is detd. by the amt. of gas absorbed. In the CO mask, however, the amt. of CO absorbed plays an insignificant part in its useful life, which depends in large measure upon the other foreign gases in the atm. It is especially sensitive to moisture and for this reason must contain a very efficient drying agent. S. and B. describe the behavior of the CO canister when other poison gases, both alone and in addn. to CO are present in the air. With an air flow of 30 l. per min. and a toxic concn. of 1 vol. %, the amts. of toxic gases in g. taken up by the Drager CO canister and the breakpoints in min. are as follows: phosgene 3.4 g., 27 min., $Cl_2$ 7.2 g., 81 min., HCN, 3.3 g., 98 min. $SO_2$ 18.5 g., 232 min. $H_2S$, 19.9 g., 467 min., $NH_3$ 2.3 g., 108 min. $CCl_4$ 8 g., 41 min. $C_6H_6$ 10 g., 103 min. The effect of other gases in addn. to CO was detd. by passing a continuous air flow of 30 l. per min. through the canister. During the first hr. of the tests CO and another toxic gas were added to the air stream. These were then omitted for ½ hr. and added again for another hr., etc. The concn. of CO was 0.5 vol. %, while the concn. of the other gas used varied. The relative humidity was 30% in all cases but one, when 90% was used. The breakpoints for the second toxic gas were detd. and the points of max. allowable concn. in the exit gas for CO. The results are shown by curves from which the following points are taken:

| Second gas added | Breakpoint for second gas, total hrs. | Max. allowable concn. CO, total hrs. |
|---|---|---|
| None | | 60 |
| 0.05 vol. % $H_2S$ | 15.5 | 24 |
| 0.026 vol. % HCN | 10.75 | 19 |
| 0.031 vol. % $SO_2$ | 21 | 15.5 |
| 0.015 vol. % $Cl_2$ | 13.5 | 14 |
| * None, but with 90% relative humidity | | 11 |

The catalyst (Hopcalite) is poisoned to an equal extent by the following parts of the gases named: $Cl_2$ 10, $SO_2$ 23, HCN 25, $H_2S$ 58, $H_2O$ vapor 150 (drying agent present). Concns. shown on curves are 10 times those shown in the text and are probably in error. A. L. KIBLER

**Misleading propaganda on refrigerants.** J. B. Critchell. *Refrigerating Eng.* 21, 269–71(1931).—C. replies to a report of the committee on poisonous gases of the American Medical Association in which the use of methyl chloride as a refrigerant is discussed. A. H. JOHNSON

**New applications of low-temperature freezing.** Frank Zumbro. *Refrigerating Eng.* 21, 253–64(1931).—The application of the quick freezing process to *peaches* and *ice cream* is discussed. Temps. between −15° and −35° F. have been found suitable, but in general the more rapidly the peaches can be frozen or the ice cream hardened the more satisfactory will be the results. The refrigerant used for obtaining the low temp. is usually $CO_2$. However, by combining an $NH_3$ and a $CO_2$ cycle, a combination is obtained whereby the very high pressures commonly used in $CO_2$ plants are eliminated. A. H. JOHNSON

**Problems of insulation.** F. Moll. *Korrosion u. Metallschutz* 7, No. 2, 39–41(1931).—Insulation of metals against the access of moisture by means of impregnated cellulose fibers has not proved entirely successful in that the fiber in spite of impregnation picks up water. Cables are found pitted because of corrosion due to the presence of water. The absorption of water by the fibers is attributed to the presence of a unimol. layer of water on the crystal faces at the intermol. boundaries. The presence of this layer is indicated in that the quantity of water absorbed by a unit quantity of cellulose when exposed to a humid atm. corresponds exactly to the quantity of water estd. from the dimensions of the mols. and the assumption of a unimol. water layer. B. E. ROSTHEIL

Estimating the hygroscopicity of materials in factories and warehouses. THOMA & CO. Swiss 142,491, Nov. 23, 1929. A sample of the material being manufd. or stored, *e. g.*, cotton, is tested in a balance, and from these data the hygroscopicity of the treated material is detd.

Heating processes. ALLGEMEINE ELEKTRIZITÄTS-GES. Ger. 521,139, July 23, 1925. Heat is conveyed to smelting furnaces, welding app., etc., by passing a di- or poly-atomic gas, preferably H through an elec. arc or other heating means capable of dissociating a substantial part of the gas, and leading the gas to the app. to be heated, where the atoms recombine to mols., with liberation of heat. Addnl. details are given and app. is described.

Catalytic reactions. ALFRED REIS. Fr. 696,131, May 26, 1930. In org. catalytic reactions, the contact masses are in intimate contact with heat-conducting metallic surfaces which are placed in the contact chamber parallel to the direction of flow of the gas.

Electrothermal reactions. BUFFALO ELECTRIC FURNACE CORP. Fr. 697,108, June 5, 1930. Reactions of solid powders at high temps. are carried out by passing the materials through a hollow electrode from the end opposite to the arc in a furnace. The electrode is maintained at a high temp. so that the reaction is complete before the materials reach the end of the electrode.

Separating gas mixtures. AMERICAN SMELTING & REFINING CO. Fr. 697,055, June 2, 1930. A mixt. of gases, such as gases from metallurgical app., is dried and sepd. by passing the mixt. through an adsorbent material satd. with one of the constituent elements and allowing the water contained in the mixt. to replace the constitutive element in question in the adsorbent material. An app. is described. *Cf. C. A.* 25, 2105.

Separating gases by liquefaction. ARTHUR SELIGMANN. Ger. 520,287, Feb. 20, 1930. A method and app. are described for removing residues of liquefied gas from the plant when the latter is shut down.

Removing phosphine from gases. SOC. D'ÉTUDES SCIENTIFIQUES & D'ENTREPRISES INDUSTRIELLES. Fr. 696,512, May 21, 1930. $PH_3$ is removed from gases contg. it in small quantities, *e. g.*, H obtained by the reaction at high temp. and pressure of P with water, by treating the gas at a high temp. with O or an oxidizing gas. If air is used in suitable amt. a gas contg. H and N in the proportions for *making* $NH_3$ may be obtained.

Recovering inflammable solvents. JEAN H. BRÉGEAT. Ger. 520,076, Aug. 28, 1928. Vaporized inflammable solvents are condensed by bringing the vapors into direct contact with blocks of compressed $CO_2$ snow. The gaseous $CO_2$ thus liberated acts as a protective gas against fire.

Colloidal solutions. HANNS STAMMREICH and WILHELM NOTHER. Ger. 521,203, Dec. 25, 1927. In prepg. colloidal solns. with the use of protective colloids, the ma-

terial to be colloidized and the protective colloid are produced simultaneously from one soln or liquid Thus, a colloidal soln of AgCl and $SiO_2$ may be prepd by adding HCl to a soln of $AgNO_3$ and water glass, or an organosol of Ag and C may be prepd by passing an arc through a suspension of a Ag salt in paraffin, or through paraffin between Ag electrodes

**Stabilization of solutions, emulsions and suspensions by lignin derivatives.** CHAS F CROSS and ALF ENGELSTAD Ger 516,566, Sept 18, 1926 See Brit 263,620 (*C A*. 22, 162)

**Automatically controlling density or character of solutions or mixtures by differences in their light transmission.** WM A DARRAH U S reissue 18,005, March 24 A beam of light passed successively through the material to be controlled and a standard may serve to *control dye solns* operations such as *bleaching and filtering of sugar solutions* or regulation of the *d of wood pulp aq mixts* Numerous details and elec features are described This pat is a reissue of the original pat. No 1,746,525, issued Feb 11 1930

**Purification of liquids by distillation** GEORGES L. GARDEL Fr 695,266, May 7, 1930 The mass of liquid to be purified is first heated to a temp near the lowest b p of the components and an inert gas or dry steam is introduced under high pressure The gas is adsorbed and by expansion produces a lowering of the temp while at the same time carrying over the mols A suitable app is described

**Liquefying chlorine** KREBS & CO., G M B H Ger 514,070, April 6, 1929 The condenser comprises a no of practically horizontal tubes arranged one above another and connected at the ends by vertical mains The gas is supplied at about the middle of one main, and the liquefied Cl is collected at the bottom of the other main, the unliquefied impurities escaping up the outflow main

**Removing liquid from gelatinous colloid emulsions.** WILFRED S ROTHERA, STANLEY BLYTHEN and H R GILLESPIE (Kurt Ripper, inventor) Ger 517,734, July 28, 1923 For producing hardened objects, emulsion colloid is set in molds permeable to heat, and formed of porous walls which allow passage of the liquid, but not of the colloid The molds may be heated Cf *C A* 19, 1464

**Separating mixtures of liquids** N.-V DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ Fr 696,324, May 30, 1930 A liquid mixt is sepd into its constituents or groups of constituents by submitting the mixt to the action of 2 liquids circulating in countercurrent and which are very insol in one another, these auxiliary liquids being so chosen that the constituents or group of constituents are divided between them in different proportions The auxiliary liquids have preferably different sp wts and one of the liquids may be miscible with the mixt to be sepd

**Separating mixtures of materials of various degrees of granularity by sedimentation.** *CHEMISCHES LABORATORIUM FÜR TONINDUSTRIE UND TONINDUSTRIE ZEITUNG H* SEYER & E CRAMER G M B H Ger 517,980, July 26, 1929 Details of the heating and agitating of the sedimentation liquid, and of the app., are given

**Lixiviating materials** GEORG WEISHEIT Ger 517,920, June 23, 1927. App for lixiviating materials, especially ores contg nitrates or chlorides under heat and pressure, is described Countercurrents of lixiviating liquid are forced through the heated material

**Substances in uniform particles.** I G FARBENIND A.-G Fr. 696 096, May 26, 1930 Fusible org or inorg substances are transformed into particles of uniform size by dividing the fused substances at a temp near the solidification pt by means of rotating disks or centrifuges, regulating the speed of rotation so that spherical particles are obtained and solidifying by cooling with a gas or liquid

**Pulverizing vegetable matter.** SOC ANON POUR L'IND CHIM A BALE Swiss 143,521, Apr 11, 1928 The method is similar to those of 128 855 and 139,324 (*C A* 25, 776), *i e*, the temp is lowered to cause the material to congeal, after which it is pulverized This method facilitates good extn

**Drying crystalline or other materials** GUTEHOFFNUNGSHÜTTE OBERHAUSEN A.-G Brit 340,057, Oct 8, 1928 Materials which may be in cryst dust like, granular or lump form or in blocks or other shaped masses are dried by making them resistances in the circuit of a high frequency elec current, and the drying may be assisted by a stream of gas

**Refrigerators.** SIEMENS-SCHUCKERTWERKE A.-G Fr 696,118, May 26, 1930 In an absorption refrigerator, a working agent is used which boils at atm pressure in the neighborhood of 100° and the m p of which is below the evapg temp entering into account for the production of cold A soln of ethyl isoamyl ether in paraffin oil or a soln of toluene in quinoline may be used

**Refrigerating agents.** Compagnie française pour l'exploitation des procédés Thomson Houston Fr 695,806, May 20, 1930 HCOOMe is used as a cooling agent, particularly in refrigerators

**Refrigerating agents.** Frigidaire Corp Fr 696,546, May 28, 1930 An absorbent material for refrigerating agents is composed of a mixt of a solid (such as $SrCl_2$) capable of forming a chem combination with the refrigerating agent and $LiNO_3$, the latter being 4–10% preferably 5%, of the total mixt and being in the liquid state under working conditions

**Foam prevention during refrigerating.** A Borsig G m b H (Gustav Jansen, inventor) Ger 520,120 July 11, 1929 Foaming of the brine is prevented by addn of oil

**Heat insulation.** Paul E Klopsteg (to Central Scientific Co) U S 1,707,265, March 24 Heat resisting walls suitable for still jackets, etc, comprise a molded thick porous layer of heat insulating material such as diatomaceous earth 75, hydrated lime 12.5 and asbestos fiber 12.5% and a molded facing layer of dense heat resisting material such as diatomaceous earth 75 and portland cement 25%, the 2 layers being molded one on the other and having about the same coeff of expansion

**Protection and heat insulation of iron tubes.** Rudolf Hirschler Ger 521,077, Nov 16, 1927 The tubes are thinly coated with nitrocellulose or like cellulosic material, dipped in a hot bath of asphalt bitumen or tar, and then rolled under pressure in powd asbestos, talc or kieselguhr

**Electric insulating compositions.** I G Farbenind A G. (Max Hagedorn, inventor) Ger 519,457, Sept 27, 1927 The compns consist of (or) contain cellulose esters of higher fatty acids, or mixed esters or ether esters contg higher fatty acid radicals

**Thermal insulation for electrolytic cells.** James N Smith (to Westinghouse Elec. & Mfg Co) U S 1,707,374 March 24 Structural features

**Impregnating fibrous insulation, etc.** Standard Telephones & Cables, Ltd, T R Scott and T N Riley Brit 330,911, Sept 18, 1929 In operations such as the manuf of high tension cables, elec condensers, etc, the insulation is dried and exhausted, and, before impregnation, residual air is replaced by the vapor of a substance which vaporizes under the temp and low pressure conditions prevailing in the impregnating vessel and which is condensed to a liquid or solid under the conditions of temp and pressure in service The lead sheathing of a cable may serve as the impregnating vessel and preferably the substance used is such as to condense during impregnation Among the materials which may be impregnated are paper, textile materials, fiber boards, asbestos and wood, and as impregnating substances there may be used, hydrocarbon oil with or without resins, tars, bitumens, resins and synthetic resins in soln, cellulose acetate solns, S, paraffin, ceresin, beeswax, halogenated waxes such as chlorinated naphthalene and petroleum jellies Methylnaphthalene and biphenyl also may be used They are stated to reduce the dielec losses in the finished cable Numerous details of procedure are described, and substances of high sp inductive capacity such as glycol or ethylene glycol may be used in condenser manuf

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Developments in western municipal water-supply practice.** Harry N. Jenks. *Eng News Record 106, 418–40(1931)*—Consideration of existing supplies from distant mountain watersheds leads to the conclusion that it may be less expensive and more reliable to filter the water than to provide the increasingly elaborate watershed protection now demanded Practically all mountain sources, through either natural or artificial causes, are becoming less desirable in regard to quality and in recent years the water from practically every source, even under apparently ideal conditions of mountain catchment area, has been subjected to some form of treatment In California, the most striking development is the reclamation of water from municipal sewage and storm water drainage. Some of the salient characteristics of western municipal water supplies and comparative cost statistics are tabulated R. E Thompson

**Ground water in eastern and central Montana.** Eugene S Perry. *Mont. Bur. Mines and Geol Mem* No 2(1931)—A report on the occurrence of artesian water in Montana, the effect of geological structure upon this occurrence, and the chem compn. of various types of ground water Curtis L. Wilson

**Operating conditions at Elbe Waterworks and pretreatment of Altona ground water supply** LICHTHEIM *Gas u Wasserfach* 74, 237–44(1931) —A description of the pumping plant and rapid filter is given with special reference to difficulties encountered in the very cold January of 1929 Acidified ($H_2SO_4$) clay suspensions are added to water before rapid filtration to improve filtration The deep wells are described and illustrated R. W RYAN

**Oberhaus water works with quick filter plant and infiltration plant for augmenting ground water** HEINRICH KRING *Gas u Wasserfach* 74, 193–9(1931) —Costs of operation are given for filter and infiltration plants and details of operations Illustrated R. W. RYAN

**Chemical and physicochemical investigation of the sulfur-bearing mineral waters of St. George in Angarano. (Bassano del Grappa)** G BRAGAGNOLO *Ann chim applicata* 21, 12–26(1931) —An extensive examn of these waters was made indicating the presence of 2 3 cc of $H_2S$ per l of water at 0° with 0 08 g solids (mostly Ca and $Mg(HCO_3)_2$ The therapeutic value of the waters was not investigated A W C

**Gravity water-supply in Franklin, Tenn.** PARK MARSHALL. *Am City* 42, No 3, 7(1930) —Well water brought 12 miles and stored in a reservoir and in an elevated tank is chlorinated C H BADGER

**Automatic chlorination of a gravity water-supply.** PERCY R. SANDERS *Am City* 42, No 3, 94–5(1930), cf *C A* 24, 1445, 5397 C H BADGER

**The chlorine-binding capacity and the potassium permanganate requirement of water and sewage.** E BARTH *Arch Hyg* 104, 318–29(1930) —Addns of urea and sugar increase the Cl no of boiled tap water, but do not affect the Cl requirement Both are increased to a greater degree by the addn of ferrous salts or nitrites than by ferric salts or nitrates Cl in a concn of 1 mg per l has a marked bactericidal effect on tap water, the bacteria requiring less Cl than an equal wt of org substance A concn of 20 mg per l is required to produce a marked decrease in the bacterial count of sewage E R MAIN

**The analysis of water.** V MADĚRA *Chem Listy* 25, 13–14(1931) —A critical review of analytical methods used in $H_2O$ analysis FRANK MARESH

**Improved water sample bottle.** Ross L. LAYBOURN *Am J Pub. Health* 21, 419–20(1931) —Glass stoppered, metal capped bottles of a type which can be purchased from a physician s supply house are used J A KENNEDY

**Mixing basins—time of mixing** JOHN R BAYLIS *Water Works and Sewerage* 77, 279(1930) —Mixing periods in filtration plants vary from 3 to 90 min but generally the mixing time in newer plants is 30 to 60 min Factors that influence time of floc formation are quantity of coagulant, time of mixing, temp , violence of agitation and character of water C C RUCHHOFT

**Odor and taste control at Charleston, W. Va.** LAWSON HAYNES *Water Works and Sewerage* 77, 266(1930) —See *C A* 25, 1308 C. C RUCHHOFT

**The Kempton Park Primary Filters of the Metropolitan Water Board.** S WALKER *Water & Water Eng* 32, 562–7(1930) —A general description of the construction of the plant EDWARD S HOPKINS

**Prechlorination of filters.** JOHN F. KINGSLEY *Water Works and Sewerage* 77, 194–5(1930) —Prechlorination of the raw water at Newburgh, N Y , has accomplished several beneficial results without any significant increase in cost of operation Pre chlorination eliminates short filter runs reduces the size and the number of the mud balls eliminates surface cracks and wall cracks in the sand bed and removes the color more readily without increasing the coagulant dose High velocity washes are not necessary when water is prechlorinated C C RUCHHOFT

**Washing rapid sand filters.** ANON *Public Works* 61, 49–51(1930) —Studies were made over a period of 2 years at the Detroit Experimental Filter Plant Shrinkage of filter sand bed and other attendant filter troubles were overcome by removing the coating from the sand grains and the mud accumulation from the beds By washing the filters at a sufficient rate to obtain 50% or more expansion of the sand coating and shrinkage were prevented permanently A method for cleaning dirty filters is presented It requires the use of NaOH and hosing with a $^1/_2$-inch nozzle. A sand-expansion index for the filter wash is recommended to supplant the generally used index of rate of wash water rise C C RUCHHOFT

**Cold-weather troubles in filtration.** C T HOUGH *Water Works and Sewerage* 74, 260(1930) —See *C A* 25, 1308 C C. RUCHHOFT

**Factors influencing the toughness of coagulated matter.** JOHN R BAYLIS *Water Works and Sewerage* 77, 184–8(1930) —Microörganisms have the greatest influence in shortening filter runs Gelatinous ppts of org origin influence the strength of coagu-

lated matter Increase of temp increases the strength but it is not desirable to increase the temp of the water Changes in chem treatment may produce a stronger flocculation The flocculated turbidity must be very low in the water going to the filter beds when the temp is low to prevent flocculated matter from passing the beds, unless there is something in the water that adds toughness to the flocculated matter C C RUCHHOFT

**Ferric iron coagulation in a plant of unique design.** ALEXANDER POTTER AND WM I KLEIN *Water Works Eng* 83, 949–50, 970–3(1930) —The treatment given at the Westchester Joint Water Works No 1 is described in detail (cf *C A* 24, 5902) The best coagulating results are obtained by mixing not in excess of 10% of the theoretical required amt of dry Cl₂ gas with the iron sulfate soln and applying to the prechlorinated raw water The superiority of ferric iron coagulant over $Al_2(SO_4)_3$ coagulant for this particular water is that ferric iron gives a heavy floc formation with quicker settling, even with low temp and over a wider range of $p_H$, resulting in better plant operation Also in *J Am Water Works Assoc* 23, 719 27(1931) C H BADGER

**Sterilization of water mains.** ELAN P STEWART *Water Works and Sewerage* 77, 191(1930) —Whenever water mains are repaired or new pipes installed liquid chlorine is used to sterilize the section of the main that may possibly have become contaminated Portable chlorinators have proved satisfactory for this work C C R

**Chemical and biological study of deposits on the interior of water pipes.** R. KOLKWITZ AND E BEGER *Gas u Wasserfach* 74, 267 8(1931) —Wood, glass and metal plates were exposed to tap water by means of a special device The plates were then examined microscopically, permitting a convenient biol analysis of the water similar to that obtained by sieving The nature of pipe deposits is discussed R W R

**Conditioning refinery water.** SIDNEY BORN *Natl Petroleum News* 23, No 6, 52–3, 56–7, *No 7* 55 57, 58 60, 61 99 *No 8*, 51 1 56 57, *No 9*, 65–8, 70 *No 10*, 49–50, 52, No 11 70–1(1931) —The following topics are discussed impurities found in natural waters methods and app for testing for hardness alky, causticity, acidity, salt and total dissolved solids the benzidine method for detg sulfates in water, limits of hardness, alky permissible in general purpose waters definition of $p_H$ value, chem reactions involved in water treatment, boiler feed water, loss of heating efficiency due to scale, removal of scale-forming materials, foaming and priming, embrittlement prevention, zeolite treating chemistry of process, operating precautions, construction and operation of soda lime water softeners, intermittent and continuous types, hot and cold processes reduction of scale forming materials; prevention of corrosion, comparison of zeolite and chem type softeners, choosing the softener, boiler compds, water for cooling and condensing drinking water at industrial plants and oil camps, filtration Cl violet ray and ozone treatment, water for treating purposes R W KELLY

**How contamination from pump packing was checked.** ARTHUR F. MELLEN. *Water Works Eng* 83, 1040–3(1930), cf *C. A* 24, 4879 C. H BADGER

**Maintaining chemical balance to resist corrosion and its applications to a recent development in lime-water softening.** CHARLES P. HOOVER W Va Univ. Eng Expt. Sta., *Tech Bull* No 3, 17-24(1930) —See *C A* 24, 3583 G. G

**Maintaining chemical balance to resist corrosion.** CHARLES P. HOOVER *Water Works and Sewerage* 77, 287(1930) —Remedies for preventing corrosion are (1) Water should be preheated to drive off oxygen (2) It should contain 30–50 p p m of alkalies in excess of that required to soften it. The higher the $p_H$ the smaller the amount of iron dissolved (3) Water can be passed through a bed of scrap iron or filings (4) Pipes may be coated with zinc, cement or tar (5) Twenty p. p. m of sodium silicate is sufficient to stop corrosive action almost entirely (6) Water may be so treated that it will deposit an impervious film on the inside of a pipe This film prevents direct contact with iron The film can be built up by satg the water with $CaCO_3$ C. C RUCHHOFT

**Corrosion and conservation of underground structures.** P. J. RICHARDS. *J. Am Water Works Assoc.* 23, 529–33(1931).—See *C. A.* 25, 1609 H. G

**Correcting corrosive water at institution.** G M RIDENOUR. *Public Works* 61, 122-3(1930) —A New Jersey state institution reports a persistent and serious case of corrosive water The water supply is secured from a 260 foot well driven in yellow sand, blue sand and clay Analysis at the well gave: $p_H$ 5 5, $CO_2$ acidity 14 0 p p m, total alky as bicarbonate 10 0 p p m, dissolved O 2 00 p. p. m and hardness 22 p p m The tap water analysis gave, in addn to the above, 4 9 p p. m of ferric iron Installation of a deaerator reduced the acidity to 2 0 p p m and increased the $p_H$ to 6 2, but failed to check the corrosive action The VanHeuser marble test was used to det.

a point of equil between the carbonate, bicarbonate and $CO_2$ such that a slight coating of carbonate would be deposited on pipe surfaces and thus serve as a protection from O or acids Lime was applied at the pump suction in sufficient quantities to maintain a *p*H of 7.7 to 8.0 This treatment resulted in a $CO_2$ acidity of 0.2 p. p. m., a bicarbonate alky of 43 p. p. m. and an occasional carbonate alky up to 8 p. p. m. Conditions were markedly improved after 2 months of the lime treatment Approx 30 lb. of lime is used per 100,000 gallons of water C. C. RUCHHOFT

**Some recent developments in boiler-water treatment.** A. W. CHAPMAN. *Fuel in Science & Practice* 10, 64(1931).—The disadvantages of boiler scale, its formation and prevention are reviewed D. A. REYNOLDS

**Ways of representing analytical results of the examination of boiler feed water.** J. LEICK *Z. angew. Chem.* 44, 100–2(1931).—A general article comparing the methods of expressing the quant. results of water analysis RUSSELL C. ERB

**Industrial sewage disposal.** S. JACKSON AND W. GARNER *Ind. Chemist* 7, 76–9, 101–4, 166–8(1931).—A review E. H.

**The present trend in sewerage and sewage-disposal practice.** W. W. HORNER *J. Eng. Club St. Louis* 10, No. 9, 12 pp. (1930). E. I. S.

**Future possibilities in sewage disposal.** H. C. SHENTON. *Surveyor* 79, 381(1931).—An ideal system would consist of a preliminary settling tank, activated sludge tanks in one or two stages, digestion tanks for mixed sludge, arrangements for heating and mixing sludge keeping the temp. at 75–80°, covered sludge-drying beds, and a power plant driven by the gas evolved A. L. ELDER

**Sewage-disposal works of Plainfield, N. J.** JOHN R. DOWNES. *Water Works and Sewerage* 77, 189–91(1930).—This plant is designed to treat 4 m. g. d. There are 6 Imhoff tanks, 2 sprinkling filters, 1 final settling tank and 5 sludge-drying beds. Provisions are also made for partial aeration of the sedimentation tank effluent in which Cl is used for odor control C. C. RUCHHOFT

**Sewage treatment at Lake City, Fla.** ANON. *Public Works* 61, 110(1930).—Lake City, Florida with a population 3000 and an av. daily flow of 100 gallons per capita per day has recently constructed a sewage treatment plant having the following units: preliminary bar screen, a primary clarifier, pump house with wet and dry well, dosing tank, sprinkling filter, sludge digestion tank, secondary clarifier and sludge-drying bed. Provision is also made for pre- or post-chlorination of sewage C. C. R.

**Los Angeles successfully reclaims sewage for replenishment of underground water supplies.** C. WILSON *West. Construction News* 5, 473–4(1930).—Discussion of sewage-disposal conditions in southern California with special reference to the program of water reclamation studies initiated by the Los Angeles Dept. of Water and Power E. I. S.

**Sewage screening—experience with disk-type screens at Rochester, N. Y.** WILLIAM A. RYAN *Am. City* 42, No. 3, 101–2(1930).—Sewage treatment was begun in 1915. The city is now served by 4 plants. The largest, the Irondequoit plant, built in 1916, was designed to treat a normal dry weather sewage flow of 24 m. g. d. The flow, since then, has increased to almost 60 m. g. d. without causing the operating difficulties usually experienced. This is attributed to the fine screening installation. The primary purpose of these screens is not to remove the solids which will settle out in the Imhoff tanks but to prevent the floating solids from entering these units or being discharged under storm flow conditions into Lake Ontario. The addn. of 2 new disk type screens in 1929, making a total of 6, now permits handling a rate of 180 m. g. d. without by passing crude sewage into the lake. A feature of the new screens is the variable speed transmission unit whereby the lineal travel of the screen may be varied instantly from 7 to 27 ft. per min. to meet existing flow conditions. The equipment of the plant is listed. The effluent is discharged through a 66 in. steel conduit and submerged outlet 7000 ft. offshore into the lake C. H. BADGER

**Plans for sewage reclamation in the Los Angeles metropolitan area.** R. F. GOUDEY *Eng. News-Record* 106, 443–6(1931).—See C. *A.* 25, 1928 R. E. THOMPSON

**Sewage treatment in Germany.** SENTENAC AND FONTAINE *Ann. ponts et chaussees Pt. Tech.* 100, No. 3, 266–97(1930).—Notes on an inspection and study trip with special reference to the methods and equipment observed in Berlin and in the Ruhr District E. I. S.

**Sewage purification by dilution and the limit of putrescibility.** H. BACH *Tech. Gemeindeblatt* 34, 29(1931).—The amount of water needed for dilu. depends on the strength of raw sewage. This factor varies greatly in different countries. The ratio of material in soln. to that in suspension is an important factor A. L. ELDER

**Some experiments on the treatment of a sewage containing wool-scouring refuse.**

C C Bretnham *Surveyor* 79, 335(1931).—The sewage of Bradford contains large quantities of wool scouring liquor. Raw effluents have analyses such as: total solids 42,000 p. p. m., grease 7900 p. p. m., alky. to methyl orange 31,200. Good purification was obtained by neutralization of the alky. and mixing gently with a little fresh sludge, settling and filtering at $p_H$ 6.0. A. L. Elder

**The question of gas formation in city sewers.** Kehr and Müller *Tech. Gemeindeblatt* 33, 303-9(1931).—Cases of explosions in sewers are cited. The amts. of $C_2H_2$, CO, etc. needed to produce explosive mixts. are given as well as the toxic concns. Discussions of methods of testing for explosive and poisonous gases in sewers are shown. A. L. Elder

**Purification of brewery sewage by the activated-sludge process.** M. Alt. *Tech. Gemeindeblatt* 33, 291-5, 309-12(1930). The activated sludge process was a satisfactory method for treating brewery waste mixed with other sewage. The $p_H$ needed to be controlled. A. L. Elder

**Influence of seeding material on sludge digestion.** C. I. Kiefer and Herman Kratz, Jr. *Eng. News-Record* 106, 474-8(1931). The following conclusions are drawn from lab. expts. conducted at the Baltimore sewage works. (1) Each g. of volatile matter destroyed or lost, as detd. by present day testing methods, will be converted into about 750 to 800 cc. of $CH_4$ and 1200 to 1300 cc. of total gas. Each g. of raw volatile matter digested will produce about 600 cc. of $CH_4$ and 800 cc. of total gas. (2) Sludge that is several years old serves just as well for seeding purposes as sludge that has just reached a digested condition. (3) Partly digested sludge, even though it contains as much as 65-70% volatile matter, becomes digested within about 60 days when 2% daily addns. of raw material are made, and within 70-80 days when 6% of raw sludge is added daily. When raw sludge, in place of digested or partly digested sludge, is used, 150 days are required to obtain ripe material in the case of 2% addns. Where 6% addns. were made, a digested sludge was never obtained. (4) The sludges receiving 2% addns. were slightly better digested than those to which 6% was added. The difference, however, was not great. It is believed that 6% addns. are about the max. which can be made and still produce a sludge with good drainability, free from odors. (5) Data obtained indicate that certain ether-sol. materials digest rapidly within 10-15 days. There is present, however, ether-sol. matter that digests at a slow rate. R. E. Thomson

**Stream pollution by textile wastes.** Robert Weston. *Public Works* 61, 110 (1930).—See *C. A.* 24, 450. C. C. Ruchhoft

**The effect of certain poisons upon mosquito larvae.** Martin Fronisher, Jr., and Raymond C. Shannon. *Am. J. Hyg.* 13, 611-22(1931).—Full grown larvae of *Aedes aegypti*, *Ae. taeniorhynchus* and *Culex quinquefasciatus* were not injured by relatively high concns. of KCN, but weak solns. of I (1 part per million) were fatal. Newly hatched larvae were much more susceptible. The toxicity of Br was practically the same, while that of Cl was less. Because of the thickly sclerotized cuticle the pupae were more resistant to the halogens. In concns. toxic to larvae I or Br cannot be tasted but their employment in drinking water is questioned. In cisterns, tanks, still water, etc. the larvae are readily destroyed. G. H. W. Lucas

**Olean City (N. Y.) epidemic of typhoid fever in 1928.** Archibald S. Dean. *Am. J. Pub. Health* 21, 390-402(1931).—This is a report of an epidemic of 218 cases due to a break in the submerged suction pipeline from a well in the Allegheny River and insufficient chlorination of the water. There were 25 deaths. (Cf. *N. Y. S. Dept. of Health Repts.* 49, 104-12 (1928)). In Jan. and Feb. there were over 1000 cases of gastro-enteritis and during Aug. and Sept. over 5000 cases. Olean derives its water from 2 sources: *Olean Creek and South Olean wells*. The former was free from *B. coli*. The latter supply came from 12 or more 6" and 8" tubular wells sunk about 72' deep in the low ground on the north side of the river and from a large open collection and suction well on the south bank of the river. Two of the tubular wells had become submerged within recent years by changes in the course of the river. Water from these wells passed by screw joint iron suction pipes across the river bed to the collection and suction well. After chlorination, instituted by a device which operated by remote control when the elec. pump was started, the water was forced into the distribution system. Raw sewage from nearly half the city entered the river and its tributary above the wells. No daily or regular tests for residual Cl were made. Nine of 16 samples exam'd. in July, Aug. and Sept. gave presumptive tests for *B. coli*. Considerable epidemiological data are given. Details on the cost of this epidemic are given. J. A. Kennedy

G A BRAVO

Soils of the eastern township of Quebec. R R MCKIBBIN AND L I. PUGSLEY MacDonald College, McGill Univ., *Tech Bull* No 6, 3–64(1930).—All soils in this region have a high percentage of org matter concd in the surface layer They also have relatively low Ca and P contents and a low nitrate N content throughout the growing seasons Three main kinds of soil are found heavily podsolized, brown forest and muck swamp soils The podsol and brown forest soils have high CaO require-

ments and low $p_H$ values The subsoils of the podsol soils are in most cases better supplied with Ca, Mg and sesquioxide bases than are the surface soils The forest crops from a large section of this area should be of great value, while the muck swamp tracts should prove highly fertile if they could be drained J R ADAMS

**The podsolic process in soils.** T J DUNNEWALD *J Am Soc Agron* 23, 259–65 (1931) —An attempt is made to follow some of the details of the podsolic process on a lab scale The results from this method indicate that org matter is not concerned in the podsolic accumulation of $SiO_2$ but is concerned in the translocation of bases and sesquioxides Extn of the bases and formation of acid conditions appear to be necessary preliminaries to the deposition of $Fe_2O_3$ and $Al_2O_3$ in the subsoil The rapid removal of bases from timbered soil as compared to grass soil is shown, and the slower removal of sesquioxide as compared to the rapid removal of bases is brought out Available P seems to be lost more rapidly into the subsoil of grass soils than is the case with timbered soils J R ADAMS

**Some characteristics of an eroded soil.** G W MUSGRAVE AND HENRY DUNLAVY *J Am Soc Agron* 23, 245–52(1931) —A relatively slight degree of erosion has a marked downward effect upon the yield of cotton A phys study of the soil across the area indicated a downward trend of the moisture and of the relative $H_2O$-holding capacity of the soil loss of org matter, decline in amt of colloids and moisture equiv and a lower percentage of clay on the eroded portions of the slope as compared with the uneroded sections J R ADAMS

**An extension program for the control of soil erosion in Nebraska.** P H STEWART *J Am Soc Agron* 23, 253–8(1931) —The use of legume crops to maintain the org matter content of the soil is emphasized for Nebraska conditions J R ADAMS

**A laboratory study of the field percolation rates of soils.** C S SLATER AND H. G BYERS U S Dept Agr, *Tech Bull* 232, 1 23(1931) —A description is given of an auger which was devised to obtain undisturbed cores of soil from the field The prepn of the sample for the percolation expts and the exptl procedure for measuring the rate of percolation are fully described There is a considerable degree of correlation between the rates of percolation obtained on field cores and on the corresponding lab-packed samples for most of the surface soils studied and a marked lack of correlation for the subsoils The percentages of silt these soils contain, the suspension percentage and the percolation ratio have been found to represent the same order The suspension percentage and the percolation ratio are valuable criteria of relative field permeability The field-percolation rate of a soil is governed more by the water passage-ways it contains than by the character or vol of the pore space of the soil mass. The ratios for erosion and for the permeability of soils show that these properties are inversely proportional in terms of the factors of the percolation ratio J. R. ADAMS

**The seasonal changes of some biological factors of forest soils.** DÁNIEL FEHÉR. *Matematik és Természettud Értesitö* 47, 617–41 (in German 642–51), *Math Naturw Ber Ungarn* 37, 51–80(1930), cf *C A* 23, 3044 —Forest soil contains most humus in September, caused by fallen leaves The least humus was found in May. Max humus content and $p_H$ are correlated Their minima do not agree The humus content of the soil of a black pine forest is greater than that of acacia forests. Black pine should therefore be preferred in reforesting sandy soils in bad condition S S DE FINÁLY

**The chemical composition of soils of the Hungarian Great Plain.** S ARANY. *Mezögazdasági Kutatások* 2, 557–68(1929) —Thirty g dry soil is moistened with distd $H_2O$ so as to form a pulp The amount of $H_2O$ multiplied by 100 and divided by the wt of soil yields a ratio no averaging 38–40 for light soils, less than 30 for sandy soils, more than 40 for heavy soils and more than 50 for clay soils The $p_H$ varied between 5 0 and 7 3 Active acidity (*i e*, $p_H$ detd in *N* KCl soln or titrated as exchange acidity) does not play a great role The use of slowly decomposing lime fertilizers seems to be preferable S S DE FINÁLY

**Data on the composition of soils of the Hungarian Great Plain.** II. S ARANY, G BUJK AND J GIDRÓ *Mezögazdasági Kutatasok* 3, 317–33(1930) —Plant-food content of soils was examd Total N was found in considerable amounts Surface layers contained 66 to 435 5 mg, first subsoil (15–55 cm deep) 46–267 mg, and layers 45–75 resp (55–85 cm deep) 20–172 mg Total $P_2O_5$ content varied from 55 to 247 mg $P_2O_5$ soluble in citric acid moved from 0 6 to 82 mg, $K_2O$ soluble in citric acid between 2–36 mg $CaCO_3$ content and $p_H$ values of the cultivated layers are very varying The upmost level lacked lime in each case. S S DE FINÁLY

**Universal apparatus for field investigations of soils.** J. DI GLÉRIA *Kisérlet*

*Közlemények* 31, 295–9(1929).—A detailed description is given of a combined Wheatstone bridge and potentiometer S. S. DE FINALY

**A large sand culture apparatus.** FRANK M. EATON *Soil Science* 31, 235–41 (1931).—A sand culture app. is described whereby 50 gals. of nutrient soln. may be used without discarding any portion of it. It is suitable for making cond. tests at frequent intervals in order to follow changes in concn. M. S. ANDERSON

**Microanalytical determination of silica in aqueous extracts of soil.** A. NÉMEC, J. LANIC AND A. KOPROVÁ *Z. anal. Chem.* 83, 425–45(1931).—The previously described colorimetric methods for detg. $SiO_2$ were tested, particularly with respect to manipulative details desirable for $SiO_2$ in concns. likely to occur in ext. of soil. A method was worked out which is suitable for detg. such quantities of $SiO_2$ in the presence of as much $PO_4^{---}$ and $Fe^{+++}$ as is likely to occur in the soil ext. To the soln. contg. 0.5–0.7 mg. of $SiO_2$ in 30 cc. add 5 cc. of 1% citric acid soln. and 5 cc. of molybdate reagent (50 g. $NH_4$ molybdate dissolved in water, treated with 30 cc. of concd. $H_2SO_4$ and dild. to 1 l.). Shake well and after 5 min. add 7 cc. of 4% $H_2SO_4$ (by vol.) and 2 cc. of 1% $NaVO_3$ soln. Then treat with 2 cc. of 5% $Na_2S_2O_4$ soln., and after allowing 15 min. for reduction to take place, add 35 cc. of alk. glycerol soln., (600 cc. of 10% $Na_2CO_3$ and 100 cc. of glycerol) and dil. to exactly 100 cc. After 2 hrs. compare the blue color with standards in a colorimeter. The presence of Fe, Ca, Mg, Al, As and P does not interfere if the directions are followed carefully. Good results can also be obtained if King's method is modified as follows. To the soln. contg. 0.1–1.0 mg. of $SiO_2$ in a 100 cc. measuring flask, add 3 cc. of 10% AcOH and 3 cc. of 10% molybdate soln. Shake well, allow to stand 5 min. and then add 2 cc. of a reagent made by dissolving 0.5 g. of hydroquinone in 100 cc. of 20% $Na_2S_2O_4$ soln. After 0.5 hr. dil. with 10 cc. of 10% $Na_2CO_3$ soln., dil. with water to 100 and compare the color with that of standards. W. T. H.

**The relation between buffer power and saturation capacity of the soils.** R. NICCORINI (WITH F. BAGNOLI) *Boll. ist. super. agrario Pisa* 6, 201–23(1930).—The buffer power against the bases of a soil increases with the increase of the absorbing (or satn.) capacity of the colloidal matters contained in the soil, while the buffer power against the acids increases with the increase of the carbonate content of the soil. G. A. B.

**Reliability of the quinhydrone method in the determination of $p_H$ values of soils.** G. HAROS *Mezőgazdasági Kutatások* 3, 189–90(1930).—The time curve can be shortened by use of a Pt electrode which was previously glowed out and put into distd. water for 1–2 min. Such electrodes show const. potentials in 5 sec. which remains for 10–15 min. Results by this method agree well with those obtained with the Haber-Klemensiewicz cell. Colorimetric $p_H$ detns. often show large divergences. S. S. DE FINALY

**Hydrogen-ion concentration, aluminum concentration in the soil solution and percentage base saturation as factors affecting plant growth and acid soils.** W. H. PIERRE *Soil Science* 31, 183–207(1931).—A greenhouse study was made of influence of growing crops on $p_H$, Al concn. and degree of satn. of soils formed under different climatic conditions. Each was brought to different degrees of acidity by appropriate lime or acid treatments. The crit. $p_H$ for growth of crops varied considerably with different soils. Analyses of displaced soil solns. showed but little Al even in those from the acid soils. The concn. of Al in different soils of like $p_H$ varied considerably. There was some correlation between concn. of Al in the displaced soil soln. and growth of corn on acid soils, but there was less correlation between Al concn. and yield of sorghum and barley. No relation was found between the amt. of phosphate in the soil soln. and the concn. of Al at which plant injury developed. The concn. of Ca bore no relation to plant injury. Some correlation was found between the ratio of K to Ca in the soil soln. and plant injury. This ratio varied considerably for different soils at similar $p_H$ values. Concn. of Mn showed no relation to plant injury from soil acidity. Soils varied considerably in their percentage base satn. at similar $p_H$ values. Good correlation was found between percentage base satn. of acid soils and plant injury. The proportions of the various bases present in the exchange complex are thought to be a factor affecting plant growth on acid soils. M. S. ANDERSON

**Temperature effects on the exchange acidity of lowland and swamp soils, especially the effect on the amount of acid ferrous iron.** K. KAWAMURA *J. Sci. Agr. Soc.* (Japan) 1928, 1–20(in English 21).—Acid soils were treated with normal KCl soln. at varying temps. (4°, 16°, 26° and 36°), and the titratable acidities and the amts. of Al and Fe in the exts. were detd. quantitatively. The acidity found agreed very well in every case with that calcd. from the amts. of Al and Fe, an indication that the acidity was produced by base exchange. The lowland and swamp soils, (peat soils and rice-

field soils), which contained more or less org matter, produced a considerable amt of $FeCl_3$ in the KCl extn., and the amt increased at a marked rate as the treating temp. rose. Org. (arid) soil, however, did not liberate any Fe in the soln. In most cases with all soils, the amt. of $AlCl_3$ produced decreased to a certain extent with the rise of temp. At the same time the sought titratable acidity decreased also, because the $AlCl_3$ generally played a greater part in the acidity than did the $FeCl_3$. The influence of the treating temp. is explained as follows. (1) As shown in the expt. with $Al^{+++}$ and $Fe^{+++}$ humates prepd. from peat and cane sugar, the base exchange of the ferrous *humate is markedly accelerated by rise of temp.*, whereas that of Al humate is somewhat *hindered*. (2) *The higher the treating temp. the greater the amt.* of $FeCl_3$ produced by the side reaction between $AlCl_3$ formed by base exchange and FeO originally present in the soil. This part of the $AlCl_3$ is changed to an insol. form, as illustrated by the reactions between the soil and dil. $AlCl_3$ solns. K. Shinohara

**Practical methods of alkali soil reclamation applied on the Hungarian Great Plain.** S. Arany. *Mezogazdasagi Kutatasok* 4, 11-21(1931). A general description is given of 3 methods. (1) liming, (2) covering the surface with a calcareous marly subsoil and (3) covering and mixing the surface layers with drift sand. S. S. de Finály

**Data on the liming of Hungarian soils and on the magnesium content of alkali soils.** S. Arany. *Mezogazdasagi Kutatasok* 2, 1-11(1929). Sandy soils of Nyirség showed neutral to weakly alk. reactions and some hydrolytic acidity. Careful liming is proposed and eventually the use of Thomas slag or Rhenania phosphate. Well water, soil water and most of the whole profile of alkali soils contained Mg. The quantity of water sol. Mg varies; that of Mg sol. in salt solns. is the same as in Californian alkali soils. S. S. de Finály

**Determination of small amounts of calcium carbonate in soils.** L. Dworák. *Kisérlet. Közlemények* 31, 174-81(1928). Ten and 20 g. of soils contg. no $Na_2CO_3$ are treated with *N* $NH_4Cl$ soln. and titrated with 0.1 *N* HCl. Percentage $CaCO_3$ equals $(2A/B)(B-A) + [(2A/B)-1](B-A) \times 0.005 \times 10$, where *A* means cc. of 0.1 *N* HCl used for titrations of 250 cc. soln. of 10 g. soil and *B* the same for 20 g. soil. The method gives good results. S. S. de Finály

**Reclamation experiments on Hungarian soils rich in lime and containing sodium carbonate.** J. Di Gléria. *Kisérlet. Közlem. nyek* 32, 252-80(1929).—The *p*H and phys. condition of soil bear a relation to the Ca ion concn. of the soil soln. Colloids coagulate perfectly only in soils with *p*H under 7.0. Coagulation by Ca salts was observed when the soil soln. contained at least 0.278 mg. equiv. Ca after treatment. Equiv. quantities of reclaiming agents do not show the same results. The least quantity is needed of $H_2SO_4$ and HCl, somewhat more of $AlCl_3$, $Al_2(SO_4)_3$, and yet more of Ca salts. Reclaiming agents should be completely washed out of reclaimed soil. $CaCO_3$ was ineffective with these soils. S. S. de Finály

**Problems of heavy metals in soil chemistry.** László de Putnoky. *Mezögazdasági Kutatások* 4, 59-65(1931).—The role of heavy metals in the animal products, soils and fertilizers is discussed. P. calls attention to the necessity of regulating the heavy metal content of the soils, especially that of sandy soils. Z. I. K.

**Comparison of the Dirks and Scheffer and the Mitscherlich methods for determining the phosphoric acid requirements of the soil.** Lasnero. *Das Superphosphat* 7, 61-2(1931).—In 225 comparative expts. with soils ranging from rich to very poor in $P_2O_5$, the 2 methods gave results that agreed in 222 cases. The poorest agreement was obtained on soils that were not deficient in $P_2O_5$. K. D. Jacob

**The significance of colorimetric methods for the determination of phosphoric acid in soils.** L. Pfaff. *Das Superphosphat* 7, 67-9(1931).—The Mo blue colorimetric and the Lorenz gravimetric methods were compared for the detn. of $P_2O_5$ in citric acid exts. of soils. The 2 methods were in good agreement when the $P_2O_5$ content did not exceed about 60 mg. per 100 g. of soil. With larger amts. of $P_2O_5$ the colorimetric method gives results that are too low. The presence of citric acid causes low results by the colorimetric method if the aliquot for analysis contains more than the equiv. of about 10 cc. of a 1% soln. of citric acid. If carried out under carefully controlled *conditions, the colorimetric method gives good results*, and because of the speed with which it may be carried out it is very desirable for use in the citric acid method for the routine detn. of the $P_2O_5$ requirements of soils. K. D. Jacob

**Changes in the availability of phosphorus in irrigated rice soils.** R. P. Bartholomew. *Soil Science* 31, 209-17(1931).—Studies were made under field conditions of the effect of irrigation upon *p*H and available phosphates in rice soils. The irrigation water contained considerable $Ca(HCO_3)_2$ and rendered the surface soils more alk. than the subsoils. When phosphate fertilizers were used, the irrigation water caused a decrease

in water sol inorg phosphate This action was due partially to reversion of the phosphates added Three months after irrigation, org water-sol P had increased, probably because of the activities of bacteria Phosphatic fertilizers are not recommended for rice in this region when calcareous water is used for irrigation M S ANDERSON

Effect of carbon on vegetation. III. R. PEROTTI AND C. FERRETTI *Boll ist super agrario Pisa* 6, 147–63(1930), cf *C A* 23, 5531.—Both animal and vegetable C are effective in rendering harmless the toxins produced by microörganisms and in activating the respiratory process A new *apparatus* is described for the detn of the respiratory activity of the soils The action of the C continues for one year after it has been added G A. BRAVO

Effect of carbon on tobacco culture. G BONUCCELLI AND V. CINI *Boll. ist super agrario Pisa* 6, 339–54(1930).—The expts described in the preceding abstr were made on tobacco If powd vegetable C is added to the soil, the crop is increased, and the leaves show greater burning capacity G A BRAVO

A total-carbon procedure [for soils]. ERIC WINTERS AND D. C WIMER *J. Am Soc Agron* 23, 280–5(1931).—This is a modification of the Winters and Smith method (cf *C A* 23, 5531) for the detn of total C, in which the loaded boat can be moved from the cool part of the tube to the center of the furnace after all the connections have been made and the O flow started, the active catalyst is in large enough quantity to insure oxidation even under extremely rapid flow of combustible gas The loaded boat is placed in that portion of the tube outside the furnace with an Fe "pusher" behind it The connections are all made and the O flow is started A solenoid which fits over the tube is then centered over the Fe "pusher," the circuit made and the boat is gradually pushed into the furnace This method of inserting the charge reduces the possibility of gas losses The percentage error in this method is ±0.55% J R ADAMS

The transformation of citric acid into acetone by the soil. R. NUCCORINI (with A FELICIANI) *Boll ist super. agrario Pisa* 6, 241–8(1930).—The decompn of citric acid and the formation of acetone by the soil take place in the presence of ferric salts and Fe-contg fertilizers (Thomas slag) This decompn is attributed to the presence of iron compds and also of other, unidentified compds (1-3%) Cf Dean and Dean (*C A* 24, 3588) G A BRAVO

A study of some soils for cotton from the Segou region made in the laboratory of the Alsace Potash Co. J FRANC DE FERRIÈRE AND E NATIER *Rev botan appl agr. trop* 11, 84–98(1931).—These soils along the Niger River vary from the coarse sand to the heavy clay type In order to obtain good yields all these soils require the addn of fertilizers high in $P_2O_5$ and $K_2O$ The fertilizers should also contain N, when they are to be used on the sandy soils The geological formation of these soils is discussed on the basis of their phys constitution J. R ADAMS

The effect of the soil reaction on beet yields. JORET *Compt.-rend acad agr France* 17, 129–32(1931).—In the heavy plateau soils the optimum soil reaction for beets should be between $p_H$ 7.2 and 7.5 On slightly acid soils the max yield is sometimes lowered as much as 10%, and this depressive effect can be increased by the addn of physiologically acid fertilizers The depressive effect of the acid reaction on the yield is somewhat corrected by the addn of $Ca(NO_3)_2$ to the soil J R ADAMS

Determination of nutrient requirement of soils by means of electrodialysis. J DI GLÉRIA *Mezogazdasági Kutatások* 3, 185–8(1930).—$P_2O_5$ and K data detd. by electrodialysis are always higher than those detd according to Neubauer Neubauer data did not show any regular connections with dialysis data Also $NO_3$ and $NO_2$ contents of soil can be detd by electrodialysis S S DE FINÁLY

The supply of plant nutrients in the soil determined by Neubauer's method and calculated by the static or Mitscherlich methods. CLAUSEN *Z. Pflanzenernahr., Düngung u Bodenk* B10, 145–55(1931).—Available P and K in soil of plots used for fertilizer expts for 8 years previously were extd by the rye-seedling method of Neubauer The indications are compared with results to be expected from the known addns in fertilizer and removal in crops (static), and also in some instances with results obtained by growing crops to maturity in pots (Mitscherlich) Available P by the Neubauer test was much less than expected except in plots fertilized without P Mitscherlich indications for P were usually in good agreement with the calcd P supply except on unlimed soil The Neubauer procedure seems to be a better indicator for available K than that of Mitscherlich, which always furnished lowest indications except on soils fertilized without K C J SCHOLLENBERGER

The "Pehameter" and its practical usefulness. R. HERRMAN *Z. Pflanzenernähr., Düngung u Bodenk* B10, 142–5(1931).—The "Pehameter" is an app intended for the

detn of soil $p_H$, it consists of a porcelain plate with a depression at one side, from which a narrow channel extends across the face On each side are small rectangles painted with ceramic colors red to blue, which indicate characteristic tints with the "Universal" indicator from $p_H$ 4 to 9 by single units A little soil is placed in the cavity, satd with indicator, and after a min a drop is led down the channel and its color compared with the standard Tests with 36 soils of known $p_H$, as detd by standard methods, gave approx correct indications in 11 cases, an error of 1 $p_H$ or less in a total of 23 cases and over 2 $p_H$ in 3 cases The largest errors were with moderately acid soils, $p_H$ 4 5–5 5, which were indicated to be neutral C J SCHOLLENBERGER

**New principles in determination of fertilizer requirement of soils. Importance of relative examinations.** L DWORÁK *Mezogazdasági Kutatások* 3, 355–9(1930) —Not only requirements but also possible and probable influence of fertilizers should be examd by simultaneous expts on untreated soils Also exptl failures are removed if relative data of unfertilized and fertilized soil are detd S S DE FINÁLY

**Determination of fertilizer requirements of soils.** J BECKER *Mezögazdasági Kutatások* 1, 65–91(1928) —Data on $P_2O_5$ and on K requirements obtained by means of the methods of Lemmermann Konig Hasenbaumer, Sigmond, Niklas and Neubauer agreed The citrate and Nebauer methods gave too low results on easily sol $P_2O_5$ in soils contg much carbonates Results by the method of Sigmond on total $P_2O_5$ were high on some soils K requirement was detd by a modification of Sigmond's method and agreed with results by the Neubauer method S S DE FINÁLY

**New method of illustrating the results of soil analysis** Z I KERTÉSZ AND J CSIKY *Mezogazdasági Kutatások* 2, 201–8(1929) —Data are shown as differently colored sectors of a circle Characteristics of soils can be seen at a glance S S DE FINÁLY

**The soil microbiology of the lower Val di Cecina.** O VERONA AND A. DEL TREDICI *Boll ist super agrario Pisa* 6, 71–102(1930) —The chem analyses of the soils are reported Two new species of bacteria were found *B danielii* and *B flavum nonliquefaciens* The seasonal bacterial activity, in regard to N circulation, is studied; this activity is defined by (1) ammonification power (mg of $NH_3$ produced from 1 l of soil), which is max in summer (2) nitrification power (mg $HNO_3$ produced), (3) denitrification power (time, in hrs., necessary for the disappearance of nitrates in the soils), which is very low in winter, (4) N-fixation, which is greater in spring and lower in the subsoil G A BRAVO

**The microbiological activity of Hungarian alkali soils.** DÁNIEL FEHÉR AND REZSÖ BOKOR *Matematik es Természettudományi Értesitö* 47, 270–319 (in German 320–36) (1930) —The alkali soil of Püspökladány has a special microflora with many ray like organisms Soil should also be reclaimed biologically Liming influences quantitatively the compn of the microflora Young forests should be helped by conserving the moisture content of the soil on reforesting The sp microflora of stall manure cannot live in alkali soils Aerobic N fixing microörganisms generally are absent in alkali soils. Decompn of cellulose goes on very slowly Respiration and $CO_2$ production are almost normal Alkali soils contain little N, little nitrite and nitrate Soils contg *Achillea* assocd with *Inula britannica* contain most nitrate N, nursery soils contained very little nitrate N The content in N decreases in the lower layers, and also the no of nitrifying bacteria Nitrification was much faster in soils contg 0.2% $Na_2CO_3$ on the addn of $(NH_4)_2SO_4$ or on inoculation with bacteria The ammonifying capacity of alkali soils having no $Na_2CO_3$ or contg less than 0.03% total salt is excellent S S DE F

**Investigations on the protozoal fauna of forest soils.** DÁNIEL FEHÉR AND LAJOS VARGA *Matematik es Természettudományi Értesito* 46, 235–71 (in German 272–6)(1929), *Math Naturw Ber Ungarn* 37, 81–110(1930) —The protozoa consist for the most part of amebae Two maxima occur in the periodic changes of protozoa numbers, one in Nov and Dec and the other in the beginning of summer The maxima are probably caused by soil humidity No definite correlations can be observed between the life activities of soil bacteria and soil protozoa No large difference was found in the protozoa fauna of conifer forests and that of leafy forests Forest soils seem to contain fewer protozoa than do soils of gardens and fields S S DE FINÁLY

**Experiments on the biological activity of soil protozoa.** L. DE TELEGDY KOVÁTS *Kisérlet Közlemények* 31, 223–31(1928) —Daily changes in the numbers of amebae and bacteria in good garden soil were investigated The data check for Hungarian soils the theory of Russel and Hutchinson Protozoa seem to have a stimulating effect on *Azotobacter* cultures *Azotobacter* cultures vitiated with *Colpidium* and *Paramecium* fixed more N than pure ones S S DE FINÁLY

**Electrophoretic measurements of the root-nodule bacteria of Leguminosae.** F.

ZUCKER *Mezogazdasági Kutatások* 3, 49-68(1930).—Representatives of the alfalfa, red clover pea bean soy bean, cowpea and lupine groups were studied The effect of the degree of dilu of cell suspension was detd from the electrophoretic velocity Velocities of dild solns are higher than those of concd solns Velocity is influenced by the gum or slime and acid by products of organisms Variations of velocities of different strains of groups of bacteria never exceed 2 microns per sec if 22.5 v is used. Various strains of *B radiobacter* showed different velocities which average about the same as those of nodule bacteria S S DE FINÁLY

**The influence of combined nitrogen on growth and nitrogen fixation by Azotobacter.** JAMES L FULLER AND LEO I RETTGER *Soil Science* 31, 219-34(1931).—*Azotobacter* is able to fix substantial quantities of free atm N when cultivated in a medium free from fixed N and in an atm free from $NH_3$ and $HNO_3$ A study is made of the influence of a large no of nitrogenous org compns. upon the fixation of N In general the more complex org compns except peptone, are not actively attacked by *Azotobacter* while the simpler ones including the lower amino acids are readily utilized Where an abundance of combined N in suitable form is present, very little atm N is fixed M S ANDERSON

**The germination of wheat in alkaline and in acid media.** GY. EPERJESSY *Mezőgazdasági Kutatások* 1, 95-111(1928).—Wheat types grown on alk soils endure NaOH and $Na_2CO_3$ more readily than do those accustomed to neutral or acid soils. The latter endure acids more readily Small amounts are stimulating $NaHCO_3$ is more toxic than $Na_2CO_3$ in the same concn $H_2SO_4$ is more toxic than $H_3PO_4$. The toxic action of $Na_2CO_3$ can be decreased with $CaSO_4$ and humus addn S. S DE F.

**Studies on root growth of wheat types accustomed to alkaline and acid soils. Determination of osmotic pressures of wheat.** GY EPERJESSY *Mezőgazdasági Kutatások* 2, 481-93(1929).—Root growth is better in $Na_2CO_3$ or $NaHCO_3$ solns. if wheat types accustomed to alk. soils are used Wheat accustomed to acid soils prefers acid media The osmotic pressure of improved wheat equalled 39.5, that of unimproved wheat 29.5 S. S. DE FINÁLY

**Yields of crude and assimilable nutrients obtained from meadows mowed twice and three times, after various fertilizer treatments.** H JANTZON AND W. KIRSCH Hess *Arch Landw., Abt B, Tierernähr Tierzucht* 1, 166-78(1930).—Plots of meadow land were fertilized with N, K and P, alone, and combinations of all 3, at the beginning of the expt. and after each cutting Total yields and yields of all constituents except crude protein were larger from the plots mowed twice during the summer, although there was no appreciable difference in the yields of assimilable nutrients, calcd on a starch basis W GORDON ROSE

**Effects of various plant foods on growth activities and development of oats.** C. K. MCCLELLAND *J Am Soc Agron* 23, 304-11(1931).—Under the given exptl conditions P generally seemed most beneficial in increasing the no of tillers, the no of heads at harvest, the no of spikelets per head, the yield and the size of the seed of oats. It also exerted a marked influence in causing early tillering and growth and a quick shading of the ground. N acted very similar to P in its effect upon tillering, no of heads at harvest, no of spikelets per head and yield K exerted no influence, unless one of restriction, on no of tillers and no of heads per plant at harvest and upon yield. Combined with N and P, it increased the size of seed, but the latter elements exerted better influence on the wts per bushel and upon general growth and development. J R A.

**The study of the black cotton soil under different fertilizer treatments.** R. D. REGE *Proc 15th Indian Sci Cong* 1928, 50-1.—Plot culture experiments with jowar were conducted under various treatments Conclusions (1) The Rab process (burning of cow dung on the plot) is not suitable to the tracts with low rainfall It leads to rapid increase in the nitrification, but the crop growth is not correspondingly increased This treatment also decreases the colloid content of the soil, especially in the first 4 inches, but this result is only short lived (2) Safflower cake produces the best effect There is not only vigorous growth of the plants, but this treatment leads also to early flowering and seeding Water logging of these plots for 2-3 days does not produce any bad effect on the crop (3) Wt. for wt., the effect of karanj cake is less than half that of the safflower cake The N content of the karanj is also about half that of the safflower, and the difference in the plant growth may be attributed to this (4) $(NH_4)_2SO_4$ produces as good an effect as safflower if buffered well with lime (5) The bad effect of water logging of the control soil is not found to be due to either increased $CO_2$ content in the soil or decreased soil aeration The nitrification in the soil is very little E J C.

**Fertilizing with carbon dioxide.** GY EPERJESSY *Természettud Közlony* 62,

630–5(1930) —Expts carried out in Germany by Reinau are described
S S DE FINÁLY

**Potassium and phosphorus fertilizer experiments with barley in Hungary during 1929.** J SURÁNYI *Kisérlet Közlemények* 33, 402–12(1930) —Use of both gave good results on medium heavy soils
S S DE FINÁLY

**Experiments with potassium-phosphoric acid fertilizers on beet barley in 1928.** J SURÁNYI *Kisérlet Közlemények* 32, 239–50(1929) —The use of both K and $P_2O_5$ fertilizers gave good results on Hungarian barleys Not only the quantity but also the quality of the barley crop was better
S S DE FINÁLY

**Phosphate-containing artificial fertilizers with respect to their raw materials.** L. SOLT *Chem Rundschau Mitteleuropa u Balkan* 6, No 14, 68–9, 76–80(1929) —A general review
S S DE FINÁLY

**Behavior of Rhenania phosphate in the soil.** L. DWORÁK *Kisérlet Közlemények* 32, 439–42(1929) —The soly of Rhenania phosphate added to loam and to sandy soils did not show any decrease in 5 months
S S DE FINÁLY

**Determination of phosphoric acid content of Rhenania phosphate.** S TANGL BOGSCHNÉ *Kisérlet Közlemények* 33, 200–2(1930) $P_2O_5$ is dissolved in Petermann's soln, and phosphoric acid is detd with ammonium molybdate according to Lorenz
S S DE FINÁLY

**Superphosphate enriched with ammonia.** S I VOLFKOVICH, L E BERLIN, I L HOFMAN AND A A IONAS *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 556–69 (1930) —Two kinds of raw phosphate were tried out in the prepn of ammoniated superphosphate by the use of $H_2SO_4$ and the phosphates of ammonia From Portland phosphate with mono ammonium phosphate and $H_2SO_4$ a product was obtained contg 21% $P_2O_5$, with 16.5% available, and 10% N The amt of $H_2SO_4$ used was 15% above that required by the stoichiometric equations, and its strength was diluted to 40% by the use of a 26% soln of $NH_4H_2PO_4$ When a mixt of mono and di ammonium phosphates was used, the product contained 22% $P_2O_5$, with 18% available, and 3% N The $H_2SO_4$ was also 15% above the stoichiometric and was diluted to 35% with 26% $NH_4H_2PO_4$ With $(NH_4)_2HPO_4$ alone the product contained 23% $P_2O_5$, with 19% available, and 5% N. The $H_2SO_4$ was 10% above stoichiometric, and it was diluted to 25% with a 26% soln $(NH_4)_2HPO_4$ For the Saratov phosphates triammonium phosphate (in liquid form) with $H_2SO_4$ was used, and the product obtained was 22–23% $P_2O_5$, with 20.5% available, and 10% N The optimum conditions were 100 parts (by weight) of phosphate for 80 parts of $(NH_4)_2PO_4$, for each unit weight of $(NH_4)_2PO_4$ 0.5 part of 60 Bé $H_2SO_4$ was used besides what is necessary to convert the raw phosphate into superphosphate By using a satd soln of $(NH_4)_2PO_4$ the product contained 18% $P_2O_5$, with 17% available, and 5% N The reagents used, were 100 parts of phosphate, 160 parts of the satd soln with 0.74 part of 60 Bé $H_2SO_4$ for each part of $(NH_4)_2PO_4$ besides what is necessary for the production of ordinary superphosphate The best product from the standpoint of phys conditions was obtained by the use of the mixt. of mono- and di ammonium phosphate Production on a semi factory scale is under way with the mixts mentioned
J S JOFFE

**Some fermentation characteristics of various strains of Rhizobium meliloti and Rhizobium japonicum.** R H WALKER AND P E BROWN. *Soil Science* 30, 219–29 (1930) —A study was made of the fermentative characteristics of 23 strains of *Rhizobium japonicum*. These organisms were grown in yeast water glucose and yeast water-galactose media The change in H ion concn was taken as a measure of fermentative ability The fermentative ability of a particular strain is comparatively const. *Different strains, however, show wide differences in fermentative ability.* Some strains of *meliloti* produced a distinctly alk reaction in the media, while others produced considerable acidity in media of the same compn The *japonicum* strains, as a rule, produced more alky than did the *meliloti* strains The *meliloti* strains fermented glucose and galactose with about the same results, while the *japonicum* showed more differences in this respect. The results indicate that fermentation tests under the condition followed would not serve to give a distinct sepn of these 2 species of legume bacteria
M S. ANDERSON

**Fermentations in a heterogeneous and discontinuous medium.** A. DEMOLON AND G BARBIER *Compt rend* 192, 514–5(1931) —In a sandy soil diffusion and migration are easy, but in a medium contg siliceous clay these phenomena are depressed
T. H RIDER

**A comparison of some nodule-forming and non-nodule-forming legumes for green manuring.** LEWIS T. LEONARD AND H R. REED *Soil Science* 30, 231–6(1930) — Legumes not bearing nodules are compared with legumes bearing nodules in green

manuring expts The indicator crops grown after plowing under the legumes show no decided difference in these 2 types of legumes as affecting total N, dry wt. and height
M S ANDERSON

Amount of manure necessary for vegetable growing F K CRANDALL AND T. E ODLAND Rhode Island Agr Expt Sta., *Bull* 225, 5–31(1930).—Field expts. conducted for 5 years included early beets spinach, carrots cauliflower and eggplants fertilized with various combinations of stable manure, green manure crops and com fertilizers Eggplants and cauliflower showed the greatest response to N, carrots were little affected. Spinach and cauliflower showed the greatest response to P Manure contg shavings was practically as effective as manure contg straw Manure increased crop yields when even moderate treatments of com fertilizers were used It is possible to substitute green manure and com fertilizer for a considerable part of the stable manure which is ordinarily applied to vegetable crops C R. FELLERS

Nitrogen loss and action of cold and hot manures. H. D MEYER, P OBST, F WILCZEWSKI AND W DIETRICH *Z Pflanzenernähr., Düngung u Bodenk* 10B, 121–36(1931) cf *Deut landw Presse* 56, 629–43(1929).—Cow manure solidly packed in tight pits was little changed in appearance and had a slight $NH_3$ odor when removed 4 months later Loosely packed manure was well rotted and without $NH_3$ odor The temp rose to 30° in the former case and to 55° in the latter case in 6 days Losses in dry matter and total N were 10 1 and 7.5% for cold and 9 1 and 15 1% for hot fermentation, resp Pot and plot expts did not furnish any conclusive evidence of superiority for manure stored by either method The relative value of different methods for storing manure can be detd only by long-continued field expts on a considerable scale C J SCHOLLENBERGER

The chemistry of artificial manure making and materials used. F ZUCKER AND L. DE TELEGDY KOVÁTS *Mezogazdasági Kutatások* 3, 198–205(1930).—Substances giving a slightly alk. reaction should be applied The conditions prescribed by Krantz for "Edelmist" manuf should be followed in order to obtain a well rotted stall manure
S. S DE FINÁLY

New experimental data on the composition of straw manures. L DE TELEGDY KOVÁTS. *Mezogazdasági Kutatások* 3, 243–50(1930).—The feasibility of artificial manure production was proved by expts. on a larger scale The principles of Krantz should be followed. Loss of N was 21%, that of $P_2O_5$ 14 7% and that of $K_2O$ 1 7% Artificial straw manure contained 4 4 1 7% N, 2 9–0.5% $P_2O_5$ and 2 1–0 6% $K_2O$
S S DE FINÁLY

Artificial stall manure. J BOCSÓ *Kiserlet Közlemények* 33, 1–15(1930).—Production of fertilizer from straw, cornstalks, leaves, etc. should be undertaken at first by aerobic fermentation, and later air must be shut off Natural manure should be mixed with the lower layers or natural manure juice should be sprayed on to inoculate the matter with bacteria. S S DE FINÁLY

Manufacture of artificial stall manure from straw. L DE TELEGDY KOVÁTS *Kiserlet Kozlemenyek* 31, 347–72(1928).—Straw was fermentated under aerobic conditions with addn. of (1) Adco powder, (2) a mixt. of nutrient salts and (3) P compds. and dung water The product in each case was similar to natural manure Anaerobic fermentation was not so effective As for biol factors, multiplication of thermophilic bacteria is the first stage, then follow molds and later bacteria. S S DE FINÁLY

Manufacture of artificial manure from peat. L KOTZMANN *Mezogazdasági Kutatások* 3, 334–8(1930).—The acid reaction of peat was neutralized with $CaCO_3$ and the mixt. was inoculated with natural stall manure $CaCN_2$ was added as nutrient, in quantity corresponding to 0 7% of the org dry matter content. The product after 4 months had better action in field expts than did natural manure. Loss of N amounted to 12%, that of $P_2O_5$ 3 1% and that of $K_2O$ 2 1% S S DE FINÁLY

Practical method of manufacturing "Edelmist". H GLATHE *Mezogazdasági Kutatások* 3, 376–9(1930).—Detailed prescription of method. S S DE FINÁLY

Spreading of "Edelmist" manufacture in Germany and observations on the quality of the product. H. GLATHE *Mezogazdasági Kutatások* 3, 463–9(1930).—Edelmist should be in piles for at least 3 months It contains more total N than does natural manure, and its $NH_3$ content is also higher than its content of water-sol. N Frequent moistening of completed stocks of Edelmist proved to be of great value.
S S. DE FINÁLY

Complete weed-eradicating fertilizers. JEAN DETERRE *Engrais* 46, 47–9 (1931).—A review is given of the work of Jaguenaud (*C A* 25, 1322) on complete weed-eradicating fertilizers, their use and advantages are stressed. J R. ADAMS

A review of methods for the evaluation of pyrethrum. C B Gnadinger *Soap* 7, 97–101, 117(1931) E. J. C.

The use of coal-tar products in spraying fruit trees. F Proffi *Zentr Bakt. Parasitenk*, Abt II, 83, 127–64(1931) John T. Myers

Pear mealy bugs and results of experiments for their control. F W Pettey and C J Joubert Union S Africa Dept Agr., *Sci Bull* 95, 23 pp (1930). cf. *C. A* 24, 5417.—Oil sprays give the best control of pear mealy bugs (*Pseudococcus maritimus* and *P gahani*) No more than 1 application of the usual winter spray of a dil'n contg about 4% actual oil of specifications ranging from 50 to 70% unsulfonatable residue and about 110 sec Saybolt viscosity can be applied with safety to pear trees in S African conditions Modern proprietary winter oil (petroleum oil) sprays generally possess these specifications No more than 2 or 3 summer oil sprays of a dil'n contg 0.8% actual oil with a max of 65 to 70 sec Saybolt viscosity and a min of 85% un sulfonatable residue should be applied, with or without nicotine sulfate or Pb arsenate, to pear trees in foliage until repeated tests over a no of years prove that the trees will tolerate more K D Jacob

Experiments with new methods for the control of codling moth in western districts of the Cape Province. I W Pettey and M C Mossop Union S Africa Dept Agr., *Sci Bull* 96, 50 pp (1930). cf *C A* 24, 2228, 3506.—The Reinette du Canada and Newtown varieties of apples are particularly susceptible to injury from repeated applications of 1% medium or light summer oil sprays Addn of summer oil to Pb arsenate sprays, particularly the heavier grades, retards somewhat the removal of the As spray residue, but this difficulty is minimized if Ca caseinate spreader is used and the oil-arsenate spray is applied at least 6 weeks before the fruit is harvested An artificial *cryolite*, used at the rate of 2 lb with 0.25 pint of fish oil in 40 gallons of water, applied through the season at intervals of 3 weeks, gave better results in codling moth control than a similar normal program of Pb arsenate only and seemed to have considerable effect in controlling mealy bugs on Kieffer pears Certain samples of cryolite caused severe foliage burning, while others did little damage Cu cyanide, 1 lb in 40 gallons, controlled the codling moth as well as Pb arsenate, but caused russetting of the pears A 7–10% soln of crude molasses, with or without the addn of yeast, was a satisfactory bait for use in codling moth traps Extensive data on the results of the investigations are tabulated K D Jacob

A preliminary note on the successful treatment of the jasmine bug (Antestia cruciata) by dusting calcium cyanide. Ramachandra Rao *Proc 15th Indian Sci Cong* 1928, 51–2.—Dusting with $Ca(CN)_2$ was found to have the effect of stupefying the bugs on the bushes and bringing them to the ground As a certain proportion of the bugs generally revived within a short time, these had to be hand-picked and destroyed by dropping them in kerosenated water E. J. C.

The onion maggot (Hylemyia antiqua) in Ohio, 1929. M P Jones *J Econ Entomol* 23, 394–8(1930).—This is a demonstration control project with Bordeaux-petroleum oil emulsion and com oil emulsions against the onion maggot About 45% increase in onion yield due to the spray is claimed An ingenious combination power sprayer and cultivator for onions is described C H. Richardson

Ecology of the microbe causing brown spots on tobacco leaves. A Gulyás *Kisérlet Közlemények* 33, 279–302(1930).—Spots are caused by an organism called *Alternaria brassicae* var *tabaci* by Preissecker Methods of prevention consist of treating seeds with a 0.2% soln of Germisan or a 0.25% soln., of Uspulum Plants in the warm beds should be sprayed weekly with 0.5–1% Bordeaux soln., and soil of warm beds must be disinfected with $CH_2O$ 3 weeks before sowing Ten to 12.5% $CH_2O$ soln should be used on 1 sq m area Soil should contain as much lime as required to show alk reaction S S. de Finály

Beet infections with Cercospora beticola Sacc. A Cierzanowski *Spisek vydany nákladem Rady Naczelnej Polskiego Przemyslu Cukrowniczego* 1927; *Listy Cukrovar* 49, No 22, *Rozhledy* 14.—*Cercospora beticola* occur sporadically decennially. Early beets were more subject to infection than later ones Plots of beets on which legumes were harvested previously were highly resistant to infection because of the high porosity and N content of the soil Fertilizing the beets with 0.3 of the annual $NaNO_3$ fertilizer during July, and fertilizing with P increased the resistance of the beets to infection Artificially infected or poorly developed seeds showed a greater incidence of infection in the field growths than did the controls C recommends soaking the beet seeds in dil HCHO before planting Frank Maresh

Influence of seed-preserving agents on the germinating activity. Árpád Szücs *Mezögazdasági Kulatások* 4, 24–8(1931).—$CuSO_4$ had a very bad influence on germi

nation activity Lime added to $CuSO_4$ decreased this influence $CuSO_4$ heated to dust and used as a powder had almost no bad influences on germination Its seed preserving action was quite good S S DE FINÁLY

Increase of action of copper salt solutions used as seed preservatives. S TERÉNYI *Chem Rundschau Mitteleuropa u Balkan* [16], 8, 1-3(1931) —The effective dosage is diminished to 25 80% of original value if Hg salts are added to Cu salts, *e g*, 0 25% $Cu(NO_3)_2$ and 0 005% $HgBr_2$ S S DE FINÁLY

Laboratory examination of "Germisan-Kurzbeizverfahren." SÁNDOR TERÉNYI *Kiserlet Kozlemenyek* 31, 332 5(1928) —The germinating power of wheat was not influenced by 0 5 0 75 1 and 1 5% solns of Germisan in the ratio of 6, 4, 3 and 2 l to 100 kg wheat Germisan killed the spores of wheat not very strongly infected (not more than 0 1% spores) quite well Field expts are under way S S DE F

Investigations on the seed-preserving influence of copper sulfate-mercuric chloride mixtures D RÉVY AND J TETIDEL *Kiserlet Kozlemények* 32, 299-304(1929) — The addn of $HgCl_2$ (equiv to 0 3 2 8% Hg) increased the influence of $CuSO_4$ in lengthening the period during which germination is possible The insecticidal and germicidal action will be investigated later S S DE FINÁLY

Sodium chlorate as a herbicide. ALBERT A HANSEN *Proc Indiana Acad Sci* 38, 139-42(1929) —$NaClO_3$ had previously been used to kill Canada thistle, field bindweed (*Convolvulus arvensis*) and quack grass The $NaClO_3$ is successfully used as a herbicide for poison ivy, buck brush (*Symphoricarpos symphoricarpos* L) and purple barberry (*Berberis vulgaris* L) Salt is applied in soln contg 1 lb per gallon The danger from fire is not great if proper precautions are taken H M STARK

Waste gas-cleaning material as weed destroyer ANON *Chem -Ztg* 55, 190-1 (1931) —Waste $NaClO_3$ from dye works has been used as a weed destroyer but is inconvenient because it must be spread at least twice a year The waste material from gas-cleaning plants contains a thiocyanate, which dissolves in rain water and penetrates the roots of the weeds The present price of $3 75 per ton is prohibitive, however CURTIS L WILSON

Prickly pear and its eradication. C R VAN DER MERWE Union S Africa Dept Agr, *Sci Bull* 93, 32 pp (1931) —Spraying with a soln of 3 lb $As_2O_3$ in 1 gallon of water kills all the young growth on old prickly pear trees and also trees up to approx 3 years old Spraying with a soln of 2 lb $As_2O_3$ in 1 gallon of water kills all of the above ground portion of the jointed cactus (*Opuntia aurantiaca*) but does not kill the underground bulbs or tubers Addn of NaCl to the sprays apparently has no effect on the results K D JACOB

Device for estimating the acidity of the soil. FRANZ SCHNURPFEIL and ALFONS FREISLEBEN Ger 519 368, Oct 6 1929

Fertilizers ARMOUR FERTILIZER WORKS Brit 340,120, Dec 11, 1928 Liquid anhyd $NH_3$ is added to fertilizer materials or mixts, at least one of which is acidic, in sufficient quantity substantially to neutralize the free acid of the materials This treatment *e g*, may be applied to a mixt of superphosphate, KCl or $K_2SO_4$, $(NH_4)_2SO_4$ and $NaNO_3$, with or without addn of org materials such as tankage or cottonseed meal Cf *C A* 24, 2538

Fertilizers. ODDA SMELTEVERK AKTIESELSKABET and E JOHNSON Brit 339,969, Nov 24, 1928 Compd fertilizers are obtained in processes in which the mother liquor, obtained after the crystn of $Ca(NO_3)_2$ from a soln of phosphate rock in $HNO_3$

as described in Brit 330,340 (C. A. 25, 2314), is neutralized with or caused to react with $NH_3$, urea, cyanamide or cyanamide salts such as Ca cyanamide, inorg. phosphates, compds. of $NH_3$ and $CO_2$, alkali carbonates, etc., so that after removal of water from the product a dry stable fertilizer is obtained. Other fertilizing substances may be added, and various details of procedure, app. used, etc., are given.

**Fertilizers.** Hubert Wittek. Ger. 517,503, Sept. 10, 1925. A non-corrosive non-powdering lime-nitrogen fertilizer is prepd. by forming an aq. soln. of the lime-nitrogen and then adding clear neutral oil while heating, or as vapor. The PhOH- and base-free fraction going over between 180–300° in a stone coal distn. is mentioned as a suitable oil.

**Fertilizers.** Gustav Hilger. Ger. 517,537, Jan. 15, 1928. App. for directly azotizing heated $CaC_2$ to produce CaNCN is described.

**Fertilizer.** Maschinenbau A.-G. vormals Buckau & Henkel. Ger. 517,551, Feb. 18, 1930. App. for working up animal matter such as flesh and bone is described.

**Fertilizer.** Firma Rudolf A. Hartmann. Ger. 517,970, Nov. 3, 1926. Animal, fish etc., waste is extd. with steam and the ext. pptd. with metal salts such as $Al_2(SO_4)_3$, $Fe_2(SO_4)_3$, etc., or quebrachotol or tanning ext. The product is used as a fertilizer.

**Fertilizer.** Emil Collet. Fr. 697,270, June 12, 1930. A granular fertilizer contg. $NH_4NO_3$ which retains its powd. state during storing is made by adding $CaCO_3$ or other non hygroscopic substance to the molten fertilizer, then adding a less amt. in powd. form to the granulated fertilizer.

**Fertilizers.** I. G. Farbenind. A.-G. Fr. 696,000, May 21, 1930. A fertilizer contg. urea and $Ca(NO_3)_2$ is made by melting or fritting together the components almost or completely free from water. A rotating furnace may be used.

**Fertilizers.** I. G. Farbenind. A.-G. Fr. 697,153, June 7, 1930. A salt contg. $(NH_4)_2SO_4$ and $NH_4NO_3$ in the mol. ratio of about 1 to 3 is crystd. and afterward mixed with addnl. substances to prevent the particles agglutinating, such as kieselguhr, KCl, $(NH_4)_2HPO_4$ or $(NH_4)_2SO_4$.

**Fertilizers.** Soc. d'Etudes chim. pour l'Ind. Fr. 696,874, June 10, 1930. K salts are intimately mixed with phosphates and the mixt. treated with suitable amts. of dil. mineral acids, such as $HNO_3$ or $H_3PO_4$. Cf. C. A. 25, 707.

**Fertilizers.** Soc. Vilain Frères. Fr. 696,900, April 11, 1930. Concd. Mg fertilizers are made by calcining to redness giobertite and like natural carbonates of Mg and then treating with an acid such as $HNO_3$, HCl, $H_2SO_4$ or $H_3PO_4$. Cf. C. A. 25, 1325.

**Fertilizers.** Soc. Vilain Frères. Fr. 697,067, June 3, 1930. A fertilizer is prepd. by the reaction of $H_3PO_4$ on MgO until complete soln. in an excess of $H_3PO_4$ is obtained, and then $NH_3$ is added until the excess of $H_3PO_4$ is neutralized. The clear liquid is decanted from the ppt. formed and used again. Fr. 697,068 describes the prepn. of a fertilizer by adding to the usual reagents for the prepn. of superphosphates MgO and $NH_3$, if desired in the form of a double sulfate, or MgO or a salt of Mg alone may be added. Cf. C. A. 24, 4116.

**Plant preservation.** Tesch & Stabenow Internationale Gas- für Schädlingsbekämpfung m. b. H. Ger. 517,632, Apr. 5, 1930. To avoid the risk of poisoning the plants themselves when using alkylene oxide-contg. gases as insecticides, fungicides, etc., these gases are brought into contact with a heat source to convert the alkylene oxide into aldehyde. Steam may also be formed by the heat source for mixing with the aldehydes.

**Insectifuges and insecticides.** Schering Kahlbaum A.-G. (Herbert Schotte and Karl Görnitz, inventors). Ger. 520,330, Nov. 15, 1925. Esters of thiocyanic acid are used, with or without the usual addns.

**Insecticides, etc.** Deutsche Gold- und Silber Scheideanstalt vormals Roessler. Ger. 517,631, July 21, 1925. Insecticides, etc., prepns. consisting mainly of HCN, have a sufficient amt. of chloropicrin present to ensure a warning odor.

**Insecticides.** Röhm & Haas Co. Fr. 696,326, May 30, 1930. An insecticide is composed of an aliphatic mono-thiocyanate, the org. group of which contains one or more neg. groups. Examples are given of the use of monothiocyanate of the mono-ethylether and the monobutylether of diethyleneglycol, the first in water and the second in kerosene. Other products are referred to.

**Insecticide, etc.** Arpad de Wiczwinsky. Fr. 695,393, May 10, 1930. Hydrogenation products of pyridine and its homologs, particularly piperidine, are used for the destruction of insects. Fr. 695,391 describes the use of furfurol or substances liberating furfurol in the organism such as furfuramide or the bisulfite compd. for destroying rodents.

**Insecticide.** Wm. Moore (to American Cyanamid Co.). U. S. 1,707,877, March

24 An insecticide which is suitable for killing plant lice comprises trimethyl chloroethyl ammonium chloride (suitably used as a spray with various other substances)

Fungicides for seeds. Chem Fab Ludwig Meyer Ger 521,235, June 28, 1925 The activity of known fungicides is enhanced by addn of a small quantity of I or its compds Cf *C A* 24, 5928

Fungicides for seeds. I G Farbenind A.-G (Max Bockmühl and Walter Persch, inventors) Ger 519,270, Apr 17, 1928 The addn. compds of Hg salts with aromatic compds having an unsatd side chain are used Suitable compds are obtainable from $Hg(OAc)_2$ or $HgCl_2$ and allyl phenols or *p* nitrophenyl allyl ether Cf *C A* 25, 1626

Fungicides for seeds I G Farbenind A G (Max Bockmühl, Walter Persch, Kaspar Haff and Robert Kramer, inventors) Ger 519,488, Apr 8, 1928 Mercurized thiophene and its homologs are used, *e g*, α thiophene mercury acetate

Destroying leaf-cutting ants Meinhard Jacoby Ger 516,595, Mar 23, 1929 A prepn giving off a gaseous or vaporous poison is used The example mentions a mixt of KCN, $NaHSO_4$ and water, acrolein or $H_2S$ may be added

Weed killer Chemische Fabrik Ludwig Meyer Fr 695,572, May 14, 1930 A weed killer is composed of a mixt of $CuSO_4$ with an alkali chloride or nitrate

## 16—THE FERMENTATION INDUSTRIES

C N Frey

František Duchâček. Jan Satava *Chem Listy* 25, 97–101(1931).—A short biography and bibliography of D 's contributions to fermentation are given P. M

Actualities and progress in the distilling industries. Emerich Stein *Chem Listy* 25, 128–35(1931).—The application of lab methods to distg industries, especially to those of Slovakia, is discussed Frank Maresh

Monograph and analyses of principal alcoholic extracts produced in this country (Mexico). Eugenio Alvarez *Rev quím* 6, No 8, 7–20(1931).—A states that there are many alc exts being manufactured by old and new methods The treatment of maguey by heating and pressing of the stalks and fermentation and distn of the juices is typical and is given in detail Other sources in addn to maguey are given The chemistry of the processes to which the juices are subjected is discussed The phys properties of the finished liquors, the *pharmaceutical uses* and the *chem analyses* are given John M Ladino

Continuous fermentation in the production of lactic acid. F O Whittier and L A Rogers *Ind Eng Chem* 23, 532–4(1931).—A method for continuous lactic acid fermentations of the lactose of sweet whey has been developed in the lab and has been adapted to commercial operation The use of a lactobacillus and a mycoderm gave a yield of 90% of the theoretical based on the lactose originally present C N Frey

The cause of the low yields of alcohol in the fermentation of Formosan cane molasses. I. N Taketomi and S Hanamura *J Soc Chem Ind, Japan* 30, 390–5 (1927), *Mem Faculty Sci Eng, Waseda Univ* 1930, No 7, 129.—Low yields of alc from the fermentation of Formosan molasses are attributed to an insufficient N supply for the growing yeast The yield of alc was increased from 82–83% to 97–98% of the theoretical yield by adding 0 1 g of $(NH_4)_2SO_4$ or $(NH_4)_2PO_4$ to 100 cc of the liquid to be fermented II N Taketomi and S Aritake *Ibid* 31, 856–60(1928), *Mem Faculty Sci Eng, Waseda Univ* 1930, No 7, 130–1.—The low yield of alc in the fermentation of Formosan molasses is due principally to the presence of glutose, which has reducing properties, and in some cases it is also due to the insufficiency of nitrogenous nutriment for the yeast L W T Cummings

Losses of water-soluble phosphoric acid by the clarification of molasses under acid conditions and heat. II. O Hummer *Brennerei Ztg* 47, 169(1930), cf *C A* 25, 1629.—The influence of the acidity of molasses upon the losses of $P_2O_5$ is described S J

Experiments with sprouting and regular rye of 1930 crop Staiger *Brennerei-Ztg* 48, 13(1931).—S shows that rye which sprouted slightly because of the weather conditions during harvesting could be processed in distilleries without malt S J

Use of corn sirup in the spirit industry. C Luckow *Brennerei Ztg* 48, 16–7 (1931) S J

Quality of Hungarian hops of 1929 crop I Iványi *Kísérlet Közlemények* 33,

238–9(1930).—Averages for 36 samples of hops are: water 7.20, ash 8.67, α-resin 3.42, β-resin 8.84, γ-resin 2.49 and bitter acids 12.26%. S. S. DE FINALY

Resin content and antiseptic value of Hungarian hops. I. IVÁNY. *Kísérlet. Közlemények* 32, 327–40(1929).—Average values for the 1928 crop are: water 6.55, ash 7.89, α-resin 4.12, β-resin 8.66, γ-resin 2.74 and bitter acids 12.78%. S. S. DE F.

Physicochemical investigation on the coloring materials of grapes and red wines. L. CASALE. *Ann. chim. applicata* 20, 559–66(1930).—The various colors in grapes and red wines are related to the $p_H$ value of the liquid, the coloring materials (enins) are amphoteric, the isoelec. pt. for the chloride is between $p_H$ 5.4 and 5.8. A. W. C.

Apparatus for the determination of fixed acidity in wines. P. BRUÈRE. *J. pharm. chim.* [8] 13, 77–81(1931).—Into a conical flask used as a steam generator, a test tube barely touching the surface of the water is fitted through a stopper. Through it another tube (*a*, connected with *b* inside the test tube) passes, conducting steam into the test tube through a stopper. The stopper also carries an exit tube bent at a right angle. Tube *a* has a lateral safety tube, and the end of *b* barely dips below the surface of the wine (5 cc.) put into the test tube, so as to avoid excessive foaming after the alc. is removed. The volatile acids are expelled after 25 min. heating, and the vol. is about doubled. The fixed acid is then detd. by phthaleinoscopy (cf. *C. A.* 24, 3193). Lactic acid (1.8 g. per l.) proved non-volatile since the blue color of water produced by 10 drops bromocresol green (0.04 g. per 100 cc. H₂O-alc., Clark) was not affected by vapors passing through it. With AcOH vapors, the color soon changed to green, then yellow. S. WALDBOTT

Determination of carbon dioxide in beer. J. BLOM AND B. KRAUSE. *Wochschr. Brau.* 47, 471–3(1930).—$CO_2$ is fixed by adding a 50% soln. of NaOH. An aliquot part is then acidified with $H_2SO_4$ to liberate the gas, which is carried by a current of air (free of $CO_2$) into 0.1 *N* $Ba(OH)_2$. The excess of $Ba(OH)_2$ is then detd. by titration. The method is described for taking samples from cask and bottle beer. The device used consists of a 10-cc. pipet with a suitable connection to a compressed air container, a tap and a steel point. A soft rubber stopper and clamp to hold the borer in position are auxiliary equipment. S. J.

The protein in beer. I. Kinds of nitrogenous substances in beer. S. AYAI. *J. Soc. Chem. Ind., Japan* 34, Suppl. binding, 72–4(1931).—Expts. were conducted to det. the amt. of total N (crude protein), protein and non-protein N in light-colored 2 months old and 2½-months old beer. Methods for each detn. are given. It was found that on aging the coagulative N and albumose N increased slightly, the peptone and amino N decreased. The amide N increased slightly. The peptone and polypeptide N comprise 40–43% of total N, albumose 24–27%, coagulative protein 15–17%, amide 9–10% and amino N 5–10%, calcd. as glycocoll. C. N. FREY

Composition of slop char. W. KILP. *Brennerei Ztg.* 47, 2–3(1930).—The compn. of slop char varies according to the compn. of molasses, the manner of processing and the method of combustion. Three different slop chars were analyzed and the $K_2O$ content was detd. Various results were found: 46–47 (beet molasses), 20.5 (cane molasses, yellow char), 15.5 (cane molasses, black char), expressed in percentages. S. J.

Phosphatide (lecithin) content of compressed yeast. DREWS. *Brennerei-Ztg.* 47, 210(1930).—Two yeast samples (74.5 and 69.4% moisture) were extd. with alc. Alc. exts. of 6.26 and 10.17% were obtained with a P content of 2.38 and 2.44, resp., corresponding to 60–62% phosphatides. Phosphatides of 60–62% purity were easily obtained without recrystn. The yeast is emphasized as a source of phosphatides. S. J.

Yeast fermentation. A consideration of the truth of the Arndt-Schulz rule. H. DANNENBERG. *Klin. Wochschr.* 10, 211–21(1931).—Quinine, phenol and $HgCl_2$ do not accelerate fermentation by yeast. H. EAGLE

---

Manufacture of alcoholic motor fuel (DIETRICH) 21. Purification of brewery sewage by the activated sludge process (ALI) 14.

---

Fermentation processes. DEUTSCHE HYDRIERWERKE A.-G. Fr. 698,035, May 31, 1930. In biochem. transformations by means of bacteria, e. g., the production of higher alcs. or org. acids, a preliminary fermentation is carried out in worts strongly diluted and with the addn. of an inoculating substance which may be already cultivated on carrier layers. The concn. of the wort is gradually increased by the addn. of worts of high concn. as soon as the fermentation process has reached its greatest intensity.

Fr 698,030 describes a fermentation process in which a bacteria culture is added to the wort at the culminating point of its physiol activity, the wort being poor in nutrients and adverse to the propagation of cells

**Alcohol** Soc anon des distilleries des Deux Sèvres Fr 696,775, Aug 1, 1929 Alc of a concn higher than that of the azeotropic alc water mixt is obtained directly from fermented wort or dil alc by combination of the ordinary continuous distn with a method using the principles of azeotropism The heat contained in the vapors from that part of the app where concn of the alc takes place is transmitted wholly and directly by the vapors to that part of the process where the operation is being carried out in the presence of a third substance, and alc of a concn higher than that of the azeotropic alc water mixt is obtained at a point where normally abs alc would be obtained if the transmission of heat was by means of a heat exchanger The alc obtained is afterward completely dehydrated by known means

**Purifying alcohol** Firma F Merck Fr 696,882, Jan 18, 1930 Crude alc is purified and dehydrated simultaneously by an azeotropic distn, with or without pressure No purification or elimination of impurities takes place between the dehydration of the crude alc and the rectification of the alc sepd from the product of the azeotropic distn except a sepn by decantation from the entraining liquid

**Making butyl alcohol and acetone by fermentation** Commercial Solvents Corp Ger 520,383, May 14, 1927 See U S 1,668,814 (*C A* 22, 2235)

**Acetone** Holzverkohlungs Industrie A G Fr 696,233, May 28, 1930 In the manuf of acetone by the action of steam on Ca acetate at high temps in the presence of catalysts such as O compds of heavy metals, the mixt of vapors liberated during the distn of worts is used directly or after sepn of impurities of high b p for the ketonization operation A suitable app is described Cf *C A* 23, 3235

**Tartaric compounds** André Montoussé Fr 697,179, June 10, 1930 Tartaric compds are extd from vinasses, which contain them for the greater part in the form of K bitartrate The vinasses are boiled in a certain amt of mother liquor, distilled and diluted and the remaining mass is poured into a fresh amt of mother liquor The temp is raised sufficiently to maintain the bitartrate in soln, while the insol compds are pptd The liquid is then decanted and crystd The mother liquor is neutralized for the following operation

**Distilling sulfite liquor spirit.** Zellstoffabrik Waldhof and Max Gade Ger 519,245, Apr 25, 1929 The first runnings, which contain the aldehyde fraction, are continuously or periodically returned to the vats in which a fresh wort is fermenting or is to be fermented The spirit obtained from a wort to which the first runnings have been added contains only the normal amt of aldehyde, the aldehyde in the runnings being eliminated in the fermentation

**Dealcoholizing wines, etc.** Marc G Coupeau and André L F Cornillac. Fr 696,773, Aug 16, 1929 Wines and other fermented fruit juices are dealcoholized by the Charentais process but at a low temp under high vacuum to cause no alteration of the various constituents and by fractional distn to collect separately the head and tail runnings, which are afterwards reincorporated in the liquid to the desired degree An app is described

**Wine and spirits.** Friedrich Faerber Ger 516,547, Oct 21, 1928. App for purifying mash is described

**Metal vat for wine, etc., fermentation processes.** Louis Granges Ger 516,549, July 19, 1927

**Filter plug for passing purified air and sulfur dioxide into wine casks.** K. Prillinger Brit 339,761, Nov 18, 1929 Filtering layers may comprise sponge impregnated with salicylic acid and $KMnO_4$ solns and wadding also impregnated with the same substances Various structural details are described

**Beers poor in alcohol.** Albrecht Haselbach Fr 695,591, May 14, 1930 Use is *made of a wort with almost double the usual amt of hops When fermentation is com*plete starch sirup, "capillaire" or bonbon sirup may be added

**Hops.** Gottfried Jakob Ger 516,548, Jan 23, 1929 Hops are first extd to give a tannin ext which is used in the manuf of mash or as a sprinkling agent The extd hops are then worked up with clear wort in the usual way By this method, the max use is made of the hop constituents

**Air heater for drying hops, etc** Vivian Elkington Ger 520,372, Nov 9, 1927 Corresponds to Brit. 285,153

**Yeast.** Aktiebolaget Separator Fr 696,094, May 26, 1930 Wort charged with yeast prepd in the usual manner is treated in a centrifuge with continuous evacua-

tion of the wort and of the yeast, which is again centrifuged in a bowl of comparatively large diam until relatively dry

Apparatus for washing yeast. Ernst Müller Ger 521,274, Sept. 27, 1928.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. Emery

The stabilization of medicinal wines. Domingos de Barros *Bol assoc brasil pharm* 11, 36–8(1930) Medicinal wines which are perfectly clear when freshly prepd often become turbid on standing because of the pptn of substances which remained in the supersatd soln To avoid this pptn it is advised to prep the wines by extg the vege table drugs with the wine itself as the solvent instead of using a stronger alc medium followed by dilu C. Abeledo

Researches on the combustibility of tobacco. IV. The combustibility in relation to the chemical composition of the leaves. R. Nuccorini (with G. Menna) *Boll ist super agrario Pisa* 6, 263–99(1930) In previous papers (*Ibid* 5, 401, 521 and 599 (1929)) an *app* for the detn of the combustibility of the various types of tobacco was proposed, and this value was studied in relation to the place of the leaves on the tree, and the soil fertilization In the present expts the leaves of Kentucky tobacco (cultivated near Pisa) were analyzed and it was found that the easily combustible leaves contained higher quantities of amide N citric, oxalic and pectic acids and $Fe_2O_3$, while those having lower burning capacity contained higher quantities of nitric, ammoniacal and nicotinic N, sugars, pentosans, fats and waxes. Na O, MgO, Cl, $SiO_2$, $SO_3$ and $P_2O_5$ There is no difference between the relative contents of CaO, $K_2O$ and malic acid G. A. Bravo

Preparation of extractum hydrastis fluidum and methods of analysis. Z. Csipke *Magyar Gyógyszerésztud Társaság Értesitoje* 5, 73–85(1929) —A report on the known methods of prepn and on the official detn of the alkaloid content in the drug and the ext. B. C. A.

Two types of arsphenamine. Reuben L. Larsen *Am. J. Syphilis* 15, 50–7 (1931) —Not only chem., phys and biological tests, but clinical reports indicate that 2 types of arsphenamine are made, a methylated and a nonmethylated type. Clinical reports check the biological tests in assigning more toxicity to the methylated than to the nonmethylated type. B. C. Brunstetter

Isolation of anonaine from Anona squamosa Linn. Feliciana R. Reyes and Alfredo C. Santos *Philippine J. Sci* 44, 409–10(1931) —The seeds of *Anona squamosa* Linn., commonly known as "ates," are used to kill parasites of the human body, especially lice The active principle is a base first isolated by Trimourti (*C. A.* 19, 656). In the present paper it is shown to be identical with *anonaine* obtained from other sources (*C. A.* 25, 705) The powdered seeds (1.8 kg.) yielded 0.258 g. of the base, m. 122–3°, by the method of extn previously described. *Hydrochloride* m. 287–8° (decompn.), *chloroplatinate* m. 248.5° (decompn.) Alfred Burger

The constituents of Sweertia chirata. A. Janaki Ram *Proc 15th Indian Sci. Congr* 1928, 160 —*Sweertia chirata*, a well known valuable Indian medicinal plant, was partially examd by Sahiar in 1914 and Subramaniam in 1924 By steam distn. of the alc. ext. R. obtained a cryst. acid, a phenol and isoamyl alc. The residual resin insol. in water yielded an acid m. 312° and a neutral substance m. 133° The nonvolatile portion sol. in water contained an acid m. 193° E. J. C.

The constituents of Plumbago zeylanica Linn. M. C. Tumminkatti *Proc 15th Indian Sci. Congr.* 1928, 163 —*Plumbagin*, the active principle of the drug, has been isolated in a pure form It forms orange-yellow silky needles m. 78°. It is sol. in most org. solvents and in alk. solns with formation of a crimson or pink color The combustion and the mol.-wt. detn. indicate an aromatic ring compd The deep red color with $FeCl_3$ soln. indicates a phenolic OH group in the compd The Bz deriv. m. 146°. Further phys. and chem. properties are being studied with a view to det. the constitution. E. J. C.

Indian cubeb oil. V. P. Shintre *Proc 15th Indian Sci. Congr.* 1928, 168 —The fruits grown in the Mysore Province gave on distn. with steam 7.5% of an essential oil The oil contained *d*-sabinene (28%), *d* terpinene and cineole (15%), *d*-4-terpineol, *d* terpineol, an unidentified primary alc., *l* cadinene and another sesquiterpene Another sample of oil was found to contain *dl* sabinene and the same constituents as the first sample. E. J. C.

Examination of the active principle of Indian henna. Syed B Ali *Proc 15th Indian Sci Congr* 1928, 173.—A water ext is treated with Pb acetate, the Pb is removed by $H_2S$, and the active principle is extd with benzene. It is quite a pure product, for it gave a const m p. It is easily oxidizable, the color changes to dark red even on exposure to air. The oxidized product can be easily reduced by Zn and HCl. The formula found differs from those given by previous workers. F J. C

Morphine determination in opium. C G van Arkel and P van der Wielen *Pharm Weekblad* 68, 309–16(1931).—The Dutch Pharm method of morphine detn does not give concordant duplicates when considerable gum is present in the opium sample. A detailed description is given of the previously recommended method (*C A* 24, 5107) which makes use of ale tartaric acid for the extn. Repeated analyses of Persian, Levantine and Macedonian opium by this method showed close agreement. A W. Dox

Thalleioquin test for quinine. A Winograd *Chemist Analyst* 20, No 3, 7(1931).—Dissolve the alkaloid in 50 000 times as much $CHCl_3$. To 0.5 cc of the soln., add 2 cc of Br $H_2O$ and 1 cc of dil $NH_4OH$. An intense, emerald green color is given by as little as 0.1 mg of quinine. W T. H

Sensitiveness of the thalleioquin reaction. J Lisenbrand *Arch Pharm* 269, 65–7(1931).—Quinine sulfate is susceptible of detection in a dilu of 1 100 000 (corresponding to quinine 1 140 000) by the thalleioquin test. However, this reaction is highly dependent on the influence of time, furthermore the action of dild Br-$H_2O$ must be accurately regulated, as also the $p_H$ carefully chosen, in order to raise the sensitiveness to the max. The most favorable conditions for highly dild solns with H ion concn $10^{-4}$ to $10^{-5}$ appear to require 10 to 15 sec. Further expts are under way. W O F

History of Austrian pharmacopeias. Otto Zekert. *Pharm Monatshefte* 12, 25, 55–7, 75–6(1931), cf *C A* 25, 1916.—An address. W O F

Three hundred years with cinchona bark. Otto Zekert *Pharm Monatshefte* 12, 25–8(1931).—An address. W O F

Examination of galenical preparations in filtered ultra-violet light. L Zechner and F Gstirner *Pharm Monatshefte* 12, 28–31(1931).—The results obtained in the examn of a series of fluid exts in ordinary and filtered ultra violet light are recorded. W. O E

Occurrence, application and adulteration of ipecacuanha root. Franz Berger *Pharm Monatshefte* 12, 33–4(1931).—A brief summary of the history of this drug in connection with an outline of its microscopical examn and possible adulterants. W O E

Drug novelties of the last forty years. I Herzog *Pharm Monatshefte* 12, 60–1 (1931), cf *C A* 24, 3320.—An address. W O I

Characteristics of the valerates and isovalerates. Arno Müller *Riechstoffind* 6, 4–7, 39–41(1931).—A compilation of the essential properties of the several members of these 2 groups in connection with their occurrence in natural products. W. O E

German Museum and German perfume industry. A M Burger *Riechstoffind* 6, 25–33(1931).—A brief description of the German Museum of Munich (apparently the largest tech and scientific museum in the world), including a few typical displays therein relating to perfumes both crude and finished, in connection with data on, and views of, several noted German establishments for the manuf of perfumes. W O F

Action of bromides on morphine hydrochloride and ethylmorphine hydrochloride. Fischer and Huppmann *Suddeutsche Apoth.-Ztg* 71, 131–2(1931).—Solns of morphine HCl and ethylmorphine HCl yield with bromides the corresponding hydrobromides of these alkaloids, this is similar to the behavior of codeine phosphate. W. O F

Pharmaceutical analysis. C A Rojahn IX. Pharmacological and biological evaluation of pharmaceutical preparations. Julius A Müller *Pharm Ztg* 76, 273–6, 286–8(1931).—This paper deals specifically with adrenaline, anthelmintics, cannabis, disinfectants, antienzymes, skin irritants, insect powders, local anesthetics, narcotics, ergot, valerian prepns., digitalis and laxatives. W O E

Economic drug testing XII. L. Rosenthaler *Pharm Ztg* 76, 288(1931), cf *C A* 25, 557.—*Estn of colchicine in colchicum seed.*—Shake 0.6 g of the powdered sample in a small medicine glass with 12 g $CHCl_3$ and 0.5 g $NH_4OH$ for 10 min., filter, distil 6 g of the soln to dryness, boil the residue with 10 g $H_2O$ until the vapor no longer blues red litmus paper, then add to the hot liquid 2.5 g dil HCl and about 0.5 g of paraffin, and cool in running water. Filter, wash with water until the filtrate shows no acidity, then dil to 250 cc. If 10 cc of this dilu gives with 9 cc HCl (d 1.19) and

1 cc phosphotungstic acid soln a turbidity after 15 min (changing to a yellow ppt the following day), the sample contains at least about 0.4% colchicine W O I

**Estimation of morphine in opium and its preparations.** Lajos David and Istvan Novak *Pharm Ztg* 76, 289(1931) cf *C A* 25, 557 —The outstanding feature of the procedure advocated by D and N consists in the use of MeOH in place of abs EtOH in the extn of morphine, on account of its greater soly in the former alc and of less likelihood of extg contaminating substances W O I

**Examination of liquor cresoli saponatus D. A.-B. 6, and sapo kalinus D. A.-B. 6** Walter Meyer *Pharm Ztg* 76, 327 8(1931) cf *C A* 25, 1031 —Recent examns of prepns alleged to be official were found to contain the fatty acids of linseed oil instead of the prescribed oil itself The methods followed in arriving at these conclusions are described in detail W O I

**Acetyl determinations** Hoffmann *Pharm Ztg* 76, 329(1931) —Reference is made to a recent paper (cf *C A* 25, 1761) in which the advantages in the use of the Verley and Bolsing method of acetylation were emphasized, satisfactory values are reported by this method in the examn of EtOH, glycerol, *iso*-PrOH, thymol, salol, β naphthol menthol and santalol The method failed with citronella oil (geraniol) W O E

**Evaluation of acetate of alumina solution** Otto Schmatolla *Pharm Ztg* 76, 352 3(1931) Attention is directed to the pharmacopeial tests for impurities in the official liquor notably Al formate $CaSO_4$ and $K_2SO_4$ These tests are discussed W O I

**Preparation of homeopathic triturations.** A Kuhn *Pharm Ztg* 76, 366–7 (1931) – The prepn of, and certain tests on, the strength and stability of homeopathic triturations are discussed in connection with an app (illustrated) to det any catalytic decompn likely to develop in the finished product W O I

**Indian kidney tea (Koemis-Koetjing).** G Kuhlmann *Pharm Ztg* 76, 367–9 (1931) —The botanical and pharmacol factors of the plant *Orthosiphon stamineus* Benth are considered in connection with its chem constituents, which at present offer no adequate explanation of the therapeutic (chiefly the diuretic) action of the tea made therefrom W O E

**Diacolation of fluidextract of valerian.** H Breddin *Pharm Ztg* 76, 427(1931) — Directions are given for the prepn of this ext., which is regarded as superior to the one commonly made by percolation W. O. I.

**"Etrate," a new highly active type of drug. II. Estimation of the extract content of crude drugs.** Clemens Grimme *Pharm Zentralhalle* 72, 183-7(1931); cf *C A*. 25, 379 —The present study was undertaken to develop a method capable of yielding a max ext corresponding to the true activity of the drug in question After reviewing the methods commonly employed in the prepn of exts., comparative results are reported on 5 g samples under hot aq extn over a period of 6 hrs., which show the highest values thus far obtainable by any extn method The materials examd were cinchona bark, uva ursi leaves, valerian root, rhubarb rhizome and their resp etrates W. O E.

**Histochemical detection of cetaric acid in Iceland moss.** M Pronier *Pharm Zentralhalle* 72, 227(1931) —In nearly every case a section immersed 2–3 min in 25% $NH_3$ soln developed a rose red to red color in the central hyphae, which changed to brown red on treatment with $FeCl_3$ W. O E

**Chemical investigations of the tobacco plant. II. Chemical changes that occur during the curing of Connecticut shade-grown tobacco.** Hubert B Vickery and George W Pucher Conn Agr Expt Sta., *Bull* 324, 207–40 (1931), *Science* 73, 397–9 (1931), cf *C A* 24, 2332–3 —The catabolic changes occurring in tobacco leaves cured for 0, 12, 18 and 51 days were detd by estg the various N fractions, solids, ash, crude fiber, ether sol solids and carbohydrates in ext of the leaves The ext was prepd by boiling the leaves carefully in water contg sufficient $H_2SO_4$ to maintain a $p_H$ of 4.0 Loss of *nicotine* was thus prevented The residue from the extn was ground and again extd with boiling water A third time the residue was boiled in water, and the exts. were combined and concd *in vacuo* After completion of the curing process approx. 20% of the solids originally present in the leaf disappeared. Over 50% of this loss was in the nitrogenous constituents Chlorophyll destruction was practically complete in 12 days Sol carbohydrates decreased in curing approx 80%; probably most of this loss was $CO_2$ and water Extensive deamination of the amino acids followed by amide synthesis occurred during curing of the leaf The protein underwent complete digestion to amino acids At least 1/2 of the potential amino N of the protein that underwent enzymic hydrolysis in the first 12 days of the curing process was further converted to $NH_3$ and amide N. The approx constancy of the quantities of $NH_3$, amide and amino N in the

exts suggests some sort of equil condition in the relationships between these forms of N Approx 75% of the loss of water and of sol carbohydrate and more than 50% of the loss of org solids and of the ether sol constituents occurred during the first 12 days more than 75% of the quantity of protein digested underwent this process in the same period Far reaching chem changes set in very shortly after the leaves were detached from the tobacco plant C. R FELLERS

**Utilization of by-products of saccharin manufacture in synthesis of drugs and in medical science.** W HERZOG *Chem Rundschau Mitteleuropa u Balkan* 7, No 15, 107 11(1930) cf *C A* 25, 42 —The utilization of *p*-toluenesulfonyl chloride and *p* toluenesulfonamide is described with detailed data from the patent literature S S DE FINÁLY

**Color and ethereal oil content of pulverized cinnamon.** I HORVÁTH AND L BENEDEK *Kisérlet Közlemények* 33, 387–91(1930) —No regular connection was found between ethereal oil content and alc ext content The ethereal oil content decreased with quantity of waste particles, especially of outer cork layers Dark powders mostly contained less ethereal oil S S DE FINÁLY

**Synthesis of local anesthetics** FRIGYES KONEK *Matematik és Természettud Értesito* 46, 348-60 (in German 361-2)(1929) —Some new derivs of 3 methoxysalicylic acid were produced Crystals of 2,3 (*m* $H_2NC_6H_4COO$)(MeO)$C_6H_3CO_2Me$ had anesthetic influence when put on the tongue The anesthetic influence of 2,3 5 (BzO)-(MeO)$(H_2N)C_6H_2CO_2Me$ was somewhat weaker S S DE FINÁLY

**Hungarian essential oils.** M JANICSEK *Mezögazdasdgi Kutatdsok* 2, 153–6 (1929) cf *C A* 24, 2235 —The following data are given for the corresponding essential oils *Coriandrum sativum* $d_{15}$ = 0 8723, $\alpha_D$ = +10° 35′, $n_D^{20}$ = 1 4653, ester content 72 6% *Mentha piperita* (1927) $d_{15}$ 0 9079, $\alpha_D$ —25° 5′, $n_D^{20}$ 1 4575, menthol content 69 34% *Chenopodium ambrosoides var anthelminticum* (1927) $d_{15}$ 0 9852, $\alpha_D$ —8° 39′, $n_D^{20}$ 1 4760 *Salvia officinalis* (1927) $d_{15}$ 0 9195, $\alpha_D$ +13° 32′, $n_D^{20}$ 1 4631 *Salvia sclarea* (1928) $d_{15}$ 0 9043, $\alpha_D$ —24° 2′, $n_D^{20}$ 1 4648, ester content 70% *Majorana hortensis* (1928) $d_{15}$ 0 9058, $\alpha_D$ +29°, $n_D^{20}$ 1 4791 *Lavandula vera* (1928) $d_{15}$ 0 8924, $\alpha_D$ —7° 29′, $n_D^{20}$ 1 4613, ester content 62 52% S S DE FINÁLY

**Composition of tobacco smoke and denicotization of tobacco** J BODNÁR *Természettud Kozlony* 62, 397–404, 443–6(1930) —A review of the present methods for denicotization Hungarian "Denik6" cigars and cigarets did not contain less nicotine than ordinary ones Cotton wool placed in the mouthpiece of cigarets retained about 50% of the original nicotine content of the smoke S S DE FINÁLY

**The assay of digitalis on frogs** B BEHRENS *Arch exptl Path Pharmakol* 140, 237 56(1929) *Physiol Abstracts* 15, 400-1 —The lethal dose for slow intravenous infusion of K strophanthin in frogs (*R temporaria*) was detd on 149 animals and found to be 0 3264 γ per g The standard deviation of a single observation was 20 1% The curve relating dose to mortality would coincide with the curve obtained by Trevan for the subcutaneous injection of digitalis When K strophanthin was injected in 10 doses with 24 frogs on each dose, the corresponding curve had a standard deviation for a single observation of 17 1% When these curves are compared with de Lind's figure of 13 03% for the standard deviation of cats, it is concluded that frogs are more variable than cats The official method in Germany for detg the lethal dose entails injecting 6 frogs on each of a series of doses It is difficult to calc the accuracy of the results to be expected in this case, so an exptl method was adopted A representative imaginary population of frogs was constructed from the results described above The lethal dose for each frog was written on a card, and expts carried out by drawing the cards from a hat It was found that with the standard method in which about 7 groups of 6 frogs were injected, 12% of the expts gave errors of over 10%, and 26% of the expts gave no definite result at all A new method of calcg results is proposed, which diminishes the no of large errors and enables all the results to be used By this method when 39 frogs were used the standard deviation of the result was 4 1% When 26 frogs were used, the standard deviation was 5 8% If the frogs were divided up so that the dose interval was smaller and there were proportionately fewer frogs on each dose, the change had no definite effect on the accuracy of the test. G G

**Assay of Lobelia inflata** O STEPPUN AND V SVEREV *Arch exptl Path Pharmakol* 141, 116–22(1929), *Physiol Abstracts* 15, 401 —A method is described for the biol assay of *Lobelia inflata*, using a decapitated cat as an exptl animal Lobeline causes a rise in blood pressure in decapitated cats By comparing the effects of lobeline and nicotine and by extirpating the suprarenals it was shown that lobeline raises blood

pressure only by acting on the suprarenals and has no peripheral action Hence it is suggested that lobeline should be assayed by comparing its power of raising blood pressure with that of a known soln of adrenaline G G

**Chaulmoogra oil from the seeds of Hydnocarpus heterophylla and the requirements of the Dutch Pharmacopeia V** D R Koolhaas *Pharm Tijdschr Nederland Indië* 7, 313 7(1930) cf *C A* 24, 2133 - The Dutch and Brit pharmacopeias require that chaulmoogra oil be pressed from seeds of *Taraktogenos kurzii*, King Chaulmoogra oils from several other botanical species are known, with nearly the same chem consts and therapeutic values I specially the required soly in alc (due to the high acid value) and the high acid value itself (21 27 Brit Pharm ) are irrational since this oil can be gathered with a low and const acid value (0 44) The high m p (32°) of the fat of *Hydnocarpus heterophylla*, indigenous to Java, the low acid value (<1) and the chem compn (glycerides of chaulmoogric and hydnocarpic acids) make this oil a good one for the combating of leprosy in the Dutch East Indies, though it does not meet the requirements of the Dutch Pharm D R Koolhaas

**The effect of fertilization on the odor and flavor of cigar tobacco.** C Coolhaas *Proefsta Vorstenland Tabak Mededeel* No 66, 1 22(1930) —Fertilization with $(NH_4)_2SO_4$ plus superphosphate gave tobacco of the best odor and flavor Tobacco fertilized with $(NH_4)_2SO_4$ alone was slightly inferior, while that fertilized with farmyard manure and that grown without fertilizer were much inferior D R Koolhaas

**Investigations on fire-holding capacity of tobacco leaf.** C Coolhaas *Proefsta Vorstenland Tabak Mededeel* No 68, 1 71(1930) —The av glowing duration was detd by noting the time in sec that each leaf burned, when ignited with a glowing carbon point at the bottom of the leaf on the right side between two veins About 800 leaves per test were burned The duration of glowing is directly proportional to the logarithm of the percentage of moisture Previous observations were confirmed that a poorly burning leaf contains more Cl and less K than a leaf that burns well The contents of Ca, Mg, and citric, oxalic and malic acids also affect the burning quality, but $SO_3$, $SiO_2$ and $Na_2O$ do not The duration of glowing is not improved by fertilizing, on the contrary, certain fertilizers injure the fire holding capacity The injurious effect is closely assocd with the amount of Cl contained in the org fertilizers $(NH_4)_2SO_4$, if necessary supplemented with double superphosphate, is detrimental to the fire holding capacity of the tobacco, although less so than stable manure Potash fertilization did not improve the fire holding capacity, probably because the absorption of the K is limited by the antagonistic influence of $Na_2O$, CaO and MgO When a leaf was gathered and the stalk placed in a weak potash soln , a considerable increase of the duration of glowing was recorded, after the leaf had been cured and fermented in the usual manner Most non burning tobacco was found in places where quantities of Cl existed in the soil moisture It is therefore probable that all measures to break the soil capillaries will be of value. Different varieties of tobacco grown under identical circumstances showed great differences in the av duration of glowing D R Koolhaas

**Harmine and its preparation from the root Peganum harmala L.** A D Rozenfeld *Farm Zhur* 1930, 183-6 —R reviews briefly the work on harmine, describes its method of prepn and phys properties according to Merck and points out the identity of harmine with *banisterine* Harmine has always been prepd from the seed, but R. was successful in prepg a harmine base from the root of *Peganum harmala* L in 3% yield It forms large needle shaped crystals, m 258° HCl salt m 262° It gives all the reactions common to banisterine and harmine The water soln is fluorescent, especially under ultra violet light B S Levine

**Potassium ferrocyanide as a microchemical reagent for the identification of strychnine.** Yu D Gnesin *Farm Zhur* 1930, 293-5 —G describes a drop method on a test plate. Strychnine, codeine and narcotine, when treated with appropriate solns of HCl and the yellow and red cyanide, yield sp crystals readily recognizable under the microscope The crystals are represented in six drawings B S Levine

**Botany, chemistry and pharmacodynamics of Toddalia aculeata.** J E Lobstein and P. Hesse *Bull sci pharmacol* 38, 157-64(1931) —The root contains a glucoside that is cleavable by emulsin, forms white crystals and is purified by pptn with $(NH_4)_2SO_4$ The oleoresin isolated is yellow and of bitter taste, $d_{17}$ 0 873, $\alpha$ = —15° 30', b 190°. It consists of a mixt of $Me_2O$, $PhCO_2H$, eugenol, citronellol and a paraffin b 80°. A dark brown rosin is contained in a quantity of 1 25%; it is sol in EtOH, $Et_2O$, $CHCl_3$, $C_6H_{11}OH$, benzine and turpentine oil, insol in petroleum ether Other constituents are saponifiable lipides 0 37%, m 39 6°, I value 66 64, $n_{25}$ 1 6339, unsaponifiable lipides 0 43% contg 2 15% phytosterol, reducing sugar, as glucose, 0 46%; hydrolyzable sugar, as sucrose, 0 12%, gum 0 80, protein 5 82, citric, malic, oxalic

and succinic acids Ca Mg Na, Fe Mn Zn, As, Cl P, S and Si The rosin in doses of 0 3 g produces abortus in pregnant guinea pigs of 500 g , in non pregnant, contractions of the uterus Larger doses cause convulsions paralysis of the posterior part and death within 48 hrs The leaves contain a gluco alkaloid, *toddaline*, which is pptd by all reagents for alkaloids, and 2 55% of tannin In pharmacol expts toddaline decreases the chronaxia of both nerve and muscle, and disturbs the isochronism In the isolated *heart the speed and the amplitude are reduced* A I Meyer

**Detection of adulteration of aloes** E Léger *J pharm chim* [8], 13, 143–4 (1931) —L recommends a simple soly test with $NH_4OH$ in the place of the more complex chlorinated aloin test (*C A* 20, 2561) In a conical flask mix 2 g powd aloes with 25 cc of a soln of 10 cc official $NH_4OH$ in $H_2O$ to make 100 cc Cork, allow to stand for 1 hr , shaking 3–4 times, then filter and wash the ppt with dil $NH_4OH$ soln until the filtrate is colorless Avoid evapn of $NH_3$ by covering the funnel to prevent the ppt becoming gelatinous Dry it in air at 25–30° and weigh The results show that Curaçao aloes with 0 25% insol are superior to all others, confirming the aloin $Cl_2$ test A carefully prepd Ooganda aloes gave 0 60% A Cape aloes gave 2 40, 9 35 and 3 40%, resp Cape aloes No 4 gave 45 5% of an insol vegetable powder, hence it was adulterated This method obviously fails to detect rosin, if its presence is suspected, ext. with benzene and apply the usual tests S Waldbott

**Biological assay of digitalis by the Hatcher-Magnus method applied to the dog.** J Pichot *Thesis*, Paris, 1929, *J pharm chim* [8], 13, 183(1931) —The substitution of the dog for the cat renders certain changes of procedure necessary Processes are given to obtain a max soly of the active principles of digitalis in infusions and tinctures Then the min lethal doses were detd for several samples of powd digitalis by means of infusions of various concns or ale tinctures Some expts consisted in the same detns after previous injection of a non lethal dose of *ouabaine*, the constancy of the min lethal dose of which has been previously studied at different concns The max error in all these detns does not exceed 18% S Waldbott

**The chaulmoogra of Cameroun.** R Mathivat *Thesis*, Paris, 1929, *J pharm chim* [8], 13, 183–4(1931) —The morphological and chem aspects of *Caloncoba welwitschii* Gilg, the chaulmoogra of Cameroun are described This shrub and *C glauca* Gilg show distinct morphological differences in their leaves and fruits The consts of the oil of *C welwitschii* are close to those found recently for the oil of *Oncoba echinata* Oliver (cf *C A* 23, 112, 4297) Figures and micrographic descriptions are given of the grains of various species and of the press cake obtained from each of these S Waldbott

**Experimental investigations concerning the standardization and the pharmacology of heart tonics with a new method.** Wm Nyiri and Louis Dubois *J. Am Pharm Assoc* 19, 945–7(1930) cf *C A* 25, 1949 —The work is in 2 parts (*a*) standardization of heart tonics and (*b*) pharmacology of digitalis, with special reference to the relationship of Ca and H ions to the drug The scope of the studies is indicated by the use of 50 cats, 300 rabbits and 4500 frogs In (*a*) warm blooded animals are to be preferred Great variations are found in the frog as a test animal The no of animals necessary to make a satisfactory assay of a prepn of digitalis should be left to the judgment of the individual worker The formula of van Wijngaarden allows too wide a range of variations and does not fulfil the purpose for which it was recommended Intravenous administration is best in the assay of heart tonics The new intravenous anesthesia (barbital Na) is to be preferred over former methods The drop in blood pressure to 0 approaches closest the theoretical end point and is preferred to the stoppage of the heart It is very important to keep the time of the individual expt as uniform as possible The chief difficulty in standardizing digitalis prepns (for heart use) is that some require preliminary treatment before assay, such as evapn of the ale , etc These manipulations frequently ppt active principles The basic requirement for a physiol assay should avoid such damaging treatment A method has been worked out by N and D which meets the principal enumerated requirements. The rabbit is used as the test *animal The advantages of the method* are that animal material is always available The end point is obtained by the drop in blood pressure supplemented by ouabain and is as close as may be expected Rabbits have a higher resistance to heart tonics than other warmer blooded animals so that tinctures need not be diluted more than 1 4 which does not interfere with the test Prepns of great concns as well as those of high dilutions may be tested (*b*) Digitalis and strophanthin poisoning of the heart takes place in the absence of $Ca^{++}$ Increase of $Ca^{++}$ to 4 times the normal reenforces and hastens digitalis action The acid base equil of the nutrient fluid of the heart may be changed within the range of $p_H$ 5 2 to 7 6 Full digitalis action occurs within the above mentioned range L E Warren

**Studies on strychnine. The relative sensitivity of certain chemical and physiological tests.** JUSTUS C WARD AND JAMES C MUNCH *J Am Pharm Assoc* 19, 954-7 (1930) —Analyzed specimens of strychnine salts were subjected to seven of the more common color tests The most sensitive test is $K_2Cr_2O_7 + H_2SO_4$, by which 1 0 γ can be detected $KIO_3 + H_2SO_4$ was the least sensitive of the oxidizing tests Malaquin's test was the least sensitive of any tested, 6 7 γ being required to obtain the reaction A quant test for strychnine was developed which depends on the sensitivity of the individual to bitter taste in tasting various concns of the alkaloid or its salts Individuals vary in sensitivity but the av limit is 5 γ NaCl and sucrose decrease the apparent bitterness Different areas of the tongue differ in sensitivity After an individual has been standardized by tasting knowns it is possible to detect differences of 5% L F WARREN

**A comparison of the $p_H$ of neoarsphenamine and sulfarsphenamine in relation to differences in their structure.** A E JURIST AND W G CHRISTIANSEN *J Am Pharm Assoc* 19, 951-3(1930) —The $p_H$ range of 9 specimens of sulfarsphenamine and 1 specimen of sulfarsphenamine acid lay between 2 15 and 4 36 Sulfarsphenamine contains some free acid as was shown by detns of As, S and Na The excess of S in some specimens is due to the presence of sulfarsphenamine acid This acid is stable while neoarsphenamine acid is unstable Conclusion The observed facts are sufficient to warrant the belief that the structures of neoarsphenamine and sulfarsphenamine are considerably different L L WARREN

**A toxicological investigation of chloral hydrate.** L W RISING AND L V LYNN *J Am Pharm Assoc* 20, 9-11(1931) —It is generally believed that $CCl_3CHO\ H_2O$ (*C*) is very unstable in the presence of decompg org matter, such as the cadaver, but there are no exptl data Knowledge is also lacking concerning the effects of preservatives on the stability of the substance Stomachs of sheep were minced and known weights mixed with known quantities of (*C*) The preservative was added and the container sealed with paraffin The preservatives were EtOH, 1% $HgCl_2$, a satd soln of $As_2O_3$, 10% HCHO and an embalmer's cavity fluid contg EtOH, MeOH, $C_3H_5(OH)_3$, $H_2O$, ethereal and other constituents not named Analyses were made at 1, 3 and 7 months (*C*) was detd by steam distn, subsequent reduction with Zn and titration by $AgNO_3$ In most tests there was progressive decompn At the end of 7 months the undecompd amts were with EtOH 41, HCHO 70, $HgCl_2$ 91, $As_2O_3$ 89, cavity fluid 88 and no preservation 63% R. and L believe that 18 months would elapse before all of (*C*) would be decompd In forensic cases $HgCl_2$ is apparently the best preservative to employ in keeping tissues for analysis for (*C*), EtOH is the poorest Analysts should recover at least 50% of (*C*) if death has occurred within 6 months L E WARREN

**Storing hygroscopic drugs and chemicals.** HANS GFELLER. Swiss 143,544, Oct 22, 1929 The substances are stored in a container supported in a second vessel contg CaO.

**Synthetic drug.** I G FARBENIND. A.-G (Karl Streitwolf, Alfred Fehrle, Walter Herrmann and Paul Fritzsche, inventors) Ger. 520,225, Aug 26, 1928 2,3-Dimethyl-4-aminopyrazolone-1 phenyl-4' arsonic acid and 3 hydroxybenzaldehyde 4-arsonic acid are brought to reaction, yielding a condensation product which is less poisonous than either initial material The reaction may be effected by boiling together aq solns of the Na salts of the acids An example is given.

**Synthetic drugs (dinitro- and diamino-pyracridones).** DEUTSCHE GOLD UND SILBER-SCHEIDEANSTALT VORM ROESSLER (to I G Farbenind A G) Brit. 339,932, Sept 29, 1928 Pyracridone is nitrated to produce a dinitro compd from which, by reduction, the corresponding diamino compd is obtained

**Therapeutic agent** Percy Desenis Ger 517,935, April 12, 1928 A stable water sol medicine contg I and Ag is obtained by mixing an aq soln of colloidal Ag with Na 7 iodo 8 hydroxyquinoline 5 sulfonate. The medicine is used against tuberculosis

**Salts of alkaloids with camphoric acid.** Schering-Kahlbaum A.-G. (Walter Schoeller and Herbert Schotte, inventors) Ger. 519,033, Apr 16, 1926 Acid camphorates of hyoscyamine, scopolamine and atropine are prepd by the customary salt forming methods Examples are given

**Dilithium sodium or potassium citrate** Firma Johann A Wülfing Ger 516,672 Nov 19, 1929 $Li_2NaC_6H_5O_7$ or $Li_2KC_6H_5O_7$ is prepd by adding $Li_2CO_3$ to a soln of citric acid in alc., boiling off the $CO_2$, adding NaOH or KOH dissolved in the least possible amt of water to the boiling soln., cooling, crystg and drying The compds are used in therapy in anti arthritis or anti diabetes preps Examples are given The yield is 95%

**Organic phosphorus compounds.** I G Farbenind A.-G. (Wilhelm Lommel and Heinrich Munzel, inventors) Ger 521,205, Nov 1, 1928 New compds are prepd by condensing triarylphosphine oxides with phenols Thus, a condensation product m 149–150° is obtained by stirring tri-*o* tolylphosphine oxide with an equimol amt of PhOH at 150° Numerous other examples are given also The products are *useful for combating microorganisms, moths*, etc., and as *intermediates for drugs* Cf *C A* 24, 4121

**Mercury compounds.** Carl L. J Loidmann Ger 519,320, Aug 7, 1928 Double compds of HgS with Hg halides or other Hg salts are prepd. in highly dispersed form by the reaction of a colloidal soln of HgS with the other Hg salt The reaction may be effected by shaking a colloidal soln of HgS with the other Hg salt in the cold, or by boiling the mixt for some hrs The colloidal soln of HgS may be prepd by treating a soln of a Hg halide with $Na_2S$ and NaI in the presence of a stabilizer Examples are given of the prepn of $HgCl_2$ HgS and $HgI_2$ HgS The products are useful for treating syphilis

**Acridine derivatives.** I G Farbenind A.-G. (Karl Schranz and Hans P Muller, inventors) Ger 520,078 Dec 14, 1928 Double compds of 3,6 diamino-10-alkylacridinium salts with salts of 3 6 diiminoacridine are prepd by bringing the salts together, or by the reaction of one of the bases with an acid salt of the other base The reaction proceeds in the cold or on warming, and a solvent may be present. Examples are given The products are more sol in water than their components, and have bactericidal properties

**Derivatives of pyrazolone.** Curt Räth and Arthur Binz Ger 516,534, Nov 26, 1924 1 Pyridyl 3 methyl 5-pyrazolone or its substitution products is treated with an equimol amt or excess of an alkylating agent Thus, 2 [3'-methylpyrazolonyl 1'] 5-nitropyridine is heated with KOH, $Et_2SO_4$ and MeOH to give 2 [2',3' dimethyl pyrazolonyl 1'] 5-nitropyridine, m 172–173°. Another example describes the prepn of 2 [2',3'-dimethylpyrazolonyl 1'] 5 chloropyridine, m 135° *The products are used in therapy*

**Quinoline derivatives.** Johanna Wolffenstein née Deen Ger 520,155, July 8, 1926 2 Phenylquinoline-4 carboxylic acid and its derivs substituted in the phenyl residue with an amino or a dimethylamino group, are esterified with 1 $Et_2NC_2H_4OH$ by the customary esterification processes Examples are given The products have anesthetic properties resembling those of cocaine

**Salts of quaternary bases** Igon Glücksmann Ger 519,324, Sept 30, 1927 New salts of halogen substituted aliphatic quaternary bases are prepd by the reaction of known salts of the bases with suitable salts of the acids to be combined therewith Thus, the halides of the bases are caused to react with Ag salts of the acids, or the sulfates of the bases with Ba salts of the acids An excess of the acid to be combined may be present Examples are given of the prepn of *β,γ-dibromopropyltrimethylammonium coumarin-3 carboxylate* m. about 130°, *triethyl β chloroethylammonium cinnamate, trimethyl β bromoethylammonium p toluenesulfonate, iodomethyltrimethylammonium mandelate β,γ-dibromopropyltrimethylammonium theobromine I acetate*, m about 150°, *iodomethyltrimethylammonium acid phthalate*, m about 133°, *β,γ-dibromopropyltrimethylammonium acetate*, m 120–2°, and *trimethyl β bromoethylammonium propionate*, m about 180° The products are of pharmaceutical value

**Antiseptics.** F Hoffmann-La Roche & Co., A G Ger 519,321, April 8, 1930 Addn to 507,418 (*C A* 25, 560) Substituted phenoxyphenols or their alkali salts are converted into their carbonates or carbamates by the customary processes Examples are given of the prepn of *hydroquinone p tolyl ether carbamate*, m 130–1°, *2-chloro-4 phenoxyphenyl carbamate*, m 129°, and *thymol p hydroxyphenyl ether carbonate*, $b_{14}$ 350°

**Use of quinatoxines with benzoic acid as bactericidal agents.** E Schulze Brit. 339,602, July 22, 1929 Benzoic acid is used together with substances such as eucupino-

toxine or vucmotoxine for sterilizing, disinfecting or preserving various products and materials

**Analgeso-hypnotic composition (a white inodorous molecular compound of pyramidone and ethylisopropylbarbituric acid.)** WERNER M LAUTER (to E. R Squibb & Sons) U. S 1,797,428, March 24

**Thymus gland extracts.** I G FARBENIND A G Brit 339,013, Sept 10, 1929 Thymus gland ext is tested in regard to its physiol activity by detg the smallest dose which, on injection into an immature female animal, will prevent the normal occurrence of rutting An ext made with Ringer's soln is tested and standardized by dilu or by concn *in vacuo* at low temp., in accord with results of the test

**Purifying biocatalysts.** KNOLL A G CHEM FAB Ger 521,126, Aug 29, 1926 Co-enzymes hormones, water sol vitamins, etc., are purified by fractional diffusion or dialysis Thus, an impure soln of the biocatalyst may be carefully introduced at the bottom of a column of solvent, whereupon the biocatalyst diffuses up the column more quickly than some of the impurities and less quickly than others, so that a relatively pure product is obtainable from an intermediate section of the column Alternatively, the impure soln may be dialyzed through two membranes the first of which retains high-mol impurities, while the second retains the biocatalyst but is permeable to low mol impurities such as salts Examples are given

**Hormones.** SIGMUND FRANKEL Ger 519,323, June 28 1927 See Brit 292,062 (*C A* **23**, 1474-5)

**Hormones.** SOC ANON POUR L'IND CHIM A BALE Ger 521 100, Sept 29, 1928 See Brit 298,089 (*C A* **23**, 2786)

**Female sexual hormones from vegetable starting materials.** SIEGFRIED LOEWE Ger 517,761, June 16, 1926 Female plant tissues are extd with water or org solvent, and the ext is freed from undesired constituents The prepn produces heat' in female mammals In example, the ovaries of the water rose *Nuphar* and willow catkins are dried and extd with ether The ext is worked up to give a product which produces "heat" in ovariectomized mice

**Removing nicotine from tobacco by prolonged extraction with water.** LUDWIG LIPPMANN Ger. 520,438, Dec. 20, 1926

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Purification of crude sulfuric acid.** H A J PIETERS AND M J MANNENS *Chem Weekblad* **28**, 130-1(1931) —Crude $H_2SO_4$ can be purified by leading through $H_2S$ or air contg about 1 vol % of $H_2S$ Arsenic is pptd quantitatively, nitrites are completely and nitrates partly eliminated The ppt can be removed by filtration or by dilu of the acid till the ppt settles Addn of mineral oil to the acid before pptn causes the ppt. to form at the oil acid boundary and the clean acid can be siphoned off F DE L

**Quinquennial review of the mineral production of India for the years 1924 to 1928. Alum and aluminous sulfates.** C S FOX *Records Geol Surv India* **64**, 311-8 (1930) —Kalinite, alunite and alunogen occur in India in limited amts Practically all the alum is produced by the sepn of $Al_2(SO_4)_3$ from decompd pyritous shales, with the addn of nitre or wood ashes The shale is built up into heaps 18 ft high with layers of wood and clay that had been once burned and exposed to the weather for 1 yr This is ignited, fresh material added on one side and roasted material removed from the other The complicated leaching process is described Alum is being displaced in most of its Indian uses by $Al_2(SO_4)_3$ from bauxite **Sulfur, sulfuric acid and soluble sulfates.** E. H. PASCOE, *Ibid* 440 6 —Small quantities of S occur in several volcanoes $H_2SO_4$ is being manufd from Sicilian S Production data are given The Indian $(NH_4)_2SO_4$ industry is considered briefly ALDEN H EMERY

**Preparation of active magnesium carbonate from magnesite.** FRANK C. MATHERS AND WALTER V. FACLESON *Proc Indiana Acad Sci* **38**, 175-82(1929) —Pptd $MgCO_3$ causes lime plaster to set quickly, but mineral $MgCO_3$ is not effective The cost of pptd $MgCO_3$ is prohibitive The authors prepd active $MgCO_3$ by calcination of magnesite to MgO, followed by hydration and carbonation Variables studied were fineness of grinding of original magnesite, temp and time of burning, time of soaking the oxide in water for hydration and time of carbonation It is recommended that the magnesite be burned at 1000° for 0 5 hr. for pieces passing a 100 mesh screen, and 2 hrs for pieces 4-5 cm in diam., that this oxide be hydrated by soaking for 24 hrs in water, and that

this hydroxide be carbonated by treating with $CO_2$ under slight pressure with agitation Pieces of $Mg(OH)_2$ which are 4–5 cm in diam require 72 hrs ' carbonation; pieces small enough to float will carbonate in 0.5 hr $Ca(OH)_2$ contg 4% of its wt. of this $MgCO_3$ produces a plaster which sets in 3 hrs H. M STARK

Historical notes on salt and salt manufacture. L G M BAAS-BECKING *Sci Monthly* May, 1931, 434–46 E H

Liquid $CO_2$—how technology has harnessed the available sources. GUSTAVE T. REICH *Chem Met Eng* 38, 130–41(1931) —The processes for the concn and purification of $CO_2$ for liquid $CO_2$ production are described Flow sheets of the principal processes are given L. W. T. CUMMINGS

The water-soluble phosphates—their principal industrial uses. CHARLES H BUTCHER *Chem Trade J* 88, 217–9(1931) —$Na_3PO_4$ is now replacing, to a considerable extent $Na_2CO_3$ for softening of boiler and laundry waters, and as a detergent $NH_4$ phosphates are used largely in concd fertilizers Na phosphates are used as detergents and degreasing agents, and in silk weighting and fireproofing agents nearly all the Na and $NH_4$ phosphates have been employed Other applications are mentioned W. H. BOYNTON

Trisodium phosphate—its manufacture and use. FOSTER D SNELL. *Ind Eng Chem* 23, 470–4(1931) —$H_3PO_4$ is added to $Na_2CO_3$ soln to form $Na_2HPO_4$. $CO_2$ escaping This soln is filtered, dild and NaOH soln added to form $Na_3PO_4$ soln , which is filtered hot, and crystd A spray congealed product may be formed if desired Caking of $Na_3PO_4$ crystals may be prevented by formation of double salts. The detergent value of $Na_3PO_4$ is due to its high $p_H$ in soln , its ability to lower interfacial tension against oils or solids, and its marked power of emulsifying oils It is used as a *water softener* and *boiler compd* because of its ability to ppt. Ca and Mg phosphates E M. SYMMES

California desert soda—plant of the Natural Soda Products Company at Keeler, California, on Owens Lake. G ROSS ROBERTSON *Ind. Eng Chem* 23, 478–81 (1931) —Deposits and plant operation are described E M. SYMMES

Rate of calcination of limestone. C C. FURNAS *Ind Eng Chem* 23, 534–8 (1931) —Calcination of limestone takes place in a very narrow zone, which is the phase boundary between $CaCO_3$ and CaO This zone advances from the outside to the inside of the piece at a const. rate for each temp , independently of particle size or degree of calcination Curves and data are given for rates of calcination and temp histories of particles Most of the resistance to heat transfer into the piece appears to be in the narrow zone of calcination, not in the body of the calcined material The calcination data may be used to det the surface area of the particles E M SYMMES

Oyster shells as raw material for chemical lime. J B NEALEY. *Chem Met Eng* 38, 145–7(1931) —The only plant using oyster shells as a raw material for producing chem lime is described. The plant is located at Houston, Texas, and obtains oyster shells by dredging on the Gulf Coast The principal problem is that of removal of mechanically entrapped foreign material L. W. T. CUMMINGS

Testing of the decolorizing power of activated carbons. A S SIPYAGIN AND E S. SERKIN *Zhur. Sakharnoi Prom* 4, 466–70(1930). V. E BAIKOW

The economics of hydrogen production from ammonia. HANS J. BRAUN *Metallborse* 21, 267–8(1931) —The Berliner and Burke process for the production of $H_2$ by the dissocn of $NH_3$ can be operated industrially in Germany at a low cost. Comparative production and shipping costs for both $NH_4$ and $H_2$ are given RUSSELL C. ERB

The present state of bromine technology in the potash mines. J. WALTER AND C. HORST *Bull soc ind Mulhouse* 97, 29–44(1931) —A detailed description is given of the app and procedure used in the recovery of Br from the potash mother liquors of France and Germany I. H. ODELL

Method for reclaiming iodine from titration residues. F. TH VAN VOORST *Chem. Weekblad* 28, 129–30(1931) —The I-contg residues are collected and the I is pptd. as CuI, by addn of $CuSO_4$ and $NaHSO_3$, the liquid is siphoned off and the process repeated until enough CuI is collected The CuI is oxidized with crude $H_2SO_4$ and $Na_2Cr_2O_7$ and the free I distd off Liquids contg $CN^-$ cannot be treated in this way. The difference in the cost of the I and of the chemicals used is large enough to make the method economical. F. DE LEEUW

Hafnium. PAUL M. TYLER. Bur. Mines, *Information Circ* 6457, 11 pp (1931) — There are discussed description and properties, occurrence (list of minerals), identification and analysis, geographic distribution, history, sepn. of Zr and Hf , prepn. of Hf and Zr, prepn. of pure Hf salts, and production ALDEN H EMERY

Detection and importance of saponins. L KOFLER. *Pharm Monatshefte* 12, 53–5(1931) —An address W. O. E.

Laminated material—method of production. HERBERT W ROWELL. *The Times Trade and Eng Suppl* 28, No 664, 19(1931) E. M SYMMES

Furfural and its application in the plastic industry. G GENIN *Rev gén. mat plastiques* 7, 89–95(1931) —A review of the properties and constitution of furfural and of its com applications as a *solvent* and as a base for *synthetic resins* A P.-C.

The importance of the isoelectric point in the manufacture of casein for paper coating. R W. BELL. *Paper Trade J* 92, No 13, 55–6(1931) —The isoelec. point is at a $p_H$ of 4 6, at which point min soly occurs Casein having this $p_H$ value, by whatever process it has been prepd , will, if other factors are properly controlled, be low in ash, dissolve easily, have high adhesive strength and good flowing properties. A P.-C.

Fractional crystallization in the Blanc process with HCl and $HNO_3$ (MALQUORI) 2. Removing $PH_3$ from gases [with production of gas contg H and N or making $NH_3$] (Fr pat 696,512) 13

---

Hydrochloric acid recovery from liquids. GREGOIRE MINKOFF and MARCEL LEVY (to International Sugar and Alcohol Co , Ltd ) U S 1,798,099, March 24 See Brit. 307,986 (*C A* 24, 208)

Storing hydrocyanic acid. HEERDT-LINGLER GES Brit. 339, 717, Oct. 22, 1928. HCN (alone or absorbed in porous or granular substances) is packed in closed metal containers from which the atm O is expelled by boiling the HCN, by generation of an inert gas such as N or $CO_2$ in the container, or by pumping

Stabilizing hydrocyanic acid. DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORMALS ROESSLER Ger 517,918, July 4, 1925 HCN is rendered stable by adding such org halogen compds (excepting irritants) which split off acid residues under the given conditions. Examples are $C_2H_3Cl_3$, $C_2HCl_3$, $C_2Cl_4$, $CHCl_3$, etc.

Nitric acid. NIKODEM CARO and ALBERT R FRANK. Fr 696,401, Aug 17, 1929. Gaseous mixts contg oxides of N, O and steam are obtained by the oxidation of $NH_3$ A part of the steam is removed, the remaining water is sepd during a 2nd phase, after or during the oxidation of the gaseous oxides of N, in a 3rd phase $N_2O_4$ or concd. $HNO_3$ is obtained Details of the process are given. Cf. *C A* 25, 2527.

Phosphoric acid. SOC. DES PHOSPHATES TUNISIENS ET DES ENGRAIS ET PRODUITS CHIM Fr 696,127, May 26, 1930 Concd $H_3PO_4$ is clarified by satg the heated acid with $H_2S$, adding $As_2S_3$, stirring and then allowing the solids to ppt

Phosphoric acid and hydrogen. MARKUS LARSSON (to Du Pont Ammonia Corp ). U. S 1,797,726, March 24 Phosphide of Fe is treated with steam or steam and air at an elevated temp. to oxidize the P of the phosphide to $P_2O_5$ and liberate H from the $H_2O$. An arrangement of app is described Cf. *C A*. 24, 3090

Eliminating arsenic from acid to be used in the manufacture of ammonium sulfate. SOC GÉNÉRALE DES FOURS À COKE SYSTÈMES LECOCQ Fr 696,341, May 31, 1930. See Belg 361,815 (*C A* 24, 4596).

Sulfuric acid. STANLEY ROBSON and BERTRAM LAMBERT. U. S. 1,797,923, March 24 In the catalytic oxidation of $SO_2$, sulfurous gases are subjected to such treatment only as is necessary to remove suspended solid matter and then passed in the presence of O over a catalyst contg solid Cr hydroxide hydrogel contg at least one adsorbed base

Sulfuric acid. MAX SCHROEDER Fr. 695,583, May 14, 1930. Mixts rich in $SO_2$ and air are obtained from poor gases such as roasting gases by absorbing the $SO_2$ in water under pressure and treating this soln under atm pressure in a stream action tower with the amt of air necessary to produce a suitable gaseous mixt. for the production of $H_2SO_4$. A moderate heating may be used if desired.

Sulfuric acid. NATIONAL PROCESSES, LTD , STANLEY ROBSON and PHILIP S. LEWIS. Fr 696,476, May 14, 1930 Catalytic materials for the transformation of $SO_2$ into $SO_3$ are made by mixing a compd. having a basis of V with an indifferent support in a finely divided state, damping the mixt and transforming it into an agglomerate with a suitable binder, and treating the damp agglomerate in the cold with a reducing gas until the product has an acid reaction and the V is completely reduced The V compd is either vanadic anhydride in the granular state, a metal vanadate or a soln of a sol vanadate

Sulfuric acid. INDUSTRIKEMISKA AKTIEBOLAGET. Fr. 697,173, June 10, 1930. $SO_2$ is oxidized to $SO_3$ which is hydrated in the liquid phase by leading, blowing or other-

wise causing the gas to pass through a layer or layers of liquid The layer of liquid may contain $H_2SO_4$ and $HNO_3$ or nitrosylsulfuric acid

Sulfuric acid. National Processes, Ltd Ger 516,764, Sept. 13, 1928 See Brit 303,459 (*C A* 23, 4539) and Brit 301,853 (*C A*. 23, 4306).

Rotary furnace for concentrating acids. Silesia, Verein chemischer Fabriken (Georg Narten, inventor) Ger 517,965, June 20, 1929 Details of construction are given

Separating ammonia from gas mixtures. I G Farbenind A G (Friedrich Frowein and Erich Rahlfs, inventors) Ger 519,225, Jan 11, 1929 The mixts are treated with mother liquors which contain metal salts capable of combining with $NH_3$ and which cannot easily be worked up in any other way A suitable mother liquor is obtained in the manuf of $KNO_3$ from $Ca(NO_3)_2$ and KCl The liquor comprises $CaCl_2$ with some $KNO_3$, and when treated while cooling with gases contg $NH_3$, *e g*, with $NH_3$ synthesis products, $CaCl_2 6NH_3$ is pptd After sepg the ppt, the residual soln may be returned to the first stage of the $KNO_3$ manuf, or worked up separately to recover $KNO_3$ The pptd $CaCl_2 6NH_3$ is decompd by heat. Cf *C A* 25, 2250

Alkali salts. Chemieverfahren Ges Fr. 697,069, June 3, 1930 $KNO_3$ and $Na_2CO_3$ are prepd A lye, obtained by mixing $CaSO_4$ in a mother liquor contg $Na_2CO_3$ and sepg the $CaCO_3$ thus formed, is treated with a crude sylvinitic salt of potash and $NH_3$ which produces glaserite and KCl The $K_2SO_4$, obtained by treating this mixt. with water, is treated with $CaCO_3$, previously obtained, and $HNO_3$ which gives $CaSO_4$ and $KNO_3$ The lye sepd from the glaserite and KCl is cooled to remove a part of the $NH_4Cl$ and is then submitted to the Solvay process

Alkaline earth cyanates. I G Farbenind A-G Fr 695,497, May 13, 1930 Alk earth oxides or carbonates are heated to temps between 130° and 400° with urea or substances contg it.

Alkaline earth metal chlorides from sulfates Theodor Lichtenberger and Ludwig Kaiser U S 1,798 091, March 24 An alk earth metal sulfate is dissolved in its corresponding melted alk earth metal chloride, the sulfate is reduced to sulfide (suitably by the action of coke) and the sulfide is converted into chloride by injection of Cl

Reducing alkaline earth sulfates. Wilhelm Rassbach Ger 520,458, Feb 14, 1930 A mixt. of alk earth sulfate with powd Al is ignited, *e g*, by means of a little powd. Mg The reaction products are alk earth sulfide and $Al_2O_3$, but some alk earth oxide and $SO_3$ may also be formed through the vaporization and air oxidation of some of the alk earth sulfide

Process for the manufacture of mono-alkali phosphates. Société d'études scientifiques et d'entreprises industrielles. Belg 372,395, Sept. 30, 1930 An alkali chloride or a mixt. of alkali chlorides is treated with an excess of $H_3PO_4$ so as to form $MH_2PO_4 H_3PO_4$, in which M is an alkali metal or $NH_4$. This salt is treated with alc, the insol $MH_2PO_4$ is sepd, and the $H_3PO_4$-alc mixt. is distd in presence of $H_2O$, the recovered alc being used again in the process

Carbonates. Chemieverfahren G m b H. Fr. 696,386, June 2, 1930 $K_2CO_3$ and $Na_2CO_3$ are obtained by mixing a $Na_2CO_3$ liquor with $SrSO_4$ or $BaSO_4$, sepg the alk. earth carbonate, and treating the lye with crude sylvinitic salt of K and $NH_3$ which produces glaserite and KCl Then the $K_2SO_4$ obtained by treating this mixt. of salt with water is treated in aq soln with $SrCO_3$ or $BaCO_3$ obtained previously, preferably in the presence of $CO_2$, which gives a soln of $K_2CO_3$ or $KHCO_3$ and a ppt. of $K_2SO_4$ and $SrSO_4$ or $BaSO_4$. The $K_2SO_4$ is sepd from the $SrSO_4$ or $BaSO_4$ by heating with water and the $K_2CO_3$ or $KHCO_3$ soln is evapd

Phosphates. Jean Margolès Fr 696,138, May 27, 1930 Aq solns of mono-alkali phosphates are stabilized by adding to the phosphate or to its mixts with the products resulting from the solubilization of crude phosphates, or to the water used for its soln, an acid, preferably org, which is weaker than the acid used for solubilization of the crude phosphate

Sulfates. Alphonse Zieren Fr 696,447, May 3, 1930 An app is described for the uniform distribution of $H_2SO_4$ in mech sulfate furnaces

Thiocyanates. Emil Hene Ger 517,759, Nov 20, 1928 Thiocyanates of the alkali or alk earth metals are prepd by heating S compds of the metals in the required proportions with $CN_2H_2$ or derivs at low temps between 200° and 500°. S may be added during the reaction if necessary Thus, BaS, S and $CN_2H_2$ are heated to about 300° to give $Ba(CNS)_2$ Also NaSH and $CN_2H_2$ give NaCNS Several further examples are given In all cases the yield is above 90%

Fluorine compounds. I G Farbenind A.-G Fr. 695,573, May 14, 1930

Solns of compds contg F and Al are prepd by the action of solns of $AlCl_3$ on difficultly sol compds of F in aq suspension, in such amts that there are at least 2 equivs of Al for 1 of F. Examples are given of the treatment of fluorspar and $Na_2SiF_6$. Complex compds of the formula $AlF_3$, $AlCl_3$ are formed.

**Compounds containing aluminum and fluorine.** I G FARBENIND. A.-G. Fr. 695,688, May 15, 1930. Difficultly sol compds are pptd from solns contg $AlF_3$, $AlCl_3$ (cf. Fr. 695,573, preceding abstr.) by the addn. of carbonates or hydroxides of alkali or alk. earth metals to form basic salts of Al or by the addn. of alkali fluorides to form double fluorides.

**Hypochlorite compounds.** THE MATHIESON ALKALI WORKS. Fr. 695,952, July 4, 1929. See U. S. 1,787,048 and 1,787,080 (*C. A.* 25, 781).

**Nitrogen compounds.** SOC. D'ÉTUDES CHIM. POUR L'IND. Fr. 695,964, May 22, 1930. Cyanamides and metallic cyanides are treated with gases contg. hydrocarbons, N and H at a temp. above 200° and below 1000°, whereby the elementary N becomes fixed as N derivs.

**Beryllium salts.** SIEMENS & HALSKE A.-G. (G. Hellmut Fischer, inventor). Ger. 520,151, Nov. 2, 1928. A soln. of an alkali beryllium fluoride or other halide is treated with an alk. earth hydroxide or a soln. thereof. Practically all the Be is thus pptd. as the hydroxide which is then worked up to Be salts.

**Rubidium salts.** GERHART JANDER. Ger. 517,921, Jan. 27, 1929. Rb salts are obtained by treating Rb carnallite with silicomolybdic acid, and decomposing the resulting Rb silicomolybdate by heating in a current of HCl, with evolution of $MoO_2Cl_2$. The Rb is then leached out from the $SiO_2$. An example is given.

**Water-soluble hydroxides and carbonates.** ALBERT FRITZ MEYERHOFER. Ger. 521,430, June 15, 1924. Aq. solns. of the appropriate fluorides under heat and pressure are caused to react with hydroxides or carbonates of metals forming insol. fluorides. The amt. of water should not exceed that required to produce a concd. soln., and may be less.

**Metal carbonyls.** I G FARBENIND. A.-G. (Emil Keunecke, inventor). Ger. 520,220, Aug. 15, 1928. See Fr. 677,548 (*C. A.* 24, 3329) and Fr. 37,284 (*C. A.* 25, 2528).

**Metal carbonyls.** I G FARBENIND. A.-G. (Leo Schlecht, Walter Schubardt and Emil Keunecke, inventors). Ger. 517,831, Mar. 7, 1929. See Fr. 691,100 (*C. A.* 25, 1042).

**Aluminum chloride.** I. G FARBENIND A.-G. (Johannes Brode and Carl Wurster, inventors). Ger. 520,152, Dec. 28, 1927. Anhyd. $AlCl_3$ is obtained in a stable form suitable for transport by passing $AlCl_3$ vapor into a cooled vessel, suitably into the vessel in which it is to be transported, until a solid block of the salt is obtained. The vessel may be conical and may be lined with a material hindering the adhesion of $AlCl_3$ crystals, *e. g.*, with graphite, soot or talc. Cf. *C. A.* 25, 1644.

**Aluminum chloride.** TURE R. HAGLUND. Ger. 521,339, April 1, 1925. $AlCl_3$ is prepd. by the action of anhyd. chlorinating agents, at a raised temp., on the Al sulfide melts that are obtained by fusing bauxite or the like with reducing agents and fluxes contg. S. The chlorination temp. may be sufficient to effect distn. of the $AlCl_3$. Suitable chlorinating agents are Cl, HCl and chlorides of S and P.

**Aluminum fluoride precipitation.** JOHN E. MORROW (to Aluminum Co. of Am.). U. S. 1,797,994, March 24. Pptn. is effected by adding to an $AlF_3$ soln. a small quantity of a finely divided inert material such as alumina, calcined cryolite or finely divided $AlF_3$ and subsequently heating the soln.

***Alumina from bauxite.*** WOLF J. MÜLLER and HEINRICH HILLER. Fr. 695,586, May 14, 1930. See Brit. 330,661 (*C. A.* 24, 5947).

**Alumina and phosphorus.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Fr. 695,962, May 22, 1930. $Al_2O_3$ and P or $H_3PO_4$ are prepd. by fusion under reducing conditions of a phosphate ore, such as natural phosphate, and Al compds. such as bauxite, Al phosphate, etc., in the presence of compds. contg. Fe and S, so as to volatilize the P and to produce a slag contg. compds. of Al and sulfides which is used for the production of pure $Al_2O_3$.

**Aluminum oxide products from material containing aluminum sulfide.** TURE R. HAGLUND. U. S. 1,797,655, March 24. Sulfide-contg. material which may be in a solid condition is treated with an oxidizing gas such as air or $SO_2$ and $H_2O$ to effect replacement of S by O. Cf. *C. A.* 24, 1473.

**Aluminum sulfate.** COLLOID-CHEMISCHE FORSCHUNGS A.-G. Swiss 143,696, Jan. 7, 1929. Al contg. material such as bauxite, kaolin, etc., is heated with an equal amt. of concd. $H_2SO_4$ and the $Al_2(SO_4)_3$ so formed extd. with water. The aq. ext. is evapd.,

wise causing the gas to pass through a layer or layers of liquid. The layer of liquid may contain $H_2SO_4$ and $HNO_3$ or nitrosylsulfuric acid.

Sulfuric acid. National Processes, Ltd. Ger. 516,764, Sept. 13, 1928. See Brit. 303,459 (*C. A.* 23, 4539) and Brit. 301,853 (*C. A.* 23, 4300).

Rotary furnace for concentrating acids. Silesia, Verein chemischer Fabriken (Georg Narten, inventor). Ger. 517,965, June 20, 1929. Details of construction are given.

Separating ammonia from gas mixtures. I. G. Farbenind. A.-G. (Friedrich Frowein and Erich Rahlfs, inventors). Ger. 519,225, Jan. 11, 1929. The mixts. are treated with mother liquors which contain metal salts capable of combining with $NH_3$ and which cannot easily be worked up in any other way. A suitable mother liquor is obtained in the manuf. of $KNO_3$ from $Ca(NO_3)_2$ and KCl. The liquor comprises $CaCl_2$ with some $KNO_3$ and when treated while cooling with gases contg. $NH_3$, *e. g.*, with $NH_3$ synthesis products, $CaCl_2.6NH_3$ is pptd. After sepg. the ppt., the residual soln. may be returned to the first stage of the $KNO_3$ manuf., or worked up separately to recover $KNO_3$. The pptd. $CaCl_2.6NH_3$ is decompd. by heat. Cf. *C. A.* 25, 2250.

Alkali salts. Chemieverfahren Ges. Fr. 697,009, June 3, 1930. $KNO_3$ and $Na_2CO_3$ are prepd. A lye, obtained by mixing $CaSO_4$ in a mother liquor contg. $Na_2CO_3$ and sepg. the $CaCO_3$ thus formed, is treated with a crude sylvinitic salt of potash and $NH_3$, which produces glaserite and KCl. The $K_2SO_4$, obtained by treating this mixt. with water, is treated with $CaCO_3$, previously obtained and $HNO_3$ which gives $CaSO_4$ and $KNO_3$. The lye sepd. from the glaserite and KCl is cooled to remove a part of the $NH_4Cl$ and is then submitted to the Solvay process.

Alkaline earth cyanates. I. G. Farbenind. A.-G. Fr. 695,497, May 13, 1930. Alk. earth oxides or carbonates are heated to temps. between 130° and 400° with urea or substances contg. it.

Alkaline earth metal chlorides from sulfates. Theodor Lichtenberger and Ludwig Kaiser. U. S. 1,798,091, March 24. An alk. earth metal sulfate is dissolved in its corresponding melted alk. earth metal chloride, the sulfate is reduced to sulfide (suitably by the action of coke) and the sulfide is converted into chloride by injection of Cl.

Reducing alkaline earth sulfates. Wilhelm Rassbach. Ger. 520,458, Feb. 14, 1930. A mixt. of alk. earth sulfate with powd. Al is ignited, *e. g.*, by means of a little powd. Mg. The reaction products are alk. earth sulfide and $Al_2O_3$, but some alk. earth oxide and $SO_3$ may also be formed through the vaporization and air oxidation of some of the alk. earth sulfide.

Process for the manufacture of mono-alkali phosphates. Société d'Études scientifiques et d'entreprises industrielles. Belg. 372,395, Sept. 30, 1930. An alkali chloride or a mixt. of alkali chlorides is treated with an excess of $H_3PO_4$ so as to form $MH_2PO_4.H_3PO_4$, in which M is an alkali metal or $NH_4$. This salt is treated with alc., the insol. $MH_2PO_4$ is sepd., and the $H_3PO_4$-alc. mixt. is distd. in presence of $H_2O$, the recovered alc. being used again in the process.

Carbonates. Chemieverfahren G. m. b. H. Fr. 696,380, June 2, 1930. $K_2CO_3$ and $Na_2CO_3$ are obtained by mixing a $Na_2CO_3$ liquor with $SrSO_4$ or $BaSO_4$, sepg. the alk. earth carbonate, and treating the lye with crude sylvinitic salt of K and $NH_3$ which produces glaserite and KCl. Then the $K_2SO_4$ obtained by treating this mixt. of salt with water is treated in aq. soln. with $SrCO_3$ or $BaCO_3$ obtained previously, preferably in the presence of $CO_2$, which gives a soln. of $K_2CO_3$ or $KHCO_3$ and a ppt. of $K_2SO_4$ and $SrSO_4$ or $BaSO_4$. The $K_2SO_4$ is sepd. from the $SrSO_4$ or $BaSO_4$ by heating with water and the $K_2CO_3$ or $KHCO_3$ soln. is evapd.

Phosphates. Jean Margoulis. Fr. 696,138, May 27, 1930. Aq. solns. of mono-alkali phosphates are stabilized by adding to the phosphate or to its mixts. with the products resulting from the solubilization of crude phosphates, or to the water used for its soln. an acid, preferably org., which is weaker than the acid used for solubilization of the crude phosphate.

Sulfates. Alphonse Zieren. Fr. 696,447, May 3, 1930. An app. is described for the uniform distribution of $H_2SO_4$ in mech. sulfate furnaces.

Thiocyanates. Emil Heine. Ger. 517,759, Nov. 20, 1928. Thiocyanates of the alkali or alk. earth metals are prepd. by heating S compds. of the metals in the required proportions with $CN_2H_2$ or derivs. at low temps. between 200° and 500°. S may be added during the reaction if necessary. Thus, BaS, S and $CN_2H_2$ are heated to about 300° to give $Ba(CNS)_2$. Also NaSH and $CN_2H_2$ give NaCNS. Several further examples are given. In all cases the yield is above 90%.

Fluorine compounds. I. G. Farbenind. A.-G. Fr. 695,573, May 14, 1930.

Solns of compds contg F and Al are prepd by the action of solns of $AlCl_3$ on difficultly sol compds of F in aq suspension, in such amts that there are at least 2 equivs of Al for 1 of F Examples are given of the treatment of fluorspar and $Na_2SiF_6$ Complex compds of the formula $AlF_3.AlCl_3$ are formed

**Compounds containing aluminum and fluorine.** I G Farbenind. A.-G. Fr. 695,688, May 15, 1930 Difficultly sol compds are pptd from solns contg $AlF_3$, $AlCl_3$ (cf Fr 695,573, preceding abstr.) by the addn of carbonates or hydroxides of alkali or alk. earth metals to form basic salts of Al or by the addn of alkali fluorides to form double fluorides

**Hypochlorite compounds** The Mathieson Alkali Works Fr 695,052, July 4, 1929 See U S 1,787,048 and 1,787,080 (*C. A.* 25, 781).

**Nitrogen compounds.** Soc d'Etudes Chim pour l'Ind Fr 695,994, May 22, 1930 Cyanamides and metallic cyanides are treated with gases contg hydrocarbons, *N and H at a temp above 200 and below 1000°*, whereby the elementary N becomes fixed as N derivs

**Beryllium salts** Siemens & Halske A G (G Hellmut Fischer, inventor) Ger 520,151, Nov 2, 1928 *A soln of an alkali beryllium fluoride* or other halide is treated with an alk. earth hydroxide or a soln thereof Practically all the Be is thus pptd as the hydroxide, which is then worked up to Be salts

**Rubidium salts.** Gerhart Jander Ger 517,921, Jan 27, 1929 Rb salts are obtained by treating Rb carnallite with silicomolybdic acid, and decomposing the resulting Rb silicomolybdate by heating in a current of HCl, with evolution of $MoO_2Cl_2$ *The Rb is then leached out from the $SiO_2$ An example is given*

**Water-soluble hydroxides and carbonates.** Albert Fritz Meyerhoffer Ger 521,430, June 15 1921 Aq solns of the appropriate fluorides under heat and pressure are caused to react with hydroxides or carbonates of metals *forming insol fluorides* The amt of water should not exceed that required to produce a coned soln., and may be less

**Metal carbonyls.** I G Farbenind A.-G (Emil Keunecke, inventor) Ger. 520,220, Aug 15, 1928 See Fr 677,548 (*C. A.* 24, 3329) and Fr 37,281 (*C. A.* 25, 2528)

**Metal carbonyls.** I G Farbenind A.-G (Leo Schlecht, Walter Schubardt and Emil Keunecke, inventors) Ger 517,831, Mar. 7, 1929. See Fr. 691,100 (*C. A.* 25, 1042).

**Aluminum chloride.** I. G Farbenind A.-G (Johannes Brode and Carl Wurster, inventors) Ger 520,152, Dec 28, 1927. Anhyd $AlCl_3$ is obtained in a stable form suitable for transport by passing $AlCl_3$ vapor into a cooled vessel, suitably into the vessel in which it is to be transported, until a solid block of the salt is obtained The vessel may be conical and may be lined with a material hindering the adhesion of $AlCl_3$ crystals, *e. g.*, with graphite, soot or talc Cf *C. A.* 25, 1044

**Aluminum chloride.** Turf R Haglund Ger 521,339, April 1, 1925. $AlCl_3$ is prepd by the action of anhyd chlorinating agents, at a raised temp., on the Al sulfide melts that are obtained by fusing bauxite or the like with reducing agents and fluxes contg S The chlorination temp may be sufficient to effect distn of the $AlCl_3$ Suitable chlorinating agents are Cl, HCl and chlorides of S and P

**Aluminum fluoride precipitation.** John E Morrow (to Aluminum Co of Am.) U S 1,797,094, March 24 Pptn is effected by adding to an $AlF_3$ soln a small quantity of a finely divided inert material such as alumina, calcined cryolite or finely divided $AlF_3$ and subsequently heating the soln

**Alumina from bauxite.** Wolf J Müller and Heinrich Hiller Fr. 695,586, May 14, 1930 See Brit 330,661 (*C. A.* 24, 5047)

**Alumina and phosphorus.** Odda Smelteverk A/S and Erling Johnson. Fr 695,962, May 22, 1930 $Al_2O_3$ and P or $H_3PO_4$ are prepd by fusion under reducing conditions of a phosphate ore, such as natural phosphate, and Al compds such as bauxite, Al phosphate, etc., in the presence of compds contg Fe and S, so as to volatilize the P and to produce a slag contg compds of Al and sulfides which is used for the production of pure $Al_2O_3$

**Aluminum oxide products from material containing aluminum sulfide.** Turf R. Haglund U. S 1,707,635, March 24 Sulfide contg material which may be in a solid condition is treated with an oxidizing gas such as air or $SO_2$ and $H_2O$ to effect replacement of S by O. Cf. *C. A.* 24, 1473.

**Aluminum sulfate.** Colloid Chemischip Forschungs A.-G Swiss 143,696, Jan. 7, 1929 Al contg material such as bauxite, kaolin, etc., is heated with an equal amt. of coned. $H_2SO_4$ and the $Al_2(SO_4)_3$ so formed extd. with water. The aq ext. is evapd.,

purified by addn. of alc., filtered and the $Al_2(SO_4)_3$ obtained by crystn. An example is given stating that a 50-60% yield is obtained

Ammonium sulfate. Daniel Vorländer and Albert Lainau. Ger. 519,043, Aug. 22, 1929. $(NH_4)_2SO_4$ is prepd. by oxidizing $(NH_4)_2SO_3$, or a mixt. of $NH_3$ and $SO_2$, in the presence of a complex cobalt sulfito-ammonia compd., which may be formed *in situ*. Thus air may be passed over solid $(NH_4)_2SO_3$ moistened with an aq. soln. of a cobaltammine or an ammoniacal soln. of $CoSO_4$ may be circulated in countercurrent to a mixt. of air, $NH_3$ and $SO_2$. Gases poor in $SO_2$ may be treated, and the air used may be completely deoxygenated in the process.

Ammonium sulfate. Gewerkschaft Victor Stickstoffwerke (Hans Schmalfeldt inventor). Ger. 517,967, May 7, 1929. In evapg. $(NH_4)_2SO_4$ solns., $Na_2SO_4$ and $NH_4HCO_3$ are deposited as well as $(NH_4)_2SO_4$. To avoid this, the soln. is neutralized with $HNO_3$ prior to evapn. so that $(NH_4)_2SO_4$ can be crystd. out at a certain stage of the evapn. leaving $NH_4NO_3$ in soln.

Ammonium carbonate. Kali Chemie A.-G. (Friedrich Rusberg and Gustav Clauss inventors). Ger. 517,758, Mar. 2, 1926. Addn. to 488,757 (*C. A.* 24, 2251). The crust of solid $(NH_4)_2CO_3$ formed on the walls of the chamber, previously moistened with water or $(NH_4)_2CO_3$ soln. into which gaseous $NH_3$ and $CO_2$ are led, as described in 488,757, is improved by keeping the temp. of the chamber below 60°.

Antimony oxides. Deutsche Schmelz- und Raffinierwerke A.-G. Fr. 696,448, May 5, 1930. Pure amorphous oxides of Sb, particularly the trioxide, with good covering power are made by heating Sb, Sb ores or mixts. of ores to a high temp. and then burning the metal with air or O dild. with inert gases, *e. g.*, O and $CO_2$.

Barium carbide and acetylene. International Industrial & Chemical Co., Ltd. Ger. 517,993, Nov. 29, 1928. See Fr. 682,479 (*C. A.* 24, 4362).

Calcium hypochlorite. The Mathieson Alkali Works. Ger. 517,964, May 24, 1927. $Ca(OCl)_2$ is formed by chlorinating an aq. lime mash and pptd. with NaCl. Examples are given. Cf. *C. A.* 25, 781.

Dehydrating calcium phosphate. I. G. Farbenind. A.-G. Fr. 697,287, June 12, 1930. $CaHPO_4$ contg. water of crystn. is dehydrated by suspending it in an aq. liquid, preferably of acid reaction and heating to the temp. necessary for dehydration. Substances favoring dehydration such as fluorides or silicofluorides may be added to the liquid. The liquid is used again.

Storing liquid carbon dioxide. P. Stapf. Brit. 338,777, Dec. 3, 1929. A tank and compressor system is described in which liquid $CO_2$ may be stored under low pressure and near triple-point temp. and various details of operation are given.

Carbon disulfide. I. G. Farbenind. A.-G. (Eberhard Legeler and Hermann Kob, inventors). Ger. 521,336, Dec. 14, 1926. An app. for superheating the S vapor is located in the same heating space as the reaction retort. In the case of an electrically heated retort, the superheater may be located in the retort. Cf. *C. A.* 25, 2251.

Carbon disulfide. I. G. Farbenind. A.-G. Ger. 521,337, June 8, 1923. Superheated S vapor is led to a retort contg. heated C. The supply of S vapor may be regulated so that the reaction temp. is maintained in the retort by the heat of the reaction.

Chlorine dioxide. Willy Becher. Ger. 517,755, Sept. 27, 1929. In the prepn. of $ClO_2$ from chlorate and concd. $H_2SO_4$, the chlorate is mixed with water and indifferent inorg. material to form solid pieces, into which the concd. $H_2SO_4$ is then poured. Thus $KClO_3$ is mixed with gypsum made into a paste with water, and dried. 96% $H_2SO_4$ is then added. Further examples are given.

Magnesium chloride. I. G. Farbenind. A.-G. Fr. 697,285, June 12, 1930. Hydrated $MgCl_2$ is dehydrated, without much decompn., into MgO and HCl, by introducing it into a mixt. of chlorides in soln., *e. g.*, KCl 50, NaCl 40 and MgCl 10%, the content of $MgCl_2$ in soln. not being allowed to pass that of natural carnallite. The dehydration may be combined with the production of Mg by electrolysis by introducing the hydrated $MgCl_2$ into a chamber sepd. from that of the electrodes, in a part of the electrolyte poor in $MgCl_2$.

Magnesia. Rheinisch Westfälische Kalkwerke. Ger. 519,420, Sept. 27, 1928. See Brit. 319,690 (*C. A.* 24, 2555).

Potassium nitrate. Wintershall A.-G., Carl T. Thorssell and August Kristensson. Ger. 517,919, Mar. 17, 1927. Solns. of KCl and $HNO_3$ are mixed in the concn. described in Ger. 242,014. After sepg. the $KNO_3$ from the mother liquor, the NOCl present is reduced to NO and worked up to $HNO_3$. $FeCl_2$ is used as the reducing agent at low temps. An example is given.

Sodium phosphate. I. G. Farbenind. A.-G. Fr. 696,360, May 31, 1930. Hydrates of $Na_3PO_4$ having various amts. of water of crystn. are made by neutralizing

$H_3PO_4$ with $Na_2CO_3$ and NaOH in a single operation The concn of the $H_3PO_4$ is detd by the content of water of crystn to be obtained It is treated with an amt of $Na_2CO_3$ calcd to produce $Na_2HPO_4$ and an amt of NaOH necessary to form $Na_3PO_4$

**Sodium sulfide.** I G Farbenind A -G Fr 696,451, May 6, 1930. Pure anhyd $Na_2S$ is prepd by reducing $Na_2SO_4$ in molded pieces below the m p of $Na_2SO_4$ by means of H or other reducing gases Cf *C A* 25, 1956

**Sulfur dioxide.** Soc anon pour l'ind chim a Bale Brit 339,926, May 15, 1929. Fr 695,500, May 13, 1930 $SO_2$ is obtained in concd form from gases contg it by absorbing it in a mixt of water and an aromatic amine such as aniline, and expelling the absorbed gas by heat

**Furnace for making sulfur dioxide by burning hydrogen sulfide.** C Otto & Co G m b H Ger 520,150, April 4, 1930

**Aqueous dispersion of titanium dioxide.** Charles de Roiden (to Commercial Pigments Corp) U S 1,797,760, March 24 For producing an aq soln contg highly dispersed $TiO_2$, about 1 part of $TiO_2$ which has been calcined after coagulation from an aq colloidal dispersion is ground with about 1 part of a dil $NH_4$ soln and water is added to the resultant paste.

**Borax.** Henry Blumenberg, Jr Fr 695,274, May 7, 1930 Borax contained in borax ores is dissolved out with water, the soln is sepd and a sol compd of an alk earth metal is added to ppt an insol borate which is calcined

**Active carbon.** I G Farbenind A G (Alwin Mittasch and Josef Jannek, inventors) Ger 517,966, Feb 6, 1923 Lignite consisting mostly or wholly of humus sol in aq alkali or $NH_4$ soln., is heated to 1000° or over The porous active C so obtained is washed with HCl and is useful in the catalytic prepn of $H_2S$ Cf *C A* 25, 2253

**Active carbon; fuel gas.** Metallges A -G (Gustav Bailleul, inventor) Ger 520,381, Oct 5, 1929 Cheap adsorption C and a heating gas are obtained by treating carbonaceous materials such as semi-coke and lignite with a mixt of steam and O, with or without other gases, contg not more than 6% by vol of O The steam-gas mixt is preheated to a temp between 120° and 200°, and the reaction temp., which is generally maintained without external heating, is about 500-600°. The conditions are adjusted so that the loss in wt of the carbonaceous materials does not exceed 40% The process may be effected at atm., raised, or reduced pressure, and the carbonaceous materials may be stationary or moved in countercurrent to the steam gas mixt. Examples and addnl details are given

**Compressing chlorine.** Krebs & Co., Ges Brit 339,855, Oct 10, 1929 Cl to be compressed is cooled by liquid Cl introduced and allowed to expand in it. App. is described

**Hydrogen.** Alfred T. Larson (to DuPont Ammonia Corp) U. S 1,797,426, March 24 Steam and CO, in a volume ratio of at least 1 5 to 1, are subjected to the action of a catalyst contg Cu and ZnO at a temp sufficiently high (suitably about 300-600°) to effect reaction with production of H Cf *C A*. 25, 1315.

**Hydrogen.** D Tyrer and Imperial Chemical Industries, Ltd Brit. 340,050, Oct. 3, 1929. H or gas mixts contg H are obtained by the alternate passage of hydrocarbon gas (with or without addn of steam) and air through a bed of highly heated coke or refractory material, the air being supplied at different levels within the bed or in different amts at different levels Various details of app and procedure are described Cf. *C. A*. 24, 5117.

*Phosphorus.* Metallges. *A -G Fr 696,540, May 27, 1930.* P or O compds of P are prepd from crude phosphates in pieces in a shaft furnace, a phosphate previously fritted in pieces in an appropriate app., *e g*, a Dwight Lloyd machine is used

**Phosphorus.** Wsesousnoe Objedinenie Chimitschieskoy Promyschlennosti "Wsechimprom" Ger 520,382, Apr 25, 1930 Pulverulent red P is prepd by simultaneously heating and grinding yellow P, *e g*, in a ball mill App. is described

**Purifying sulfur.** I G Farbenind. A -G Fr. 696,010, May 23, 1930. S is purified by treating it at ordinary or raised temp. with acids of medium concn while eliminating, if necessary, the tarry impurities by a simultaneous treating with energetic oxidizing agents

**Crystalline substances.** Superfine Chemicals, Ltd. Fr. 695,508, May 13, 1930 Cryst substances, particularly salts, are obtained in a more easily sol form than the ordinary cryst form by producing, in a vessel having a smooth and substantially continuous interior surface, a relatively large amt of a supersatd soln of the substance in question by cooling in the state of rest a hot concd soln, and at the same time pre

venting evapn at the surface of the soln The cooled soln. is then agitated or seeded Examples are given

Sulfonation Paul Baumgarten Ger 519,046, Aug 12, 1926. Org or inorg substances to be sulfonated are treated in aq soln or suspensions with a trisubstituted sulfamic acid prepd by treating a tertiary amine with $SO_3$ or a compd giving rise thereto Examples are given

Active masses suitable for use as catalysts. Fritz Stoewener (to I G Farbenind A G) U S 1,797,804, March 24 After prepg an irreversible colloid of the second kind such as silica sol it is mixed before drying with a catalytic substance such as $CuSO_4$ and the mixt is then dried and most of the catalytic substance may be removed (as by acids) to leave a highly adsorbent product Cf *C A* 24, 3615

Urea-formaldehyde condensation products. Kunstharzfabrik F. Pollak G m b H Brit 339,601, May 11 1929 See Fr 680,110 (*C A* 24, 3867)

Urea-formaldehyde condensation products. Fabriques de produits de chimie organique de Laire J Malet and R Armenault Brit 340,114, Dec 6, 1928 Condensation of urea or its derivs with formaldehyde or its polymers is effected in the presence of a Zn or Pb carbonate or oxide, Bi carbonate, a colored metal carbonate, or $TiO_2$ (an example being given of the use of $ZnCO_3$ in producing a moldable product from urea and formaldehyde)

Condensation products containing halogen. I G Farbenind A G Fr 695,602, May 14 1930 Aq solns of $CH_2O$ satd with hydracids are caused to react on phenols with the exception of nitrophenols, halogen phenols and those contg a COOH or aldehydic radical Cryst. or resinous products are obtained according to the conditions of working and contain halogenated methyl groups They are useful as starting materials for the manuf of *dyes artificial resins, tanning materials* etc

Moldable phenolic pentosan material. Orland R Swepney (to Iowa State College of Agriculture and Mechanic Arts) U S 1,797,559, March 24 Reaction is effected between a solid pentosan-contg material such as corncobs and a phenol (the latter being in a proportion of approx 60% by wt of the pentosan-contg material) in the presence of HCl approx 10% by wt of the pentosan material, at about 100° for 3 hrs

Moldable phenolic pentosan material. Orland R. Swpney (to Iowa State College of Agriculture and Mechanic Arts) U S 1,797,593, March 24 A process similar to that described in U S 1,797,559 (preceding abstr.) is employed for effecting reaction of ground corncobs and cresol in the presence of S monochloride.

Aromatic condensation products. Compagnie nationale de matières colorantes et manufactures de produits chimiques du Nord réunies établissements Kuhlmann Fr 695,980, May 22, 1930 Products which as salts or "free" are *emulsifying, wetting or dispersing agents* are prepd by condensing aromatic hydrocarbons, sulfonated or not, with esters of $ClHSO_3$ Condensing agents such as $H_2SO_4$, oleum or $ClHSO_3$ may be used. Thus, $C_{10}H_8$ is sulfonated and the reaction product of $SO_2Cl_2$ on iso-PrOH is added and the mixt heated to about 100° for 4 hrs

Celluloid substitute. Motomu Sugata U S 1,797,806, March 24 Camphor (suitably in the proportion of about 50% the wt of the rosin) is added to rosin and the mixt. is heated to fuse it to a sticky condition and is mixed with a product such as may be obtained by boiling floss-silk, other silk or like fiber in dil alkali soln so as to swell and gelatinize it, suspending homogeneously in alc or ether and mixing intimately with $MgCO_3$ or MgO, and heating and kneading

Artificial substances Bakelite Corp Fr 695,589, May 14, 1930 Nonfibrous artificial substances are composed of viscose, the surface of which carries a coating of a flexible resinoid of phenol and possesses a dielec resistance of more than 1000 v per mm

Artificial substances. Hans Kappeler Fr 697,169, June 10, 1930 Infusible substances are prepd by condensing furfural or its derivs with other aldehydes or their polymers with or without solvents or diluents and in the presence of acid condensing agents Several examples are given

Artificial masses. I G Farbenind A -G Fr 696,008, May 23, 1930 Artificial masses are made by condensing polyvinyl esters with unsatd aldehydes in the presence of catalysts The products may be vulcanized in the usual manner or fillers, dyes, etc., may be added

Plastic masses from ivory-nut material. Emil Teltschik & Co Ger 516,589, Dec 11, 1927 The ivory nut material is ground up, treated with an org solvent and added to binding material Thus, the powd nut is mixed with S and MgO and treated with $C_6H_6$. Rubber soln may be added and the whole pressed at 70–100° Another example describes the admixt. of acetone, celluloid waste and rubber soln

**Moldable compositions.** BAKELITE CORP. Fr 695,699, May 15, 1930. A moldable compn contains granular or fibrous filling substances and resinoid binders in colloidal dispersion in a soln so as to be easily sepd from the liquid and applied to the filler Examples are given

*Molded fibrous materials.* COMPAGNIE GÉNÉRALE D'ÉLECTRICITÉ. Fr 696,962, May 13, 1930 In making molded fibrous materials, the binding agent and the other ingredients of the mixt except the fibers are reduced to a powd state and are dispersed along with the fibers in water The aq suspension is sepd into an aq and a solid phase, the latter serving, after drying, as a primary material for molding

**Construction material.** FRIDA ROSE REIMANN NÉE VAN JACKSTEN Fr. 696,509, May 20, 1930 Coumarone resin is melted with filling materials with the addn of lithopone and if necessary hard waxes, hydrocarbons of high mol wt or rubber

**Artificial horn.** INTERNATIONALE GALALITH GES. HOFF & CO Ger 521,346, Jan 14, 1928 Artificial horn is prepd by moistening casein until its total moisture content is about 20–25%, allowing it to stand in the cold for 6–15 hrs, homogenizing it between heated rolls under high pressure and then cooling one of the rolls so as to form a skin The product is cut off, molded and further worked up as usual

**Adsorption and filter masses.** RHEINHOLD & CO, VEREINIGTE KIESELGUHR- UND KORKSTEIN GES. Ger 517 756, Feb 23, 1929 Kieselguhr contg Fe and S compds is heated with natural or org addns The temp is kept below 600° to avoid the formation of readily sol S and Fe compds Oil or vegetable fiber is mentioned as the added material

*Improving the filtration and decolorizing properties of kieselguhr.* RHEINHOLD & CO, VEREINIGTE KIESELGUHR- UND KORKSTEIN GES Ger 517,757, May 7, 1929 The kieselguhr is mixed with natural org material and subjected to a heating process at suitable temps for suitable times Tables showing the effect of heating various kinds of kieselguhr at temps ranging from 300° to 600° with methylene blue are given

**Kieselguhr.** RHEINHOLD & CO, VEREINIGTE KIESELGUHR- UND KORKSTEINGESELLSCHAFT Ger 517,536, Apr 27, 1929 The acid content of kieselguhr is reduced by heating the crude material with exclusion of air, at suitable temps, *e. g.*, 250–600°

**Kaolin purification.** E MÜLLER Brit. 340,142, Jan 4, 1930 Kaolin (previously sepd from raw material, as by fractional pptn with or without the addn of electrolytes, centrifugal action, etc) is formed into a suspension of a sp gr of 1 06–1 12 and is subjected to further fractional pptn. by allowing it to stand for about 12 hrs (the height of the suspension vessel being not greater than $\frac{3\,2}{S-1}$ cm, where $S$ represents the sp gr. of the suspension. The poured-off and filter-pressed suspension is a highly plastic kaolin of a high degree of purity

*Treating bauxite.* METALLGES. A.-G (*Hans Siegens, inventor*). Ger 509,131, June 2, 1926 In the manuf of $Al_2O_3$ and ferrosilicon by electrothermic reduction with C of the oxide impurities in bauxite, the sepd ferrosilicon is freed from Al by using it to pre reduce a further batch of bauxite After sepg the purified ferrosilicon, the pre-reduced bauxite is further reduced with C Operative details and examples are given

**Asbestos and other artificial fibers.** WERNER LÜDKE. Fr. 697,254, June 12, 1930. Asbestos and like artificial fibers are made by spinning, according to the processes used in the artificial silk industry, sol silicates or mixts of silicates in soln through appropriate coagulating agents such as inert gases or through vapors of org liquids, or org liquids such as acetone or alc. Neutral salts such as $MgCl_2$ or $CaCl_2$ may be used as pptn or conversion agent.

*Lime kilns.* LÉANDRE RIGAUD. Fr 695,343, May 9, 1930.

**Apparatus for slaking lime.** SPOERRI & CO Swiss 142,389, Dec. 23, 1929 Details are given.

**Rotary-drum apparatus for slaking lime.** SPOERRI & CO Ger. 519,007, Dec. 28, 1929

**Adhesive.** MARIE A MAJOR NÉE ODAU. Ger. 521,199, Mar. 17, 1928 A thick adhesive for patching fabrics, etc, comprises crude crepe rubber 10, $C_2HCl_3$ 80, $C_2Cl_4$ 20, AcOEt 25 and methylated spirit 15 parts Cf. *C. A.* 25, 1348.

**Adhesive.** NAAMLOOZE VENNOOTSCHAP W. A SCHOLTEN'S CHEMISCHE FABRIEKEN Fr 696,635, June 4, 1930. A dry stable product capable of use as a strong glue is made by incorporating sol salts of naphthenic acid with an alk. starch capable of swelling in cold water or like starchy materials

**Viscous adhesive.** ADOLF MENGER (to I. G FARBENIND A.-G). U. S. 1,798,097, March 24 Nitrocellulose and ethyl acetanilide are used together with a softening

agent such as castor oil and a solvent and ground asbestos (suitably at least 10%) to form a viscous highly sticky product suitable for uniting leather or wood veneer to iron or Al. Various other mixts. are described

Cold-water paste. Henkel & Cie G m b H Fr. 696,867, June 10, 1930. Starch and products resembling starch are made suitable for the manuf of cold water pastes by heating them under pressure.

Marine algae Compagnie française de l'iode et de l'algine. Fr. 695,778, Sept. 6 1929 Marine algae are submitted to the action of solns. of alk. earth salts which transform the algine into an alk. earth compd not capable of swelling in water After dilu with water the compd is treated with dil $H_2SO_4$, washed and taken up by an alk. soln to form a soln of an alkali alginate which is filtered to sep cellulose. Cf *C. A.* 24, 2563

Cleaning metal surfaces. C. F Dyerly Brit. 340,047, Sept. 28, 1929 Rust and oil etc., are removed from metal surfaces such as those of vehicle bodies by the use of rust solvents (such as phosphoric, selenic, oxalic, acetic, tartaric or citric acids) together with a compatible oil and grease-solvent such as alcs., ketones such as Et Me ketone or esters and a thickening agent (such as raw sienna or metallic oxides such as ferric or Mn oxides) which is inert at ordinary temp but reacts with the rust solvent on heating or drying and thus renders the compn friable and "self peeling" A pigment such as willow charcoal or lampblack may also be added

Polish for lacquered surfaces, etc. Arthur van der Bruggen Ger. 519,084, May 2 1928 Collodion, wax $PhNO_2$ and petroleum are used with or without acetone

Composition for cleaning and polishing painted or other surfaces. James G Fancy U. S. 1,798,075, March 24 Phosphate rock powder 16, soap 4 and alc. 8 parts.

Coating compositions. Jean L. Sicard and Alice Sicard née Paris. Fr. 697,120, June 6, 1930 A coating compn which agglomerates instantly is made by heating 3 parts of glue with 1 part of alum to 60° and incorporating 10 parts of sawdust or the like

Coating materials. Hermann Mayr. Fr. 697,211, June 11, 1930 A metallic coating on objects of all kinds is obtained by applying several layers of a mixt. of metallic powder, powd. graphite, prepd. chalk, Java chalk, $Na_2SiO_3$ and casein Cf *C. A.* 25, 484

Decorating agents. Jean de Granville Fr. 696,776, Sept. 4, 1929 A double oxysulfate of Zn and Al is prepd. by the reaction of $Al_2(SO_4)_3$ with ZnO under pressure and at 50° A plastic mass, which is resistant and very hard, is obtained by carrying out the reaction in the presence of a mass capable of independent crystn. such as re-heated $CaSO_4$ The mass obtained may be molded, and nitrated cellulose previously dissolved in acetone etc., may be added during mixing Metal powders may also be added

Peroxide containers. I G Farbenind A.-G. Fr. 695,498, May 13, 1930. $H_2O_2$ or other peroxide compds. are produced treated or stored in metal vessels coated with an enamel very resistant to acids

Wetting agents. Röhm & Haas Co Fr. 696,328, May 30, 1930 For wetting, emulsifying, or penetrating agents use is made of salts of tertiary alkyl amines in which the alkyl radicals consist of a long straight chain of C atoms and 2 straight chains with not more than 4 C atoms in each, except the hydrochloride of cetyldiethylamine, the remaining valencies of the C atoms being completely satd. with H Examples are given of the prepn. of salts of *n*-octyldiethylamine, di-*n*-butyllaurylamine, dimethylcetyl amine and diethyloctadecylamine

Wetting, etc., agents. I G Farbenind A.-G. Fr. 693,814, April 12, 1930 Sulfuric acid esters of aliphatic, cycloaliphatic or aliphatic-aromatic compds., each atom of which has not more than 2 valencies bound to the O or their salts are used as wetting, cleansing, dispersing or solvent agents Thus cetyl alc. in ether soln. is treated with $ClHSO_3$ and the ether is removed, giving a product for use as wetting, etc., agent in the textile industry Several other examples are given Fr. 693,815 describes the prepn. of wetting etc., agents by transforming alcs. or amines or their derivs. with carboxylic acids or their derivs. into esters or amides, the substances participating in the reaction (aliphatic, cycloaliphatic, aliphatic-aromatic or aromatic) are chosen so that the product of reaction contains at least one aromatic radical, sulfonic groups are introduced Thus stearic acid and $C_6H_4CH\cdot OH$ are boiled while passing a current of HCl gas through. Excess $C_6H_4CH_2OH$ is removed and the product sulfonated Several other examples are given

Wetting and emulsifying agents. H Th Böhme Chem Fabrik Fr. 696,104, May 26, 1930 Wetting and emulsifying agents are prepd. by condensing triglycerides,

particularly castor oil, or unsatd fatty acids, or oils contg. a large proportion of acids and emulsifiable with water, in the presence of condensing agents, with hydrocarbons (aliphatic or aromatic, satd or unsatd) or with mixts contg hydrocarbons such as solar oil, paraffin oil or resin oil or with appropriate derivs of hydrocarbons, *e. g.*, (1) halogen compds of hydrocarbons such as $CHCl_3$, (2) ales or ethers, (3) aliphatic carboxylic acids, (4) primary or secondary amines or other N compds, except those which form insol compds with the triglycerides or their fatty acids, and (5) esters and ester acids of ales The products may be sulfonated to increase the wetting, etc, properties Several examples are given Cf. *C A* 25, 2531.

Transfer sheet. HELENA S. SADTLER U S 1,797,997, March 24 A design is printed in sol dyes on a base such as paper and after the design is dried the design-bearing surface is coated with mucilaginous material such as gum tragacanth or gum karaya

*Impregnated fibrocement plates, tubes or other objects.* G ARNOUTS and M. BLAMPAIN Belg 373,033, Sept 30, 1930 The objects, after oven-drying, are impregnated with a mixt of pitch, solvent naphtha and wood oil, or of bitumen, benzene and $CCl_4$

Sound record compositions. A D. LITTLE, INC, and H J BILLINGS. Brit. 340,099, Nov 15, 1929 Outer playing surfaces of records are formed of fibers and a binder of thermoplastic material such as shellac, with a laminated core formed of fibers and a binder including hardwood pitch and preferably also including a resin having low susceptibility to temp changes such as copal resin, manila gum, ternati gum or the like Numerous details and formulas for prepg the compns used are given

*Bearings.* FREDERICK H RAGAN (to Columbia Axle Co) U S. 1,797,444, March 24 Bearings are formed with a rigid plate or tube having cemented to it a substantial layer of granular compressible material such as cork and graphite.

Bearing material. BERT H MCQUEER (to National Carbon Co). U S 1,797,833, March 24 Bearings are formed comprising carbonaceous material such as petroleum coke, a B compd. such as borax and a polyhydric ale. such as glycol

Brake linings, etc. I. G FARBENIND A.-G. Fr 696,705, June 6, 1930 Fibrous materials are soaked with the products resulting from the condensation of urea, thiourea or their derivs or mixts with aldehydes or their polymers and molding under heat and pressure, if necessary in the presence of small quantities of an acid condensing agent The condensation may be carried out on the fiber itself

Dental cements. HANS HEYNEMANN Ger 520,138, Sept. 30, 1927 In the manuf. of these by prepg. oxides, phosphates or silicates of one or more metals of the second or third periodic group by a sintering or fusion process, and then mixing the product with $H_3PO_4$, a compd of Li is added to the material to be fused or sintered. A lower temp can then be applied, without increasing the soly of the final product.

Cigaret tips. CHEMISCHE FABRIK VON HEYDEN A.-G Ger. 516,752, Dec 31, 1926 Cigaret tips consist of a layer of cellulose hydrate mixed with mineral colors, cork or wood dust, mica, etc.

Pest-destroying agents. HEERDT LINGLER G. M. B. H. Ger. 516,594, Feb. 14, 1928 The agent depends for its action on the evolution of HCN from alk. earth cyanides when exposed to air The alk. earth cyanides are powd., optionally mixed with irritants and odorants, and pressed into briquets, etc., with binding material. Thus, $Ca(CN)_2$ is mixed with nicotine sulfate and briquetted

Phenylurethan derivatives. F. HOFFMANN LA ROCHE & Co A.-G. Ger. 519,226, Nov. 23, 1928 The dialkylaminophenyl esters of alkylcarbamic acids are converted into quaternary salts by treatment with dialkyl sulfates Examples are given The products are non hygroscopic, stable in air, sol in water, and strongly poisonous They are useful for destroying animal pests. Cf *C A* 21, 962

Rat poison. I G FARBENIND A.-G (Karl Streitwolf, Alfred Fehrle and Hubert Oesterlin, inventors) Ger. 517,513, Sept 9, 1928 A poison for rodents consists of org aromatic As or Sb compds mixed with fats, waxes, starch, albumin, etc Bait may also be added. In an example, fresh margarine is melted with chlorophenylarsine oxide. Several further examples are given.

*Foam-producing compositions for extinguishing fires.* MINIMAX A.-G. and HANS BURMEISTER Ger. 521,271, July 31, 1925 A hygroscopic substance, *e. g.*, anhyd $Na_2CO_3$, is included in foam producing compns. that are to be dry-stored

# 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G E BARTON, C. H KERR

The history of Hungarian glass manufacture. O KNAPP *Termeszettud Kozlony* 61, 46–8(1929) L SZATHMÁRY *Ibid* 481–6 —Historical review S S DE FINÁLY

Manufacture and characteristics of laminated glass WILLARD L. MORGAN, *Ind Eng Chem* 23, 505–8(1931) —The early work of Benedictus in 1911 is described In modern manuf glass sheets are cut to size, thoroughly cleaned and sprayed with a microscopic layer of gelatin Several sheets of celluloid, previously sprayed with a mixt of a plasticizer and high boiling solvent, are placed on top of the glass followed by a final glass cover These sandwiches, so-called are pressed at 200–260 F at 150–350 lb pressure for 6–20 min The edges of the finished glass are sealed with a water proofing substance such as pitch The use of cellulose acetate instead of celluloid as the inner component of laminated glass has been unsatisfactory The major problems in the industry are dirt elimination securing of permanent adhesion, selection of a plastic and control of the laminating process to prevent off color, brittleness or bubbles JOHN M LADINO

Permanent marking of glass and porcelain vessels. H G ISBELL *Chemist-Analyst* 20, No 3, 20(1931) —A good ceramic ink can be prepared from 1 g $K_2CO_3$ 1 g borax 2 g PbO and 2 g $Co(NO_3)_2$ Mix with raw linseed oil with possibly a little turpentine apply with a pen and heat W T H

Removing the iron of Hungarian sands L L DE PUTNOKY AND B BORBST *Magyar Mernok Epit Közlonye* 65, 63–70(1931) —Five Hungarian sands were examd for Fe content and means for reducing it to an amount which does not prevent the use of the sand in glass ceramic, etc, industries By washing sands with 2 *N* HCl about 25% of the original Fe was removed HCl (0.5 *N*) removed only 10–12% of Fe HCl also dissolves $CaCO_3$ thus sands contg lime lose much wt and contain relatively even more Fe after washing than originally HCl attacks the limonite crust of sand particles, but it cannot dissolve grains of siliceous Fe On washing with water, a sample from Mountain Mátra gave fairly pure quartz, contg 0.2% $Fe_2O_3$ and 93.6% $SiO_2$ with some $Al_2O_3$ and no $CO_2$ Other methods for Fe removal are under examn S S DE FINÁLY

**Treating silver mirrors.** RUDOLF RITSCHL. Ger. 520,023, June 22, 1929 and 520,024, Oct. 13, 1929; addn. to 520,023. The mirror layers are mechanically and optically improved, and rendered more resistant to chem. influences, by treating them with $HNO_3$ vapor (520,023). The same results are attained by treating the mirrors with other oxidizing agents, e.g., $O$, $O_3$ or $H_2O_2$, during or after their prepn., the formation of an oxide layer (520,024) being avoided.

**Apparatus for rolling and wire-reënforcing glass sheets.** CHANCE BROS. & CO. LTD., and A. J. LOCKETT. Brit. 330,704, Nov. 20, 1929. Structural features.

**Compound glass.** GEORGE J. HEYL and MORRIS GREENHUT. Ger. 510,028, Aug. 30, 1928. A sheet of cellulose acetate or other cellulose deriv. is interposed, while immersed in a softening liquid such as triacetin, between two glass sheets, and the resulting compound sheet is pressed, rolled and finally united by steam pressure. The edges of the sheet may be treated with rubber soln. before the steam treatment.

**Composite glass bars.** EDWARD J. CONLAN (to Kimble Glass Co.). U.S. 1,707,855, March 24. A glass rod is placed within a glass tube and the intervening space is filled with a liquid cement.

**Composite sheets of glass with intervening cellulose derivative material.** CELLUTOID CORP. Brit. 330,702, Nov. 24, 1928. Intervening sheets are used for uniting glass, formed of a cellulose deriv. such as cellulose nitrate together with a non-volatile plasticizer such as dibutyl tartrate, triacetin or the like, and stabilizers such as urea, and dyes (*preferably of violet hue*) *also may be added*. *Various other details of manuf.* of the composite sheets are also described.

**Uniting sheets of glass and cellulose acetate, etc.** SOC. DES USINES CHIMIQUES RHÔNE-POULENC. Brit. 330,872, April 13, 1929. The surfaces to be united are coated with an adhesive (such as gelatin and celluloid) and the sheets are assembled at slight pressure in a bath of volatile liquid which is a solvent for the plastic sheet only when hot (such as a soln. of ethyl lactate or ale. and water with cellulose acetate sheets) and the materials are then heated in an autoclave contg. gas under pressure. *Cf. C. A.* 24, 1051.

**Safety glass.** ROBERT P. P. V. HAMOIR. Fr. 690,787, Sept. 10, 1929. Safety glass is made with sheets of glass united by a layer of transparent or translucid synthetic resins, particularly by products having a basis of urea $CH_4O$.

**Safety glass.** I. G. FARBENIND. A. G. Fr. 695,130, May 8, 1930. A layer or layers of esters of polyvinyl ale. such as polyvinyl acetate is interposed between 2 or more layers of glass.

**Bleaching and purifying clays and other minerals.** R. PERROT. Brit. 330,707, Dec. 18, 1928. "Earths" clay, china clay, quartz, feldspar, alumina, baryta, Ca and Sr carbonates and sulfates, etc., are bleached and purified by initial washing with *peptizing* of the colloid matter by a nonelectrolytic org. substance preventing coagulation such as *an infusion of plants, straw or bark, followed by solubilizing of impurities such as* Fe by a suitable oxidizing, reducing or oxidizing and basic treatment (as by successive use of Cl and $SO_2$ and $NaHSO_3$ in the presence of glycerol, glucose or Na hydrosulfite) and the purified material may be neutralized if acid, with water contg. lime, Na zincate or a silicate. Various details and modifications of procedure are described.

**Ceramic materials.** M. LASLEY. Brit. 330,770, Jan. 10, 1929. See Fr. 680,207 (*C. A.* 25, 672).

***Apparatus for making ceramic products in a continuous manner.*** WILLY LINGERSDORFF and MAX LINGERSDORFF. Fr. 695,050, May 22, 1930.

**Apparatus for drying ceramic products.** MAISON P. FOUCHÉ. Fr. 690,648, June 4, 1930.

**Drying chamber for porcelain goods.** GEBRÜDER NETZSCH. Ger. 521,000, Dec. 22, 1928.

**Furnace for baking tiles, etc.** SOC. SERDORFF-HARFRED GEORGE. Fr. 690,210, May 28, 1930.

Automatic stoker for brick kilns. ROBERT K. GOODWIN. U S 1,797,608, March 24 Structural features

Glazed silica articles QUARTZ & SILICE SOC. ANON. Ger 519,363, June 3, 1927 See Brit 273,636 (*C A* 22, 2040)

Molded articles of fused silica. QUARTZ ET SILICE Brit. 340,167, April 18, 1929. A silica blank is placed over a mold (which may be formed of graphite or Ni) so that an air tight joint is formed between the mold and blank, and suction is produced between the blank and mold while heat is applied to the blank (suitably by an O-H blowpipe)

Articles made from mica sheets. I G FARBENIND A.-G Fr 696,196, May 28, 1930 Articles such as insulators are made by uniting sheets of mica by the condensation products of dicarboxylic acids of ethers or thioethers with polyhydric alcs with or without other substances Examples are given of the use of the condensation products of diglycolic acid or thioglycolic acid and glycerol

Electrical insulation formed by vitrification of aluminum oxide. SIEMENS & HALSKE A G Brit. 339,726, Oct. 17, 1928 To avoid formation of Al carbide in producing insulation such as that for spark plugs, by vitrification of $Al_2O_3$, the heating is carried out in an elec. furnace free from C parts and in a vacuum or atm free from reducing gases or vapors contg C. An atm. of mixed N and H may be used. Cf *C A* 24, 447.

Refractory furnace linings. T H GRAY. Brit. 340,141, Jan 1, 1930. A furnace lining is made of fireclay mixed with about 1.5 times as much foundry sand, which is screened and dampened and made into a paste with the clay Other fillers may be added.

Apparatus for projecting refractory material on to furnace walls. BLAW-KNOX CO Ger 519,163, Feb. 28, 1929

Refractory and acid-proof masses, coatings, etc. STETTINER CHAMOTTE-FABRIK A. G VORM DIDIER. Ger 521,350, Dec. 23, 1924 Use is made of refractory and acid-proof substances, *e g*, Zr or $ZrO_2$, with the use as binder of colloidal $ThO_2$ in the form of a mineral glue obtained by boiling Th salts with acids

Abrasives. SOC. ANON DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE ST GOBAIN, CHAUNY & CIREY Ger 521,124, June 17, 1928 Ground bauxite is mixed with up to 2% of an alkali or alk. earth fluoride or fluosilicate, and the mixt. is heated to 1300–1350°

Enamels. DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM ROESSLER. Fr 695,609, May 14, 1930 Enamels, which are resistant to acids, are made by melting together $Li_2SiO_3$ or a eutectic mixt of $Li_2O$ and $SiO_2$ with a flux such as minium.

Rotary furnace for enameling and glazing MITTELDEUTSCHE STAHLWERKE A.-G (Wilhelm Philipp inventor) Ger 490,973, Feb 28, 1928 Structural details are given.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cement investigations in Japan. C. R. PLATZMANN *Tonind.-Ztg* 55, 424–5 (1931).—A summary of articles by S Nagai *et al* appearing in *J. Soc Chem Ind* (Japan) 33, (1930) B A SOULE

Chemical composition—influence on manufacture and quality of cement. ALTON J BLANK. *Rock Products* 34, No 2 62–3(1931).—As the $Al_2O_3/Fe_2O_3$ ratio increases, kiln output decreases fuel consumption increases, grinding becomes more difficult quick setting and unsoundness tend to become more frequent. These conclusions are based on several years' observations in various plants RAYMOND WILSON

Sources of trouble in a cement plant. ALBERT HEISER. *Tonind.-Ztg* 55, 433–4 (1931).—Correct sampling and accurate analyses are of primary importance. Ignorance and carelessness of employees as well as poorly working kilns must be considered. H. gives analysis of raw materials and shows how to calc. the correct mixt. for a product contg 76.4% $CaCO_3$ and a ratio $SiO_2 : Al_2O_3 + Fe_2O_3 = 2.3$ B A SOULE

Transporting and elevating in cement works. A. C. DAVIS *Cement and Cement Manuf* 3, 681–90(1930).—Belt, bucket, screw and pneumatic conveying systems are described. RAYMOND WILSON

Power for cement works. A C DAVIS *Cement and Cement Manuf* 3, 925–45 (1930).—Elec. power equipment is described. RAYMOND WILSON

New apparatus for measuring the consistency of cement pastes. KARL E DORSCH

*Zement* 20, 26–8(1931).—A plunger is allowed to fall freely between guides upon the surface of the cement paste contained in a hard rubber ring. The paste consists of 300 g. cement mixed for 3 min. with about 28% $H_2O$. The depth of penetration of the plunger or the weight of the paste displaced may be used to compare consistencies. H. F. Kriege

**Indirect determination of lime in cement with sodium oxalate.** A. Heiser. *Zement* 19, 1154–5(1930).—A definite weight, 1.9832 g., of $Na_2C_2O_4$, equiv. to 0.8300 g. CaO, is added to the soln. of 1.000 g. cement from which the $SiO_2$ and $R_2O_3$ have been removed. After several hrs.' standing, the pptd. $CaC_2O_4$ is filtered off and washed. The filtrate is made up to 500 cc., and the excess $Na_2C_2O_4$ remaining in soln. is detd. by titrating 100-cc. portions with 0.10 *N* $KMnO_4$ soln. in the usual way. H. F. K.

**Testing refractories for cement kilns.** J. Schaefer. *Zement* 19, 1112–3(1930).—A furnace is described in which cement or powd. clinker is carried by the flame against the heated face of the refractory. H. F. Kriege

**Some observations and data in connection with the manufacture of portland cement from raw materials and fuels high in sulfur content.** Alton J. Blank. *Rock Products* 34, No. 8, 64–5(1931). cf. *C. A.* 25, 183.—Clinkers of high $SO_3$ content yield cements which are unsound or show retrogression in strength. This effect may be due to CaS assocd. with the $CaSO_4$. Raymond Wilson

**The entropy of portland cement.** Geoffrey Martin. *Cement and Cement Manuf.* 3, 678–80(1930).—In calcg. the thermal balance of the rotary kiln it is necessary to consider the temp. at which heat is available. A table of entropy changes for portland cement clinker is given. Raymond Wilson

**Action of carbon dioxide and acetic acid on portland cement.** Hans Th. Bucherer and J. W. Meier. *Zement* 19, 1134–8(1930).—Various cements were titrated with 1% AcOH in the presence of $CO_2$ in an attempt to dissolve out the CaO and MgO without the $SiO_2$ and $R_2O_3$. The titration curves of the quantity of acid used against the time in seconds before the color change of the indicators occurred showed breaks or stages for most of the cements, indicating the soln. periods of definite compds. $SiO_2$ and $R_2O_3$ were found in the soln. in increasing amts. as the CaO dissolved. The titration curve of lime under similar conditions showed no breaks. H. F. Kriege

**Chemical action of gypsum and other set-retarders upon portland cement clinker.** L. Forsén. *Zement* 19, 1130–4, 1155–60(1930).—The sulfate ion disappears from 100 cc. of a satd. soln. of gypsum when shaken in contact with 50 g. of ground clinker. This is considered to be taken up by the Ca aluminates, since considerable $Al_2O_3$ dissolves in $H_2O$ unless gypsum is present. When aq. filtrates from clinker and gypsum suspensions were combined, 2 types of crystals were found, one spherulitic and the other in long needles. These crystals were found to consist of $3CaO.Al_2O_3$ plus $X CaSO_4$, where $X = 2.38$–$2.75$. From 1 to 2% of $Ca(NO_3)_2$, $CaI_2$, $CaBr_2$, $Ca(ClO_3)_2$ and $Ca(NO_2)_2$ was found to increase the setting time of clinker flour 2–3 hrs., while some sparingly sol. salts such as $CaCrO_4$, $CaSO_3$ and CaS had little effect. The action of several Ba, Na, K and $NH_4$ salts as set retarders is also discussed. Complex compds. of $Al_2O_3$, CaO and $CaSO_4$ with strong hydration and crystn. properties are thought to form first, serving as nuclei for the setting of the cement proper. H. F. K.

**Free lime in portland cement clinker and soundness of cement.** Katsugo Koyanagi. *Rock Products* 34, No. 7, 74–5(1931).—See *C. A.* 25, 1353. R. W.

**A tentative modification of the free-lime method [for portland cement].** H. R. Brandenburg. *Rock Products* 34, No. 6, 68–9(1931).—The addn. of 1 g. anhydrous $BaCl_2$ greatly hastens the soln. of CaO in the alcohol glycerol mixt. R. W.

**Crushing and preliminary grinding in portland cement manufacture.** A. C. Davis. *Cement and Cement Manuf.* 3, 813–22(1930).—Jaw, gyratory, roll, hammer and disk crushers and ball mills are described. Power requirements and characteristic size-reduction ratios are given for the various mills. Raymond Wilson

**Grinding of cement clinker.** A. C. Davis. *Cement and Cement Manuf.* 3, 1184–95(1930).—Jaw and cone crushers and ball and tube mills are discussed. R. W.

**Coal grinding.** A. C. Davis. *Cement and Cement Manuf.* 3, 1050–72(1930).—The coal grinding equipment used in the cement industry, with particular reference to unit systems, is described. Raymond Wilson

**Quick-setting silicate of soda cements for acid-proof tank and tower construction.** Foster Dee Snell and Howard Farkas. *Ind. Eng. Chem.* 23, 525–9(1931).—Acid-proof cements composed of a mixt. of inert aggregate and highly siliceous Na silicate set by evapn. of water and drying. They are workable until they dry and give a weak bond until thoroughly dry. When an acidic material such as Na fluosilicate is incorporated, the cements are workable for only a few min., set without drying and yield

a hard, brittle cement with a good bond Alk. types contg Al hydrate and neutral types contg a mixt of Al hydrate and Na fluosilicate are intermediate in properties They set after a few min to give a rubbery mass which sets further by drying The neutral or alk types are therefore best able to take up strains incidental to further building operations Details of representative types of acid proof construction are given for which the original must be consulted FOSTER DEE SNELL

Tricalcium silicate. ERNST JÄNECKE *Zement* 20, 26(1931), cf. *C A.* 24, 1309 — Further notes are given which deal with the controversy over the existence of the compds $3CaO\ SiO_2$ and $3CaO\ Al_2O_3$ or $8CaO\ Al_2O_3\ 2SiO_2$ in portland cement. H F. K

Field determination of cement content of paving concrete. H ALLEN *Eng News Record* 106, 513(1931) —A field method is described for detg the wt. per cu ft. of concrete as placed, from which data the yield and cement content per unit vol can be calcd for jobs on which proportioning is done by wt and the mixing water is accurately measured R P THOMPSON

Artificial control of the strength of concrete. III. C R PLATZMANN *Zement* 19, 1139–41(1930) —The use of certain hardening and acid proofing materials for concrete floors is discussed H F. KRIEGE

Cinders as concrete aggregate. EINER CHRISTENSEN. *J. Am Concrete Inst* 2, 583–646(1931) —Report of Comm 203 of the Institute RAYMOND WILSON

Ideally graded aggregates and the quality of concrete. PAUL HIRTEL. *Zement* 19, 1087–90, 1117–21, 1141–4, 1167–9(1930) —The combined aggregate gradings designed by Fuller and by Otzen (slightly heavier in intermediate sizes than Fuller's grading) are compared in concrete with natural gradings Both gravel and crushed basalt were used Specimens of const cement content (300 kg per cu m ) were made up to similar consistency and of nearly equal *w/c* ratio for the usual strength tests and for water imperviousness The natural sand and gravel grading which was excessively fine showed by far the lowest strength and water imperviousness The aggregates graded according to Fuller's curve gave concrete of excellent transverse and compressive strength for both crushed and rounded coarse aggregates, though slightly lower than those of Otzens gradings. Greater water imperviousness resulted from the use of Fullers grading than from any other The mere presence of a fairly high cement content is not sufficient to insure strength or quality in concrete H F. KRIEGE

Strength and resistance to sulfate waters of concrete cured in water vapor at temperatures between 100 and 350°F. DALTON G MILLER *Proc. Am Soc Testing Materials* 30, Pt II, 636–53(1930) —With some exceptions the trend of those cements that lost strength most rapidly in storage was toward greatest resistance to the action of sulfate waters Curing in water vapor between 100° and 190° F did not generally increase the resistance of concrete to the action of sulfate water, in some cases a decrease was indicated Curing in water vapor at 212° F and above markedly increased the resistance with increase of curing temps between 212° and 285° F for a 12 hr curing period Curing at 212° F has been more effective in developing resistance when continued for 6 days than for 2 Absorption of concrete cured in water vapor at high temps is not a criterion of resistance to sulfate waters H. C. PARISH

Heat balance of the gypsum plaster kettle process. WALLACE C. RIDDELL. *Rock Products* 34, No 9, 66(1931) —A report on a 10-day test run showing 61% of total heat imput utilized in calcination, 20% loss in stack gases, and 19% lost by radiation and otherwise RAYMOND WILSON

Roumanian trasses, their reactions and technical properties. A STEOPOE *Tonind-Ztg* 55, 436–8(1931) —Exptl data are given to show that the baryta no method for detn of quality is valueless. S 's method (*C A* 23, 680) is reliable B A SOULE

Scales for field tests of materials. HAROLD ALLEN *Eng News-Record* 106, 533 (1931) —A brief illustrated description of scales suitable for use in making sieve analyses, detg wt per cu ft and moisture content of aggregates, etc., for small projects for which the expense of a lab would be unwarranted R. E THOMPSON

The active material of wood-conservation agents. E PANNEWITZ *Z. Desinfekt u Gesundh* 23, 57–68(1931) —The inorg and org chemicals, in use or proposed, fungicides or insecticides in wood conservation are completely reviewed Special consideration is given to German patent literature B C BRUNSTETTER

Hygroscopicity of woods after different kinds of drying. CARL G SCHWALBE AND KURT BERNDT *Kolloid Z* 54, 314–26(1931) —Small rectangular blocks of pine (*Picea excelsa* and *Pinus silvestris*) were subjected to 92% humidity after a drying treatment. Drying at 50° in a vacuum for 24 hrs and drying at 105° for 48 hrs decreased the water absorption No difference was found on drying the wood in an $O_2$ stream or a $N_2$ stream Preswelling the wood in water and then placing in the 92% humid air

increased the water absorption The processes are irreversible only to a slight degree *Drying* with $C_2H_5OH$ or $C_6H_6$ does not change the water absorption The swelling capacity may be detd by the measurement of the water absorption A. P.

---

Apparent specific gravity apparatus [for stone, slag, gravel, etc.] (Shurr) 1. Accurate air separator for fine powders (Roller) 1. *Preparation of active* $MgCO_3$ from magnesite (Mathers, Eagleson) 18. Distilling shale, coal, etc [to form pitch-like residue suitable for roads, roofing, etc.] (Brit. pat. 339,963) 22.

**Cement.** Charles E. Kraus. Ger. 520,053, June 18, 1926. See Brit. 253,929 (*C. A.* 21, 2778).

**Cement.** Stefan Kohut. Ger. 520,211, Oct. 9, 1929. In the manuf. of cement by a fusion process in which a mixt. of raw material and solid fuel is supplied to a shaft furnace supplementary pulverulent, liquid or gaseous fuel is supplied to the furnace, at a point above the tuyères, in order to reduce the production of CO in the furnace. The known methods of supplying supplementary fuel when smelting Fe in cupola furnaces may be adopted in the process.

**Method and apparatus for grinding cement while cooling.** Carl Pontoppidan. Ger. 519,308, Sept. 23, 1928. *Corresponds to Brit.* 283,091.

**Rotary kiln and cooling drum for use in cement manufacture.** Fritz Luther (to the firm G. Polysius). *U. S.* 1,797,831, March 24. *Structural features.*

**Shaft and rotary furnaces in series for cement manufacturing.** G. Polysius A.-G. Ger. 516,526, May 3, 1928. Details of arrangement and interconnection are given.

**Rotary-tube furnace and cooler for cement, ores, etc.** G. Polysius A. G. Ger. 520,212, Sept. 3, 1925.

**Apparatus for adding flux, etc., to cement mixtures.** G. Polysius A.-G. Ger. 517,652, Feb. 21, 1929.

**Sample plates or tiles of colored cement.** Philipp Schubert. Ger. 517,706, Jan. 23, 1930. A layer of water-absorbing material (*e. g.*, gypsum, felt, pumice, etc.) is formed on a ground plate of metal, etc., dried and the colored cement layer is then added.

**Artificial aggregate for mortars and concretes.** John E. Greenawalt. Fr. 696,067-8, May 24, 1930. See U. S. 1,786,713 (*C. A.* 25, 793).

**Porous concrete.** Enamuele Stracquadaini. Fr. 697,127, June 6, 1930. A cellular or porous concrete is made by adding powd. Al, Zn or Ca and a resin such as colophony to a cement, *e. g.*, portland cement.

**Concrete bricks, pipes, etc.** G. R. Tustian. Brit. 340,112, Dec. 3, 1929. Bricks, pipes and other articles of concrete are waterproofed and hardened by coating them, while still moist, with a compn. of cement, sand, powd. mica and water, subjecting them to steam satn. in a closed chamber, and drying.

**Mixtures of concrete and asphalt.** Hermann Milke and Josef Oberdach. Fr. 695,265, May 7, 1930. Mixts. of concrete and asphalt are prepd. by adding to mixts. of ores and natural calcareous asphalt, mixts. of coal tar and artificial asphalt.

**Macadam, etc.** I. G. Farbenind. A.-G. Fr. 697,286, June 12, 1930. A slag suitable for making macadam, paving blocks, etc., is made by adding to a slag from P furnaces, the compn. of which corresponds approx. to Ca metasilicate, about 5–10% of $Al_2O_3$. The $Al_2O_3$ may be added to the furnace charge in the form of $Al_2O_3$ or in the form of materials contg. $Al_2O_3$.

**Paving slabs.** The Dunlop Rubber Co., Ltd. Fr. 696,044, May 23, 1930. Rubber paving slabs have the upper layer of relatively elastic rubber; the intermediate layer is of hard rubber of the consistency of ebonite, and both are seated in bitumen and bituminous aggregates.

**Impregnating natural or artificial stone with bituminous material.** Kleinberger & Co. A.-G. Ger. 519,129, May 9, 1926. The stone is heated to about 250° and then immersed in a bitumen bath having a lower temp.

**Fireproof mortar.** Rheinhold & Co., Vereinigte Kieselguhr- und Korkstein-Ges. Ger. 517,959, Feb. 22, 1930. A fireproof mortar contains a mixt. of carbonates and (or) oxides of alk. earth metals and heavy metals, with an addn. of at least 2% of heavy metal oxide. In the example, the mortar contains $Fe_2O_3$, $MnO_2$, $CaCO_3$, CaO calcined kieselguhr, powd. asbestos, gypsum and $FeSO_4$.

**"Artificial marble."** F. Roses-Galceran. Brit. 339,674, Sept. 10, 1929. A

polished plate of material such as glass, "crystal," steel or brass which has been treated with oil and then cleaned is placed in the bottom of a mold, and over this is placed three successive layers of material (1) a wet mixt of cement and ochre or other earthen coloring matter to which Zn white is usually added, (2) a dry mixt of fine sand and cement, and (3) a wet mixt of rough sand and cement The product may be repeatedly treated with boiled linseed oil

Roofing material W M SHAKESPEARE (to International Copperclad Co) Brit. 340,168 March 1, 1929 Structural features of composite roofing which may be formed with asphalted felt and thin Cu (which may be in the form of an electrodeposited strip)

Securing linoleum and similar plastic masses to floors, etc. ARTIFEX CHEMISCHE FABRIK G M B H Ger 517,847, Oct 13, 1929 Use is made of a layer of an uncongealed mixt of oil and $CS_2$ to which mineral material may be added Latice and tar-oil may be added The oils mentioned are, olive castor, soy and maize

"Sheathing lumber" from redwood bark. ILTON R DARLING (to Pacific Lumber Co) U S 1,797,901, March 24 Redwood bark is treated for the sepn of its fibers by boiling in a soln of a salt such as $Al_2(SO_4)_3$ capable of forming colorless tannates and producing a product which is suitable for making sheets or boards

Photographic reproductions of wood grain. MASA GES ZUR HERSTELLUNG KÜNSTLICHER OBERFLÄCHEN Brit 340 131, Jan 20, 1929 A smooth board, before being photographed, is treated with a hard wax or with a polishing stone, such as agate or like non smearing material, to alter the n of the surface parts without affecting the underlying parts Cf *C A* 24, 560

"Wood substitute" S SCHLESS. Brit. 339,853, Jan 27, 1930 A product which may be made in laminated form comprises a mixt of pulverulent CaO or $Ca(OH)_2$ with pulverulent silica and cellulose or other fibrous material, the mixt being moistened, allowed to stand pressed heated to about 100–110°, treated with $CO_2$, and finished if desired by oiling, impregnating and polishing

Apparatus for drying wood CHARLES GOODALL Ger 517,714, Sept 15, 1929 O or $O_3$ is added to the drying air

Plant for drying wood. FRITZ HAAS Ger 521,005, June 18, 1929

Preserving wood SOC ANON DES ÉTABLISSEMENTS ARMAND BEAUMARTIN Fr 695 479, May 12, 1930 Wood to be preserved by antiseptics has its surface perforated with a large no of small holes by an instrument covered with sharp projections

Impregnating wood with salt solutions IMPREVA HOLZIMPRÄGNIERUNG UND HOLZVERWERTUNG A G Ger 521,110 Dec 1, 1925 The wood is steamed, rapidly dried at a temp up to 150°, and then immersed while hot in the cold salt soln, *e g*, a soln of $HgCl_2$ The wood may be kept hot after drying by steaming again App is described

Preserving organic material SERGE PISSAREV Ger 514 981, Sept 3, 1926 Wood, paper, fiber, etc, are preserved by impregnating with metal salts of naphthenic acid in alk $NH_3$ soln and fixing with metallic $NH_4$ compds of cellulose Salts of Cu, Zn or Ni are preferred

## 21—FUELS, GAS, TAR AND COKE

A C FIELDNER AND ALDEN H EMERY

Notes on recent developments in fuel technology. R WIGGINTON *Fuel in Science & Practice* 9, 497 9 54 7(1930) —Brief reviews are given of industrial use of pulverized fuel, Esthonian oil shale, gasification of coke breeze, prevention of gas explosions, industrial use of coal gas, oil in Germany, burning a hole in fog

D A REYNOLDS

Graphical methods of fuel control. JAS. CUNNINGHAM *J Inst of Fuel* 4, 216–22 (1931) —C shows that much of the fuel data entered into plant records can be used graphically to increase fuel economy)

D A REYNOLDS

Manufacture of alcoholic motor fuel K. R DIETRICH *Z Spiritusind* 53, 349 (1930) —General discussion of the subject

S J

S A KARJALA

Molasses as a fuel. A RODZIEWICZ *Gazeta Cukrownicza* 68, 133–5(1930), *Listy Cukrovar* 49, No 26, Rozhledy 24 —Low monetary values of molasses suggested the use of molasses as a combustible The sugar factory at Brześć Kujawski mixed coal with 20 and later with 10% molasses The mass became tacky in the furnace and was

difficult to stoke The warm molasses drained off the coal into the ashes before combustion occurred Greasy soot deposited throughout the drafts For economical usage the furnaces will have to be altered so that the molasses will enter the hot coals and a copious blast of air will have to be supplied to prevent the formation of soot

**The washability of Transvaal coals.** J MUNDELSOHN *J. Chem Met Mining Soc. S Africa* 31, 101-5(1931).—M was unable economically to wash 8 Transvaal coals below 8.0% ash Analyses of 5 samples are given ALDEN H EMERY

**Hydrogenation of South African coal.** P. N. LATHOAN. *J. Chem. Met Mining Soc S Africa* 31, 199-200(1931); cf *C A*. 24, 2959-60, 5133; 25, 301 A H E

**The Charleston coalfield.** W H A. PENSHURR. *New Zealand J. Sci Tech* 12, 211-56(1931).—The location, history, geology and phys characteristics of Charleston, N. Z., coal are discussed The proximate analyses of 22 samples of the coal are tabulated The coal is generally non caking, has a high S content, and burns to a buff-colored ash. W. H. BOYNTON

**The hydrogen in coal.** A FEELEY, G. H KENYON AND A McCULLOCH. *Fuel in Science & Practice* 10, 4-15(1931).—Four coals of different ranks were chlorinated and distd. under identical conditions Carbonization was effected in 100° stages up to 900° and the products of each stage were examd $CH_4$ was the only paraffin hydrocarbon found in the gaseous products in measurable quantities. No tar was formed Practically all the Cl in the coal was evolved as HCl, this evolution was almost complete at 600° except with one coal where it continued to 900°. D A REYNOLDS

**The swelling of coal during coking.** K. BAUM AND P. HEISER. *Glückauf* 66,

1497, 1538(1930) *Fuel in Science & Practice* 10, 51–64.—An abstract of recent literature bearing upon the hydrogenation of coal. D. G. Skinner. *Fuel in Science & Practice* 10, 109–37(1931).—A review of scientific press and patent literature with 248 references. D. A. Reynolds

**Development of hydrogenation of coal.** Sz. Hankiss. *Tüzelőstech.* [N. S.], 2, 17–22(1930).—A review of the theoretical and technical development, present state and possible future of coal hydrogenation. S. S. de Finály

**Distribution of carbon, hydrogen, nitrogen, sulfur and oxygen in the products of hydrogenation of a Hungarian coal.** Imre Makray. *Tüzelőstech.* [N. S.], 2, 25–8(1930), cf. *C. A.* 25, 188.—The coal used contained $H_2O$ 2.60, ash 7.30, total S 4.23, combustible S 3.92, C 63.01, H 5.42, N 1.04, O 16.71%, net calorific power 6024 cal. The oil obtained contained 53% of the original C, H 30, S 2.9, N 17 and O 15%. The gas produced contained 21.7% of original C, H 47, no S, N 50 and O 46%. The water obtained contained 0.2% of the original C content of coal, H 10, S 0.4, N 16 and O 34%. S. S. de Finály

**A study of the Marshall-Bird test for determining the agglutinating value of coal.** K. A. Johnson and H. F. Yancey. *Fuel in Science & Practice* 9, 517–21(1930). See *C. A.* 24, 3343. D. A. Reynolds

**The spontaneous ignition of coals.** Károly Gärtner. *Matematik és Természettud. Értesítő* 46, 378–406(in German 407–8)(1929).—Ignition points of Hungarian brown coals were detd. in air and in O currents. Coal consisting of smaller particles ignited more readily. Ignition is accelerated by the presence of unsatd. org. compds. The presence of S, moisture and humic acid showed no influence on the ignition temp. Data in the literature on the spontaneous ignition point of coals have value only in case grain size of coal is stated. S. S. de Finály

**Coking coal. Its nature and synthesis.** Balaram Sen. *Proc. 15th Indian Sci. Congr.* 1928, 292.—The coking value of coal does not depend on its ash, volatile matter or fixed C, but is due to a resinous substance in the coal (called resinoid by S.) which can be extd. with a suitable solvent. Coal treated with a suitable solvent loses its coking power to an extent depending on the degree of extn. Poor coking coals can be made to cake by the judicious addn. of pitch or other suitable bond. Increases of volatile matter in the coking coal results in the lowering of its coking value. E. J. C.

**Coal-dust recovery at Toronto Station.** W. S. Johnston. *Power* 73, 409–11(1931).—Bag filters are used. D. B. Dill

**The connection between ash content and specific gravity of Hungarian brown coals.** J. Finkey. *Soproni M. K. Bány. I. rd. Főiskola Bány. és Koh. Oszt. Közleményei* 1930, 158–65.—Expts. made with sep. fractions of washed coal showed a mathematical connection between sp. gr. and ash content. A brown coal of Dorog gave, *e. g.*, the following data:

| Fractions | % of unwashed coal | Ash content % | Sp. gr. |
|---|---|---|---|
| 1 | 8.5 | 5.6 | 1.32 |
| 2 | 56.8 | 11.6 | 1.41 |
| 3 | 14.1 | 28.1 | 1.57 |
| 4 | 20.6 | 71.0 | 2.17 |

Sp. gr. was detd. with the volumoscope of Kühn within 2 min. Graphical examn. of the above data gave the equation $A = 82d - 104$, in which $A$ is ash content and $d$ sp. gr. of the coal. S. S. de Finály

**The possibility of manufacturing illuminating gas from Hungarian brown coals.** Zs. Gálócsy. *Tüzelőstech.* 2, 42–7(1929).—An address. S. S. de Finály

**The Fleissner method of drying lignites.** H. Klein. *Intern. Bergw. Berglech.* 23, 377–82(1930), cf. *C. A.* 24, 4916.—The method is well adapted for improving low-grade fuels, especially brown coal. The method consists of preheating the coal, heating under pressure with live steam, release of pressure and airing. A plant operating with this method is described. The properties and economic possibilities of dried lignites are discussed. A. Hirsch

**Plant and operating costs with the low-pressure Mont Cenis process.** W. F. Scholvien. *Chem. Met. Eng.* 38, 133–5(1931), cf. *C. A.* 25, 1971.—Detailed plant and operating costs based on the data of German plants show that anhyd. $NH_3$ may be produced in the U. S. for 2.25 cents per lb. by the low pressure Mont Cenis process. L. W. T. Cummings

**Combustion of natural gas.** T. J. Ess. *Blast Furnace and Steel Plant* 19, 647–50(1931), cf. *C. A.* 24, 5135, 25, 269. W. H. Boynton

Results of laboratory experiments on manufacture of gas from Hungarian coals. István Jakóby and Ervin Becker. *Tüzelőstech* [N. S.], 2, 1-6(1930).—Seven typical samples of various Hungarian coals were tested for distn. A large content of S (1-6%) makes purification of gas too expensive. Coal of Nagybátony (41.90% C) gave 13.9 cu. m. gas per 100 kg. coal on high-temp. carbonization, 72% coke remained, with a C content of 34 kg. Half of this was converted to water gas and mixed with the original distn. gas. This mixed gas contained $CO_2$ 5.5, $O_2$ 0.8, $C_nH_m$ 0.5, CO 28.6, $H_2$ 47.3, $CH_4$ 12.5 and $N_2$ 4.8%; sp. gr. was 0.619, net calorific power, 3587 cal. S. S de F.

Catalytic preparation of a gas rich in methane from a mixture of water gas and steam. J. C. Ghosh and K. Chakravarty. *Proc. 15th Indian Sci. Congr.* 1928, 148-9.—The authors have previously shown that a gas mixt. contg. CO and $H_2$ 1:1 by vol. can be made to yield a fuel gas contg. over 25% $CH_4$ if passed over suitable catalysts at temps. 350-450°. The efficiency and life of certain catalysts have now been very considerably increased by introducing steam in suitable proportions in the reacting gas mixture. The following reactions take place simultaneously on the catalyst surface: (1) $2CO \longrightarrow CO_2 + C$, (2) $C + H_2O \longrightarrow CO + H_2$, (3) $CO + 3H_2 \longrightarrow CH_4 + H_2O$, (4) $2CO + 2H_2 \longrightarrow CH_4 + CO_2$. It is seen from (1) and (2) that CO reacts with steam giving $CO_2$ and $H_2$. The $H_2$ so produced increases the ratio of $H_2$ to CO in the reacting gases and prolongs the life of the catalyst by preventing deposition of C. Catalysts (not mentioned) have been found which so regulate the rates of the reaction given above that the resulting fuel gases, after removal of $CO_2$, contain more than 50% $CH_4$. E. J. C.

Experiments on a Goffin gas plant. A. Romwalter. *Soproni M. K. Bány. Erd. Főiskola Bány. es Koh. Oszt. Közlemények* 1930, 166-77.—By a special method light hydrocarbons were obtained instead of low-temp. tars from S-contg. Hungarian brown coals. Lignite coke and distn. gas were secondary products. The amount of light hydrocarbons obtained was larger than that obtained by hydrogenation of low temp. tars produced by the usual carbonization. Results of large-scale expts. will be published later. S. S. de Finály.

The origin and decomposition of organic sulfur compounds under gas-making conditions with particular reference to the role of the carbon sulfur index. John C. Holtz. *Fuel in Science & Practice* 10, 16-30(1931).—Exptl. work on the cracking of a gas oil contg. 3.61% S showed that $CS_2$ may be formed if a temp. of 649° is exceeded. $CS_2$ was formed on cracking a S-free oil in the presence of a gas from the same oil to which $H_2S$ was added. An important loss of S to products other than $CS_2$ was noted. N contg. small quantities of $H_2S$ was passed over sugar charcoal and heated to incandescence. After a short time $H_2S$ was formed and its concn. slowly increased. After more gas had passed, $CS_2$ appeared as a reaction product. The residue contained S, and concns. proportional to the surfaces per unit wt. of charcoal exposed. The effect of hot surfaces of pumice or charcoal free from S in removing org. S was studied. As the deposition of C and S on these surfaces increased they became ineffective for removal. Conclusion. Org. S compds. result from the decompn. of a complex of S and C. This theory was tested under equil. conditions by passing N contg. $H_2S$ over sugar charcoal and cooling the reaction products to prevent reversion. $CS_2$ and other org. compds. were formed. Other factors affecting the formation of gaseous org. S compds. studied were: temp.; concn. of $H_2S$, the presence of $H_2O$, CO, O or H. An increase in temp. or concn. of $H_2S$ caused an increase of total org. S formed as well as that of $CS_2$. CO or O caused an increase in the org. S other than $CS_2$. H caused a decrease in the concn. of org. S. $H_2O$ had little effect on the concn. of total org. S but reduced that of $CS_2$. D. A. Reynolds.

Organic bases for gas purification. R. R. Bottoms. *Ind. Eng. Chem.* 23, 501-4 (1931).—Certain amines and amino compds. have the property of absorbing $CO_2$ and $H_2S$ to form unstable carbonates and hydrosulfides that decomp. at about 50° to liberate the gases and release the free bases in their original forms. Among the N bases found to be suitable are benzylamine, diaminopropanol, diethanolamine, diethylamineethanol, etc. Operating methods are outlined. H. L. Olin.

The bearing of fluctuations in the price of coke and by-products on the cost of production of gas. M. Barash. *Trans. 2nd World Power Conf.* (Berlin) 2, 42-62 (1930).—Comparative costs of gas production in continuous vertical retorts, intermittent vertical retorts and horizontal retorts are shown. The value of the coke represents > 70% of the cost of coal. The credit for tar is sufficient to pay for the capital and maintenance charges, the labor costs and a portion of the fuel costs. The total value of coke and by-products forms so large a proportion of the credit side that the net cost of gas is likely to be more dependent on fluctuations in the prices of these resi-

duals than on variations in capital charges, fluctuations in labor costs, etc. These factors far outweigh any economies from large units Figures given show that each variation of 1 shilling in selling price of coke affects the cost of gas production 3–4% Cost figures for low temp carbonization are given and show that only under very favorable conditions will the process pay Tar, road tar, coal tar pitch, creosote oils and coal tar preservatives, cracking of tar, benzene, $(NH_4)_2SO_4$, and steam from waste heat are discussed Benzene extn is not a paying proposition and $NH_3$ liquor is a source of loss ALDEN H EMERY

Phenols in lignite tars. F v HESSERT *Z angew Chem* 43, 771–4(1930).—A tar ext. representative of the phenolic compds was dissolved in NaOH, polyphenols being eliminated by air oxidation The remaining phenols were liberated and fractionated Fractions were dissolved in 50% KOH, at 50°, and powd $K_2S_2O_7$ was added to form phenylsulfuric esters After satn with $CO_2$, inorg salts were pptd with excess of alc The dried esters, dissolved in abs alc, were repptd with $Et_2O$ Alkyl groups were oxidized with alk 6% $KMnO_4$, the soln was filtered, acidified with HCl, and evapd Phenolcarboxylic acids were taken up with $Et_2O$, and again dried Salicylic acid was extd. with $CHCl_3$ and the remaining acids were sepd by fractional crystn from $H_2O$ H identified the 3 hydroxybenzoic acids, the 4,1,3- and 5,1,3 $HOC_6H_3(CO_2H)_2$, the 2,1,4-$HOC_6H_3(CO_2H)_2$, the 3,1,2- and 4,1,2-$HOC_6H_3(CO_2H)_2$ From these, quant and qual conclusions regarding the original phenols were drawn All the known coal-tar phenols were also found in the lignite tar Considerable amts of $FtC_6H_3OH$ were present in the xylenol fraction. Trialkylphenols could not be detected *p*-Substitution appeared to be the most favored K. H. ENGEL

An economic comparison between German and Japanese coking plants. S AYABE *J Soc Chem Ind* (Japan) 34, Suppl binding 77(1931) E H

New methods of coke testing WOLFGANG MELZER *Arch Eisenhüttenw* 4, 225–38(1930).—The phys properties of coke samples from different locations in a retort differ greatly The reactivity, structure, hardness and friability are influenced both by the type of coal and the method of coking Coke produced in narrow retorts is not the equiv of that from wide retorts For blast furnaces which produce high-Si Fe a slow-burning, dense, hard coke is preferred H F JOHNSTONE

Fuel. KARL NEYNABER. Ger 516,762, Nov 30, 1929 Details of a dehydrating press for crude peat, etc., are given.

Producing fuel for internal-combustion engines from water gas. MARCUS BRUTZKUS Ger. 520,222, Feb 21, 1925 See Brit. 252,786 (*C A*. 21, 2551).

Motor fuels. ERNST G F MEYER. Ger 520,011, June 13, 1926 Motor fuels consist exclusively of hydrocarbon distillates, $Et_2O$, and a readily volatile base, *e g*, $NH_3$, $NH_2Me$ or $NH_2Et$, which diminishes the volatility of the $Et_2O$ The hydrocarbon distillate may boil within the range 70–200°, and may contain 1–5% b up to 80°, 8–25% b up to 100° and 20–65% b up to 120° The proportion of $Et_2O$ may be 1–5%.

Motor fuels from plants or fruits containing fatty oils GUTEHOFFNUNGSHÜTTE OBERHAUSEN A.-G Brit 340,107, Nov 23, 1928 In a modification of the process described in Brit 339 048 (*C A* 25, 2548), in which fatty oils are converted into products of low b p suitable for use as motor fuels by heating their vapors at high temps with H and preferably with catalysts, the plants or fruits contg the oils in

their natural state are subjected to a similar treatment without preliminary extn. of the oils Soy beans yield 20% of an unsaponifiable oil b 60–200°. The catalysts may be used as aq solns of suitable salts and the hydrogenation may be effected in a rotary furnace

Liquid hydrocarbons. PHYSICAL CHEMISTRY RESEARCH Co Fr 696,610, June 3, 1930 Liquid hydrocarbons, particularly fuels, are obtained by bringing gases from the distn of solid fuels mixed with water gas under the action of an electrostatic field and under the action of a source of ultra violet rays An app is described

Fuel agglomerates. P GLOESS Brit 339,876, Feb 14, 1929 Fuel agglomerates formed with algine are impregnated with coal tar, wood tar, pitch or other org coking material, followed by coking to render the agglomerates resistant to water

Fire-lighting fuel. BRIQUETTING & CARBONISING SYNDICATE, LTD., and T A GOSKAR Brit 339,985, Sept 17, 1929 Finely divided material such as coal or coke is mixed with comminuted peat and pugged and molded into briquets, and sawdust or paper pulp may be added and the peat may be treated with Na silicate before milling The briquets are dipped in a bath of paraffin, paraffin oil and resin Various details of manuf are described

Briquet manufacture. W BOOTH, V BOOTH and W J BOOTH Brit 339,868, Feb 6, 1930 Mech features

Acetylene storage. ALTOGEN GASACCUMULATOR A G (to Gas Accumulator Co (United Kingdom), Ltd.) Brit 339,899, May 30, 1929 Cylinders for holding $C_2H_2$ are filled with a cemented block of pumice, trass, natural or artificial slag or other material having the same coeffs of expansion by gas absorption and heat as cement

Hydrogenation and desulfuration of hydrocarbons. PAUL L F NICOLARDOT Fr 696,771, Aug 14, 1929 Gases from the distn of coal, oils, tars, etc., are transformed into substances resembling gasoline and petroleum, by subjecting the gases to a preliminary hydrogenation to sat the unsatd hydrocarbons and to render the sulfured products more sensitive to the final action of desulfuring materials, and then to a subsequent desulfuration and hydrogenation Both operations are carried out at ordinary pressure or pressures not above 50 atm The preliminary hydrogenation may be by means of nascent H produced by oxidizing CO with steam in the presence of a reacting mass at 350–500°

Destructive hydrogenation. N V BATAAFSCHE PETROLEUM MAATSCHAPPIJ Brit. 339,873, March 11, 1929 Co-pptd Fe and Al oxides (which may contain water and may be obtained by the action of $NH_3$ on a soln contg $FeCl_3$ and $AlCl_3$, washing the ppt. and drying it at 150° until it contains 10–12% $H_2O$) are used as catalysts in the destructive hydrogenation of materials such as coal, brown coal, tar, mineral oils and their derivs, wood, etc.

Filtering oils from destructive hydrogenation products, etc. I. G FARBENIND A.-G Brit 339,681, Sept 13, 1929 Mixts of oil and carbonaceous matter such as produced in the destructive hydrogenation of coal, brown coal or tar or by refining oils with active C or with bleaching earth are filtered at an elevated temp. through a layer of powd or granular material or through a plurality of fine mesh filters, and the filter residue is freed from oil by distn at low temp., by extn with solvents or by emulsification The filtration may be effected in an inert gas, and numerous details and modifications of procedure are described, as is also an app

Apparatus for distilling bituminous fuels. COMPAGNIE CONTINENTALE POUR LA FABRICATION DES COMPTEURS ET AUTRES APPAREILS and ALBERT BREISIG Fr. 696,696, June 5, 1930

Furnace for the low-temperature distillation or carbonization of coal, etc. CHARLES HONNAY. Fr 696,502, May 19, 1930

Apparatus for carbonizing bituminous materials. HENRY LATHAM DOHERTY. Fr 696,414, Mar 15, 1930

Apparatus for carbonizing bituminous materials. I. G. FARBENIND A.-G. Fr 697,075, June 4, 1930

Rotating furnace for carbonizing fuel at a low temperature. BRENNSTOFF-VERSCHWELUNG G M B H Fr 697,085, June 4, 1930

Electrically heated traveling-grate apparatus for low-temperature carbonization. TROCKNUNGS- VERSCHWELUNGS-, UND VERGASUNGS-G M B H. Ger. 520,456, Feb. 3, 1928

Agitating and conveying apparatus suitable for use in low-temperature fuel carbonization. MAXWELL MCGUINNESS U S 1,798,026, March 24 Structural features

Low-temperature carbonization of coal. WALTER RUNGE (to International Coal Carbonization Co) U. S. 1,797,796, March 24 Coal, while suspended in a "cloud-

like ' form, is subjected to the action of gases in a processing zone having an av. temp of approx 575°, to effect deduction of a large portion of its volatile hydrocarbon content as gases and vapors, and the gases and vapors are cooled within the same app to such an extent that a large portion of the vapors are condensed in a cooling zone with parts having a temp as low as 150° and condensates thus obtained are returned to the processing zone where they are subjected to carbonization, gases thus obtained being sepd. from the coke and removed and collected App is described. Cf. *C. A.* **24**, 5137.

Directly heated distillation retort for coal, etc. Georg Merkel. Ger 521,201, Jan 16 1929

Rotary chamber oven for distilling coal, etc. Hector Hardy Ger 519,442, May 5, 1929

Coking of soft coal. N.-V. Silica En Ovenbouw Maatschappij Fr. 696,385, June 2, 1930 Soft coal is coked by introducing it into the coke ovens in as divided a state as possible with appropriate charging means, the water content being kept between 6 and 10%.

Drying coal. Böhmische Handelsges Ger 520,369, Nov 27, 1927 Coal is treated in a closed vessel with superheated water under pressure and when the coal has attained the temp of the water the pressure is released. The water present in the coal itself is then liberated The method is intended particularly for coarse lignite.

Centrifugal drying of peat and other materials. D W Berlin Brit 340,156, Feb 6, 1929 Peat, sawdust, waste wood, dry grasses or the like, which may be wet carbonized, is subjected to successive centrifugings the first of which throws out the solid from assocd. liquid and the second of which (suitably utilizing app with walls penetrable to liquid) throws liquid away from the solid. Various details of app. and procedure are described.

Gas. Humphreys & Glasgow, Ltd., and Arthur R. Griggs. Fr. 696,082, May 24, 1930 In the manuf of gas by passing through coal the hot gases produced in the manuf of water gas from coke, the gases produced by injecting air are drawn off from the coke without passing through the coal and used for heating a recuperation chamber surrounding the retort contg the coal. The steam used for making the water gas is superheated by passage through this chamber An app is described.

Desulfurizing gases. I G Farbenind A.-G Brit. 340 016, Sept. 16, 1929 S compds are converted into $H_2S$ and subsequently removed from coal gas, coke-oven gas, gases from cracking and distn. processes, etc., by use of catalysts comprising sulfides of elements of groups 2 to 7 of the periodic system together with metals of group 8 or heavy metals of group 1 or their compds. (preferably at a temp of 200–400°) A suitable catalyst for treating coal gas may be prepd. by pptg Mo sulfide on Florida earth, applying Ni carbonate and reducing at 300°

Washing gases. N. V. Silica En Ovenbouw Mij Fr 696,682, June 5, 1930 Substances contained in distn. gases, particularly $C_6H_6$, are removed by bringing a solvent for the substance in a finely divided form into the gas, after which the gas charged with fog is brought to an elec. app for purifying gases where the substance and solvent are pptd.

Removing nitric oxide from gases. Ges. für Linde's Eismaschinen A.-G Ger. 521,031, Oct. 15, 1929 Traces of NO are removed from gases by washing them with solns. contg lower oxides of S or the alkali salts of the corresponding acids Since the presence of free OH ions promotes the absorption, an alk. washing liquor is preferred, and the gases should be preliminarily freed from acid constituents other than $CO_2$. The method is particularly useful in purifying coke-oven gases prior to sepg constituents thereof by liquefaction, and may be put into effect in this case by adding an alkali sulfite to the alk. washing liquor used to remove $CO_2$

Apparatus for making fuel gas from crude liquid fuels. Heino Ballhöfer. Ger. 520,012, Feb 8, 1929

Washing coal gas, etc. Ges. für Kohlentechnik m. b. H. Ger 521,361, Dec. 13, 1929 A portion of the gas-washing water, which contains $CO_2$ and $NH_3$, is withdrawn from the still column at an intermediate point at which the water has lost most of its $CO_2$ content but still retains most of its $NH_3$ content. This portion of the water is returned to the gas washer

Water gas. I G Farbenind A.-G (Fritz Winkler and Paul Feiler, inventors) Ger 516 655, Nov 28, 1926 Addn. to 437,970 A method is described of producing water gas by conveying steam up a whirling column in which finely powd. fuel is burning Cf *C. A.* **25**, 2273

Apparatus for cooling gas such as carbureted water gas. J S Haug (to Humphreys & Glasgow, Ltd.) Brit. 339,885, May 6, 1929 Structural features.

**Plant for generating gas in furnaces.** CLARK C. BOARDMAN (to Thermatomic Carbon Co.) U. S. 1,797,256, March 24. A generator whose rate of discharge is subject to quick rises is assocd with a chamber contg primary cooling means such as a water spray cooling the gases discharged from the generator, with a second chamber for receiving the gases from the cooling chamber, and with auxiliary cooling means controlled in accord with the temp in the second chamber. Various details of construction are described.

**Gas producer.** J. S. HAUG (to Humphreys & Glasgow, Ltd.) Brit. 339,743, Dec. 7, 1928. Various structural details are described relating to a water-jacketed water gas producer having a rotary grate with a central tuyère.

**Gas producer.** ALDO LOMBARDI. Fr. 695,817, May 19, 1930. A device is described for making a gas rich in CO from wood.

**Gas producers.** MASCHINEN- UND FAHRZEUG FABRIKEN ALFELD-DELLIGSEN A. G. Ger. 517,580, Jan. 16, 1927. The producer has an inclined grate for the introduction of air and a lower roller grate partly immersed in water.

**Producer for gasifying fuels.** MATHIAS FRÄNKL. Ger. 514,194, Dec. 3, 1929. A producer comprising two shafts communicating at the bottom is used. Steam is passed in at the top of one shaft, and O or oxygenated air is passed in at the bottom of the shaft. The gases are withdrawn from the top of the other shaft. The functions of the shafts are interchanged from time to time.

**Recuperator for gas-heated gas producer.** JEAN SAUVAGEOT and HENRY DIFTER LEN. Fr. 696,052, May 24, 1930.

**Cooling the gas liquor of gas producers.** WILHELM OEFVERBERG. Ger. 517,977, Aug. 9, 1924. Details of the app. are described.

**Apparatus (with thermostatic control) for producing lampblack by combustion of natural gas, etc.** BRADLEY W. RUMBARGER (to Imperial Oil & Gas Products Co.) U. S. 1,797,368, March 24. Structural features.

**Tars or pitch.** COMPAGNIE DES MINES DE VICOIGNE, NOEUX ET DROCOURT. Fr. 696,245, Sept. 7, 1929. Tars or pitch from the distn. of coal, lignites or schists at high or low temp. are treated to eliminate oxygenated asphaltic or acid substances by pptn. with appropriate solvents such as petroleum, gas oil, etc., or by fixation with alk. solns. The purified products are hydrogenated.

**Acid treatment of wax-free tar.** THERMAL INDUSTRIAL & CHEMICAL (T. I. C.) RESEARCH CO., LTD., and C. O. CONDRUP. Brit. 339,640, Aug. 6, 1929. In connection with the agitation of wax free tar with acid such as $H_2SO_4$ at a temp. of about 50–80°, the mixt. of oils and tars (either with or without previous sepn. and remixing) is neutralized, dehydrated, and heated until of the desired consistency, and the oils may be sepd. and fractionated and the residue and oils (except those oils distg. 325–395°) mixed with the tar after neutralization. Various auxiliary steps and modifications of procedure are described.

**Filtering oleaginous or tarry liquids.** I. G. FARBENIND. A.-G. Brit. 339,636, June 7, 1929. A filtering diaphragm such as that of a described rotary vacuum filter is prepd. for filtering oleaginous or tarry liquids by applying to it a layer consisting of finely divided carbonaceous residues contg. oily, tarry or asphaltic substances such as those derived from destructive hydrogenation or heat pressure treatment of coal, peat, shale, tars or mineral oils (preferably after the residues have been heated to 250–300° to drive off lighter fractions).

**Distillation apparatus for removing tar from waste waters from cokeries.** PAUL GRUHL. Fr. 696,837, June 7, 1930.

**Coke.** GUSTAV HILGER. Fr. 696,966, May 15, 1930. Canals for the evacuation of gas are formed in the charge of fuel used for making coke or semi-coke so that the gases are led from the hot walls of the furnace to the colder center of the charge.

**Coke.** SOC. GUSTAV WIPPERMANN, MASCHINENFABRIK, STAHLWERK UND EISENGIESSEREI G. M. B. H. Fr. 696,647, June 4, 1930. Metallurgical coke is improved by adding coke dust of irregular-sized grain of dimensions below 3 mm. obtained by crushing under pressure the coal used for making the coke.

**Method of dry-cooling semi-coke.** N.-V. CARBO-UNION INDUSTRIE MAATSCHAPPIJ. Ger. 519,441, Oct. 5, 1924.

**Coke ovens.** ARNOLD BECKERS. Fr. 695,632, May 15, 1930. Construction of tight fitting doors is described.

**Coke ovens, carbonization chambers, etc.** WOODALL-DUCKHAM (1920), LTD., and ARTHUR MCD. DUCKHAM. Fr. 697,233, June 11, 1930.

**Horizontal coke oven.** CARL OTTO. U. S. 1,798,129, March 24.

Vertical chamber oven for producing gas and coke. HEINRICH KOPPERS. Ger 521,105, Feb 2 1926

Regenerative coke oven. HEINRICH KOPPERS A.-G. (Friedrich Totzek, inventor). Ger 520 073, Dec. 13, 1927

Coke-oven battery with horizontal coke chambers. JOSEPH BECKER. Ger 516,532 Jan. 25, 1925

Heating coke ovens. UNION CHIMIQUE BELGE, SOC ANON Belg 372,788, Sept 30 1930 The rate of feed of heating gas is maintained const., but in the periods between inversions the amts of air introduced at various points are varied No 372,789 provides for the use of a heating gas of variable compn., or consisting of a mixt. of 2 or more constituents, the proportions of which can be modified as required during the interval between 2 inversions of the heating medium

Coke-oven-heating system. WOODALL-DUCKHAM (1920), LTD., and A. M. DUCKHAM Brit. 339,641, Aug 6, 1929 Structural features

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F FARAGHER

Hydrogenation of petroleum oils. RALPH H McKEE AND ANTONI SZAYNA *J Inst Petroleum Tech* 17, 121–33(1931).—The mechanism of hydrogenation is discussed from a consideration of the data in the literature L. W. T CUMMINGS

Decolorization of petroleum with acid clay. I. K. YAMAMOTO AND H. ISHIKAWA. *J Soc Waseda Applied Chem* 1930, No. 12, 6–13, *Mem Faculty Sci Eng Waseda Univ* 1930, No 7, 28.—The power of acid clay to decolorize petroleum products increases with decreasing particle size II. III. *Rept Tech Chem Lab. Waseda Univ* 1930, No. 13, 5–7, 7–14 *Mem Faculty Sci Eng Waseda Univ* 1930, No. 7, 29, 30–1.—The acidity and petroleum-decolorizing power of acid clays decrease as the temp of treatment increases from 100° to 1000° HCl treatment increases and alkali treatment decreases the decolorizing power of acid clay. L. W T. CUMMINGS

Synthesis of petroleum hydrocarbons from hydrogen and carbon monoxide at ordinary pressure. II. K. KOBAYASHI, K YAMAMOTO AND H ISHIKAWA. *Mem Faculty Sci Eng Waseda Univ* 1930, No 7, 26–7 cf *C A* 23, 5035.—Nine catalysts composed of Co, MnO and Cu were used in the synthesis of oil from CO and $H_2$. Active C formed from the decompn of the CO is considered the basic material for subsequent hydrogenation and polymerization to oils. $CH_4$ was formed simultaneously. L. W T. CUMMINGS

Luminous stationary flames: the quantitative relationship between flame dimensions at the sooting point and chemical composition, with special reference to petroleum hydrocarbons. S. T. MINCHIN *J Inst Petroleum Tech* 17, 102–20(1931).—The tendency of hydrocarbons to smoke as detd. in a Weber photometer lamp was found to decrease in the naphthalene and benzene series as the no of C atoms increased, but increased in the paraffin series. This property also increases in synthetic mixts. of paraffins and aromatics or naphthenes as the concn. of either of the latter is increased L. W. T. CUMMINGS

Cretaceous limestone as petroleum source rock in northwestern Venezuela. HOLLIS D HEDBERG *Bull Am Assocn Petroleum Geol* 15, 229–46(1931).—The lithology, microscopic character and occurrence of oil in La Luna and Cogollo limestones are compared in detail. The conclusion is that the oil in the former is indigenous, whereas it has migrated into the latter The La Luna formation is probably a petroleum source rock. The specific source of the oil generating material in these sediments is discussed. ALDEN H EMERY

East Hackberry salt dome, Cameron Parish, Louisiana. A. J. BAUERNSCHMIDT, JR. *Bull Am Assocn Petroleum Geol* 15, 247–56(1931).—The Hackberry oil is a typical heavy Gulf Coast crude oil ranging from 18° to 24° Bé (av. 22°) A. H E.

Finished products from oil shale. WM BLELOCH *S African Mining and Eng J.* 41, Pt. II, 393(1930).—The following products are obtained from Scottish shale oil gasoline (motor fuel), extg spirit (for removal of oil from seeds and bones), solvent naphtha (mfg rubber goods), 0 741 naphtha (safety lamps), 0 750 naphtha (flare lamps), white spirit (paints), solvent (removal of naphthalene from coal gas and manuf. of linoleum), various grades of illuminating oil, gas oils, fuel oils, cleaning oil, batching oil (jute

spinning), lubricating oil, residual oil for compounding thick greases, paraffin wax, $(NH_4)_2SO_4$ and coke. ALDEN H. EMERY

Oil in 1930. ANON. *Mining J* (London) *Annual Rev. No.* (Jan. 24, 1931) 10 The oil industry of the U. S. S. R. during 1930. W. LEONTIEF *Ibid* 11-2.—Oil production and consumption in Russia increased at a greater rate than ever before; production increased 17.1% in 1929 and 26% in 1930. Refinery production increased 37.1%. Cracking is almost negligible. ALDEN H. EMERY

The pyrogenic decomposition of paraffin oil by different catalysts in air and hydrogen. R. ODA. *J. Soc. Chem. Ind. Japan* 34, Suppl. binding 58-62(1931).—$Fe_2O_3$, $Al_2O_3$, $Ni_2O_3$, Fe, MgO, ZnO, $SiO_2$ and fullers' earth have been tried. $SiO_2$, the best catalyst, gave 73% of cracked oil, 70% of which boiled between 35° at 760 mm. and 200° at 9 mm. The original oil b. 83–215°. V. F. HARRINGTON

Examination of paraffin products by means of the refractometer. W. J. PIOTROWSKI AND J. WINKLER. *Erdöl u. Teer* 6, 447–8, 463–5(1930); cf. *C. A.* 24, 233.—The method of Diggs and Buchler (*C. A.* 21, 816) is adapted to a rapid detn. of small percentages of oil in paraffin wax, by simplifying the isolation of the pure components. "Blue oil" (from Polish sources), mixed with amorphous $SiO_2$ (2:1), was chilled to −21°. A few drops of the pure oil were obtained by filtration through a Gooch crucible. Other samples were prepd. by dissolving paraffin products from various sources in $Et_2O$ and reppte. paraffin by addn. of EtOH (1:1). All products gave closely agreeing values for $n_{D^{20}}$ as 1.4387. It was found that oils were selectively removed from paraffin wax by fuller's earth (2:1) at 80°. A pure paraffin retained its $n_D$ value after such a treatment, various com. samples and artificial mixts. of the components gave const. values for the pure paraffin after a single filtration (1.4370). The analysis of a mixt. requires only the detn. of its $n_D$ value, if the values for the pure components have been detd. Applied to known mixts., the method was accurate within 0.2%. Holden's method gave results which were higher by 1.1–2.6%. K. H. ENGEL

The chemical aspect of drilling muds. ALEXANDER DUCKHAM. *J. Inst. Petroleum Tech.* 17, 153–82(1931).—Drilling mud is used to carry cuttings from the bit to the surface, to keep the cuttings in suspension, reducing settling when circulation ceases, to act as a lubricant for the drill pipe and between the formation and the bit, to minimize the abrasive action of sand and rock particles in the pumps, to keep gas, oil and water back in the formation, to plaster the walls of the hole and of cavities and exhausted sands, and to protect the operators against blowouts. Mud must often be "doctored" as to sp. gr., viscosity and colloidality. Sp. gr. is raised by adding barytes. Bentonite is used very generally to raise the colloidality, though no standardization has been worked out. It has been suggested that 0.02% of bentonite should be added to the mud for every 1% of settling which would otherwise occur in 24 hrs. By adding quantities of $Na_2CO_3$ of the order of 0.2%, wt. may be increased as desired without increasing the viscosity. Costs of doctoring are considered. EMMA E. CRANDAL

The reactions of olefins with sulfuric acid. W. R. ORMANDY AND E. C. CRAVEN. *J. Inst. Petroleum Tech.* 17, 185–7(1931).—A series of olefins of C content $C_6$, $C_8$, $C_{10}$ and $C_{12}$ was treated with $H_2SO_4$ of concns. from 81 to 99.5%. The olefins of higher mol. wt. resisted the action of the $H_2SO_4$ better than those of lower mol. wt., when acid of 81.0 to 92.8% concn. was used. For the acids of highest concns. this was not true. The statement of Howes and Nash, that the olefins which are stable to $KMnO_4$ are also fairly resistant to $H_2SO_4$, was not confirmed (cf. *C. A.* 24, 333, 3107). E. E. C.

Twenty-second semiannual motor gasoline survey. II. Additional data. A. J. KRAEMER AND E. C. LANE. Bur. Mines, *Rept. of Investigations* 3092, 33 pp. (1931); cf. *C. A.* 25, 806.—Results of the detn. of Cu strip corrosion, color, S content by the lamp method, Cu-dish evapn. residue, gum content (steam-oven method) and antiknock value are given. Only 1 of the 298 samples failed to pass the Cu strip test; 23.7% of the competitive-priced gasolines and 84.6% of the premium-priced motor fuels were artificially colored, for the others, color was without significance, and 85.6% of the samples had < 0.10% S (lamp method). There is no relation between doctor test and color, S or gum content. The av. octane no. of the competitive gasolines is 59 (51–68) and of premium motor fuels 74 (65–80). ALDEN H. EMERY

Gravity of natural gasoline and percent evaporated at 140° F. are related. S. S. SMITH. *Natl. Petroleum News* 23, No. 4, 31–2(1931).—From data obtained from inspection of a large no. of Mid Continent gasolines it is shown that gasolines with 70% evapd. at 140°F. have gravities of from 85 to 89 and when they are controlled to 26 lb. vapor pressure they will fall close to 70% evapd. at 140°F. and have gravities of 86 ± 2. R. W. KELLY

Gasoline dopes. H. C. DICKINSON. *Ind. Eng. Chem.* 23, 517–9(1931).—Based

has a Krämer Sarnov m p of 37°, no phenol reactions, free asphaltic acids 1.37%, lactones and anhydrides 2.20%, asphaltenes 2.11%, asphaltic resins 41.29% and oily constituents 51.25% Elementary analysis gives C 81.77, H 10.85, S 1.29, N 0.94, O 4.07 and ash 1.08% FRANK MARESH

**The Ragusa asphalt rocks.** ANDREA LA PORTA *Ind mineraria* 5, 65–77(1931).—A ton of Ragusa bituminous limestone contains 40–65 kg of org combustible matter of higher calorific value than coal At 450° it loses ⅔ of the hydrocarbons A rock with 4% asphalt yields 2.5% of mineral oil The bitumen contains 84.9% C, 11.7% H and 3.4% S The consts of the raw mineral oil are $d_{15}$ 0.960–0.965, viscosity (Engler degrees) at 20°, 20 000, at 50°, 3 500 and at 100°, 1 300 Pensky Martens flash 126°, fire point 158°, ash 0.008%, hard asphalt 1%, soft asphalt 0.15%, 32% remains unchanged by $H_2SO_4$ S 2.19% org acidity (oleic acid) 0.35%, org acidity ($SO_3$) 0.049%, no mineral acidity, no alkalinity fractions under 300° 18–22.3% Distn at Strasburg gave under 225° 1%, 225–300° 13%, 300–350° 35%, 350–380° 27% and a residue of 24% Distn in a vacuum at 50 mm., at 200–290°, gave 28% of oil with a Pensky Martens flash of 158°, viscosity (E 35°) 1.5, from 290° to 345° there was 30% of oil with a flash point of 220° viscosity (E 35°) 41.8, at a pressure of above 50–100 mm above 345° there was 9% of oil with a flash point of 98°, viscosity (E 35°) 8.4 residue 6.6% loss 2.5%, 180–310% paraffin The oil has cyclic, naphthenic and other unsatd compds, org S compds, little H, a high sp gr, very little hard asphalt and no resinifiable substances The presence of unsatd compds makes it suitable for producing lubricants Cracking yields 50% of light compds R S

**Atjeh turpentine, its present quality and properties.** IR W. SPOON *Ber. Afdeel. Handelsmuseum Ver Koloniaal Inst* No 57, 30 pp (1930).—A description of the tapping and distn app used in Sumatra and tables of the principal consts of the turpentine are given By the use of modern app an improved product is obtained, which, however, cannot as yet replace the superior product imported from the United States and France The reason for this condition is discussed in detail J C JURRIENS

**The iodine number of turpentine oils.** V KUBELKA AND S. ŽURAVLEV *Chem Listy* 25, 124–8(1931).—Using the Hanuš, Margosches and Rosenmund methods for detg the I no of a French turpentine, K finds the action proceeding in 2 phases (1) a rapid and active phase lasting 3 hrs in the M and R methods and 30 min in the H. method, (2) a slow and prolonged phase due to side reactions The wt of the sample alters the I no, it should not exceed 0.1 g The 3 methods gave the following I nos: H 190–200, M 280 and R 300 If the turpentine is pinene with 1 unsatd bond, 1 mol of pinene adds 2 equivalents of I and demands an I no in the range 185–200, this is the value given by the H method If 1 mol of pinene combines with 4 equivalents of I, the I no must be 370, this value is approached by the R. method. In the first phase of the reaction, the pinene unsatd bond combines with I, later, in the second phase, the internal chain is attacked and gives rise to free bonds which attach I The Hanuš method gives results which have a sound theoretical foundation Recommendations had been given that distn products of turpentine and pine oils could be differentiated by the I no By the H method on 0.1-g samples and with the time of reaction limited to 30 min., 15 turpentine oils of standard grades were analyzed The I nos ranged from 154 to 202 The I no cannot be used for differentiating fractions of pine oils, etc Changes in I nos of oils during 1.5 yrs were insignificant FRANK MARESH

**Petroleum.** YVES CORNIC. Fr. 696,163, May 27, 1930 Petroleum is obtained by treating $CH_4$ with nascent $CO_2$; the O of the $CO_2$ burns a part of the H of the $CH_4$ which then condenses to petroleum The $CO_2$ is obtained from carbonates dissocd.

by heat with or without the addn of substances favoring dissocn and with or without pressure

**Cracking petroleum oils.** Cornelius B Watson (to Gyro Process Co). U. S 1 797,305, March 24 Petroleum, from which free gasoline has been removed, is vaporized in a still and the vapor is conducted to a cracking app and cracked by heating; highly heated cracked vapors are passed to a sep receptacle through a closed coil within which charging stock is passed to effect vaporization of its low b p constituents, and the high b p portion of the charging stock is discharged into the receptacle in liquid form for admixt with vapors discharged from the cracking app, to lower the temp of the cracked vapors and arrest further cracking An arrangement of app is described

**Cracking hydrocarbons.** Martin B Schuster Ger 521,052, Jan 18, 1927 See Brit. 289,556 (*C A* 23, 696)

**Pressure cracking of liquid hydrocarbons.** Samuel J. M Auld and Percy H Herring (to Anglo-Persian Oil, Co, Ltd) U S. 1,798 054, March 24. The liquid is heated in a single stream to below a detd limit of the eventual temp of cracking, then passed in narrow streams at low velocity in a direct and relatively short course into a reactor, and subjected in the narrow slowly moving streams having a very low cross-sectional temp gradient to heat uniformly and gradually applied to a cracking temp without causing consummation of the cracking reaction, and the liquid is maintained in the reactor to consummate the cracking before withdrawal of the treated liquid App is described

**Cracking hydrocarbon oils.** Γ. P E. S Duplan Brit. 339,841, Jan 21, 1929 Cracking is effected by heating oils, under pressure sufficient to maintain them liquid, to a temp somewhat below 360°, while flowing through a tubular heating furnace at a speed of 6 to 72 cm. per sec for a tube of 10 mm diam, so that the oils are heated for about 1 0–1 5 min only. Various details of app are described

**Cracking oils.** Petroleum Conversion Corp Brit 340,030, Sept. 19, 1929 Oil vapors are brought into contact with a heated carrier gas supplied in stages so as to maintain a substantially const. temp level throughout the operation App and details of temps and other features of procedure are described Cf *C A*. 25, 410

**Cracking oils.** A P Sachs and E W Beardsley (to Petroleum Conversion Corp) Brit 340,021. Oct 6, 1928 In a vapor phase cracking process in which heat for the cracking is supplied by a carrier gas the oil is fractionally vaporized and the sep fractions are added in stages to the carrier gas so that the lighter fractions are subjected to a longer period of conversion An arrangement of app and various details of operation are described

**Cracking and hydrogenating oils, etc., in the interior of a compressor.** Marcus Brutzkus Ger 520,223, Feb 21, 1925 See Brit 252,787,(*C A* 21, 2556)

**Coatings for oil-cracking retorts** Albert C. Holzapfel. Ger 519,085, July 19, 1927 See Brit 291 585 (*C A* 23, 1260)

**Refining hydrocarbons in vapor phase.** Frank A Apgar (to Sinclair Refining Co) U S 1,797,255, March 24 The vapors are passed through fuller's earth or other suitable adsorptive catalyst in 2 different bodies through which the vapors are successively passed, and the sequence of passage of the vapors is periodically reversed before complete deactivation of the first body of adsorbent occurs An arrangement of app is described Cf *C A* 24, 718

**Refining hydrocarbons in vapor phase.** Eugene C Herthel (to Sinclair Refining Co) U S 1,797,262, March 24 Hydrocarbon vapors such as those from cracking processes are passed through an adsorptive catalyst such as fuller s earth and high b p polymers produced are then sepd and the vapors are subjected to fractional condensation to sep substances of higher b p than desired in the final product. Oil components are vaporized from the polymers and higher b p condensate and are condensed free from tar including the high b p polymers and this oil condensate is passed through the adsorptive catalyst with the hydrocarbon vapors to be refined during the refining operation, as a washing agent An arrangement of app is described

**Refining hydrocarbon oils.** Irving C Carpenter and Arthur R. Moorman (to Contact Filtration Co) U S 1,797,715, March 24 A body of oil such as crude petroleum is maintained at a temp above the vaporization temp of water but not substantially above the vaporization point of a desired fraction of the oil, by heating a stream of oil withdrawn from the body to such intermediate temp, sepg vapors from the heated liquid and returning a portion of the heated liquid to the body of oil to maintain a substantially const volume, with sep feeding onto the surface of the body of a stream of oil to be treated and sep removal of vapors from the body App is described Cf *C A* 24, 3638

**Refining oils.** The Sharples Specialty Co Fr. 696,461, May 9, 1930. Oil of low m. p is obtained in a continuous manner from mineral oil contg paraffin by submitting the mineral oil to a continuous vaporizing heat and obtaining from the resulting mixt of vapors and liquid by a continuous fractionated condensation with reflux, a fraction contg paraffin which ppts during a lowering of temp of this fraction in a form in which it may be removed by a continuous centrifuging process

**Hydrocarbons of low boiling point.** I. G. Farbenind A.-G Fr. 695,496, May 13, 1930 Hydrocarbons of high b p, mineral oils, distn residues, etc., are preliminarily treated in the liquid state at high temps. with H under pressure, in the presence of catalysts contg elements of group 2 to 8 The S and O compds contained in the starting materials are destroyed, to a great extent, without any appreciable amt of decompn. or hydrogenation of the hydrocarbons Afterward the purified materials freed from the catalyst, are decomposed by heat in the presence of H Cf *C A* 24, 5470; 25, 1536

**Distilling shale, coal, etc.** F Esling Brit. 339,963, Sept. 12, 1929 Bituminous shales, cannel coals, torbanites, etc, are distd in admixt with petroleum or its derivs at ordinary, reduced or slightly increased pressure, to form distillates of low S content and an un-coked pitch like residue suitable for road surfacing, roofing, etc Vegetable oils such as linseed, cottonseed, rape, olive or tung oil may be added, and the shale is preferably powdered and may be mixed with lime to assist in removal of S Steam may be injected during the distn.

**Column still suitable for use in fractionation of oil vapors, etc.** J V. Gaudet and A Abramson Brit. 339,663, Aug 8, 1929 Various structural details are described

**Oil-refining residues.** I. G. Farbenind A.-G (Richard Michel, inventor). Ger. 516,653, July 27, 1928 The ext. left by the refining of oils by liquid $SO_2$ is worked up by treating with olefins in the presence of catalyzers. Thus, such an ext of viscosity 1.4°E. at 20° is treated with $C_2H_4$ at 20 atm. at 140° in the presence of $AlCl_3$ until no further $C_2H_4$ is absorbed The product is washed with water and distd., giving a yellow oil of viscosity 4°E at 20°, and a resinous residue A further example is given

**Refining paraffin.** A. Riebeck'sche Montanwerke A.-G Ger. 517,744, April 5, 1928 Paraffin is deprived of smelling and tasting impurities by treating it with alkali in solid form or in concd aq soln or suspension The paraffin is then sepd. without distn. Adsorbants may also be added The process may take place under pressure and is particularly suitable for lignite tar paraffin

**Filter for gasoline, etc.** Antonin Boulade (to Soc. du carburateur Zenith). U. S 1,797,399, March 24 Structural features.

**Apparatus for refining "cracked gasoline" by use of fuller's earth, etc.** Rudolph C. Osterstrom and Robert T Tucker (to Pure Oil Co) U S 1,797,513, March 24 Structural features

**Liquid fuels.** General Technical Co., Ltd. Fr. 696,822, Sept. 21, 1929 Heavy residues from the distn. of petroleums above 350° or from the thermal dissocn of hydrocarbons, asphaltic compds., bitumens, tars, tar residues, natural waxes, etc., are converted into a mixt of gasoline, kerosene and gas oil distg below 350°. The products to be treated are submitted, under atm pressure, to the action of an alk. earth base between 350° and 400° so that the gas oil and kerosene products are formed at a temp below the critical temp of dissocn The process may advantageously be combined with a cracking under pressure. The residual oil is transformed either directly or indirectly into gasoline, gas oil and kerosene and the latter 2 are sent either directly or indirectly into the cracking circuit under pressures to be transformed into gasoline and residual oil which is treated again

**Non-detonating motor fuels.** Arthur B. Brown and Frederick W. Sullivan, Jr (to Standard Oil Co of Ind) U S 1,797,819, March 24 A high b. p. hydrocarbon oil such as gas oil is subjected to conversion temps under pressure in the presence of $NH_3$ or a nitrogenous org compd of the substituted-$NH_3$ type such as urea, $(NH_4)_2CO_3$, guanidine or dicyanodiamide to produce cyclic N compds in the oil, and a fuel of the gasoline b p range is distd.

**"Antiknocking" motor fuels.** I. G. Farbenind. A.-G Brit. 339,637, July 10, 1929 Antiknocking agents for addn to motor fuels comprise an amine which is alkylated or arylated on its N atom, and at least 5% of Fe carbonyl Examples are given of the use of dimethylaniline, monoethylaniline and diethylaniline and the use of other amino derivs and various diluents, etc., is also mentioned

**Motor fuels and lubricants.** Albert J. Ducamp. Ger. 520,010, Mar. 26, 1929. $Hg(CN)_2$ is added to motor fuels or lubricants, to prevent premature combustion and knocking The $Hg(CN)_2$ may be dissolved in glycerol and the soln dispersed in a hy-

drocarbon fuel with the aid of an oil and alkali, or the salt may be dissolved in EtOH and $Et_2O$ and the soln added to a hydrocarbon fuel, or the salt may be dissolved in an ester, *e. g.*, AcOEt, and the soln added to an alc fuel. An addn of 0.1–1 g. of $Hg(CN)_2$ to 10 l. of fuel is suitable. Alternatively, the salt may be dissolved in glycerol, with addn of PhOH if desired, and the soln dispersed in the lubricating oil for the motor.

**Lubricants.** Lubricating Products S. A. and J. Woudhuysen. Belg. 372,620, Sept. 30, 1930. Lubricants consist of an emulsion of fatty acid, glycerol, NaOH, $Na_2CO_3$, AcOH, $K_2Cr_2O_7$, talc, graphite, mineral oil, vegetable or animal oil and water.

**Cooling system for lubricating oil such as that of internal-combustion engines.** T. R. Cave Brown Cave. Brit. 339,650, Sept. 10, 1929. A cooling coil mounted in an oil tank contains a liquid of lower b. p. than that of the oil, such as $CCl_4$ or EtBr, and this coil is connected to a condenser. Various structural details and modifications are described.

**Regenerating lubricants such as those from marine or internal-combustion engines.** Swan Hunter & Wigham Richardson, Ltd., and Horace J. Young. Ger. 517,848, Mar. 25, 1928. See Brit. 292,300 (*C. A.* **23**, 1502).

**Filter for waste lubricating oils, etc.** Stanley Pipkin (49% to James Higgins). U. S. 1,798,031, March 24. Structural features.

**Transformer and switch oils.** I. G. Farbenind. A.-G. (Richard Michel, inventor). Ger. 519,069, July 17, 1927. Liquid polyalkylnaphthalenes b. p. above 160° are used. The oils may be prepd. by condensing $C_{10}H_8$ or its non-oxygenated derivs. with olefins at raised temp. and pressure in the presence of $AlCl_3$, and fractionally distg. the products.

**Asphaltic compositions.** Hermann H. Schröder. Ger. 519,031, Oct. 29, 1926. See Brit. 260,621 (*C. A.* **21**, 3443).

**Bituminous emulsions.** Jonathan Parker. Fr. 696,277, May 28, 1930. See Brit. 333,303 (*C. A.* **25**, 589).

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**An explanation of the swelling effect of thiocyanates on cellulose; compounds of cellulose with neutral salts.** J. R. Katz and J. C. Derksen. *Rec. trav. chim.* **50**, 149–52(1931).—The swelling of stretched ramie fibers by concd. LiSCN solns. has been investigated by the x ray method. When solns. more concd. than $3LiSCN\,1H_2O$ are used the fibers show an altogether new Röntgen spectrum for cellulose. With solns. of lower concns., the salt appears to be adsorbed on the surface of the micelle, without any change in the structure of the latter. With higher concns., presumably addn. products are formed on the O atoms of the cellulose, and these compds. are responsible for the new x ray patterns. Cellulose can be mercerized by solns. of salts of high soly., the degree of mercerization increasing with the salt concn. and the length of heating. J. H. Reedy

**Cellulose acetate—its production and uses.** Herbert Levinstein. *The Times Trade and Eng. Suppl.* **28**, No. 664, 8–9(1931).—A review. E. M. Symmes

**Nitrocellulose—a basis for plastics.** F. Sproxton. *The Times Trade and Eng. Suppl.* **28**, No. 664, 10(1931).—A review. E. M. Symmes

**$p_H$ control in rayon manufacture.** Chas. E. Mullin. *Rayon* **10**, No. 12, 8, 16, 38–9, 44(1930).—The probable advantages of $p_H$ control in the processes of rayon manuf. are discussed and the glass-cell electrode is suggested for certain detns. C. E. M.

**Paper coloring on the calender and in the size tub.** P. W. Carr. *Dyestuffs* **31**, 38–41(1930). Chas. E. Mullin

**Making beater-dyed paper fast to light.** Ivar Ekholm. *Dyestuffs* **32**, 10–5(1931).—Suitable dyestuffs are suggested. Chas. E. Mullin

**Electrical materials commonly used—paper.** Wm. C. Hirsch. *Elec. Mfg.* **7**, No. 4, 55–7(1931).—A brief general outline of paper manuf. is given, attention being specially drawn to the prepn. and properties of papers particularly useful to the elec. industry. The numerous applications of paper in the manuf. of motors, condensors, transformers, etc., and as insulation material, as well as for decorative effects, are reviewed. Edward B. Sanigar

AcOH and cellulose acetate in the United States (Partridge) **10**. Thermoelastic effect in cellulose ester films (McNally, Sheppard) **2**. Structure of celluloid and nitrocellulose and the gelatinizing medium of nitrocellulose as a swelling medium (Katz, *et al.*)

2. The importance of the isoelectric point in the manufacture of casein for paper coating (Bell) 18. Automatically controlling density [of wood pulp aqueous mixtures] (U. S. reissue 18,005) 13. Roller apparatus for applying liquid to paper on one side (Ger. pat. 519,404) 1. Rubber latex [in impregnation of paper] (Ger. pat. 519,483) 30. Preserving [paper] (Ger. pat. 514,981) 20. Synthetic rubber [products for manufacture of coatings, films, artificial silk, etc.] (Brit. pat. 340,008) 30.

---

Faust, O. Kunstseide. 4th and 5th ed., revised and enlarged. Dresden: T. Steinkopff. 289 pp. About M 13.50, bound, about M 15.

Stark, Curt. Die Kollodiumwolle. Ihre Herstellung und Verwendung für Zelluloid, Kunstleder, Nitroseide, Nitrolacke, Filme und plastische Massen. Anhang: Andere Zellulosen. Berlin: M. Krayn.

---

**Cellulose.** Bernardino Oglietti. Fr. 697,228, June 11, 1930. Cellulose is extd. from vegetable materials, particularly waste wood, by submitting the material to a treatment with aq. NaOH or KOH of 3–10% concn. and in amt. of 3–6 parts by wt. to 1 part of material for 5–12 hrs. at 100–160°. The material is afterward treated with strong mineral acids or by the wash waters from a previous chlorination and then chlorinated with Cl gas.

**Digester for cellulose manufacture.** Einar Morterud. Ger. 519,110, Mar. 5, 1930.

**Regenerated cellulose films.** Ernest Muller. Ger. 520,105, June 4, 1926. The films are given a final wash, dried to remove about 80% of their water content and then treated with a softening agent, *e. g.*, glycerol, glucose or maltose. They are then dried completely. The softening agent may be applied in concd. form to one or both sides of the films, or the films may be passed through an aq. soln. of the softening agent.

**Press for alkali cellulose.** Maschinenfabrik M. Hausser. Ger. 521,362, Nov. 5, 1929.

**Cellulose derivatives.** Léon Lilienfeld. Ger. 519,138, May 30, 1926. See Brit. 252,654 (*C. A.* 21, 2384).

**Cellulose derivatives.** Léon Lilienfeld. Ger. 521,452, Mar. 28, 1922. Alkali-sol. alkyl derivs. of cellulose are prepd. by treating alkali sol. conversion products or derivs. of cellulose with an alkylating agent in such an amt. that not more than 1 mol. of alkylating agent, preferably 0.33–0.66 mol., is present for each mol. of $C_6H_{10}O_5$. Suitable cellulosic initial materials are crude or purified viscose and cellulose hydrates. The reaction may be effected in aq. alk. soln. Examples are given. Cf. *C. A.* 24, 3646.

**Cellulose derivatives.** U. S. Industrial Alcohol Co. Fr. 695,401, May 10, 1930. In the manuf. of org. derivs. of cellulose such as the acetate, propionate, benzoate or ethers, a volatile liquid is used as a constituent of the reaction mass and this liquid, by the latent heat of evapn., is used to control the temp. of the reaction. A suitable app. is described.

**Moldable masses from solutions of cellulose derivatives.** I. G. Farbenind. A.-G. (Erich Richter, inventor). Ger. 514,640, July 8, 1925. The cellulose is partly pptd. from the soln. by precipitants which evap. more quickly than the solvent. Thus, a soln. of nitrocellulose and tricresyl phosphate in AcOBu, AcOEt, toluene and benzene is pptd. in a gelatin network by addn. of a soln. of ester gum in AcOBu and alc. The whole is then kneaded to desired shape. Other examples are given.

**Cellulose ethers.** Imperial Chemical Industries, Ltd. Fr. 696,158, May 27, 1930. Cellulose is mercerized in 18–20% NaOH soln., pressed and ripened by storing at about 20–30° and for 12–90 hrs. according to the temp. used and the product desired. The product is treated with at least 50 parts of NaOH for 100 parts of cellulose and then by an alkyl chloride such as EtCl or MeCl. The ethers are sol. in ethylene chlorohydrin, or a mixt. of alc. and $C_6H_6$ or both.

**Cellulose ethers.** Alexander Wacker Ges. für elektrochem. Ind. G. m. b. H. (Alfons Ascherl and Wolfgang Gruber, inventors). Ger. 520,384, Feb. 16, 1930. About 1% of a carbonate, calcd. on the alkali cellulose, is included in the reaction mixt., and the reaction is interrupted as soon as $CO_2$ is evolved. This method of detg. the end point of the reaction is particularly useful in the reaction of alkali cellulose with alkyl halides under pressure. An example is given.

**Cellulose esters.** I. G. Farbenind. A.-G. Fr. 695,283, May 7, 1930. Esters of cellulose or other carbohydrates are prepd. by first partially substituting by an alkoxy group the OH group of the carbohydrate and afterward esterifying the alkoxy compd. obtained. Thus, cellulose is treated with ethylene oxide and afterward esterified to

give a mixed acetic-butyric ester of a partially hydroxyethylated cellulose which is directly sol. in acetone. Other examples are given.

**Cellulose esters.** I. G. Farbenind. A.-G. Fr. 697,156, June 7, 1930. Esterification of esters is carried out in the absence of free fatty acid and in the presence of liquid chlorinated hydrocarbons not miscible with water and b. below 100° such as $CH_2Cl_2$, $C_2H_4Cl_2$ or $CHCl_3$, acting as solvents. The reaction is carried out at normal temp. and with less catalyst than usual. In a variation of the process the esterification is effected with the anhydride of one acid in the presence of the chlorinated hydrocarbon and another fatty acid.

**Concentrated colloidal dispersions of cellulose esters.** Hugh M. Spencer. U. S. 1,797,843, March 24. A cellulose ester such as a cellulose nitrate is incorporated with a substantially anhyd. alkali in soln. such as $NH_3$ in EtOAc.

**Cellulose acetate.** Kurt Brating and Albert Giesmanns. Ger. 519,137, Feb. 19, 1929. The manuf. of cellulose acetate is effected more rapidly and uniformly by transferring the reaction mixt. from a container under pressure to an evacuated container through a narrow orifice. The mixt. may be repeatedly transferred.

**Precipitating cellulose acetate.** Verein für chem. Ind. A.-G. Ger. 521,125, Aug. 12, 1928. Cellulose acetate soln. and a precipitant are drawn through sep. conduits by a centrifugal pump, which mixes the soln. and the precipitant and feeds the mixt. to a collecting vessel.

**Films of cellulose acetate.** Spicers, Ltd. Fr. 696,603, June 3, 1930. A plasticizer for use in the manuf. of plastic materials having a basis of a cellulose ester is composed of an org. deriv. of phosphoric acid contg. a naphthyl group, *e. g.*, β-naphthyldiphenyl (or dicresyl) phosphate.

**Disintegrating vegetable fibers.** Firma Otto C. Strecker. Fr. 697,030, May 30, 1930. In the disintegration of vegetable fibers and transformation of phenols by the method of phenolates to obtain cellulose, the aerobic enzymes and like organisms of the vegetable fiber used are rendered inactive by heat. The lye contains with the phenolate, free phenol and free phenolic compds. During the cooking the greater content of phenolate is reached before the highest temp. is reached. The gases and hydrocarbons liberated during the cooking are eliminated by distn. from the lye.

**Carbohydrate xanthates.** Wm. Harrison. Ger. 519,050, Oct. 5, 1926. See Brit. 264,261 (*C. A.* 22, 164).

**Sodium hydroxide solutions for viscose manufacture.** Hoesch & Co. Fr. 696,153, May 27, 1930. Solns. of NaOH produced by electrolysis with a Hg cathode for the manuf. of viscose are improved by adding to these solns. a small quantity of compds. of Na, K, Fe or Mn, *e. g.*, NaCl, KCl, KOH, complex compds. of K, ferrites, ferrates and their complex compds.

**Viscose.** Friedrich G. C. Klein. Fr. 696,411, Feb. 14, 1930. Viscose is made by passing cellulose or transformation products of cellulose in a const. uninterrupted course, avoiding all treatment in charges, through app. in which the material is simultaneously treated (*e. g.*, impregnated, disintegrated, ripened, pressed, sulfured, dissolved, filtered, ripened again, deaerated, etc.) and transported. A suitable app. is described.

**Hollow fibers of viscose, etc.** Courtaulds, Ltd. Ger. 516,572, April 26, 1927. See Brit. 273,506 (*C. A.* 22, 2056).

**Mat fibers, etc., from viscose.** Steckborn Kunstseide, A.-G. Ger. 516,573, Nov. 27, 1928. An emulsion of org. material sol. in viscose, etc., is added to the viscose, etc., so that the O or other chemicals in the viscose, etc., ultimately cause pptn. of the material to give the mat finish. Anthrahydroquinone and the phthalic acid ester of isoamyl alc. are mentioned in examples as the org. material added.

**Filaments, films, etc., from viscose.** I. G. Farbenind. A.-G. (Adolf Kämpf, inventor). Ger. 519,349, Jan. 6, 1928. The pptg. bath contains up to 42% of a mineral acid, calcd. as $H_2SO_4$, and is substantially satd. with an org. substance of high mol. wt. capable of pptg. gelatin, *e. g.*, Na carbazolesulfonate or a condensation product from $CH_2O$ and naphthalenesulfonic acid. The baths are intended particularly for unripened viscose.

**Artificial silk from viscose.** Vereinigte Glanzstoff-Fabriken A.-G. Ger. 519,233, Jan. 13, 1929. Filaments of less than 6 deniers are prepd. by spinning crude viscose through orifices of the normal size into pptg. baths contg. higher concns. of acid than is normal. Higher concns. of acid are used for finer filaments, and the min. concn. of acid is greater or less according to whether the diameter of orifices is greater or less than 0.1 mm.

**Artificial silk, etc., from viscose.** I. G. Farbenind. A.-G. Brit. 339,740, Nov. 2, 1928. The process described in Brit. 307,829 (*C. A.* 24, 240) is modified by the use of an

unripened viscose prepd from a ripened alkali cellulose The viscose may contain 10% or more of cellulose and the use of high-cellulose viscoses reduces the dilu of the spinning bath Filaments of 1 denier may be made by this process, having a dry strength of 3 g or more per denier and a wet strength of 2 g or more

**Artificial silk.** J. A SINGMASTER Brit 339,603, May 8, 1929. For modifying the luster and covering power of artificial silk (such as that made from nitrocellulose or cellulose acetate) by incorporating in the filaments finely divided inert white pigments, the pigments are first distributed in the solvent used for the soln of the material and after the addn of the dispersed pigment the resulting soln is subjected to filtration, which removes the larger particles and renders the material more homogeneous Various examples of pigments used, etc., are given Cf *C A* 24, 3902

**Artificial silk, etc.** I. G FARBENIND A.-G Brit. 340,138, Dec. 20, 1928. Artificial silk, artificial horse hair or ribbons are made by pptn of cellulose hydrate by a wet-spinning process, and the freshly pptd. material is stretched by passing it over one or more rubbing surfaces which are heated, so that damage to the material is minimized For this purpose there may be used glass tubes or rollers which are internally heated by electricity, gas, steam or liquid, and if desired the surface of the stretching device may be irrigated with water or other suitable liquid at about the same temp in order to prevent accumulation of crystn products, etc., on the heated surface The strength of viscose silk is thus improved Some details of app are described

**Artificial silk.** MARTIN HÖLKEN Ger 517,747, Oct. 11, 1928 In degasifying cuprammonium silk spinning soln by reducing the pressure, the gases are passed over solid superphosphate, etc., so that the $NH_3$ present is absorbed, forming a powerful *fertilizer*

**Artificial silk.** EUGEN MOSSGRABER. Ger 517,932, Dec. 14, 1929 A device is described for supplying the viscose, acetylcellulose, etc., to the spinning heads for making artificial silk

**Artificial silk.** CHATILLON (SOCIETÀ ANONIMA ITALIANA PER LA SETA ARTIFICIALE). It 307,261, June 12, 1930 The brilliancy of artificial silk is diminished by producing a current of air or gas perpendicular or oblique to the threads leaving the nozzle by means of a small propeller blade inside the spinning vessel and in the neighborhood of the nozzle

**Artificial silk.** HANS SUTER. Fr. 696,306, May 30, 1930. Filaments obtained by dry- or wet-spinning cellulose derivs., particularly cellulose acetate, are drawn under adequate tension in the presence of swelling agents and org substances which have the power of diminishing the solvent action of the agents. As swelling agents, $CH_2Cl_2$, $CHCl_3$ and $C_2H_4Cl_4$ may be used, and as substances to reduce the solvent action, $CCl_4$, $C_2H_4Cl_2$, $C_6H_6$, PhMe, xylene and their homologs may be used

**Artificial silk.** SOC. POUR LA FABRICATION DE LA SOIE "RHODIASETA" Fr. 695,490, May 13, 1930. Mat effects are obtained on cellulose acetate silk by dissolving in the spinning soln a small quantity of a sol acid such as stearic acid or a sol anhydride, dry-spinning the solns obtained and treating the filaments obtained with aq solns. of salts or bases which form insol or difficultly sol compds with the acid used Fr. 695,491 describes the production of mat effects on cellulose acetate threads by dissolving in the spinning soln non-volatile or high-boiling substances, dry-spinning the solns obtained and removing the added substances from the finished thread by a washing operation Salts of alk. earth metals and org substances such as glycerol or stearic acid may be used

**Artificial silk, etc.** HENRY DREYFUS. Fr. 696,219, May 28, 1930 In the manuf. of artificial filaments the spinning soln in its passage to the extruding nozzles is passed through one or more parts in metal or other impermeable substance pierced by a series of small holes which are not sensibly greater, preferably much smaller, than the extruding orifices Details of construction are given

**Artificial silk.** HENRY DREYFUS. Fr. 697,216, June 11, 1930. Filaments or threads are made by extruding a spinning soln of a cellulose deriv. through a nozzle and receiving the filaments in an evaporative medium in which an exterior skin like layer is formed, and afterward passing them into a solvent vapor to soften the layer and drawing the filaments thus softened. The filaments are then passed through a second evaporative medium An app is described

**Artificial fibers.** JOHN BILLWILLER and JOHANN BILLWILLER. Ger. 517,933, Sept. 3, 1922 Carbohydrates contg little or no fibrous material are worked up by treatment with disintegrating liquids such as solns of $NH_4OH$, NaOH, alkali carbonates, hydrosulfides, $H_2SO_4$, $H_2S$, etc., at temps. above 175° and under pressure, with strong and continuous rotary washing. The product is then spun in the manner of artificial silk. In the example bran is treated with $NH_4OH$ at 280°.

**Artificial fibers.** Alsa Soc. anon Ger 521,055, Oct. 30, 1927. The gas content of hollow artificial fibers is raised by soaking the fibers in a liquid in which gas is then evolved by phys. or chem means Thus the fibers may be (*1*) immersed in cold water satd with gas, and the water then warmed or (*2*) immersed successively in liquids which react to form a gas or (*3*) immersed in a soln of an unstable compd that yields a gas on decompn *e g*, a diazo compd The method may be used to distend collapsed hollow fibers Examples are given

**Making films, fibers, etc., from cellulose esters and ethers.** I G Farbenind A G (Adolf Kämpf, inventor) Ger 520,411, Aug 20 1927 The solvent for the ester or ether contains a substantial proportion of $CS_2$ Examples are given

**Artificial threads, films, etc.** Otto Sindl. Fr 697,272, June 12, 1930 Solns. of cellulose esters are submitted to the action of a coned mineral acid Thus cellulose acetate in an org solvent is spun and coagulated in $H_2SO_4$ contg more than 30 and less than 80% monohydrate The $H_2SO_4$ contains at least 0.01% $CH_2O$

**Ribbons from cellulose esters or ethers.** Henry Dreyfus Fr. 695,843, May 19 1930 Solns. of cellulose esters or ethers, such as cellulose acetate in org solvents miscible with water, are passed through narrow and relatively long extruding orifices and the ribbons received in coagulating baths composed of water, aq solns. of salts or aq solns of mineral acids

**Artificial silk filaments.** I G Farbenind A-G (Otto Faust, inventor) Ger 517,771 Mar 5, 1927 Filaments which will dye uniformly are spun by passing the filaments from the nozzle over a spring abutment and winding them on a roller, the tension of the spring ensuring a uniform filament

**Spinning nozzle for artificial silk.** Henri Colomb Ger 519,348, Nov 17, 1928

**Spinning nozzle and holder for artificial silk.** Oscar Konorn & Co and Alfred Lehner Ger 516,571, Jan 24, 1930

**Spinning nozzle with means for uniform aeration of the threads leaving the nozzle.** I G Farbenind A-G Fr 697,260, June 12, 1930

**Spinning pot for artificial fibers.** Siemens-Schuckertwerke A-G (Hans Dietzius, inventor) Ger 520,172, Jan. 28, 1930.

**A spinning pot for artificial silk.** Eduard Svatek. Fr. 695,840, May 19, 1930 Use is made of artificial resin mixed with detached particles of fibrous material and strengthened with layers of fiber soaked in artificial resin

**Continuous filtration apparatus for solutions for spinning artificial fibers.** I G Farbenind A G (Adolf Kampf, inventor) Ger 520,296 Mar 21, 1928

**Apparatus for making artificial silk by dry-spinning.** Adolf Ewald Gull. Ger 520,479, Oct 5, 1928 See Brit. 303,778 (*C A* 23, 4573)

**Apparatus for making artificial silk from cuprammonium cellulose solutions by stretch-spinning.** Grunert & Giannettl. Ger 520,063, Oct 9, 1925. Brit. 263,462 (*C. A.* 22, 165)

**Apparatus for stretch-spinning of artificial threads.** Courtaulds, Ltd, W. H Glover and G D Bond Brit. 339,745, Nov 4, 1929 Structural features.

**Apparatus for making artificial silk filaments, ribbons or straw, etc., by the dry or evaporative process.** British Celanese, Ltd, A H Tidmus, F. A. Reeson and R. H J Riley Brit. 339,670, Sept 5, 1929 Two spinning jets are arranged in series and in proximity to each other on a single supply pipe so that the second jet may be removed or replaced without interfering with the first jet Various structural details are described

**Apparatus for washing and after-treating artificial fibers in spinning pots.** I G Farbenind A-G (Richard Hofstadt and Wilhelm Eller, inventors) Ger 521,010, Sept 16, 1927

**Thread guide for artificial silk.** Comptoir des textiles artificiels (Soc. anon) Fr 696,211, May 28, 1930 Construction is described of a slightly conical thread guide and drawer mounted in a box where the drops of coagulating liquid are collected and returned to the bath

**Apparatus for treating cakes of viscose silk with liquids.** Acme Rayon Corp Fr 696,965, May 14, 1930.

**Washing apparatus for yarn spools.** Harzer Achsenwerke G m b H Ger 517,733, April 17, 1927.

**Grinding mill for wood pulp, cellulose, etc.** Max Tamaschke Ger 520,423, Nov 18, 1927.

**Fibrous pulp from wood and other materials.** O. A Müller. Brit. 340,164, Feb 9, 1929 Easily bleached cellulose is made from wood or the like contg cellulose

and lignin by treating the material, after chlorination while moist, with a mixt of a water-sol org solvent such as alc and an inorg acid such as HCl, by using boiling alc. on the countercurrent principle the chlorolignin is extd and the cellulose can be purified by further treatment with fresh alc MeOH, acetone, glacial HOAc, PrOH, phenol, etc., also may be used, and various details of procedure are described.

*Treating waste liquor from chemical wood-pulp manufacture.* LINN BRADLEY and EDWARD P MCKEEFE (to Bradley McKeefe Corp) U S 1,797,678, March 24 The inorg content with admixed org matter of a coned mixt of the waste residual liquor resulting from the digestion of cellulosic material such as wood chips in a soln of Na-S salts (contg most of the Na in the form of a sulfite of Na) and the residual liquor resulting from the digestion of cellulosic material in an alk soln contg Na compds (the major portion of which are S-free Na compds such as NaOH) is subjected to furnacing under reducing conditions to produce a furnace product contg the Na compds mainly as $Na_2CO_3$ and Na sulfide, and the resulting Na compds are treated to produce an alk cooking liquor for further use as a digesting agent for cellulosic material Cf *C A* 24, 4158

**Treating waste liquors such as those of soda and sulfate pulp manufacture.** DAVID D PEEBLES (to Peebles Processes, Inc) U S 1,797,585, March 24 The liquor is dehydrated to a high concn by continuously circulating the heated liquor through a closed expansion chamber while simultaneously continuously removing evolved vapors from the chamber, and the coned waste liquor is burned in a furnace with gases evolved from the chamber

*Rotating autoclave for the extraction of glucose from wood pulp.* SILLER & RODENKIRCHEN G M B H Ger 517,890, June 14, 1928 Structural details.

Paper pulp. MEAD PULP & PAPER CO Brit. 339,599, Aug 28, 1929 Material such as wood, straw, fibrous grasses and the like is used for the prepn of a free pulp of high strength, good color and clay carrying properties, by first subjecting the material to an incomplete chem digestion (suitably for 1–2 hrs at 125° and then at 160–180° for 1–4 hrs with addn of $CO_2$ in a soln of alkali metal sulfite and $NaHCO_3$ or a tartrate, citrate, borate or oxalate) while maintaining substantial neutrality of the cooking liquor, and then subjecting the material to a limited chlorination treatment while dild and subsequently to a stronger chlorination while thickened The process is especially suitable for treating waste wood from furniture factories App and various details of procedure are described Cf *C A* 24, 4392, 25, 2503

Paper. DONALD K. PATTILLO (to Mathieson Alkali Works). U. S 1,797,789, March 24 Cl is added to the stock in the beater near the beginning of the beating operation to sterilize the stock, which is then subjected to beating and made into paper. *Cf. C A.* 24, 4932

Paper-making apparatus. HERMAN L KUTTER (to Black-Clawson Co). U. S 1,797,290-1, March 24 Various details of doctor construction, etc., are described.

Paper-making apparatus. T D. NUTTALL and BENTLEY & JACKSON, LTD Brit. 340,087, Nov 6, 1929 Structural features

Paper-making apparatus. C G HAUBOLD A.-G. Ger. 520,122, Sept. 6, 1927. Means is described for controlling the run of the wire cloth and the felt.

Dewatering machine for paper manufacture. EISENGIESSEREI, MASCHINEN- UND PAPPENFABRIK F A MÜNZNER G M B H Ger 521,172, Feb 15, 1929

Couch press for paper manufacture. JOHANNES RAITH. Ger 519,111, Jan 20, 1928

Suction rollers for dehydrating paper, cellulose, wood pulp, etc. JULIUS STEPHANSEN Ger 517,661, April 27, 1926

Machine for disintegrating paper, cardboard, etc. LEOPOLD SCHUMANN Ger. 516,505, Mar. 19, 1929

Sizing papers and cloth. JULIUS GLATZ Fr 695,626, May 15, 1930 Paper and cloth are sized by adding, during or after their manuf., the $NH_4$, Na or other salt of the glycolic acid of cellulose sol in water, or homologous compds, or a substance such as starch having an affinity for cellulose

Water-fast colored paper. SOC ANON POUR L'IND CHIM À BÂLE. Swiss 143,416, April 4, 1929 The paper is immersed in a dye bath which contains also a salt of oleyldiethylethylenediamine and then is dried

Corrugated cardboard. THE WESTON PAPER AND MANUFACTURING CO. Ger 519,209, Jan 12, 1930 The cardboard is prepd from a mixt of straw cellulose that has been boiled with $Ca(OH)_2$ soln and straw cellulose that has been boiled with NaOH soln

# 94—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Consumption of explosives in February, 1931. W. W. Adams and L. S. Gerry. Bur. Mines, *Repts. of Investigations* 3103, 15 pp. (1931). Alden H. Emery

The velocity of the phenomena involved in the detonation of solid explosives. P. Lafitte and M. Patry. *Compt. rend.* 192, 744–6 (1931).—An optical method (*C. A.* 25, 1383) was used for measuring the velocities of the shock wave and of the luminous gases from the detonation of 10-cm. columns of dynamite No. 1 and ammonal, 13 mm. in diam., loaded in tubes at different densities (Δ). The 2 velocities are identical in the vicinity of the charge and are greater than the velocity of detonation in the column of explosive itself. The velocity of the gas then diminishes more rapidly than that of the shock wave, the sepn. of the 2 waves occurring at the following distances from the charge for tetryl, with Δ = 0.55, 35 cm., Δ = 0.65, 45 cm., Δ = 0.90, 55 cm., for dynamite, with Δ = 0.90, 35 cm., Δ = 1.25, 50 cm., Δ = 1.65, 58 cm. These distances are independent of the length of the column of explosive, but increase as the diam. of the column increases. C. G. Storm

The propulsive strength and rate of pressure development of the Cardox blasting device. N. A. Tolch and G. St. J. Perrott. Bur. Mines, *Repts. of Investigations* 3084, 7 pp. (1931).—The propulsive strength of the Cardox blasting device Model G does not increase directly with the $CO_2$ charge, but depends on the heater and disk used. In general, the propulsive strength increases with the wt. of the heater and always with the thickness of the disk. The smaller grain sizes of $NaClO_3$ as used in the heater element gave greater propulsive strength than the larger sizes. An increase in the charge of $CO_2$ lengthened the duration of the pressure period. The shearing of the disk took place before the pressure was completely developed. With 104-g. heaters and a non-shearable disk, the av. max. pressures developed for 570-, 680- and 1135-g. charges of $CO_2$ were 810, 1380 and 2850 kg./sq. cm., resp.; with 140-g. heaters, 340- and 680-g. charges of $CO_2$ gave av. max. pressures of 940 and 2110 kg./sq. cm. Alden H. Emery

Ignition, combustion and explosion. N. Athanasesk. *Chem. Rundschau Mitteleuropa u. Balkan* 7 (15), 57–8 (1930).—An address. S. S. de Findly

Instability of colloidal powders. Henri Muraour. *Bull. soc. chim.* 49, 275–9 (1931); cf. *C. A.* 25, 817.—A further discussion relative to the effect of water and acid produced by the hydrolyses of nitrocellulose on thermolysis is occasioned by comments of de Brun, which are quoted. At temps. of 15–20°, water exerts no action on nitrocellulose, even during periods of 20–30 yrs.; at 50–75°, however, hydrolysis proceeds rapidly in the presence of moisture. Nitrocellulose (13.24% N) kept in 20% $HNO_3$ for 8 months was reduced to 12.91% N. Thirty % $HNO_3$ caused the same effect in 3.5 months. As a result of the greater effect of acid of increased concn., a decrease in the moisture content of a powder contg. even a trace of free acid may cause an increase in the rate of decompn. C. G. Storm

Influence of moisture on the speed of combustion of colloidal powders. Henri Muraour. *Bull. soc. chim.* 49, 278–74 (1931).—The influence of moisture in smokeless powder was calcd. from the ignition temp. (approx. 200°) and the sp. heat of the powder (0.27 for poudre B, and 0.337 for the non solvent type of powder). The addn. of 1% moisture caused an increase of 13.3 and 10.7%, resp., in the energy required for combustion of the two types. $\int pdt$, or the total area of the time-pressure curve, is a measure of the total energy required for decompn. of the powder. $\int pdt$ was therefore detd. in the Vieille bomb on powder samples with different moisture contents, and the effect of 1% moisture was noted. These expts. showed an increase in $\int pdt$ for 1% moisture equal to 12.9% for poudre B, and 10.8% for the non-solvent type of powder. The sample of the latter type contained nitrocellulose (11.7% N), nitroglycerin (approx. 25%) and diethyldiphenylurea, with or without Et phthalate. C. G. Storm

Burning characteristics of smokeless powder. I. Burning temperature. A. M. Ball. *Ind. Eng. Chem.* 23, 498–501 (1931).—The method of calcn. of burning temp. from the heat of combustion of the powder and sp. heats of the gases is discussed in detail. Heats of combustion of the various constituents of smokeless powders are listed, and a tabulation given showing for 16 different powder compns. their heat of combustion, burning temp., gas vol. and compn. of gases, illustrating the effects of increase in content of nitroglycerin and of addns. of deterrent materials. C. G. S.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**The numerical solubility of dyes.** W. C. DURFEE *Proc. Am Assoc. Textile Chem. Colorists* 1931, 103–4; *Am Dyestuff Reptr.* 20, 185–6(1931). R. H.

**The dyestuffs act in Britain.** E. F. ARMSTRONG *Ind. Eng. Chem.* 23, 575–80 (1931). G. G.

**Fast-to-light substantive dyes.** T. F. MURPHY *Dyestuffs* 31, 97–9(1930).—The light-fastness properties of the Solantine dyes are discussed. CHAS. E. MULLIN

**Azo-chromophore. III.** J. S. P. BLUMBERGER. *Chem. Weekblad* 28, 190–8 (1931); *cf. C. A.* 22, 3824.—*Absorption spectra of about 20 dyes of the o- and p-amino- and -hydroxy-azobenzene types were detd. and compared* The effect of the auxochrome is influenced by the polar character of the substituents, through an inductive action over atoms of alternating functions. In the abnormally behaved *o*-hydroxyazo dyes the effect on the chromophore is heightened by a coördinate bond between the OH and N N groups In a series of related, isomeric dyes, the electrostatically most unsym mol has the deepest color The influence of the substituents, whether $NH_2$, OH, $NO_2$ or $CH_3$, depends on their position A *p*-$NO_2$ is strongly bathochrome, a *m*-$NO_2$ feebly so in aminoazobenzenes, and hypsochrome in hydroxyazobenzenes. *A second auxochrome in the primary dye component has a negligible effect; p,p'-*diaminoazobenzene and *p*-hydroxy-*p'*-aminoazobenzene absorb very much the same as aminoazobenzene, the stronger auxochrome, in the second case, detg. the character of the dye. K. H. ENGEL

**Azo dyestuffs derived from arsanilic acids.** VENANCIO DEULOFEU AND EUGENICO MARÍN. *Anales soc. espaü. fis quím* 29, 65–73(1931).—By diazotizing the acids and coupling with the phenols in alk. soln the following compds. were prepd: From *p*-arsanilic acid and resorcinol, 2,4-dihydroxyazobenzene-4'-arsonic acid, yellow-orange, with phloroglucinol, 2,4,6 trihydroxyazobenzene-4'-arsonic acid, red brown, with orcinol, 2 methyl-4,6-dihydroxyazobenzene-4'-arsonic acid, deep red brown; from 2 methyl-4-aminobenzenearsonic acid and resorcinol, 2,4 dihydroxy-2'-methylazobenzene-4'-arsonic acid, orange; from *o*-arsanilic acid and PhOH, 4 hydroxyazobenzene-2'-arsonic acid, yellow; with resorcinol, 2,4-dihydroxyazobenzene-2'-arsonic acid, light orange-yellow; with phloroglucinol, 2,4,6-trihydroxyazobenzene-3'-arsonic acid, red; and with

orcinol, 2 methyl-4 6 dihydroxyazobenzene 2' arsonic acid, deep red Comparison of the colors of the dyes shows that they follow the Nietzki rule F M Symmes

**Properties of insoluble azo colors on the fiber in relation to their constitution. Fastness of kier boiling and the method of testing.** F. M Rowe *J. Soc Dyers Colourists* 47, 29-35(1931) —The products of the interaction of β hydroxynaphthoic acid and aromatic amines depend upon the conditions employed Examples of the reaction are given Halogen and other groups in the compds obtained from this reaction increase the fastness The presence of a nitro group in an azo coloring matter has an adverse effect on the fastness or kier boiling of the dyeing Robert Houghton

**Action of boiling caustic soda (kier boiling) on insoluble azo colors on the fiber.** F M Rowe *J Soc Dyers Colourists* 47, 35-9(1931) —Cotton exerts a favoring influence to decompn of the color aggregates into other compds A study is made of the effect of boiling NaOH upon the chem decompn of the color lakes of some azo colors Robert Houghton

**New kinks in wool dyeing** Werner von Bergen. *Proc Am Assoc Textile Chem Colorists* 1931, 98-103 *Am Dyestuff Reptr* 20, 180-5(1931) —The effect of metals on wool dyes causing change of color and a method for detg this effect are presented Vat colors are dyed on wool at *p*H 9.2-9.4 Tippy dyeings and methods of avoiding them are discussed Chlorinated wool can be detected by treating under the microscope with 0.1 *N* NaOH A decided swelling indicates chlorinated wool Robert Houghton

**Dyeing of union felt.** Walter Winkler *Dyestuffs* 31, 41-2(1930). C. E M

**The dyeing of rayon yarns.** D O Gryder. *Proc Am Assoc Textile Chem Colorists* 1931, 92-8, *Am Dyestuff Reptr* 20, 174-80(1931) —Methods of handling rayon yarns during dyeing are discussed Robert Houghton

**Dyeing raw stock for carpet yarns.** F. C. Walsh *Dyestuffs* 31, 186-7(1930) Chas. E. Mullin

**Dyeing carpet yarn.** Harry Peers *Dyestuffs* 31, 28-9(1930) —Formulas and dyes are suggested Chas E Mullin

**Dyeing cotton yarn in the package.** Kenneth MacKenzie *Dyestuffs* 31, 12-4 (1930) —The application of the direct, developed, S and vat dyes is discussed Chas. E Mullin

**Printing of cotton.** Geo M Bishop *Dyestuffs* 32, 1-10(1931) —Direct, discharge, vat, and naphthol printing are discussed, with formulas Chas E Mullin

**Wooden vessels in the dyehouse.** Fred Grove Palmer. *Am Dyestuff Reptr* 20, 189-93(1931) —The selection of the proper wood for the use and installation are discussed Robert Houghton

**Peculiarities of fading** Wm H Cady *Proc Am Assoc. Textile Chem Colorists* 1931, 130-5, *Am Dyestuff Reptr* 20, 232-7(1931), cf *C. A* 25, 386 —Combinations of fast and fugitive dyes are given which exhibit peculiar fading properties Various methods of fading by light exposure are presented and discussed R H

**Detection of traces of active chlorine in textiles.** Alfred Schmidt *Z. angew Chem* 44, 278(1931) —The iodo-starch test recommended by K Schwarze (*C A* 25, 1387) is inconclusive, inasmuch as chloramines present in vegetable fibers will give the test Whether they are injurious, or to what degree, is not yet known with certainty They can be destroyed by treatment with bisulfite or thiosulfate but are more stable than hypochlorites, which react with hot $Na_2O_2$ solns W T H

**Washing of wool and its chemical control.** V Döhrmann *Kisérlet Közlemények* 32, 405-13(1929) —Well washed wool should not contain more than 1% fat No washing agent should remain in wool and washing should not deteriorate the physical qualities of wool fibers $Na_2CO_3$ soln weaker than 2.5% combined with a neutral K soap should be used as washing substance at exactly 45° Washed wool should be examd for (1) fat content by extn., (2) content of $Na_2CO_3$ by titration, and (3) quality of wool fibers by the elasticum reaction of Allworden S S de Finály

**Artificial wools and wool-like finishes on fabrics.** Chas E Mullin and Florence H Cadwell *Textile Colorist* 52, 161-4, 198, 241-4, 269(1930) —A review and discussion of the patents and literature on the manuf., uses, properties and probable future of the so-called artificial wools wool substitutes and imitation wool finishes on the vegetable fibers Chas E Mullin

**Identification of artificial silks.** A K. Gyzander *Dyestuffs* 31, 1-2(1930) — National Erie Black GXOO dyes the regenerated silks black and acetate silk yellow or orange A soln contg 20 mg National Erie Yellow F or National Erie Fast Orange CG, 50 mg $Na_2CO_3$, 1 g soap and 1 g $Na_2SO_4 \cdot 10H_2O$ in 50 cc $H_2O$ dyes cuprammonium silk in a few min but viscose is hardly stained Chas. E Mullin

The investigation of faults in rayon hosiery. V. T. F. Heyes. *Rayon Record* 5, 233-7(1931), cf *C A* 24, 5504.—II gives methods for the detection and examn of the character of oil and metallic soaps in rayon hosiery. A. K. Johnson

Peraktivin. Richard Teibelmann *Chem.-Ztg.* 55, 191-2(1931).—In order to strengthen the bleaching power of aktivin, dichloramine is suggested in place of chloramine. Its insoly in $H_2O$ is disadvantageous, but it can be used in a finely divided or colloidal state, by dissolving in alkali and diluting. Peraktivin contains about 30% active Cl, and is employed as a bleaching agent in the textile industry and as a "safe" bleaching agent in laundries. Curtis L. Wilson

Dyes. I. G. Farbenind. A.-G. (Karl Wilke, Josef Stock and Fritz Schubert, inventors). Ger. 516,698, Dec. 2, 1928. Dyes of the benzanthronepyrazoleanthrone series are prepd. by the action of aminobenzanthronepyrazoleanthrone with compds. which cause a substitution of the *N*-linked H atoms. Numerous examples are given, in which the amino compd. is treated with $Ac_2O$, BzCl, cyanuric chloride, $Na_2PO_4$, $Me_2SO_4$, 1-chloroanthraquinone and AcONa, and other substances, to produce dyes of various colors.

Dyes. Soc. anon. pour l'ind. chim. à Bâle. Swiss 143,025, Mar. 16, 1929. A new dye is obtained when 2 mol. 4-aminoazobenzene-3'-sulfonic acid is condensed with 1 mol. of 4,4'-dinitrostilbene-2,2'-disulfonic acid under pressure. The dye colors cotton in light- and alkali-fast yellow-orange shades.

Azo dyes. I. G. Farbenind. A.-G. Brit. 340,009, Aug. 19, 1929. Azo dyes of the tartrazine series are obtained by a selection of the reacting components such that the finished dye is substituted in the 1- and 4-positions of the pyrazolone ring by a phenyl and a phenylazo radical, resp., which each contain 2 sulfo groups, and such that of the 4 sulfo groups one pair occupies the 5'- and 5''-positions while the other pair occupies either the 2'- and 2''- or the 3'- and 3''-positions, or, if each of the phenyl radicals carries a methyl group in the 2'- and 2''-positions, the second pair of sulfo groups occupies the 4'- and 4''-positions. The products give greenish yellow dyeings fast to water and are especially suitable for printing on paper and are convertible into lakes by the usual methods. Numerous details and examples are given.

Azo dyes. I. G. Farbenind. A.-G. Brit. 339,620, July 10, 1929. Azo dyes insol. in water are made in substance or on a sub-stratum or fiber such as regenerated cellulose and cellulose-ester and -ether fibers, by coupling a diazo or tetrazo or diazoazo compd. free from COOH, $SO_3H$ and OH groups with an arylide such as 2',3'-hydroxynaphthoyl-4-amino-1,2-dimethoxybenzene (which may be made from 2,3-hydroxynaphthoic acid and the corresponding 4-amino-1-alkoxymethoxybenzene). Examples are given of various suitable components.

Azo dyes. I. G. Farbenind. A.-G. (Hermann Wagner and Karl Beck, inventors). Ger. 520,240, Oct. 22, 1927. The diazo compds. from esters of 2,3-aminonaphthoic acid or their substitution products are coupled, in substance or on the fiber, with arylides of 2,3-hydroxynaphthoic acid or their substitution products. Examples are given. Cf. *C. A.* 25, 2299.

**Azo dyes.** I G FARBENIND A G (Heinrich Clingestein and Karl Wiedemann inventors) Ger 520,242, July 27, 1928 The dyes obtained by coupling diazotized *o*-aminophenolsulfonic acids or their nuclear substitution products with 1,7-aminonaphthol or its *N* acyl derivs are treated in substance with chroming agents, yielding blue dyes Examples are given

**Azo dyes.** I G FARBENIND A.-G (Leopold Laska and Arthur Zitscher, inventors) Ger 520 241, May 8, 1928 Diazo, tetrazo, or diazoazo compds not contg the COOH or $SO_3H$ group are coupled, in substance or on a support, with a 2,3 hydroxynaphthoyl 2 amino-5-halohydroquinone dimethyl ether The dyes are insol in water, and are useful as pigment colors as well as for dyeing or printing vegetable fibers Numerous examples are given Cf *C A*. 25, 2290

**Azo dyes.** I G FARBENIND A.-G (Leopold Laska and Arthur Zitscher, inventors) Ger 520,243, Feb 2, 1928 See U S 1,762,022 (*C A*. 24, 3652).

**Azo dyes.** I G FARBENIND A.-G Fr 696,542, May 27, 1930. Dyes contg. Cu are prepd by treating dyes obtained by coupling tetrazotized 4,4'-diaminobiphenyl 3,3'-dicarboxylic acids with 2 mols of aminonaphtholdisulfonic acids or their substitution products, with agents yielding Cu or by prepg the dyes in the presence of agents yielding Cu The products dye cotton in fast blue and gray shades Several examples are given

**Azo dyes.** I. G FARBENIND A.-G Fr. 696,873, June 10, 1930 Azo dyes, which dye wool in shades going from red to violet, are prepd by introducing acyl radicals into the monoazo dyes obtained by coupling diazotized 4 nitro-1 aminobenzene 2-sulfalkyl , -aryl- or -aralkylamides with 2 naphthylaminosulfonic acids or 2 amino-8-naphtholsulfonic acids or their derivs and reducing in an alk medium (See Fr 515, 442) Examples are given

**Azo dyes.** SOC ANON POUR L'IND CHIM À BÂLE Fr. 697,141, June 6, 1930 Metallized azo dyestuffs are prepd by treating azo dyes capable of forming complex metal derivs , with substances which yield metals, in the presence of org bases such as pyridine, quinoline, $PhNH_2$, triethanolamine or benzylamine The azo dyes were derived from coupling components such as naphthylamines of their derivs Examples are given Cf *C A* 25, 822

**Azo dyes.** SOC. ANON. POUR L'IND CHIM À BÂLE Fr 695,869, May 20, 1930 The azo dyestuffs obtained by the union (in an alk medium) of diazo compds contg a OH or COOH group in the *o*-position with respect to the azo group, with derivs of 2,5 aminonaphthol-7-sulfonic acid substituted at the N atom by an appropriate group such as an alkyl, aralkyl or aryl group, are treated with $HNO_2$ and agents capable of liberating metals to form lakes The dyes are particularly suited for regenerated cellulose Several examples are given

**Vat dyes.** C SHAW, R F THOMSON, J THOMAS and SCOTTISH DYES, LTD Brit. 339,954, June 11, 1929 *Bz*-1,*Bz*-1'-dibenzanthronyl or a substitution product is treated with a dichromate in $H_2SO_4$ and the product is subjected to alkali fusion, with or without a diluent such as alc or phenol The resulting dyes give blue-gray to black shades

**Vat dyes.** I. G FARBENIND A.-G (Erwin Hoffa, Hans Heyna, Erwin Thoma and Otto Hirschel, inventors) Ger 521,051, May 30, 1926 3,5-Dimethyl-4 halophenyl-1 thioglycolic acids, or 3,4-dimethyl-5-halophenyl-1-thioglycolic acids, or their derivs substituted in the 2 position with CN, $CONH_2$ or COOH group, are converted into the corresponding hydroxythionaphthenes, and these are converted into sym thioindigo dyes by oxidation, or condensed with the customary thioindigo dye components Examples are given

**Vat dyes.** I. G FARBENIND A.-G. (Werner Zerweck, inventor). Ger. 517,846, Apr 3, 1928 A brown vat dye of the anthraquinone series is produced by condensing aminoanthracene with 1-chloroanthraquinone 2-carboxylic acid and treating the product with an acid condensing agent Thus, naphthalene, 1-chloroanthraquinone 2-carboxylic acid, $(COOH)_2$ and β-anthramine are heated in a reflux condenser, and the product diluted with ligroin The dye colors vegetable fibers in fast red brown shades Several further examples are given Cf *C A* 25, 1094

**Vat dyes.** I G FARBENIND A.-G (Georg Rösch, inventor). Ger. 520,088, Sept. 13, 1929 Addn to 518 017 (*C A* 25, 2573) Yellow to orange vat dyes are prepd as in Ger 518,017, using naphthalene-2 7-dicarboxylic acid or its derivs not contg OH groups, instead of naphthalene 2,6 dicarboxylic acid or its derivs Examples are given

**Vat dyes.** I. G FARBENIND A.-G Fr 696,011, May 23, 1930 Vat dyes of the anthraquinone series are prepd by treating with acid condensing agents the products resulting from the reaction of aminoanthraquinones with 5,8 dihalo-1,2 benzanthra-

quinones Thus, the product obtained by the reaction of 1 mol of 5,8-dichloro-1,2-benzanthraquinone with 2 mols of 1-aminoanthraquinone is introduced into a soln. of $AlCl_3$ in pyridine and heated to 125–130°

Vat dyes. I. G. Farbenind A.-G Fr 696,423, April 8, 1930. Vat dyes of the anthraquinone series are prepd by causing one or more radicals of anthraquinone-β-carboxylic acid, substituted or not, to enter into the $NH_2$ group of α-aminoanthrimidcarbazoles or their derivs or substitution products by known methods Examples and the formulas of the compds obtained are given

Vat dyes. I G Farbenind A.-G Fr. 697,231, June 11, 1930. Acylating agents are caused to react with condensation products, or their derivs halogenated in the benzanthrone ring, which are obtained by the alkali treatment of 1-(benzanthronylamino)-4 (5 or 8)-aminoanthraquinone Similar dyes are prepd by submitting 1-(*Bz*-1-benzanthronylamino)aroylaminoanthraquinones or their substitution products to an alk. condensation using agents practically free from OH groups. Several examples are given

Green vat dyes. I G Farbenind A.-G Fr. 696,862, June 10, 1930. New dimethoxydibenzanthrone is halogenated in the presence of indifferent org solvents and catalysts Examples are given

Brown vat dye. Paul Nawiasky and Julius Mueller (to General Aniline Works) U S 1,797,478 March 24 The nitrobenzanthrone obtainable by treating benzanthrone with $HNO_3$ in boiling glacial HOAc is treated with a caustic alkali Cf *C A* 24, 1225

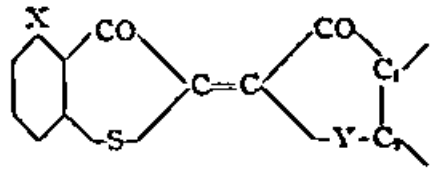
Dye mixtures. Soc. anon pour l'ind. chim à Bâle Ger 521,476, June 19, 1928 Brown dye mixts are prepd by mixing sym 1,2 naphthothioindigo with sym 2,1 naphthothioindigo, or by mixing the corresponding leuco compds or hydroxythionaphthenes and oxidizing the mixts

Metallic dyes. Soc. anon pour l'ind. chim. à Bâle. Swiss 143,026, Mar. 16, 1929 The azo dye from 5-nitro-2-diazo-1-phenol and 1-amino-8-hydroxynaphthalene-4-sulfonic acid is treated with Cu yielding agents The dye colors silk in greenish blue shades

Metallic dyes. Soc. anon pour l'ind. chim. à Bâle. Swiss 143,027. Mar. 16, 1929. The chromed dye from 5-nitro-2 diazo-1-phenol and 2 phenylamino-5-hydroxynaphthalene-7-sulfonic acid is reduced, diazotized and coupled with salicylic acid. The dye colors cotton and artificial silk in blue-green shades

Wool dyes. I. G Farbenind. A.-G. Fr. 695,807, May 17, 1930 1-Amino-4-bromoanthraquinone-2-sulfonic acid is condensed in aq soln. and in the presence of agents neutralizing the acid and a catalyst with aryldiamino compds. (with the exception of *o*-diamines and *p*-phenylenediamine) or their substitution products, particularly their sulfonic acids contg at least one free $NH_2$ group. The condensation products obtained may be treated with acylating agents, or the sulfonic groups contd. in the anthraquinone ring may be sepd

Anthraquinone dyes. Imperial Chemical Industries, Ltd. Ger. 521,382, July 27, 1929 See Brit. 323,026 (*C. A.* 24, 2890).



Anthraquinone vat dyes. I G. Farbenind. A.-G. Brit. 339,626, Aug 8, 1929. 2,2'-Dimethyl-1,1'-dianthraquinonyls or 2,2'-dimethyl *ms*-benzo- or naphtho-dianthrones in which the H atoms of both methyl groups are partially or wholly replaced by halogen are treated with acid or alk condensing agents having a reducing action and capable of splitting off halogen or a H halide. Numerous details, examples and modifications of procedure are described The dyes dye materials orange-yellow to red shades.

Indigoid dyes. Compagnie nationale de matières colorantes et manufactures de produits chimiques du nord réunies etablissements Kuhlmann. Fr. 695,979, May 22, 1930 4,6-Dimethyl-5-nitro- and 4,6-dimethyl-5-amino-1-phenylthioglycolic acids are obtained by diazotizing 1,3-dimethyl-2-nitro-4-aminobenzene in the presence of a mineral acid, pouring the diazo soln into a dil soln of alkali xanthogenate or the like in alk medium, sapong., adding alkali monochloroacetate or the like and acidifying after elimination of alc The new dyes, *5,7,5',7'-tetramethyl-6,6'-dinitro-* and *-diamino-2,2'-bisthionaphtheneindigo*, are obtained by cyclization of the acids mentioned, *e. g.*, by means of $ClSO_3H$

Indigoid dyes. Soc. anon. pour l'ind. chim à Bâle. Ger. 519,265, Nov. 16, 1928 New indigoid dyes are prepd from 1-methyl-2,3-naphthoxythiophene by oxidizing this or condensing it with the cyclic diketones or their reactive derivs. usually employed as indigoid dye components. 1-Methyl 2,3 naphthoxythiophene is prepd from 1-methyl 2 aminonaphthalene by diazotization, treatment with alkali xantho-

genate and sapon to yield 1 methyl 2 thionaphthol, conversion of this into 1 methyl-2-naphthylthioglycolic acid, followed by conversion of the acid into its halide and treatment of this with acid condensing agents to effect ring closure The dyes obtained may be halogenated Examples are given Cf *C A* 25, 825

Thioindigo dyes. I G Farbenind A -G Fr 695,763, May 16, 1930 3 Halophenyl 1 thioglycolic acids, which are substituted in the 2 position by a carboxylic, carboxamide or nitrile group, are transformed into the corresponding hydroxythionaphthenes and the latter by oxidation into symmetrical thioindigo dyes, or the said hydroxythionaphthenes or their 2-derivs may be condensed with diketones or their 2 derivs Compds of the formula

are obtained in which X is a halogen, Y an imino group or an atom of S, and $C_1$ and $C_2$ belong to a $C_6H_4$ or a $C_{10}H_6$ ring

Triarylmethane dyes. I. G Farbenind A -G Brit. 339,823, Jan 4, 1929. 1 Naphthaldehyde 2 sulfonic acid or a deriv is condensed with an alkylated or aralkylated arylamine and the resulting leuco compd oxidized (if desired after sulfonation) The dye formed from 1 naphthaldehyde 2 4-disulfonate and ethylaniline produces a bluish green color on wool and other examples also are given

Xanthene dyes. Imperial Chemical Industries, Ltd Ger. 521,291, June 30, 1929 See Brit. 320,345 (*C A* 24, 2608)

Xanthene dyes. Imperial Chemical Industries, Ltd Ger 519,345, June 30, 1929 See Brit. 320,345 (*C A* 24, 2608)

Sulfurized phenol derivatives for use in dyeing. I G Farbenind A -G and A Thauss. Brit 340 007, Aug 19 1929 In processes such as described in Brit. 173,313 (*C A* 16, 1510) and Brit. 298 280 (*C A* 23, 2837) for the production of mordanting thio derivs of phenols by heating phenol or a homolog or substitution product (other than a phenol contg N) with S in the presence of a neutral salt of an org carboxylic acid or of a weak inorg acid, an excess of at least 50% of phenol over the theoretical quantity of 1 mol phenol to 2 mols of S is employed The reaction proceeds rapidly to completion and the excess of phenol is removed by distn *in vacuo*

Bromo substitution product of isodibenzanthrone. Soc. anon pour l'ind chim. à Bâle Swiss 143,711, July 20, 1929 Isodibenzanthrone is treated with 2 atoms of Br in the presence of $ClSO_3H$ and a carrier such as S or I The product dyes cotton violet blue from a red blue vat.

Pyrazoleanthrone condensation products. I G Farbenind A.-G (Georg Kalischer, Heinz Scheyer and Heinrich Ritter, inventors) Ger 517,845, Feb 17, 1928 2 Methylpyrazoleanthrone is alkylated or aralkylated, and the *N*-alkylated or *N*-aralkylated product treated with alkali until the product gives a red color in concd. $H_2SO_4$. Thus 2 methylpyrazoleanthrone is treated with $Me_2SO_4$ to produce *N* methyl-2-methylpyrazoleanthrone, m 163° This is heated with NaOH in a reflux condenser to give a dye which colors cotton red from a green blue vat. Further examples are given

Dye pastes. Imperial Chemical Industries, Ltd Ger. 521,123, July 6, 1928. See Brit. 300 800 (*C A* 23, 4079)

Colored lakes fast to light. I G Farbenind A -G Fr 695,495, May 13, 1930 Basic dyes, which may contain acid groups, are treated with complex acids or their salts and substances having a basic reaction in amt. not sufficient for complete neutralization are added before allowing them to react on the dyes Examples are given

Dyes and intermediates. I G Farbenind A G Brit. 339,659, July 8, 1929 *ms* Naphthodianthrones, *allo ms* naphthodianthrones and *ms* anthradianthrones are treated with a nitrating reagent (preferably in the presence of diluents such as mono-, di or tri-chlorobenzene, bromobenzene or quinoline) and the nitro groups in the products are replaced by halogen or are partly or wholly reduced Examples are given for producing dyes giving various colors

Dye intermediates. I. G Farbenind A -G Brit 339 699, Sept. 24, 1929 Aromatic aminoaldehyde compds are made by heating aldehydes of the benzene and anthraquinone series contg easily replaceable halogen atoms with acid amides or sulfonamides or their monoalkyl, aralkyl or aryl derivs, in the presence of an acid binding

agent, with or without a diluent or catalyst, and saponifying the acylamino or sulfamino compds obtained Examples are given of the production, as final products, of 5-nitro-2 aminobenzaldehyde, 6-methylacridine, 6 chloro-2 amino- and 2 6-diaminobenzaldehyde, 3 nitro-2,6-diaminobenzaldehyde 2,5-diaminoterephthalaldehyde and 1 aminoanthraquinone 2 aldehyde

**Dye intermediates (anthraquinone derivatives).** P F Bangham, L J Hooley, J Thomas and Scottish Dyes, Ltd Brit 339,589 June 4, 1929 Anthraquinone derivs with heteronuclear substituents are obtained by condensing halogenated phthalic acids, salts or anhydrides with halogenated phenols in $H_2SO_4$ or oleum with $H_3BO_3$ or borax Halogen atoms in α positions may be wholly or partly hydrolyzed to OH groups The products are chlorinated quinizarins and alizarins Examples are given

**Dye intermediates.** I G Farbenind A.-G Fr 690,043, May 23, 1930 Substituted phenol o-carboxylic acids are prepd by heating under pressure with $CO_2$ the alkali salts of chloromethyl or dimethyl phenols, particularly *asym o* xylenol, *p*-chloro-*o*-cresol or *o*-chloro-*p*-cresol Examples are given

**Dyeing** I G Farbenind A G (Franz Streng, inventor) Ger 519,252, July 29, 1928 Colored reserves under aniline black are obtained with a printing paste free from nitro-substituted bases and comprising a nitrosamine alkali salt and, as coupling component, an arylide of 2 3 hydroxynaphthoic acid or a compd contg a reactive $CH_2$ group The paste contains also ZnO and an excess of caustic alkali The material is slop padded with the usual aniline black liquor, dried, printed with a paste of the kind described steamed to develop the black and then passed through a bath contg AcOH and a bichromate soda bath Cf *C A* 24, 5509

**Dyeing fabrics.** Karl Schmidt Ger 517,916, Oct 21, 1926 An aniline black dye is produced by a slop pad bath contg $PhNH_2$, an oxidizing agent, a large amt of weak acid salt an org catalyzer and a heavy metal salt as an auxiliary catalyzer Such a bath contains $PhNH_2$ HCl, Na $S_2O_3$, $CuS_2O_3$, $NaClO_3$, $(NH_4)_2SO_4$ and *p*-phenylenediamine The slop padded goods are dried and developed by a Cr bath A further example is given

**Dyeing fabrics.** Soc. anon pour l'ind chim à Bâle Ger 521,200, Dec 22, 1928 Color effects on fabrics, etc, are obtained by treating the materials with an alkali salt of a 1 naphthol-4 aryl ketone and with a dye or other compd fixable on the materials by steaming The materials are then steamed, and finally the ketone is coupled with a diazo compd to produce an azo dye Thus, a mixed fabric of cotton and acetate silk may be padded with a bath contg a salt of 1-naphthol-4 phenyl ketone and aminoazobenzene, steamed so as to fix the dye on the acetate silk, and then treated with a diazo soln from 4 chloro-2 aminobenzene 1 phenyl ether The acetate silk is colored yellow and the cotton red Further effects may be obtained by impregnating the materials with the ketone, printing with dyes requiring steaming, and then proceeding as above

**Dyeing animal fibers.** Durand & Huguenin S A Ger 516,669, April 21, 1928. Addn to 418,487 Colors fast to rubbing are produced on animal fibers by ester salts of leuco vat dyes. The dyes are developed by acid sapamin soaps in an acid oxidizing bath Thus, wool, soaked in a 10% soln of ester salt of leucoindigo, is immersed in a cold bath contg sapamin, $NaNO_2$ and $H_2SO_4$ The wool is washed and dried Leuco compds of quinone and anthrone are mentioned also

**Dyeing silk.** Compagnie nationale de matières colorantes et manufactures de produits chimiques du nord, réunies établissements Kuhlmann Fr. 695,981, May 22, 1930 Natural silk is dyed by combination with diazonium salts of amines such as *m* chloroaniline, *m*-nitro-*o*-anisidine or bianisidine.

**Dyeing acetate silk.** I G Farbenind. A.-G Fr. 696,026, May 23, 1930. Acetate silk is dyed by treating it with dyes of the type $(4)H_2NRN{\cdot}NR'NX_2(4)'$, diazotizing and developing with 2 hydroxynaphthalene 3-carboxylic acid In the formula R is a phenyl group substituted or not by halogen, an alkyl or alkoxy group or several of these, R' is a phenyl or naphthyl group substituted or not by a halogen or an alkyl, and X is an aliphatic group Examples are given

**Dyeing materials containing cellulose acetate and like substances.** British Celanese, Ltd Brit. 339,997, June 8, 1928 Dispersed relatively insol coloring agents having an affinity for unsaponified cellulose esters are used for dyeing materials such as mixed goods contg partially saponified cellulose acetate or the like which may be assocd with cotton, wool, silk, linen or regenerated cellulose, and the non-ester portion may be dyed with suitable dyes having an affinity for such portion.

**Dyeing cotton associated with "cuprammonium yarn."** Fritz Steinberg (*to* American Bemberg Corp). U. S 1,797,247, March 24. For equalizing the dyeing

effect of a fabric comprising a mixt. of cotton and "cuprammonium yarn," the cotton is treated with a Cu-oxide-$NH_3$ soln.

Printing on cloth with dyes. I G Farbenind A.-G (Friedrich Teller, inventor) Ger 519,440, Mar 20, 1929 See Brit. 329,207 (*C. A.* 24, 5510)

Printing textiles. I G Farbenind. A.-G (Heinz Gossler, inventor) Ger 521,219, Apr 1, 1928. Reserves colored with vat dyes under dyeings with vat dyes are obtained with the use of reserve pastes contg thickeners which permit the addn of acid reacting heavy metal salts or like reserving substances to the paste, and which fix the reserve dye as a pigment to such a degree that the reserve dye is not removed during the dyeing with the grounding dye Suitable thickeners are cellulose ethers, carob-bean gum and blood albumin Thus, the goods may be printed with a reserve paste contg a rose vat dye, carob-bean gum, $CuSO_4$, $Cu(NO_3)_2$ and $Cu(OAc)_2$, then vat-dyed in the ordinary way with indanthrene blue, washed, acidified, washed again and dried. The reserve color is then fixed by padding the goods with a soln contg *Rongalite C, NaOH and glycerol, steaming and finishing* as usual. Cf *C. A.* 24, 974

Use of color reserves in textile printing. I. G Farbenind. A.-G. (to Durand & Huguenin A.-G.) Brit. 340,088, Nov 5, 1928 Color reserves under vat dyeings are obtained by means of ester salts of leuco vat dyes by use of the process described in Brit. 298,088 (*C. A.* 23, 2830) and Brit. 321,964 (*C. A.* 10, 1058), as modified or improved upon by the processes described in Brit. 281,336 (*C. A.* 22, 3536) or Brit. 306,800 (*C. A.* 23, 5329), by incorporating in the printing paste, together with glycol or a glycol ether, a heavy metallic reserve salt, printing therewith, drying and steaming to develop the ester salt, and finally dyeing with the vat dye in the usual manner Various details and examples are given. Cf *C. A.* 24, 5510

Apparatus for dyeing fabrics in open width. Frank Davis Ger 520,009, Sept. 21, 1927 See Brit. 275,207 (*C. A.* 22, 1800).

Apparatus for dyeing merchandise in the piece. F Randall (Luton), Ltd. Fr 695,318, May 8, 1930.

Cloth-dyeing machine. Maschinenfabrik Benninger A.-G Ger 516,667, July 21, 1929

Machine for dyeing hank yarns. Maschinenfabrik Tellm Gerber Söhne and Gebr. Wansleben Ger 520,068, June 22, 1929

Dye vat. Rudolf Thun Ger 517,732, Oct. 27, 1927 The vat has a drum with rungs on which articles for dyeing are hung

Tubular heating apparatus for dyeing vats. Wilhelm Schönicke Ger 520,376, Mar 11, 1930.

Ceramic plates for lining dyeing and bleaching vats, etc. Paul T Gerber Ger 520,375, Sept. 27, 1929 Structural features are described

Charts with relatively movable sheets for indicating the correct compositions of different dye baths. I G Farbenind. A.-G Brit. 339,842, Feb. 2, 1929

Dyeing apparatus with telescoping adjustable dye-liquor circulating pipes. C. E. Oldroyd. Brit. 339,909, March 20, 1930. Various structural details are described.

Treating textiles. Camille Dreyfus. Fr 696,224, May 28, 1930. The luster of cloth or textiles of or contg artificial filaments is diminished by submitting the cloth, etc., to a wearing action by an abrasive on brushes, etc An app. is described.

Boiling (bucking) textile materials. G Ullmann Brit. 339,550, Jan. 26, 1929 In obtaining fibers from vegetable materials such as cotton, flax or jute, by removal of fatty and waxy substances, pectin substances, albuminoids, coloring substances and woody and husk portions, using such solvents as hydroxides of Fe or alk. earth or alkali metals, the use of these reagents together is effected and a product capable of continuous bleaching without pressure is obtained by adding to the boiling liquor such materials as allow the metallic soaps of the fats and waxes present to be produced in a sol or highly dispersive form in which they can easily be rinsed off For this purpose, various sulfonated prepns and compds. may be added

Waterproofing textiles. Alexander Nathansohn. Ger 521,029, Sept 15, 1929 The materials are partly esterified by treatment with a fused fatty acid chloride or anhydride in the absence of a solvent. The excess of esterifying agent is afterward removed by means of a solvent. Thus, a dyed cotton fabric may be immersed for 8 hrs. at 65° in fused stearic anhydride, and the excess of the latter afterward removed with $CS_2$. Cf *C. A.* 25, 1686

Treating textile fibers. Wilhelm Francke. Fr 696,072, May 24, 1930. Natural or artificial silk is wound on bobbins, etc., in such a way as to form uniform channels throughout so that the treating liquids, gases or vapors flow or are forced under moderate pressure through the bobbins.

Apparatus for the wet treatment of textiles. René Clavel. Fr. 696,158, May 29, 1930.

Retting fibers. Röhm & Haas Co. (Soc. anon.). Fr. 696,850, May 12, 1930. Vegetable fibers surrounded by ligneous materials are retted in a bath contg. an enzyme, glauber salt and a substance preventing the growth of bacteria such as toluene.

Retting bast fibers such as flax straw. Vickers, Ltd., and O. D. Lucas. Brit. 339,858, Dec. 23, 1929. The material, after de-seeding, is placed in a tank to which water together with a portion of liquid from a previous first stage of treatment is admitted at a temp. of 25° which is maintained for 12–24 hrs., a portion of the liquor is then run off and may be used for the next batch, and the tank is filled with fresh water and the temp. slowly raised to 37° and this temp. is maintained until retting is completed (after 3–4 days). Various auxiliary details of procedure also are described.

Softening fibers with sulfonic acids. I. G. Farbenind. A.-G. Brit. 339,858, Aug. 24, 1929. "Cuprammon rim silk" or other fibers are softened and rendered flexible by treating with aq. solns. of true sulfonic acids prepd. from carbocyclic acids of aliphatic satd. hydrocarbons contg. more than 8 C atoms, or water-sol. salts of such acids. Use of the mono-Na salt of sulfopalmitic acid or of sulfostearic acid or the salt of triethanolamine with the sulfonic acid or stearic acid is described.

Weighting fibers. Oscar Berg and Max Imhoff. Ger. 521,122, Dec. 10, 1925. See Brit. 256,727 (C. A. 22, 504).

Calendering and glazing fabrics. Arnold Bosshard. U. S. 1,797,338, March 24. The fabric is dried and electrostatically charged and subjected to heat and pressure (in a roller app. which is described) while in the dry electrostatically charged condition.

Removing stains from fabrics. Soc. anon. des produits R. Appenzeller. Brit. 340,077, Oct. 23, 1928. Stains are removed from crepe-de-chine or other fabric by the action of the vapor of a volatile solvent in the presence of an adsorbent such as fuller's earth and bleaching charcoal sepd. from the fabric by a thin cloth or leather. The solvent, such as a small proportion of benzene, may be mixed with the adsorbent, and the treatment may be effected by weighting down the materials between a marble slab and a covering felt.

Fabrics containing natural silk. British Celanese, Ltd. Brit. 339,886, March 5, 1929. In the manuf. of fabrics contg. natural silk, especially in combination with yarns of cellulose acetate or other artificial silk, the silk in the state of yarn or fiber is degummed and then sized before weaving, knitting or other textile operations, and after these treatments the size is removed. Sizes are used which can be easily removed with hot water, and various details and examples of materials used are given.

Apparatus for finishing and polishing cloth. William B. Broadbent. U. S. 1,797,704, March 24. Structural features.

Centrifuge for the wet treatment and drying of yarns on beams. Carl Bayer. Ger. 519,043, Mar. 12, 1927, and 519,045, May 22, 1928, addn. to 519,043.

Centrifuge for the wet treatment and drying of yarns on beams and bobbins. Carl Bayer. Ger. 519,044, April 18, 1929.

Bleaching animal and vegetable fibers and materials. Österreichische Chemische Werke G. m. b. H. Ger. 516,581, July 6, 1927. Feathers, hair, fur, bristles, etc., are bleached by the action of gaseous $H_2O_2$. The materials are kept at about 50°. In the case of furs, etc., the skin is given a protective coating of fat, etc., before bleaching the fur, etc. Cf. C. A. 24, 3872.

Treating wool-washing waters. Carl von Overstraeten. Ger. 520,170, Nov. 11, 1927. The waters are treated with a reagent, e. g., $CaCl_2$ or an acid, capable of pptg. all the suspended or dissolved substances derived from the wool. The ppt. is dried, e. g., by centrifuging, and treated with $Na_2CO_3$ to convert the Ca soaps or free fatty acids into Na soaps. The product is dild. with soap soln., and the emulsion so obtained is resolved by centrifuging into sludge, soap soln. and wool fat.

Oiling wool. Gaston L. Dechorgt. Fr. 696,801, Sept. 18, 1929. Wool is oiled by an emulsion in oil of an infusion of substances such as algae, lichens or gums with the addn. of substances preventing mold formation.

Apparatus for drying wool in air currents. P. Malard. Brit. 339,907, April 29, 1929. Structural features.

Proofing wool, fur, feathers, hair, etc., against moths, etc. I. G. Farbenind. A.-G. (Max Weiler and Hermann Stötter, inventors). Ger. 520,184, Apr. 10, 1929. The materials are treated with hydroxybiphenyls or their substitution products contg. halogen atoms or alkyl or alkoxy groups, but not contg. sulfo, carboxy, or nitrogenous groups. Examples are given.

**Wool fat.** Eugène Mertens Ger 520,008, Oct. 26, 1926. The scum obtained in known manner from wool washing waters is heated under 2–3 atm pressure without addn of reagents, whereby it is resolved into wool fat and an aq soln of soap, etc An example is given Cf *C A* 24, 4641

**Artificial silk.** Aceta G m. b H Fr 695,737, May 16, 1930 App for wetting or oiling threads is described

**Artificial silk cloth.** Soc. pour la fabrication de la soie "Rhodiaseta." Fr 696,875, June 10, 1930 Crêpe effects are obtained on cloth composed of or contg strongly twisted cellulose acetate, without sizing the threads before twisting, by treating the cloth in a bath having a very marked swelling action on cellulose acetate, and the peptization action of which is small or nil Examples are given of the use of baths contg EtOH and water, MeOH and water, EtOH and $C_6H_6$ and EtOH and trichloroethylene

**Desulfurizing and bleaching artificial silk.** Wilhelm Francke Fr. 695,845, May 19 1930 Use is made of baths contg active O, *e g*, baths contg $H_2O_2$ A desulfurization and preliminary bleaching may take place in a bath already used and a further bleaching in a fresh bath

**Artificial threads, filaments, ribbons, etc.** Henry Dreyfus Fr 695,844, May 19, 1930 The properties of products of cellulose esters or ethers which have been coagulated with aq agents are improved by the action of heat The heating may take place in the presence of solvents, swelling or plastifying agents

**Ribbons, bands, films, etc.** Camille Dreyfus. Fr 695,371, May 9, 1930 A liquid having a limited solvent or softening action on cellulose derivs is applied to a series of filaments of cellulose acetate or other thermoplastic deriv. of cellulose so that the filaments are rendered adhesive, and heating, under pressure if necessary, so that they unite to give a product of flattened cross section The solvent or softening agent may be diacetin, triacetin, dibutyl tartrate or tritolyl phosphate.

**Treating regenerated cellulose or vegetable fiber yarns.** Chem Fab vorm Sandoz Ger 521,121, Oct. 20, 1929 The dyeing properties of yarns of cotton or other vegetable fibers or regenerated cellulose are modified by treating the yarns, while wound on bobbins or the like, in turn with an alkali soln and a soln of an esterifying agent, the treating liquids being forced or drawn through the yarns *via* the hollow cores of the bobbins, etc Suitable esterifying agents are $PhSO_2Cl$ and its homologs Cf *C A* 24, 5168

**Fireproofing porous materials such as cotton fabrics.** Harry Hopkinson (to Brunsene Co of Mass) U S 1,797,865, March 24 The material is treated with a soln of a Pb salt such as Pb acetate and then treated with a soln of a haloid such as $AlCl_3$

## 26—PAINTS, VARNISHES AND RESINS

A H Sabin

**The paint trade—new types of finishes** H Houlston Morgan. *The Times Trade and Eng Suppl* 28, No 664, 10–11(1931).—Cellulose ester lacquers and synthetic resin varnishes are discussed briefly. E. M Symmes

**Covering power of paint.** H. Rabate *Peintures, Pigments, Vernis* 7, 1184–92 (1930) B. Hamilton

**Some considerations on black asphalt paints.** Manuel González de la Vega *Rev Quim* 6, No 8, 25–7(1931).—The author shows that paints made with natural asphalts, such as gilsonite, are superior to those having asphalts obtained from petroleum distillate residues Petroleum asphalt paints under the action of air, sun and rain are turned into a fine dust This effect is especially noted when the proportion of linseed oil is too great or when Pb or Mn resinates are used as driers A marked difference in weathering properties and fusion points was noted A natural asphalt resists exposure 3 times as long as a petroleum asphalt The fusion points were 300° and less than 50°, resp In a further study of the fusion points, the presence of volatile vehicles altered the results Exposure for 24 hrs at room temp eliminated any volatile matter. Linseed oil lowers the fusion point but after 24 hrs is converted into linoxyn, which raises the fusion point. The presence of resinates and linoleates was disregarded with reference to their effect on the fusion point The author developed the following method for detg the nature of asphalts· One-half of the surface of 2 similar glass pieces is painted with a uniform coating The pieces are dried at room temp for 24 hrs. A mark is made on the glass close to the painted area and the unknown samples are placed in a

controlled heating device The heating progresses slowly and the temp at which the paint runs down and reaches the mark on the glass is found to be significant in each case. The temp for petroleum asphalt paints was found to be less than 85°, and for natural asphalt paints 135° The former always run at less than 100°, except in cases of emulsions with asphalts in different phys conditions JOHN M LADINO

**Titanox-C in paints.** M DONIGER *Paint, Oil & Chem Rev* 91, No 15, 12–4 (1931) —Some of the advantages of Titanox C are its low sp gr, its ease of wetting and its non reactivity with acid vehicles Because of its low sp gr it is the slowest settling white pigment available Other factors involved in the settling properties of paints are (1) non volatile content of the vehicle, (2) character of pigment, (3) mixing and grinding of the paint, (4) use of $H_2O$ (5) character of the vehicle (6) use of metallic soaps and methods of incorporating them With respect to (6) the use of as much as 12% Pb in the oil portion of vehicles is advantageous To avoid excessive darkening, the Pb is best incorporated on down heats and in the form of basic carbonate G G SWARD

**The viscosity and brushability of paints.** HANS WOLFF *Farben-Ztg* 36, 1088–9, 1131–2(1931) —Data are produced to show that the turboviscometer is as suitable for detg the consistency of paint as the Couette viscometer (cf *C A* 24, 2313) The plastic nature of paints is brought out more clearly if the data obtained with the latter be plotted as $\phi\omega$ against $\omega$ instead of simply $\phi$ *vs* $\omega$ Curves of viscous materials are parallel to the axis With either app, the data do not reveal differences in the brushing properties of paints G G SWARD

**Hydrogen-ion concentration and the color of lead chromate pigments.** R. C. ERNST, E PRAGOFF, JR, AND E L LITKENHOUS. *Ind Eng Chem, Anal Ed* 3, 174–6(1931) —Lead chromates were pptd from solns of $Pb(OAc)_2$ and $K_2Cr_2O_7$ The acidity of the solns was regulated by the addn of HOAc, HCl, $HNO_3$ and $H_2SO_4$. H-ion concn was detd by use of the quinhydrone electrode Each acid caused the color to change from yellow at $p_H$ 3 5 to orange at $p_H$ 9, at which there was a max of brilliance and darkness of shade For $p_H$ values above 9 the colors were off shades The color changed from yellow at low temps to a max at 80°, above which the color again became lighter. Variations in time of pptn and in concn of metal ions had no appreciable effect on the color H M STARK

**Uses of solvents—important applications.** THOMAS H. DURRANS. *The Times Trade and Eng Suppl* 28, No 664, 11(1931) —Nitrocellulose lacquer solvents are discussed briefly E M. SYMMES

**Glyptals, albertols and coumarone—their value to the varnish manufacturer.** E. E. WALKER. *The Times Trade and Eng Suppl* 28, No 664, 7(1931) —A review. Vinyl resins are also included E. M. SYMMES

**Formula for black, acid-proof stain for wood.** F. L. KISKADDEN. *Chemist-Analyst* 20, No 3, 17(1931) —Apply 2 coats of hot aq soln contg 4% copperas, 4% blue vitriol and 8% $KMnO_4$. Rub off the excess of the second coat and apply 2 coats of aq 12% aniline and 18% concd HCl When dry apply a coat of linseed oil W T H

Gum ester. A. NAUROY. *Peintures, Pigments, Vernis* 7, 1214–8, 1262–6 (1930).—A review. B. H.

**The older compounds—permanently fusible gums and resins.** H. COURTNEY BRYSON *The Times Trade and Eng Suppl.* 28, No 664, 17(1931).—A review of the manuf of molded plastics E M SYMMES

Phenolic resins—the raw materials. G T. MORGAN. *The Times Trade and Eng Suppl* 28, No 664, 8(1931) —A review, with plant illustrations. E M. SYMMES

Synthetic resins. O KUULA AND O. ROUTALA *Acta Chem. Fennica* 4, 1–16 (1931).—A review on the prepn., properties, reactions and uses of synthetic resins. S. A. KARJALA

**The constitution of the synthetic resins.** GEORG WALTER. *Z. angew. Chem.* 44, 136–7(1931) —The ability of thiourea to form complex compds. with metal salts, *e. g.*, $CuCl_2$, was utilized in prepg thiourea-formaldehyde condensation products contg Cu and Cl The colloidal solns. of these products give on electrolyte flocculation, *e. g.*, with KCl, ppts which, unlike the gelatinous ppts obtained from urea formaldehyde condensation products (I), may readily be dried to const. wt. The dry ppts. present, because of their content of Cu and Cl, a suitable material for an analysis Comparative cryoscopic investigations of solns. of methylolthiourea (II) and solns. of the complex compds prepd from II and $Cu_2Cl_2$, together with the results obtained from the analysis of the flocculation ppts., gave data from which, certain plausible assumptions being considered, numerical expressions were obtained as to the structure and size of the mol present in the colloidal soln. of I. W. has previously shown (*C. A.* 21, 3626) that clear

condensation products may be prepd from the methylol compds. of urea also in the absence of water. It was now detd. that by condensing dimethylolurea in the presence of the generally known condensation agents 6% $CH_2O$ and 22% $H_2O$ were sepd. These values vary somewhat with the different condensing agents used. In the absence of condensing agents a sepn. of 12.5% $CH_2O$ and 15.1% $H_2O$ took place and methylol methyleneurea was formed, in agreement with the calcd. values. The remaining resin was investigated in each case. The values obtained show that the urea residues must be connected through $CH_2$ groups (*C. A.* 23, 2425). W. discusses the structure of the condensation products, the av. no. of links in the chains, etc. Cf. *C. A.* 22, 4538, 23, 1136, 1623; 25, 1398. D. Thiessen

Paint. Josef Blumenfeld. Ger. 516,748, April 22, 1926. See Brit. 256,302 (*C. A.*, 21, 2002).

Paints. I. G. Farbenind. A.-G. Fr. 695,523, May 13, 1930. White pigments having good covering power are made by adding to Zn lyes a fixed sol. base such as hydroxides of alkali or alk. earth metals in excess so that the liquid above the ppt. formed has a $p_H$ value of 12 or more.

Testing paint films. Kali Forschungs-Anstalt G. m. b. H. (O. F. Kaselitz, Erich Ritter and Paul Nettmann, inventors). Ger. 519,486, Feb. 2, 1930. The method described by Ritter (*C. A.* 23, 3357) is modified by coating the gelatin layer with a thin layer of metal, concrete or other material to which the paint to be tested is intended to be applied in use. This may be effected by spraying molten metal onto the gelatin layer, or by dusting graphite on to the layer and then depositing metal electrolytically. The paint is then put on the metal, etc., coating and the test proceeded with as before.

Painting with successive coats. E. Frenkel. (trading as the firm of H. Frenkel). Brit. 339,789, Dec. 10, 1928. In a process involving application of successive coats before the underlying material is dry, the binding medium of the coating compns. comprises oil treated with air or gases contg. $O_3$ so that they are viscous, and a finishing

coat such as a nitrocellulose varnish also may be applied before the preceding coat is dry Use of various other addnl ingredients also is mentioned

**Driers for use in paints, etc.** I G Farbenind A -G Brit. 339,865, Feb. 22, 1929 Solns of heavy metal or alk earth naphthenates which are sol in drying oils and org solvents, for use as driers, are made by dissolving the naphthenates in the fatty acids of drying or semi drying oils such as linseed, wood, soy bean or poppy oils Examples are given of driers contg Co and Mn

**Driers for paints, etc.** I G Farbenind A -G Brit. 339,922, June 14, 1929 The process described in Brit. 339,865 (preceding abstr ) of prepg solns of driers by dissolving heavy metal or alk earth naphthenates in the fatty acids of drying or semi-drying oils is modified by partially replacing the fatty acids by drying or semi drying oils, *e. g.*, a soln of Pb and Mn naphthenates in various proportions of linoleic acid and linseed oil may be used

**Mixing and grinding machine for paints, enamels, inks, etc.** Lionel G Holmes Ger 520,495, April 6, 1930

**Pigments.** Compagnie Lorraine de charbons pour l'électricité Fr 696,242, Sept 7, 1929 Flocculent pigments of very fine grain are deflocculated by treatment with a dispersing agent composed of an amphoteric colloid in aq soln possessing a suitable elec sign In the case of pigments composed of lamp black, C black, etc, a protein previously brought to a suitable $p_H$ value above 7 is used, the grains of pigment being totally or partially absorbed by the micellas of the protein used The apparent d of the treated pigment is increased by a final trituration made in the dry state

**Pigments.** Soc. anon pour l'ind chim à Bâle Swiss 143,293 to 143,295, Aug 21, 1928. Addns to 141,886 (*C A* 25, 2310) Colored pigments which withstand weather, light and water are formed by treating suitable dyes with metals. In 143,293, the azo dye obtained by treating the sapond dye from the diazotized *p*-toluenesulfonic acid ester of 1,8-aminonaphthol-3,6 disulfonic acid and cresidine ($CH_3$ $OCH_3$ - $NH_2$ = 1,4 3) is treated with $COCl_2$ and MgO In 143,294, the azo dye from the tertiary condensation product (from 1 mol cyanuric chloride, 1 mol of 1,8-aminonaphthol-3,6-disulfonic acid, 1 mol of *p*-aminobenzeneazosalicylic acid) from 1 mol of PhNH and 1 mol of the azo dye from diazotized 1,8-aminonaphthol-3,6-disulfonic acid and cresidine, is treated with pptd chalk or similar Ca compds In 143,295, the same dye is treated with MgO

**White lead.** Compagnia Metalurgica de Mazarron (Georg Sitz, inventor). Ger 521,383, Aug. 13, 1924 An aq sludge of PbCl, or suitable metallurgical products contg $PbCl_2$ is gradually treated, while stirring, with $Na_2CO_3$ soln , which may contain NaOH, the addn. of the $Na_2CO_3$ soln. being regulated so that the mixt does not show an alk. reaction until all the Pb has been converted into basic carbonate Instead of $Na_2CO_3$ soln , NaOH soln may be used while passing $CO_2$ into the mixt An example is given

**Red lead.** H. Erzinger and Chemische Fabrik Schonenwerd H. Erzinger A -G Brit. 340,082, Oct 30, 1929 Red lead of low d is produced by adding to PbO, in an excess of water, small quantities of an org acid (such as acetic, formic, or amino acids obtained by heating protein refuse) capable of forming basic Pb salts sol in water, treating with $CO_2$ until a strongly basic Pb carbonate of low sp. gr. and an approx compn. $4PbCO_3 Pb(OH)_2$ is formed, sepg this product and oxidizing it to red lead by burning at the lowest possible temp (preferably 100° lower than that usually employed in red lead production, care being taken to prevent pulverization)

**Naphthazarine derivatives.** I. G. Farbenind A -G (Georg Kränzlein and Robert Welde, inventors) Ger 520,089, Sept 5, 1929 Addn to 507,347 (*C. A.* 25, 609). The fastness to light of the products described in Ger 507,347 is improved by treating them with oxidizing agents, *e. g.*, $NaNO_2$, NaOCl or $MnO_2$ and $H_2SO_4$ Examples are given

**Printing inks.** Hans Zimmer. Fr. 696,723, June 6, 1930 The inks are improved by incorporating colors sol in water, particularly tar colors, in the oil base Colors sol in the oil are also added

**Intaglio printing ink.** I G Farbenind A -G Brit. 339,733, Oct. 23, 1929 An ink suitable for printing on metal foils, celluloid, acetyl cellulose products, cellulose foils, paper, etc , comprises cellulose esters sol in EtOH such as acetylcellulose or nitrocellulose contg. 10 5–11 5% N, coloring matter and a solvent consisting of at least 70% EtOH but free from aliphatic homologs of 1,4-dioxane Various resins, pigments, oils, fillers, plasticizers, etc., may be added

**Ornamenting surfaces.** Helena S Sadtler. U. S 1,797,998, March 24 A film such as cellulosic material is secured to a base material and is covered with a layer of

water sol adhesive such as gum arabic and a protective layer such as varnish or lacquer overlying the base and film bearing a design imprinted on it in coloring matter which would be injuriously affected by the solvent of the protective film

Thick oils. Josef Sommer. Ger 517,506, Mar 27, 1929 Thick oils, such as lithographic or printing varnish are prepd by heating linseed, etc., oils in a vessel in an atm of indifferent gas and subjecting them during heating to tangential currents of superheated steam App is described

Varnish. I G Farbenind A.-G (Karl Daimler, inventor) Ger. 517,902, May 2, 1925 A varnish comprises an aq emulsion of resin in $NH_4$ salts of fatty acids, with or without addn of aq.-sol org solvents Thus, nerolenic acid and colophony are mixed with aq $NH_3$ and water Spirit, methylcyclohexanol, PrOH, etc., and coloring matter may be added Further examples are given

Varnishes, etc. Bakelite Corp Fr. 695,588, May 14, 1930 Solns. of resins having a basis of thiourea and $CH_2O$ are prepd by the reaction between thiourea and $CH_2O$ or paraformaldehyde free from water, in the presence of a solvent such as Et lactate The amt. of hardening agent used is such that a resin of the hardening type is obtained The reaction may be carried out in the presence of the mono-Et ether of ethyleneglycol.

Lacquers. I G. Farbenind A.-G Brit. 339,936, Aug 8, 1929 Lacquers with a base of cellulose deriv such as nitrocellulose are colored with alk earth metal salts of azo dyes contg sulfonic groups obtained by coupling diazotized nitroarylamines with acetoacetic acid arylides. Several examples are given

Esters of polysaccharide ethers. I G Farbenind A.-G Fr. 695,323, May 8, 1930 Cyclic carboxylic acids having more than 6 C atoms are caused to react on polysaccharide ethers with or without catalysts Thus, benzylcellulose is added to linoleic acid heated to 100° and contg a little $H_3BO_3$. Prolonged heating at 120–150° gives the linoleate of benzylcellulose. The products are used in the manuf. of lacquers and plastic masses Several examples are given

Coating compositions. Wm. E Smith. Fr 695,922, May 21, 1930 A coating compn. which is resistant to acids and chem agents consists of approx. pigment 45 and a carrier 55%. The pigment consists of asbestos fiber 28, Al silicate 44 and $BaSO_4$ 28 parts The carrier may consist of a mixt. of mineral asphalt, stearin pitch and petroleum asphalt, melted and reduced with naphtha to produce a quickly drying mixt. resistant to acids

Oily resinous products suitable for softening celluloid, casein, synthetic resins, etc. I G Farbenind A.-G Brit. 339,958, Aug 12, 1929 Esterification of the hydroxyl groups of aliphatic long-chain carboxylic acids contg OH groups in the chain, or esters of such acids with alcs such as castor oil, nerolenic acid or dihydroxystearic ethyl ester, is effected by heating with colophony or other natural resinic acid materials, either *in vacuo* or in a current of inert gas, with use of either acid or alk. condensing agents. Several examples are given

Resin acid derivatives. Chemische Fabriken Kurt Albert G. m. b. H. Fr 696,584, June 3, 1930 The acid is transformed into its anhydride and the crude anhydride treated with alcs., phenols, amines, amides, esters, etc. Several examples are given. Cf. *C. A.* 25, 710

Resin layers. Bakelite Corp. Fr. 696,754, June 6, 1930 Layers contg one or more resinoids are fixed to a metal or wood support by means of a cement obtained by treating rubber with $H_2SO_4$.

Paracoumarone resins. Edward H. Ellms (to Barrett Co.). U. S. 1,797,260, March 24. A paracoumarone resin is made contg Na sulfonates and $Na_2SO_4$, the sulfonate ash being greater than the $Na_2SO_4$ present as such and the total ash within the range of 0.3 to 1.9%. This product forms stable emulsions in water and oils such as "spindle oil."

Artificial resin coating. Compagnie française pour l'exploitation des procédés Thomson Houston Fr 695,951, May 22, 1930 An adhering surface coating forming a thin film is obtained with an alkyd resin reduced to a finely divided state and put in suspension in an inert volatile liquid and appropriately heated after application. Suitable liquids are $CCl_4$, kerosene and paraffin hydrocarbons or oils of the terpenic series

Synthetic resins. American Cyanamid Co Fr 695,424, May 10, 1930 Synthetic resins are made by heating a mixt. contg esters of a polyhydric alc. and a polybasic acid, stearic acid or palmitic acid or both and one or more unsatd. fatty acids. An example contains glycerol 100, phthalic anhydride 160, stearic acid 45 and distd. fatty acids from coconut oil 45 parts.

**Synthetic resins.** BAKELITE CORP Fr 690,390, June 2, 1930 Phenol resins or compns having a basis of phenol resins are made by first making a resin or compn. contg a free phenol, treating the resin with $Ca(OH)_2$ or an equiv base to transform the phenol into the corresponding phenolate, then mixing with the resinous mass obtained an amt. of $(CH_2)_6N_4$ or an aldehyde with equiv hardening action, with or without the addn of appropriate fillers Cf *C A* 24, 4945

**Synthetic resins.** BAKELITE, LTD Fr 697,207, June 12, 1930 In the manuf. of resins having a basis of urea and PhOH or their derivs or homologs, and an aldehyde, a solid polymer of the aldehyde such as paraformaldehyde or trioxymethylene is used The 3 constituents are preferably solid and heated to complete condensation The urea is in proportion considerably greater than the phenol and the reaction mixt. is maintained neutral or alk Cf *C A* 25, 1400

**Synthetic resins.** I G FARBENIND A.-G Fr 695,476, May 12, 1930 Neutral resins sol in oil are made by the reaction of mono- or poly nuclear hydrocarbon derivs, which contain one or more $ClCH_2$ groups, with aromatic hydrocarbons or their derivs contg at least one aliphatic or hydroaromatic side chain, or at least one phenolic OH group which may be alkoxylated Several examples are given

**Artificial resins.** THOMAS & HOCHWALT LABORATORIES, INC. Brit 340,001, July 16, 1929 See Fr 679,402 (*C A* 24, 3915)

**Synthetic resins.** BRITISH CELANESE, LTD Brit 340,101, Nov 17, 1928 BzH is condensed with an aromatic sulfonamide such as benzenesulfonamide or a toluene or xylene sulfonamide, and mixed products may be obtained by including in the reaction mixt other synthetic resin components such as formaldehyde, furfural, acetone, urea, phenol or aniline The condensation may be effected without a catalyst or with use of an acid, neutral or alk catalyst, and the products obtained may be used in cellulose ester or ether compns for forming lacquers, varnishes, plastic masses, etc., for making films, filaments or the like or as adhesives for manuf of laminated glass Pigments, natural resins, etc., may be added Various details and examples are given

**Synthetic resins.** BRITISH CELANESE, LTD Brit. 340,102, Nov 17, 1928 Products are obtained of generally similar character to those described in Brit 340,101 (preceding abstr.) and by a similar process except that furfural is used as an initial material instead of BzH

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**Lecithin retards hydrolysis of fats.** RALF B TRUSLER *Oil and Fat Ind.* 8, 141–3(1931).—In catalytic splitting of fats it was observed that glycerides from various sources behaved differently; animal fats could be split 90% in 10–18 hrs while crude vegetable oils showed no change for similar treatment By treating such oils with 5–7% of a 20% soln of $H_2SO_4$ or with 1–3% HCl, hydrolysis by means of a catalyst can then be effected This difference in behavior is explained by the presence of some compd which inhibits hydrolysis and is removed by the acid treatment. This also explains why a pretreatment with acid is necessary with the use of the Twitchell reagent. It is thought that the inhibiting substance is lecithin or a closely related substance. By incorporating lecithin with lard and then subjecting the latter to hydrolysis with a catalyst in the presence of oxalic acid for 6 hrs only 20% of fatty acids was produced E. S

**A stearin 80 years old.** J DAVIDSOHN. *Seifensieder-Ztg.* 58, 222(1931).—A stearin which had been kept for 80 yrs in a corked bottle showed the following characteristics: a rancid odor, disappearing when treated with 5% of Frankonite bleaching earth, a pure white color, acid no 209 5, sapon no 210 3, I no (Hanus) 7.05, unsapon matter 1 07%; it m 54°. P. ESCHER

**The Twitchell reagent for splitting fats. III. Influence of salt additions and of physical conditions upon the activity of the reagents now on the market and upon the color of the resulting fatty acids.** K. NISHIZAWA AND Y. MATSUKI. *Chem. Umschau Fette, Oele, Wachse Harze* 38, 73–8(1931).—See *C. A.* 24, 3915. P. ESCHER

**Twitchell reagent. IV. Influence of electrolyte additions on the colloidchemical properties of commercial fat splitters.** K. NISHIZAWA, R. ASADA AND B. SAKUMA. *Kolloid-Z.* 54, 334–40(1931).—See *C. A.* 25, 427. **V. Various influences on the colloidchemical properties of a new commercial fat splitter, Dilvulson D.** K. NISHIZAWA AND B. SAKUMA. *Ibid* 340–6.—See *C A.* 25, 612. ARTHUR FLEISCHER

**Testing and evaluating stearin pitch.** GG. SIEBERT AND E. BLENNEMANN. *Farben-Ztg* 36, 1090(1931).—The following tests should be applied to stearin pitch: presence of

wool fat or of asphalt, soly., viscosity of solns., drying rate and color, and character of film produced by baking at various temps. G. G. SWARD

Hydrogenation of oils in the presence of a catalyst prepared from nickel borate. L. L. UBBELOHDE AND H. SCHÖNFELD. *Allgem. Öl- Fettztg.* 27, 425–6(1930).—A catalyst prepd. by the reduction of Ni borate at 420–430° contained 47.4% $B_2O_3$. The free boric acids amounted to about 23%. The reduced Ni borate when cooled in the presence of $H_2$ was unaffected by atm. $O_2$. In the hydrogenation of oils it showed approx. 1/4 the catalytic activity of a Ni kieselguhr catalyst. On hydrolyzing and washing Ni borate with $H_2O$ it was possible to reduce the $B_2O_3$ content to 13.5%. This corresponds roughly to the $B_2O_3$ content of Ni metaborate. Reduction of this hydrolyzed Ni borate at 420–430° resulted in a product having about 3 times the catalytic activity of the originally reduced Ni borate. It was also unaffected by atm. $O_2$. It is suggested that it is possible to produce a borate of the same $B_2O_3$ content by the pptn. of a Ni salt with a mixt. of soda and borax. W. I. BOLLENS

Saponification values of highly colored oils. H. S. JOIS, B. L. MANJUNATH AND S. V. RAO. *Half Yearly J. Mysore Univ.* 4, 241–2(1930).—"The Albert method of detg. the sapon. no. of highly colored oils (cf. H. H. Coburn, *C. A.* 24, 2902) was applied to several oils and found to be very satisfactory." GEORGE CALINGAERT

The determination of inorganic impurities in sulfonated oils. R. HART. *Chem. Umschau Fette, Oele, Wachse Harze* 38, 81–3(1931).—Referring to Nishizawa-Winokuti's paper (*C. A.* 25, 426) H. discusses the development of his own method now official with the Am. Leather Chemists Assoc. which dets. indirectly the inorg. impurities from the % of ash, the original $SO_3$ and the alkali combined with soap, and gives formulas of calcn. in the presence and absence of $Na_2CO_3$ in the ash. When a sulfonated oil is washed with concd. $Na_2SO_4$ the originally combined $H_2SO_4$ is more completely neutralized than with NaCl and the oil is then the least sol. of all its forms. P. FISCHER

The composition of linseed oils, obtained by different methods and stored under different conditions. K. H. BAUER AND A. FREIBURG. *Chem. Umschau Fette, Oele, Wachse Harze* 38, 78–80(1931).—Three La Plata linseed oils were obtained from one lot of seeds of 1927 by cold pressing, warm pressing and by benzine extn. Their "consts." did not vary greatly, but in the drying tests the cold pressed oil dried more rapidly and completely than the others, the warm pressed oil being the slowest. The 3 oils were exposed to diffuse daylight and sunlight in well stoppered bottles for 1 yr. and again tested. The drying tests showed the 3 oils in the same order as before, but the total time was very much shortened. The complete analysis by the Eibner-Schmidinger method (*C. A.* 18, 1211) of the fresh oils and the stored oils gave such contradictory results, that no definite conclusions could be drawn, the same is true when they were analyzed by Kaufmann's thiocyanate method and no conclusive relationship could be established. The only definite result is a change in the oils by exposure to light, not measurable by chem. means. P. FISCHER

Thiocyanometric analysis of soy-bean oil. H. P. KAUFMANN. *Allgem. Öl- Fettztg.* 27, 325–7(1930).—The fatty acid constituents of oils from various varieties of soy beans were detd. The satd. and unsatd. acids were sepd. by both the Twitchell and Bertram methods. The individual unsatd. acids were detd. by the thiocyanate method of K. Crude and refined oils from Manchurian soy beans gave, resp.: satd. acids 15.1, 15.7, oleic acid 21.1, 25.7, linoleic acid 54.5, 50.9, linolenic acid 8.1, 7.0, unsaponifiable 1.2, 0.6. Oils from Am. soy beans and so-called Am. "giant beans" gave, resp.: satd. acids 15.0, 14.7, oleic acid 24.55, 24.6, linoleic acid 53.3, 50.2, linolenic acid 6.4, 9.9, unsaponifiable 0.65, 0.57. W. F. BOLLENS

Properties and composition of sandal-seed oil. M. SREENIVASAYA AND N. NARAYANA. *Proc. 15th Indian Sci. Congr.* 1928, 160.—Sandal seeds contain 50–55% of a thick viscous oil. On exposure to light, the oil spontaneously thickens to a resinous mass, at 130–40°, S is absorbed and a plastic rubber-like compd. formed. On sapon. with alc. potash a white resinous mass is thrown out which has a very high I no. Another extd. oil has the following consts.: $n^{30}$ 1.4790, $d_{30}$ 0.9304, I no. 130–140, sapon. no. 185–195, acid no. 20–25, Hehner no. 96.97, Richert Meissel no. 1.5, Polenske no. 0.2–0.3. The mean mol. wt. of the mixed fatty acids is 288.5. E. J. C.

The hardening of linseed oil at very high hydrogen pressure. H. I. WATERMAN AND J. A. VAN DIJK. *Rec. trav. chim.* 50, 279–82(1931).—In these expts., Ni pptd. on kieselguhr was used as a catalyst (cf. Waterman, *Het harden van oliën* 5(1921)), the hardening being carried out in the rocking autoclave described previously (Perquin, *Diss. Delft* 1929) with an initial H pressure of 100–195 atm., and at temps. varying from 35° to 70°. Some of the hardened fats had a pungent odor, strongly resembling that of acrolein but after treatment with water vapor in a vacuum at 150° complete deodorization took

place For comparison the results of a no of expts. with the same linseed oil raw material at ordinary pressure in Normann cups at a max. temp. of 180° are also given A comparison of both sets of figures shows that the hardening at high pressure proceeds in an entirely different manner from that at ordinary pressure, the former especially resulting in the formation of satd fatty acids. The fats hardened to the same I no contain more satd fatty acids on hardening at high pressure and show a higher m. p., while the SCN I no is lowered more in the beginning Consequently at high-pressure hardening a smaller quantity of H is needed to obtain fats of a definite m. p. C. F VAN DUIN

**Recent developments in the fish oil and fish meal industries.** H M. LANGTON. *Food Manuf* 6, 109–13(1931) E H

**The chemistry of liquid soaps.** H POMERANZ. *Seifensieder-Ztg.* 58, 220–1(1931).—The transparency of solid and liquid soaps is due to the soly of the $C_6$ to $C_{18}$ fatty acids (in coconut oil), to hydroxy acid (in castor oil) and to sulfonated acids P ESCHER

**Washing effect of unfilled soap.** C. F. GOHRING *Dyestuffs* 31, 52–6(1930).—The theory of detergents is discussed, as well as soap concn., temp., hard water and the germicidal properties of soap CHAS E MULLIN

**The influence of lead soaps on the Mackey test.** H WOLF AND R. HERLINGÖTTER. *Allgem Öl Fettztg* 27, 407–8(1930).—Oleic acid, free from metallic soaps, after being heated in a Pb container for 20 hrs at 80–90° contained 1% of Pb The same oleic acid, allowed to stand in a Pb container at room temp for 4 weeks, contained 0.39% Pb The addn of 1% of Pb in the form of Pb oleate to an oleic acid not spontaneously combustible in the Mackey app causes it to become so The addn of 1% of Pb to an oleic acid contg 5% of linseed oil increased its spontaneous combustibility in the Mackey app W F BOLLENS

**Determination of sodium silicate in washing compounds.** M DITTMER *Seifensieder-Ztg* 58, 168–9, 185–6(1931).—D criticizes the Wizöff standard method which first filters the hot aqueous soln of the sample, D decomposes the sample with acid without first filtering, fearing that filtering might remove some $SiO_2$ which may have become insol D further proposes the formula $Na_2Si_4O_7$ for calcn in place of the present $Na_2Si_4O_9$ P ESCHER

**The Marwa process.** O UHL. *Seifensieder Ztg* 58, 167–8(1931).—The Marwa washing process of E Walter launders in a washing machine with fatty acids plus an excess of $Na_2CO_3$ in place of normal soap U finds no advantage in this method P. ESCHER

**Evaluation of creolin.** P KARSTEN AND D VAN OS. *Pharm Weekblad* 68, 295–303 (1931).—Methods for the analysis of "creolin," a soap emulsion of crude phenols, are discussed A W DOX

**Sulfonated wetting and cleansing agents and related products.** CHAS. E MULLIN AND ROSS M STRIBLING *Textile Colorist* 51, 367–71(1929), *Textile Recorder* 48, No 571, 65, No 572, 61, No 573, 63–5(1930), cf. *C A* 24, 5522.—A review of the patents covering the manuf and uses of the sulfonated aliphatic oils, including the mineral oils, halogen substituted sulfo acids, etc CHAS. E. MULLIN

**The manufacture and constitution of the new wetting-out and emulsifying agents.** CHAS E MULLIN AND ROSS M STRIBLING *Textile Colorist* 51, 655–8(1929).—A review of the patents covering the manuf of wetting, cleansing and emulsifying agents of the aromatic type, such as the compds of $C_{10}H_8$, mineral oils, ethers, resins, proteins, phenols, etc. CHAS. E MULLIN

**Various applications of the wetting-out agents.** CHAS. E MULLIN AND ROSS M. STRIBLING *Textile Colorist* 51, 727–30, 807–10(1929).—A review of the patents covering the use of wetting agents in wetting, scouring, bleaching, mercerizing, dyeing, carbonizing, fulling, spinning, desizing, retting, rayon manuf., polishing and cleaning mixts., dyestuff manuf., inks and paints, absorbents, emulsifiers, etc CHAS. E MULLIN

**Oils and fats.** I. G FARBENIND A.-G Fr 696,707, June 6, 1930. Oils and fats are freed from mucilaginous substances by heating them with sulfonic acids of org compds or their salts Examples are given of the use of β naphthalenesulfonic acid

**Bleaching fatty acids from marine oils.** ARNE GODAL. Ger. 520,475, Jan. 27, 1926. The acids are freed from impurities coagulable by $H_2SO_4$, and are then treated in the dissolved state with up to 5% of concd $H_2SO_4$ at 15–20°. Further bleaching with an adsorbent may follow. Cf. *C A*. 24, 983.

Apparatus for extracting oil from bleaching earths, or for filtering. PHILIPP L. FAUTH Ger 520,169 Jan 8, 1927. See Brit 283,216 (*C. A.* 22, 4001)

Apparatus for distilling and recovering solvents used in oil extraction. LOUIS J. SIMON AND SIMON BROTHERS (ENGINEERS), LTD Ger 520,396, June 22, 1927 Brit 278 815 (*C A* 22, 2851)

Solvents and emulsifying agents. MENDEL BURAK. Fr. 697,102, June 5, 1930 Solvents and emulsifying agents for fatty materials and mineral oils are made by adding olein or its equivs to a mixt of soaps or soap equivs such as aromatic or hydroaromatic sulfonic acids or their salts, with ales of high mol wt Examples are given

Glycerol. HENKEL & CIE G M B H Ger 519,470, Oct. 15, 1927. Glycerol recovered from waste soap lye is purified by treatment with aldehydes or ketones in the presence of a small quantity of mineral acid, whereby liquid glycerol aldehyde or -ketone condensation products are formed which do not dissolve the saline impurities in the glycerol After sepg the pptd salts, the condensation products are decompd., *e. g.*, by boiling with water Examples are given Cf *C A* 24, 5044

Soap HENKEL & CIE G M B H Ger 520,090, Mar 24, 1928 Fatty acid glycerides are saponified by heating them with alkali carbonate soln to about 100° in the presence of a small quantity of a catalytic fat splitter, *e. g.*, an alkylnaphthalenesulfonic acid Emulsifying agents may be included in the mixt An example is given Cf *C A* 24, 3670

Soap. HEINRICH SCHMIEG and ROTHENBURGER SEIFEN- UND ÖLFABRIK SCHMIEG & SCHEIB G M B H Ger 521 478, Nov 24, 1928 Soap prepd by a cold process is cooled in a machine of the kind used for cooling curd soap The cooling water is run out of the machine, and the soap soln is then poured in Cooling water is not supplied to the machine until the evolution of heat due to the reaction has ceased

Soap. FEDERICO JAACKS-BALLESTER Swiss 143,405, June 5, 1929 A soap for cleansing and softening the skin even when stained with tar, lubricating oil, etc., consists of water, cacao butter, NaOH, KOH and corn $C_6H_6$

Soap. GEORGES M M GUIOT. Fr 696,978, May 17, 1930 A soft soap is made by mixing ordinary black soap with powd $CaCO_3$ and adding, with stirring, a satd soln of $Na_2CO_3$ in repeated amts

Machine for pressing and cooling soap SIMON A.-G Ger. 516,654, April 4, 1928

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

Short review of the most important work in the chemistry of carbohydrates for 1929. P P. SHORUIGIN *Zhurnal Sakharnoi Prom* 4, 413–27(1930) —A review V. E BAIKOW

Notes on the economic production of sugar. WILLIAM E. CROSS. *Rev ind agr Tucumán* 20, 105–14(1929–30) —C. discusses selection of suitable ground, prepn. of the plantation and cane selection, methods of cultivation, fertilizers, watering, harvesting, cane transportation, factory control, grinding, losses in crude juice due to fermentation, defecation, decantation, evapn crystn., refining, class of sugar most desired, losses, chemicals, fuel economy and by products S L B ETHERTON

Errors which disturb chemical control of the sugar factory. WM E CROSS *Rev ind agr Tucumán* 20, 120–3(1929–30) —C discusses errors in the detn of sugar entering, of sugar extd., wt of sugar cane water of imbibition, cane fiber, sugar yield, sugar retained, plant efficiency and sugar losses, and he gives an extensive list of the effects of errors on values directly detd and on calcd values in chem control work S. L. B. ETHERTON

Mechanical refrigeration in the sugar industry. CHARLES DOMBITSKY *Refrigerating Eng* 20, 354–7(1930) —The manuf of sugar from sugar beets is described. Refrigerating processes are of importance in recovering sugar from molasses A. H. JOHNSON

Colloids of a diffusion juice. A V. DUMANSKII *Zhurnal Sakharnoi Prom.* 4, 427–42(1930) V E B.

Centrifugal pumps for sugar liquids. M G EFIMOV AND I I. EGOROV *Zhur. Sakharnoi Prom* 4, 450–8(1930) V. E B

The action of sulfides on filter cloth. O SPENGLER. *Deut Zuckerind* 56, 17–8 (1931) —A discussion J. F. LEETE

**The results of experiments on continuous vacuum pan of the Zuev-Vostokov system.** V. I Kolpakov and B A Burdakov *Zhurnal Sakharnoi Prom* 4, 458–60(1930) —The app for continuous boiling represents a combined vacuum pan and crystallizer If this app is compared with vacuum pans there is not much advantage in heat transmission, but there is higher efficiency, decrease in labor and economy of steam V I Baikow

**Effect of preliminary liming on the juice work and on the quality of the sugar.** F Naehring *Deut Zuckerind* 55, 1353(1930) —Lab tests on the Teatini process (*C A* 24, 5529) showed that prelming of diffusion juice with 0.15–0.2% CaO improves the quality of the juice, but that addn of $SO_2$ at this stage causes no further improvement On the basis of this observation, 40 l of milk of lime was added in the factory in each juice measuring tank, and the prelimed juice passed through the heaters This gave a juice of yellow color, with a quick settling, dirty green ppt, consisting of large flocs The alky was 0.030% CaO The juice was then further treated as usual, but with only 1.5% and later 1.25% CaO, instead of the usual 1.75% With the new method, the color of the juice increased only 1.65° Stammer from the 2nd presses to the 4th effect, while with the old method the increase averaged 5.93° In factories using only fresh water in the diffusion battery the CaO may be reduced even further to 0.75–1%, instead of 1.25%, with 0.20% for the prelming The quality of the sugar compared favorably with that obtained by the Teatini process Other favorable effects of N's process will be reported later I W Zerban

**The effects of sediment during digestion and evaporation of sugar juices.** Jos Hamous *Listy Cukrovar* 49, 108(1930) Stanek and Pavlas (*C A* 23, 4388) showed that if the coned and satd solns are not filtered before digestion more Ca remained in suspension than if the same liquors were filtered before the digestion H carried out his expts on a com scale Unfiltered liquor from the first satn was passed through a heat interchanger until 96° was attained, pumped into liquors awaiting second satn, satd during the usual second satn and filtered The filtrate was coned at 102° and filtered again The process involved only 2 filtrations The above procedure was used throughout the entire 1930 season Compared to previous seasons, the heat interchanger was free from incrustations (more Ca remained in suspension in unfiltered liquors) One filtration process was saved without interrupting the manuf or decreasing the quality of the product Better results were obtained by a single filtration of the coned liquor than from 3 filtrations of liquors before evapn F. M

**The effect of Atlacide on Aegineta indica.** Julian A Agati and Jose P. Tan, Bureau of plant industry (Manila, P I), *Sugar News* 12, 82–9(1931) —Aegineta indica on sugar cane. Manuel L. Roxas *Ibid* 89–91 —The application of the weed killer Atlacide in a manner similar to that of fertilizer is effective in destroying *Aegineta indica*, which is becoming more and more dangerous in the sugar cane regions in the P I. V. G Lava

**Filterability of raw cane sugars. I. Effect of various factors prior to pan-boiling.** J C Krant and H G Hill *Ind Eng Chem* 23, 421–4(1931) —Poor filterability of sirups and sugars is closely assocd with the quantity of suspended matter So far no satisfactory method has been found to det filterability except by actual filtration tests Pulverized raw sugar shows a much higher filtration rate than the original sugar. The filtration rates of sirup and of the resulting sugar were greatly improved by adding 0.008 g $P_2O_5$ to each 100 cc of raw juice before liming The total $P_2O_5$ content of raw juice is no criterion as to whether such juice requires further addn of $P_2O_5$ to obtain good clarification, because evidently the $P_2O_5$ may be only partly in available form *II. Effect of pan boiling operations* *Ibid* 424–7 —The filterability of sugars is affected not only by that of the sirup from which it is made, but also by pan boiling operations The principal factors in the latter class are pan circulation, design and manipulation F. W. Zerban

**The removal of some of the soluble aliphatic salts of calcium during saturation.** T Nemes *Z Zuckerind. Techoslovak Rep* 55, 159–62(1930), *Listy Cukrovar* 49, 315–8(1931) —Expts were conducted to det whether other Ca salts besides Ca formate were adsorbed and removed from soln by $CaCO_3$ A definite quantity of fatty acid (insufficient to exceed the soly. of its Ca salt), together with the corresponding wt of CaO, was placed in a 200 cc flask, which was then filled to the mark at room temp The soln was heated to 85° and satd with $CO_2$, cooled to room temp and again made up to the mark The quantity of $H_2O$ displaced by $CaCO_3$ was calcd and this amt was added After filtration 50 cc of the soln was used for the detn. of the Ca salt as follows: The free lime was titrated with 0.1 *N* HCl against methyl orange, and the total lime was detd by pptn as oxalate and conversion to sulfate. The difference

gave the lime in combination with fatty acid and from this value the adsorbed Ca salt of the fatty acid was calcd It was found that the adsorption of Ca salts by $CaCO_3$ was greater with acids of higher mol wt, *i. e.*, formic, acetic, propionic, isobutyric, *caproic* and valeric The results for caproic, which has a higher mol. wt than valeric (and should, therefore, follow it), cannot be considered accurate because of the impossibility of thorough satn with $CO_2$ on account of foaming J. F. Leete

Determination of natural alkalinity and calcium salts. I. B. Mintz and I I Shorkhet *Nauk Zapiski Tzukrovoi Prom* 10, 131–7(1930) V. E. B

Optimum alkalinity and calcium salts. S S. Afanasenko *Nauk Zapiski Tzukrovoi Prom* 10, 42–50(1930) V. E B.

Calcium salts in juices and products of beet-sugar fabrication. I Levin *Nauk Zapiski Tzukrovoi Prom* 10, 17–23(1930). V. E B.

Determination of the sugar losses in the filter-press cakes, following the ordinary and Shapiro's methods. I I Shorkhet. *Nauk Zapiski Tzukrovoi Prom* 10, 14–7 (1930) V. E B

Foam pressure as a measurable quantity. K. Schiebl. *Chem.-Ztg* 55, 169–70 (1931) —The fact that in the satn of batches of limed beet sugar sirup with $CO_2$ the end point of desired $p_H$ is estd by observing the height of the foam led to a study of the variations of this height during the process. The total head of liquid and foam at various levels, from the bottom of the vessel to the upper limit of foam, was measured by an app in which the hydrostatic pressure was transmitted through air-vessels to manometers At the bottom, the head remains const. throughout the process. At the level of the non foaming liquid, the head rises from zero at the start to a const. value which continues until near the end and then falls to a final value characteristic of the end point in a given vessel Above this level, positive pressure is observed early in the process (as soon as the foam rises) and follows a curve similar to the above. Thus the process can be controlled by 2 manometers, one at the bottom to indicate the proper amt of charge and one at the quiet level of liquid to indicate the end point pressure. The operation can be made automatic, and the same principle can be applied to a continuous satn process I. H. Odell

Rendering the diffusion juice alkaline when working with dried beet cossettes. O Spengler and N. Loginow. *Z Ver deut Zuckerind* 81, 107–18(1931) —Diffusion expts were carried out with dried beet chips in a lab diffusion battery with (1) tap water, (2) water + lime and (3) water + soda Conclusions: (1*a*) With tap water the $p_H$ falls continuously from the first to the last cell of the battery. (1*b*) The amt of invert sugar, % sucrose, increases in the course of the diffusion process by about 40% (2*a*) On the addn of 0.1% CaO or 0.2% $Na_2CO_3$ (calcd on fresh beets) equally distributed among the cells of the battery, an almost neutral ($p_H$ 6.9) diffusion juice of normal purity is obtained (2*b*) The invert sugar, % sucrose, in the juice obtained is practically equal to that in the dried cossettes (3) The relative viscosity of the juices rendered alk. is higher than for the same juices without alkali addn by some 14% for the 0.1% CaO treatment and by 8% for the 0.2% $Na_2CO_3$ method By the addn of alkali to the diffusion battery invert sugar formation is practically completely stopped The addn of lime to the extent of not over 0.1% on fresh beets is recommended By the addn of too much alkali the risk is incurred of making the exhausted chips unfit for fodder, *e. g.*, 0.2% CaO gave dirty greenish exhausted chips, while 0.5% $Na_2CO_3$ gave sticky chips of normal color F Camps-Campins

Calculation of production in raw sugar factories and refineries (beet). J. Hamous. *Z. Zuckerind Techoslovak Rep* 55, 120(1930) —*A discussion with computations* J. F. Leete

## 29—LEATHER AND GLUE

ALLEN ROGERS

A new and improved method of moisture determination and its application to leather. A. COLIN-RUSS. *J. Intern. Soc. Leather Trades' Chem.* 15, 113–26, 166–82 (1931).—An app. is described wherein leather is heated in a tube surrounded by vapor

of a boiling liquid, and the $H_2O$ evolved from the leather is allowed to react with $CaC_2$ forming $C_2H_2$ which is collected over Hg and measured A blank on the $CaC_2$ is indispensible For standardizing the procedure, numerous hydrates and liquid $H_2O$ were used, the latter, as well as Glauber's salt, give up their $H_2O$ so rapidly that the reaction with $CaC_2$ is incomplete, borax and gypsum are not completely decomposed at 100°, $(NH_4)_2C_2O_4 \cdot H_2O$ gave the theoretical yield of $H_2O$, and the time gas volume curve is that of a monomolecular reaction With leather of heavy vegetable tannage, it was found that the percentage water obtained by the method is almost independent of the reaction temp *(controlled by suitable choice of surrounding solvent vapor)* over the range from 61 5° to 133 5° 12 6% at 61 5°, 13 1% at 76 5° 13 8 at 100 5°, 13 05 at 133 5° Time required to complete the reaction decreased as temp increased Degree of subdivision of the sample is practically without effect In a sumac tanned leather, which showed marked contraction at 100°, percentage $H_2O$ obtained by the method decreased from 13 9% at 61–74° to 10 3 11 0% at and above 100°, the decrease indicating that the contraction involves fixation of $H_2O$ Comparative results on 4 leathers by the carbide and by the oven drying methods showed that the former always gives lower results the difference varying from 1 45% for Cr tanned calf to 6 03% for heavily curried vegetable cowhide Good agreement was obtained between results yielded by the carbide method and those obtained by very prolonged desiccation over $H_2SO_4$, except in the case of the abnormal sumac leather H B Merrill

Salt stain in the manufacture of leather. P White and F. G Caughley *New Zealand J Sci Tech* 12, 108–13(1930).—Lab scale tests show that the growth of the halophyllic organism responsible for "red heat" of hides is inhibited in media and on skin by adding 0 5–1 0% NaF or $Na_2SiF_6$ to fresh curing salt. With used curing salt, the fluorides were not effective Fluorides appear to cause unusual shrinkage of hide during curing, the effect largely disappears after liming Practical tests are projected H B Merrill

Deliming and bating. E Stiasny *Schweiz Leder-und Ztg* No 25 (1929); *J Am Leather Chem Assoc* 25, 46.—The theory of deliming and bating is discussed The most important role of trypsin is believed to be that of producing a partial peptization of the collagen fibers This action is more marked in the presence of chlorides than in the presence of sulfates, for this reason $NH_4Cl$ is preferred to $(NH_4)_2SO_4$ The activity of the bate falls off rather slowly on the alk. side of the optimum $p_H$ range *(which is from 7 5 to 8 5), being little less at $p_H$ = 10 than at 8 5, at $p_H$ values lower* than 7 5 the decrease in activity is more marked H B Merrill

High tannin yield from South African gum trees. G Smith *Shoe and Leather Reporter* 179, No 6, 16(1930); *J Am Leather Chem Assoc* 25, 427.—The bark of *Eucalyptus astringens* has been found to contain 33–44% tannin The rate of growth is rapid enough to justify com culture H B Merrill

Theory of chrome tanning. K. H Gustavson. *J. Tech Assoc Fur Ind* 2, 7-26 (1931).—A review H B Merrill

Camphor as a preservative for tan liquors. P. D Dalvi *Proc 15th Indian Sci Cong* 1928, 154.—*Aspergillus niger* and certain other fungi constantly found in tan liquors bring about a reduction in the tanning value of the liquors because of the fermentation of the tannic acid induced by the organism The action of various disinfectants or preservatives in diminishing this loss has been investigated, and of those tried camphor seems the most promising, since it is efficient in small quantities and without harmful effect on the activity of the liquor E J C

The washing and utilization of chrome leather shavings. E. Sauer and W. Eschmann *Kolloid Z* 54, 326–34(1931).—The raw material showed the following analysis $H_2O$ 14 8, *ash* 10 7, $Cr_2O_3$ 5 9 *and* N 11 8% Tests on the extn of $Cr_2O_3$ were made at 20° and 30° with 0 5–10% $H_2SO_4$, treatment with 1% alkali before $H_2SO_4$ treatment, treatment with lime and subsequently HCl, and treatment with dil $H_2O_2$-NaOH soln The highest extns (93%) were with pretreatment with NaOH and subsequent $H_2SO_4$ extn. and with the $H_2O_2$-NaOH solvent A dark-colored glue may be extd from the residue A F.

Level dyeing in leather. Walter C Durfee *Dyestuffs* 31, 125–7(1930) Chas. E. Mullin

Glues and gelatins—varied applications. J C Kernot *The Times Trade and Eng Suppl.* 28, No 664, 24 (1931).—Examples of uses are given. E M. S

---

**Leather.** ALBERT J DUCAMP and CHARLES F A GUÉNOT Fr 696,252, Sept 9, 1929 The hardness and resistance to wear of leather is increased by introducing into the leather chem substances having the character of anti-catalysts such as cyanides, particularly $Hg(CN)_2$, or organometallic compds such as $PbI_2$, $PbI_2Ph_2$ and Fe carbonyl, or phenols such as resorcinol or their derivs The catalysts are used in soln in appropriate solvents

**Stretching and drying skins, hides, etc.** THE LEATHER MAKERS PROCESS CO Ger 516,568, Feb 18, 1930

**Stretching and drying hides.** MACHINERY DEVELOPMENT CO Ger 516,569, Jan 8, 1929

**Tanning.** CHARLES L MAYER Fr 696,254, Sept 10, 1929 Acrolein in the form of vapor or in soln in animal, vegetable or fish oils is used for tanning leather, etc Fr 696,255 describes the tanning of leathers by treating them with phenolic compds (phenols cresols, naphthols etc) and aldehydic compds ($CH_2O$ AcH, acrolein, etc.) in succession The products may be used in soln in animal or vegetable oils or fats

**Tanning.** OTTO RÖHM Ger 520,091 June 21, 1927 $H_3PO_4$ or $H_3AsO_4$ or salts or esters of these acids are added to mineral tanning baths Examples are given

**Tanning agent.** OSKAR A MÜLLER Ger 510 267, Feb 10, 1929 Ligneous cellulose materials are chlorinated while moist and then extd with a water sol org solvent, *e g* EtOH, in the presence of a strong mineral acid The ext is freed from chlorolignin by pptg this with water, and the org solvent is removed by distn The tanning agent can then be extd from the aq residue with AcOEt, or pptd therefrom with $Ba(OH)_2$

**Tanning and cleaning agents.** RÖHM & HAAS CO Fr 696,327, May 30, 1930 Compds formed by condensing a phenol with an aldehyde in the presence of a small quantity of acid as catalyst are afterward condensed at high temps with an unsatd fatty acid having 10 or more atoms of C, such as oleic acid, and the resin obtained is sulfonated to obtain a product sol in water The products are useful for tanning, cleaning, emulsifying, wetting, mordanting, as penetrating agents for acid coloring materials and as dispersing agents for dyes

**Detanning chrome-tanned leather.** HENKEL & KRAUSE, CHEM FAB G M B H (Erich Krause, inventor) Ger 521,477, Nov 11, 1928 The leather is treated with alk. reacting borates, or with alk reagents in the presence of sol borates The Cr compds are then extd with acid. Examples are given

**Dressing for leather.** E I DU PONT DE NEMOURS & CO Fr 696,523, May 23, 1930 A dressing for leather contains a cellulose deriv such as the nitrate or acetate, a wax, a softening agent, a solvent and a diluent. An example contains cellulose nitrate of high viscosity 1 7, dibutylphthalate 0 8, carnauba wax 1 7, $TiO_2$ 3 3, AcOEt 15 5, AcOBu 10 3 and alc 66 7%. Other examples are given

**Preserving bone material.** BRITISH GLUES & CHEMICALS, LTD., and R B DREW Brit 340,010, Sept 7, 1929 Fresh bones are subdivided as by cutting into shavings, followed by drying, and, before drying, may be extd with a solvent such as water contg NaCl to remove blood, fat-splitting enzymes and other undesirable constituents An app and various details of operation are described

**Transparent gelatin, etc., layers.** GEBRÜDER KLOTZ Ger 516,586, Feb 6, 1926 Transparent foils of gelatin are toughened by coating with transparent rubber

**Working up animal wastes, etc.** GUSTAV HÖNNICKE Ger 516,819, Dec. 28, 1928 The waste is treated with super heated steam to ext sol matter and glue The ext is treated with a pptg agent to ppt the extd matter and the glue, which may be then added to the solid residue remaining after extn

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

**The plasticizing of rubber.** F. JACOBS *Rev. gén caoutchouc* 8, No. 69, 17–27 (1931), cf *C A.* 25, 1705.—A review and discussion of the properties of gutta resins, various pine products and fatty acids. C. C. DAVIS

**Hard rubber—its main applications.** T. R. DAWSON. *The Times Trade and Eng. Suppl.* 28, No. 664, 18(1931). E. M. SYMMES

Organic rubber colors. F. Harris Cotton *India Rubber J.* 81, 413–4(1931); cf *C. A.* 25, 1117.—A general discussion, with 21 references C. C. Davis

Stretch in rubber transmission belting. C. W. Staacke. *Proc Am. Soc. Testing Materials* 30, Pt II, 944–56(1930).—The expts were made to det the proper inelastic stretch to remove from belting contg a given fabric during the vulcanization process C. C. Davis

A study of the performance characteristics of a 4-inch 4-ply rubber transmission belt. J. E. Skane *Proc Am Soc. Testing Materials* 30, Pt II, 928–43(1930).—The tests were made to det the performance of the belt under varying loads, speeds and slips. C. C. Davis

Substitutes for natural rubber—difficulties of synthetic process. Henry P. Stevens. *The Times Trade and Eng. Suppl* 28, No. 664, 26(1931).—A review E. M. Symmes

Synthetic rubber. Ernst Kleiber *Kunststoffe* 20, 5–6(1930).—A review. B. H.

---

Distillation products of polymeric hydrocarbons (Fr. pat. 696,812) 10.

---

Rubber. Albert C. Burrage, Jr. Fr. 697,090, June 4, 1930. Oxidation or aging of vulcanized rubber is prevented or reduced by substituted nitrosoamines such as *diphenylnitrosoamine, phenyltolylnitrosoamine, di α naphthylnitrosoamine*, etc.

Porous rubber. K. D. P., Ltd. Ger. 521,307, Mar. 31, 1928. Latex is converted by mech. means into foam, if desired with the aid of a foaming agent, and the foam is vulcanized. Thus, a mixt. of latex, S, ZnO and an accelerator may be agglomerated with $(HCOO)_2Ca$ soln. and the mass beaten to a stable foam after addn. of saponin. The foam is charged into molds and vulcanized.

Rubber latex. I. G. Farbenind. A.-G. Ger. 519,483, Nov. 12, 1926. Salts of true sulfonic acids having good wetting properties are used as preservatives for rubber latex, alone or with other preservatives. The salts may be used also as assistants in the *impregnation of fabrics, cork, paper, etc.*, with latex. Examples are given.

Coagulating latex. Metallges. A.-G. Fr. 695,786, May 17, 1930. Latex is coagulated by adding substances which do not on addn., have a thickening or coagulating action, but which on a change of phys. conditions such as change of temp. introduce substances which have a coagulating action in an amt. sufficient for the coagulation of the latex. A complex salt which gives a coagulating ion on dissocn. by heat, a salt which dissoc. on heating to give an acid, or a coagulant protected by a layer of inert adsorption substance which is removed by heat may be used.

Rubber inner tubes from latex. Edwin B. Newton (to American Anode, Inc.). U. S. 1,797,240, March 24. Various details are described of uniting valve pads of masticated rubber to wet coagulated tubes, pressing, drying and vulcanizing.

Electrodeposition of rubber, etc. The Anode Rubber Co. Ger. 520,323, April 30, 1926. See Brit. 253,085 (*C. A.* 21, 2438).

Preserving rubber. Marion C. Reed (to B. F. Goodrich Co.). U. S. 1,797,241, March 24. An addn. product of an aromatic nitro compd. such as dinitrochlorobenzene with a secondary aromatic amine such as phenyl β naphthylamine is added to rubber compns. as a preservative (suitably in the proportion of about 0.5%). Various other examples are given also. Cf. *C. A.* 25, 2331.

Rubber preservation against aging. P. C. Jones (to B. F. Goodrich Co.). Brit. 339,834, Jan. 21, 1929. Aging is retarded by adding tetrasubstituted hydrazines (several of which are mentioned as suitable) to latex, to rubber before vulcanization or to the surface of rubber after vulcanization. Some description of the manuf. of these preservative substances also is given. Cf. *C. A.* 25, 617.

Rubber dispersion. Waldo L. Semon and Richard A. Crawford (to B. F. Goodrich Co.). U. S. 1,797,243, March 24. A mixt. of rubber 100, benzene 10–100, glue 1 and casein 1 part is masticated while slowly adding an aq. soln. of K oleate until the rubber constitutes the dispersed phase of the batch. The product is suitable for use as a cementing medium. Cf. *C. A.* 24, 2918.

Filtering apparatus suitable for filtering rubber dispersions. Andrew Szegvari and Charles M. Spencer (to American Anode Inc.). U. S. 1,797,248, March 24. Structural features of an app. having a filtering material such as a textile fabric strip.

Apparatus for making spongy articles from organic dispersions. The Dunlop Rubber Co., Ltd., and The Anode Rubber Co., Ltd. Fr. 696,176, May 27, 1930.

Coloring rubber, etc. I. G. Farbenind. A.-G. (Arwin Ranft, inventor). Ger. 506,207, Nov. 14, 1924. Addn. to 462,221. Natural or synthetic rubber, gutta percha

or balata is colored with water insol vat, sulfur or azo dyes or lakes by incorporating in the rubber, etc., an aq soln of the leuco compd or other sol. modification of the dye, or an aq soln of the dye or lake components, and then converting the leuco compd., etc., into the insol dye or lake in known manner Examples are given Cf. *C. A.* 25, 2021, 2331

**Light rubber board.** Dunlop Rubber Co., Ltd., and E. W. Madge Brit. 340,024, Sept 19, 1929 Light rubber board suitable for use in airplane and speedboat construction comprises one or more porous layers of hard rubber (obtained from aq dispersions) sepg 2 or more layers of metal, ebonite, ebonite-coated metal, fabric-reënforced ebonite or ebonite-impregnated fabric or "doped fabric" or plywood The aq dispersions used may contain rubber, gutta-percha, balata and similar vegetable resins, natural or artificial, vulcanized or unvulcanized, etc Various details of manuf are described

**Forming rubber tubes suitable for use as tire inner tubes.** Ernest Hopkinson and Willis A Gibbons (to Morgan & Wright) U S 1,797,580, March 24 An aq dispersion of rubber is placed in contact with a surface of a tubular form of fibrous material such as woven fabric and fluid from the dispersion is withdrawn through the form to deposit solids from the dispersion in tubular shape on the form, the thickness of the deposit adjacent to its ends is gradually reduced to form skived ends, the deposit is dried and removed, and its skived ends are united App is described, as are also various compns used

**Rubber threads.** Dunlop Rubber Co., Ltd., W G Gorham and E A Murphy Brit 339,676, Sept 13, 1929 Threads are made by cutting an unvulcanized sheet which may be produced directly from latex, and vulcanization is then effected (after skeining, if desired) The sheets may be made, from a dispersion prepd as described in Brit 290,313 (*C A* 23, 1012), by the method described in Brit. 302,201 (*C A* 23, 4375)

**Stiffening and impregnating fibrous materials such as "shoe socks."** Dunlop Rubber Co., Ltd., D F Twiss and E. A Murphy Brit 339,974, June 18, 1929 Shaped cellulosic or other fibrous products such as shoe socks are treated with the foam obtained by whipping up aq dispersions such as those of rubber which may be prepd as described in Brit 332,525 and Brit. 332,526 (*C A* 25, 437), and the treated material is cured and dried or subjected to a setting treatment as described in Brit 303,544 (*C A* 23, 4596) The material may be preliminarily stiffened, waterproofed and coated with acid latex.

**Rubber impregnation of ropes, cords, etc.** D. P. Frost and British Ropes, Ltd. Brit 340,051, Oct 3, 1929. Some of the yarns to be formed into a strand are treated with an aq rubber dispersion in such quantity that when the treated yarns, together with untreated yarns, are formed into a strand, the strand will have the desired degree of impregnation Various details of procedure are described

**Apparatus for manufacture of cords or strings of rubber-impregnated materials, etc.** Reginald Truesdale, Robert C. Smith and Edward Simpson (to Dunlop Rubber Co., Ltd.) U S 1,797,249, March 24 Structural features

**Putting rubber tags on laces.** A Schoeler Brit 340,173, Feb 27, 1930 A mixt of coned latex and S is applied at the end of a hollow lace, which is pressed into a needle form in a heated mold (the mixt being transformed into soft rubber) To accelerate vulcanization, a metal salt or oxide in alk. soln may be added, with other materials such as tannin, phenol, lampblack, ocher, etc. Various modifications of the procedure also are described

**Pencil erasers.** Établissements P. Orange et Cie. Fr. 695,288, May 7, 1930. A rubber suitable for removing pencil marks, etc., contains starchy materials, a suitable compn being natural rubber 4, starchy substances 10, petrolatum 4, vulcanized waste 2, abrasives 2, factice 1, lithopone 3, S 0.1 and accelerators 0 05 part. The mixt. may be vulcanized or not.

**Polymerizing butadiene hydrocarbons.** I. G Farbenind. A.-G. Fr. 695,299, May 8, 1930 The polymerization of butadiene hydrocarbons using alkali or alk. earth metals is carried out in the presence of small quantities of unsatd. ethers such as vinyl ethyl, vinyl butyl, allyl ethyl or propargyl ethyl ether. Several examples are given Cf *C A*. 25, 1412

**Polymerizing diolefins.** I G. Farbenind A -G. Fr. 695,441, May 12, 1930. In the polymerization of diolefins by alkali or alk. earth metals, the reaction is carried out in the presence of org compds contg an atom of C, 2 valencies at least of which are satd with O Acetals, especially cyclic acetals and among them those contg a double bond, are particularly advantageous. Several examples are given.

Diolefin polymerization products. I G Farbenind A.-G (Georg Ebert and Friedrich A Jones inventors) Ger. 420,104, Jan 26, 1929 The polymerization of butadiene and other diolefins by means of alkali or alk. earth metals is improved and accelerated by addn. of a small quantity of a cyclic ether, *e. g.*, dioxane The products may be made into filaments or films, which may be hardened by heat or by vulcanization The vulcanized products resemble *soft rubber* Examples are given.

Artificial rubber-like masses. I G Farbenind A.-G Fr. 635,300, May 8, 1928 Polyvinyl alcs are condensed with aldehydes in the presence of catalysts such as $AlCl_3$, $ZnCl_2$ or $NaHSO_4$. The products may be vulcanized to hard substances resembling ebonite

Synthetic rubber. I G Farbenind A.-G Fr. 635,745, May 16, 1928 Masses resembling mixed rubber are made by taking polymerizates, finished or unfinished, of diolefin hydrocarbons and continuing their polymerization with one or more analogous or homologous diolefin hydrocarbons under the same or modified conditions Examples are given.

Synthetic rubber. I. G Farbenind A.-G Fr. 636,149, May 27, 1928 Diolefins are polymerized in the presence of alkali or alk. earth metals, their mixts. or alloys in the form of particles of uniform size.

Synthetic rubber. I G Farbenind A.-G Brit. 340,008, Aug 19, 1929 Polymerization of diolefins with alkali or alk. earth metals is effected in the presence of an org. compd. contg. a C atom with at least 2 valencies satisfied by O, such as satd. and unsatd. acyclic or, preferably, cyclic acetals, or the components of such acetals, *e. g.*, dibutyl acetal, ethylene acetal or other acetals from 1,2- and 1,3-glycols with aldehydes, unsatd. acetals such as those from crotonaldehyde or acrolein and butylene glycol. Various aliphatic, aromatic or hydroaromatic ketones also may be added, as may aldehydes, esters, small quantities of acids such as HOAc or formic acid, etc., and either tough or soft and plastic products can be obtained by varying the proportions of the added substances. The products are *suitable for vulcanizing or for the manuf. of coatings, films, lacquers, artificial silk*, etc. Numerous details and modifications of procedure are described.

Synthetic rubber, etc. I. G Farbenind A.-G Brit. 340,004, Aug 12, 1929 Unsatd. org. compds. such as acrylic, linolenic, ricinoleic and other long-chain acids or their derivs. such as their esters and their mixts. (*e. g.*, crude linseed oil), unsatd. aliphatic hydrocarbons with more than one double linkage such as butadiene, isoprene or other diolefins or their mixts., or unsatd. aromatic compds. such as styrene are polymerized in the presence of heavy metal carbonyls such as those of Fe, Ni, Co Mo, W or Cr Numerous details and modifications of procedure are described.

Storing unvulcanized rubber sheets. P Beebe (to Goodyear Tire & Rubber Co.). Brit. 339,730, Feb 26, 1929 Adhesion of the sheets is prevented by interposing between their surfaces a non-adhesive liner comprising fabric which has been treated with soap soln. (suitably soap prepd. from coconut oil)

Transparent vulcanized rubber. Douglas F Twiss and Edward A. Murphy (to Dunlop Rubber Co., Ltd.) U. S. 1,707,250, March 24. Deposits or products are formed directly from a mixt. of rubber latex, S and an ultra-accelerator such as Zn pipendine carbothionolate without use of ZnO, and vulcanized.

Rubber vulcanization accelerators. Dunlop Rubber Co., Ltd., D F. Twiss and F A. Jones. Brit. 340,083, Nov. 1, 1929 Accelerators are prepd. by the interaction of halogen derivs. of $C_6H_6$ or its homologs with dithiocarbamates. An example is given involving the use of pipendine pipendine 1-carbothionolate and 4-chloro-1,3-dinitrobenzene, and other suitable starting materials also include Zn diethyldithiocarbamate, diethylammonium diethyldithiocarbamate and picryl chloride. Various details of procedure are described.

Rubber vulcanization. Deutsche Hydrierwerke A.-G Brit. 339,826, Jan. 8, 1929 Vulcanization is accelerated by the addn. of esters of cyclic alcs. such as the bornyl ester of adipic acid, cyclohexyl esters of hydrophthalic acid, and cyclohexyl ester of benzoic acid.

Vulcanizing synthetic rubber. I. G. Farbenind. A.-G. Fr. 635,269, May 7, 1928 See Brit. 335,970 (*C. A.* 25, 2022).

# CHEMICAL ABSTRACTS

Vol. 25. JUNE 20, 1931 No. 12

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Two laboratory devices. M. TROMBE. *Bull. soc. chim.* [4], 49, 185-6(1931).—In a modification of the ordinary coil gas-washing *bottle* the upward movement of the bubbles is utilized for producing a continuous circulation of the washing medium through the 2 limbs of the app. An open vessel of any size can be used for holding the washing medium. In an app. (of glass) for producing hydraulically a high-pressure *air blast* the water level, which dets. the air pressure, is automatically maintained for any set water pressure by means of a float valve. Sketches are included. W. A. LA LANDE, JR.

Laboratory apparatus for tube distillation. HUGO BURSTIN AND JOSEF WENZLER. *Chem.-Ztg.* 55, 212(1931).—*This is an illustrated description of a continuous vacuum* distn. outfit of cast iron, Cr-Ni steel or other metal which was originally designed for crude-oil distn. but which can be used for soap, naphtha, sulfonic acid, etc. The basic principle of the app. is that the liquid *to be distd. is led in a uniform stream through* the heating zone and from there is immediately brought to a dephlegmator filled with filter rings and to a condenser. Since the heating surface and the vaporization space are very large compared with the amt. of heated liquid, a continued heating of the liquid is avoided. M. McMARON

Laboratory oven for carrying out chemical reactions. E. BERL AND K. WINNACHER. *Chem. Fabrik* 1931, 194.—*A Cu block oven* is described in which about 95% of the inner space is held const. to ±2°. J. H. MOORE

Liquid filters for the preparation of artificial sunlight. R. LUTHER. *Z. wiss. Phot., Schaum-Festschr.* 29, 234-8(1930); cf. *C. A.* 25, 1450. E. J. C.

Use of filter pencils. E. SCHWARZ VON BERGKAMPF. *Mikrochem., Emich Festschr.* 1930, 268-74.—Filter pencils made of tightly rolled ashless filter paper placed in a glass tube serve for the sepn. of ppts. such as silica which have to be further treated after ignition. B. C. A.

A buret for titration with solutions affected by air. PETER DICKENS. *Chem. Fabrik* 1931, 185.—The buret is fused *into the stopper of the stock bottle* and is so connected that it is filled by pressure from a cylinder of H or N. J. H. MOORE

A simple extraction apparatus. ARTHUR G. MULLIGAN. *J. Soc. Chem. Ind.* 50, 144T(1931).—The app. used for the extn. of rubber with $(CH_3)_2CO$, consisting of a siphon extn. tube suspended in the wide neck of the boiling flask, is improved by inserting between the flask and cooler a tube filled with small glass beads to heat the condensate to the b. p. before it drops into the extn. tube. J. H. MOORE

An apparatus for extracting liquids with solvents *of higher specific gravity*. P. H. PRAUSNITZ. *Chem. Fabrik* 1931, 193-4.—The usual form of the extn. vessel is modified by putting in the bottom a glass filter plate *through which* compressed air, or other gas, is blown to mix the liquid and solvent, thus hastening the extn. Some results and a few references are given. J. H. MOORE

Cooling apparatus. JUAN HALLER. *Chem. Ztg.* 55, 267-8(1931).—The app. is for quickly cooling and holding small quantities of liquid at any temp. down to −15°. *It depends upon the evapn. of* $CS_2$ *by* bubbling a current of air. If the liquid container is replaced by a coil, gas currents may be cooled. J. H. MOORE

An automatic balance. F. J. VERMEYER, C. H. HOFMANN AND C. V. GIVAN. *Science* 73, 424-6(1931).—A description is given of a device operating on the displacement principle in which the usual difficulties encountered *in* such app. are overcome. a sensitivity of 0.02 g. at a load of 3 kg. is given. If it is attached to a 200-g. balance an accuracy of less than 0.005 g. is possible. J. H. MOORE

Microbalance with proportional swings and damped oscillations. J. DONAU. *Mikrochem., Emich Festschr.* 1930, 39-42; cf. *C. A.* 25, 1121.—The balance may be adjusted *to give a movement of 1* division per 0.05 mg. and may be loaded up to 500 mg. B. C. A.

**A device for producing a slow constant flow of liquid.** R. J. DAVIES. *J. Sci. Instruments* 8, 110–1(1931).—The liquid is forced out of the container by displacement with Hg, the flow of which is regulated by passing it through a system of capillary tubes A steady flow of 25–150 cc per day may be obtained J. H. MOORE

**The construction of some new acid pumps.** H. WINKELMANN *Chem Fabrik* 1931, 195–6.—Two pumps are described, 1 based on the "2 liquid" principle in which the working parts are protected by an "oil cushion" on the acid, so arranged that there is no mixing of oil and acid J. H. MOORE

**Improved apparatus of Engler-Heusler.** JAROSLAV FORMÁNEK. *Chem. Obzor* 6, 36–7(37 English)(1931).—The stopper with a small metallic drum is replaced by a simple cork with a larger bore for a small burner, it also contains 6 bores for the air A small hollow glass burner, fitted on an Erlenmeyer flask, is used A moderate air current is blown into the inside tube of the burner, thus makes the min gasoline flame larger By this arrangement 6-g gasoline can be burned in 1 hr The small delivery tube is ground into the adsorption cylinder and drawn out at the mouth into an opening 2 mm in diam The opening is provided on the sides with 4 bores approx 1.5 mm. in diam, and thus a better distribution of the combustion products, collected in the adsorption vessel, is obtained J. KUČERA

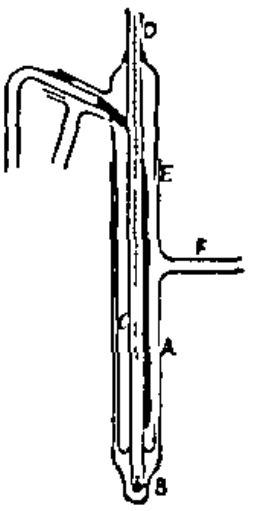
**Spray driers.** O. ZAHN *Chem.-Ztg* 54, 973–5(1930).—Patents covering driers of this type are reviewed The essential points in design are the atomization of the liquid and the course of the hot air current In the author's "Ravo-Rapid" system the drying chamber is a vertical cylinder The liquid is allowed to fall centrally onto a rapidly rotating disk, while the main air feed rises in an ascending spiral and thus passes transversely across the course of the droplets Subsidiary air feeds assist the atomization, and the dried powder is collected at the bottom of the chamber. It is claimed to yield a very uniform product and to have a high thermal efficiency. B. C. A.

**Ionization manometer for small pressures.** RUDOLF SEWIG. *Z. tech. Physik* 12, 218–21(1931).—The app is described in detail Curves are given showing its adaptability to pressures from 0.01 to 0.0001 mm Hg WILLIAM F. VALGHAN

**The thermometer and its production.** H. FISCHER *Uhrmacherkunst* 1929, Nos 7, 8, 9, *J. Soc. Glass Tech* 14, 41–2A.—The evolution of the thermometer is traced from Galileo's "thermoscope" (1593) to the first Hg filled thermometer of Fahrenheit (1714) Methods of making modern thermometers are described, the requirements for the glass and for the filling liquid are discussed, calibration is described, and constructional details of the various types of thermometer are given E. H.

**Theory, design and construction of sensitive vacuum thermopiles.** C. H. CARTWRIGHT *Rev. Sci. Instruments* 1, 592–604(1930) E. H.

**Impervious tubes of pure alumina.** F. ADCOCK AND D. TURNER. *J. Sci. Instruments* 7, 327(1930).—Tubes are made by extrusion through dies and fired at about 1900° in a C resistance furnace, being supported by packing with powdered alumina They are then glazed by careful heating with an oxyhydrogen flame and are practically impervious to gases at the ordinary temp B. C. A.



**Sublimation apparatus using sintered glass.** A. SOLTYS. *Mikrochem., Emich Festschr.* 1930, 275–9.—An app is described wherein satn of the current of air by the vapor of the subliming substance is ensured by spreading the material on a plate of sintered glass, the max sublimation velocity at any given temp is thus obtained The plate is fused into a glass tube, which is fitted at the lower end with a water-cooled tube for condensing the vapor and at the upper end with a capillary for the admission of the air current B. C. A.

**A strongly lighted fluorescence microscope.** MAX HAITINGER. *Mikrochemie* [N. S.] 3, 220–3(1931).—In the search for a suitable source of ultra-violet rays, iron proved to be the most practical metal to use for the electrodes, improvements in the design were made whereby a steady light, free from flickering, could be obtained The lamp finally designed uses about 5 amp of current and by means of it good illumination and great detail is obtained under the microscope. The app of improved design can be obtained from C. Reichert of Vienna W. T. H.

**New photoelectric recording microphotometer.** J. A. CARROLL AND E. B. MOSS. *Monthly Not. Roy. Astron. Soc.* 91, 191(1930).—This is a detailed description with diagrams and photographs of a new recording microphotometer patterned after the Dobson-Skinner instrument and designed for studying photographs of stellar and solar spectrum lines and for measuring extended objects, as *e. g.*, nebulae and the corona J. W. MCFARLANE

**Fractional macro- and microsublimation at ordinary and at reduced pressures.** G. ILLARI *Ann. chim. applicata* 21, 127–36(1931).—Sublimation, although having

several advantages over distn and crystn , has not been developed to the same extent owing to the lack of suitable app After defining the *initial temp of sublimation* as that temp at which the first sublimate is observed, for a given pressure, I. describes the app shown for detg this temp *A* is a tube provided with a well *B*, in which the material is placed, and a side arm *F*, which may be connected to a suction pump Inside is the condenser *C*, which passes through the ground glass joint at *E* and is provided with the thermometer *D*, which passes right through so as to be imbedded in the material at *B* The material is heated at such a rate as to raise the temp 1° per min until the first sublimate is observed In this way the *initial temp of sublimation* of the following were detd at 760 and at 7 mm anthracene 98°, 50°, naphthalene 50°, 22°, benzoic acid 82°, 27° cinnamic acid 95°, 42–4°, α-naphthol 67°, 26°, β naphthol 78°, 27–8°, camphor 40°, 20°, caffeine 113°, 48°, theobromine 175°, 87 90° Detns were also made at intermediate points for some of the above compds and the curves plotted Results show that the rate of rise of the *initial temp* is most rapid between 0 7 to 100 mm , and then increases more slowly By modifying the app , so that it is shaped like a U and provided with condensers with ground glass joints at the bases of the U, a mixt. of 2 compds. can be *fractionally* sublimed by opening only one of the condenser arms, till 1 component has sublimed and then opening the other to condense the second component A W CONTIERI

A simple thermostat for 20°, with temperature regulation independent of room temperature. V. ČUPR. *Z Elektrochem* 37, 129–30(1931) —There is a continuous flow of cool water (cooled with ice if necessary) through the thermostat, this eliminates the necessity for stirring The water is heated before it enters the bath by an elec. heater which operates intermittently when the circuit is closed by the thermoregulator and relay system. An EtOH-Hg regulator is used, with a Hg relay The regulation interval is said to be 0 02° CHANNING WILSON

**From the atomic weights of Dalton to the isotopes of Soddy.** L. De Ilosvay. *Természettudományi Közlöny* 63, 193–200(1931) —Historical address S S de F.

**Development and present state of our knowledge of the natural system of the elements.** F. Paneth. *Chem. Rundschau Mitteleuropa u. Balkan* 7, No. 15, 98–100 (1930).—A general review. S S. de Finály

**The atomic weights of nitrogen and silver. I. The ratio of ammonia to silver.** Gregory P. Baxter and Charles H Greene. *J Am. Chem Soc* 53, 604–13(1931) — The ratio $Ag:NH_4$ was detd. as 0.33420 by weighing $NH_4$ adsorbed on dehydrated chabazite in a closed tube, causing a suitable quantity of $NH_4$ to evaporate into dil HCl or HBr and measuring the halogen content nephelometrically By using this ratio and that for $NO_3Ag$ the at wt of N was calcd as 14.0078 and that of Ag 107.879. L. P. Hall

**Molecular and atomic volumes. XXIV. Technical experiences in volume measurements of density at low temperatures.** E. Wünnenberg, Werner Fischer, Adolf Sapper and Wilhelm Biltz. *Z. physik Chem*, Abt. A, 151, 1–12(1930); cf. *C. A.* 24, 2343, 4200 —Practical matters concerning the app., temp., filling gas and handling of the materials previously investigated are discussed. The corrections for compression of the filling gas are given in detail, as well as the absorption of the filling gas by various substances. **XXV. The volume occupied by crystalline organic compounds at low temperatures.** Wilhelm Biltz, Werner Fischer and E. Wünnenberg. *Ibid* 13–55 — The vols. of various typical cryst. org compds., contg H, or both O and H, were detd at temps. down to —195° The results are tabulated according to the principles of additivity, effect of constitution (arrangement of atom and at. groups), and equal vols **XXVI. The molecular volumes of several silver and potassium salts of monobasic aliphatic acids.** W. Fischer and Alfred Lemke *Ibid* 56–64 —The densities of 9Ag and 3K salts of normal monobasic aliphatic acids were detd at room temp and at —78°. The measurements were carried out pycnometrically, with toluene as the enclosing liquid The mol. vols of the salts are discussed in the light of Biltz's space theory. **XXVII. The space requirements of several cellulose derivatives and the gas absorption of acetylcellulose.** E Wünnenberg, W. Fischer and W. Biltz *Ibid* 65–70 —The ds and coeffs of expansion of cellulose, cellulose acetate and cellobiose were measured. Some

data of gas absorption (air and $H_2$) by cellulose acetate are given. Air is absorbed about 3 times as much as $H_2$, obeying Henry's law XXVIII. The molecular volumes of several substituted benzoic acids. Li Klemm and Wilhelm Klemm *Ibid* 71–9 — The mol vols. of methyl, hydroxy, amino-, nitro-, chloro- and bromo-benzoic acids were detd Louis Waldbauer

Electron diffraction and molecular structure. R. Wierl. *Ann Physik* 8, 521–64(1931) —It is shown that if one gives to a fast moving electron a wave length according to de Broglie, then the theoretical treatment of Debye on the x ray diffraction by gases may be applied to *electron* diffraction by gases The diffraction pattern obtained on allowing the electron beam to penetrate the vapor of a gas which is forced from a narrow nozzle into the electron beam at right angles is characteristic of the structure of a *single* mol of the vapor under investigation By allowing the time of exposure of the photographic film to be only a fraction of a sec. the theoretical treatment becomes sufficiently accurate to det the form and the at. distances of the mol and thereby gives to the structures of stereochemistry the clearest proof of their spacial reality The results are as follows

| Molecule | At. distances A | U | At. form |
|---|---|---|---|
| $Br_2$ | Br—Br | 2 28 | |
| $CO_2$ | O—O | 2 26 | linear |
| $CS_2$ | S—S | 3 16 | linear |

| $C_5H_{10}$ (cyclopentane) | C—C | 1 52 | a plane |
| $C_6H_{14}$<br>$C_4H_{12}$ | C—C | 1 5 | tetrahedral angles |

Malcolm Dole

The effective cross section of argon and hydrogen against electrons of 0 2 to 6 volts. H. Gaertner *Ann Physik* 8, 135–62(1931) —The effective cross section of A was accurately detd for various electron velocities The min cross section occurs at 0 4 v instead of 0 7 v as previously reported by Rusch (*C. A.* 20, 3129). The effective cross section in sq cm per cc of gas at a pressure of one mm of Hg at 0° decreases from 24 at 5 5 v to about 1 at 0 4 v and then rises again to 6 at 0 17 v. The effective cross section of $H_2$ rises slowly from 32 at 6 v to 39 5 at 2 5 v and then decreases to 30 at 0.3 v.

P T. Newsome

Refractivity of a binary mixture and its relation to the molecular size of the components Tetsuya Ishikawa *Anniversary Vol Dedicated to Masumi Chikashige* (Kyoto Imp Univ) 1930, 275–91 —Formulas relating $n$ and the compn of a binary mixt are reviewed and discussed For successive members of a homologous series the equation, $\sigma_2 = \sigma_1 \sqrt[3]{\frac{M_2 v_2}{M_1 v_1}}$, is proposed connecting the mol diam, mol wt and sp vol The mol diam of one component of a binary mixt can be calcd from the refractivity provided that of the other is known The equation is strictly true for MeOH, EtOH and $n$ $C_3H_7OH$ nearly so for iso $C_3H_7OH$ and iso-$C_4H_9OH$, but not true for $n$ $C_4H_9OH$ and $n$- and iso-$C_5H_{11}OH$ This suggests that the addn of the $CH_2$-group to the alc. series above $C_3H_7OH$ is not literally an elongation of the C chain Expts on the refractivity of the alcs with benzene and of the alc pairs are described The values of $\sigma$ obtained are compared with those from the expression of Lorentz Lorenz Allen S Smith

X-ray studies of motions of molecules in dielectrics under electric stress. Ralph

D. BENNETT *J. Franklin Inst.* 211, 481–7(1931) —X ray examn of paraffin solidified under elec. stress indicates that the thin flakes of the hydrocarbon crystal with long chains perpendicular to the face of greatest area orient themselves edgewise to the applied elec field (So that the elec field is perpendicular to the plane of the hydrocarbon chain) MALCOLM DOLE

**A general theory of paramagnetic rotation in crystals.** H A. KRAMERS. *Proc Acad Sci Amsterdam* 33, 959–72(1930), cf *C A* 25, 873 —Math analysis shows that in a doubly refracting crystal of slight anisotropy possessing magnetic rotatory power the introduction of a vector of rotation permits the simple description of properties of a luminous beam of any orientation A consideration of the properties of an atomic system with an odd number of electrons in an external field of purely elec origin shows the energy levels are necessarily doubly degraded The magnetization produced in an atom possessing such a degraded field by a magnetic field of arbitrary direction leads to a paramagnetic rotation in a crystal contg such atoms A P SACHS

**Electrical properties of molecules. II.** A. H W. ATEN *Chem Weekblad* 27, 235–6(1930); cf *C. A* 24, 3143 —Dipole moments of org compds are discussed H S v KLOOSTER

**Magnetic rotatory power of halogen derivatives of saturated hydrocarbons in the gaseous state.** R. DE MALLEMANN AND P GABIANO *Compt rend.* 192, 278–80 (1931), cf *C A* 25, 1418 —The magnetic rotation in the gaseous and liquid states for the 578 mμ Hg line was detd for MeCl, EtCl, MeBr, EtBr, PrCl, iso-PrCl, $CHCl_3$, $CCl_4$ and PrBr The mean values of the at. rotatory powers of H, C, Cl, Br and I are 5 5, 10, 33, 66 and 143 × $10^{-3}$, resp., whereas the values ions are 108, 208 and 450 × $10^{-3}$ for Cl′, Br′ and I′ The rotatory power of the ion therefore is greater than that of the corresponding atom The ratio of the ionic to the at rotatory power is 3.2 F W LAIRD

**The dielectric constant of hydrogen chloride from 85° to 160°K.** RICHARD M CONE, GEORGE H DENISON AND JACOB D KEMP *J Am Chem Soc* 53, 1278–82 (1931) —The dielec const for solid HCl changes isothermally from 3 to 10 at the transition point at 98.4°K This behavior is predicted by Pauling's theory of the free rotation of mol in crystals JOHN R HILL

**The dielectric properties of antimony pentachloride and phosphorus pentachloride.** J H SIMONS AND GILBERT JESSOP *J Am Chem Soc* 53, 1263–6(1931) —This work was done with a view to obtaining information regarding the mol structure of $PCl_5$ and $SbCl_5$ The molar polarizations of $SbCl_5$ and $PCl_5$ were measured in $CCl_4$ solns and the dipole moments concluded to be either zero or very small The dielec. consts. of $SbCl_5$ and $PCl_5$ were measured in both liquid and cryst states The specific cond of $PCl_5$ was measured Various structural theories for $PCl_5$ and $SbCl_5$ previously advanced by other authors are discussed The authors conclude from their own data that these compds have a symmetrical structure with a ten-electron shell for the central atom R. H C

**Magnetism and molecular structure. I.** The magnetic susceptibilities of some inorganic sulfides and electronic isomers. S S BHATNAGAR AND S L. BHATIA *Proc. 15th Indian Sci Congr* 1928, 141, cf *C. A* 23, 4857, 24, 5550 —The magnetic consts were detd (at room temp.) of the yellow and red sulfides of As (solids) and also of their colloidal solns in water A modified Wilson's magnetic balance was used The results (not given) show that realgar ($As_2S_2$) is less diamagnetic than orpiment ($As_2S_3$) both in the solid form and in colloidal solns. These differences can be explained on the basis of atomic structure and the valency theory of Langmuir E J. C.

**Electric moment and molecular structure. III.** Double and triple bonds and polarity in aromatic hydrocarbons. C. P. SMYTH AND R. W. DORNTE. *J. Am. Chem Soc* 53, 1296–304(1931), cf *C A* 25, 2032 —The dielec. consts. and ds of dil solns. of the Ph substituted ethylenes and acetylenes were measured between 10° and 70°. The mol. refractions were also detd and the data used to calc. the elec. moments of the mols The Ph substituted ethylenes have small or zero moments according to their symmetry about the double bond The replacement of H on a doubly-bonded C by a hydrocarbon group gave moments of the same magnitude as those resulting from a similar replacement in $C_2H_4$. The large moment for PhC CH and still larger value for PhC : CPh give evidence of unsymmetrical mols, this is explained in terms of a tautomeric equil. between a symmetrical form and an unsymmetrical contg bivalent C, the shift in equil. with temp causing the temp variation of the moment observed H W. L.

**The magnetic susceptibilities of the polyoxymethylenes and formaldehyde solutions.** W. GOOD *J Roy Tech Coll* (Glasgow) 2, 401–9(1931) —The investigations described were undertaken in the hope that measurement of the magnetic susceptibilities of the polyoxymethylenes and of formaldehyde solns would furnish some information

regarding the *constitution of highly polymerized substances* The values found for the polyoxymethylenes are not in agreement with the theoretical values calcd. from the formulas that have been proposed to represent their constitution They seem to lend support to the view that the polymers consist of small elementary units held together by strong crystal lattice forces The values found for formaldehyde solns. support the view that the hydrates HOCH-OH and HOCH OCH$_2$OCH$_2$OH are in equil in formaldehyde solns A. L. KIBLER

Avogadro's number and "mean free path." SATYENDRA RAY. *Proc 15th Indian Sci Congr* 1928, 141 —Millikan calls the mean free path a "hypothetical" quantity It is shown that this mean free path is not related in any intimate manner with the properties of a gas like vol pressure temp or entropy, if the expression usually accepted for it viz $\lambda = 1/\sqrt{2}\pi N\sigma^2$ is correct Instead the fairly close agreement of Avogadro's no for different atoms means that the size of atoms is very nearly identical and that perhaps $\lambda = \sqrt[3]{3} - \sigma$ is a more nearly correct expression for the mean free path than the one usually accepted which makes the value of $\lambda$ infinite when the size of particle is infinitely small L. J. C.

Viscosity, heat conduction and diffusion in gas mixtures. XIII. Diffusion constants of dilute gas mixtures. MAX TRAUTZ AND WILH RIES. *Ann. Physik* 8, 169–84(1931) cf C. A. 25, 2034 —The diffusion consts of $C_6H_6$-$H_2$ and $CCl_4$-$H_2$ mixts were detd at 23 The diffusion const ($D$) was unaffected by changing either the size of the tube or the rate of flow The following values were obtained $D_{C_6H_6-H_2}$ = 0.363 sq cm sec $D_{CCl_4-H_2}$ = 0.342 sq cm /sec P. T. NEWSOME

Methods for measuring the mobilities of gaseous ions. PETER GOLDMARK AND FRANZ KAMMER *Sitzb Akad Wiss Wien*, Abt. IIa 139, 241–53(1930) —By an improvement in the Rutherford Frank method, the mobility of gaseous ions can be measured without extrapolation Math proof and a description of the app are given Sp ionic mobilities ($u$) for atm ions were detd (1) by means of a sine form alternating voltage for the pos ion, $u$ = 1.364 ± 0.000 sq cm /v sec., and for the neg ion, $u$ = 1.811 ± 0.008 sq cm /v sec., (2) by means of an abruptly changing alternating voltage for the pos ion $u$ = 1.369 ± 0.008 sq cm /v sec., and for the neg ion, $u$ = 1.814 ± 0.008 sq cm v sec. DON BROWN

Uniform propagation of flame. N. R. SEN AND H. K. SEN *Nature* 127, 125–6 (1931) —The velocity equation shows the condition for uniform propagation to be $\theta = \frac{\alpha Q}{\rho C}$ where $\theta$ = the ignition temp., $\rho$ = density of the inflammable mixt., $C$ = the sp heat and $\alpha Q$ = the fraction of the total heat of combustion utilized for conduction The above equation takes note of the distribution of temp in every section of the gaseous medium comprising the traveling flame the traveling flame is also considered as a region having temp gradients corresponding with the combustion temp at the rear and the ignition temp at the front In advance of this a progressive fall of temp to that of the cold gas occurs The ratios of flame to ignition temps were for Coal gas + air 2.02, $CH_4$ + air 1.91, $CH_3$ $CH_4$ + air 1.90, CO + air 2.08 FRANK MARESH

Highly dilute flames of alkali metal vapors with hydrogen halides. GÉZA SCHAY. *Z physik Chem*, Abt. B 11, 291–315(1930). cf *C. A.* 19, 3221, 20, 1947, 22, 1898.— The vapors of Na and K under low pressure react with HCl, HBr or HI with displacement of H atoms. These atoms react with H to form $H_2$ and X or NaH to yield Na + $H_2$ with the emission of light. The velocity of the reaction of sodium with hydrogen halides. H v HARTEL. *Ibid* 316–20(1930) —The reaction of Na vapor with HI, HBr and HCl was followed by a diffusion method (*C. A.* 25, 1726) At 240° Na and HI react at every collision, Na and HBr after 6 collisions, Na and HCl after 86 The heats of activation for their reactions were calcd as 200, 1900 and 4500 kg-cal and reaction velocities were detd. as 53 000, 10 000 and 800 mols./sec. × $10^{-12}$, resp A similar heat of activation of Na and HCl was also found from measurements at different temps. L. P. H.

Highly dilute flames. GÉZA SCHAY *Fortschritte Chem Physik physik Chem* 21, 68 pp —A general review of the technic and interpretation of the reaction of dil vapors of alkali metals with halogens H halides, Hg halides and stannic halides. A bibliography is given L. P. H.

The effect of an electric field on flames and their propagation. BERNARD LEWIS. *J Am Chem Soc* 53, 1304–13(1931) —The effects of an elec. field on the flames of 10 hydrocarbon air and CO-air mixts. were investigated The field was applied between fine wire gauze electrodes placed on either side of a stationary flame confined in a Pyrex tube. The flame is invariably pulled toward that electrode on which the charge is neg, thus moving in the direction of the pos ion flow, its propagation is slowed down or

speeded up depending upon the direction of the elec field With appropriate direction and strength of field the flames of all the mixts. could be extinguished. P. H. E.

**Calculation of the specific heats of gases from vapor-pressure curves.** M. Trautz and W. Badstübner. *Ann. Physik* 8, 185–202(1931).—Sp. heats of paraffins, alcs., fatty acids, esters, ketones, aromatic bases, org. and inorg. halogen compds., etc., were calcd. from the relation $C_p = c_p + (\Delta L \cdot \Delta T)$. Known values of $c_p$ were used and values of $\Delta L \cdot \Delta T$ were detd. by application of the Clausius equation to the vapor pressure curves. Good agreement was obtained between calcd. and observed values of $C_p$ for 30 different substances. $c_p$ values were also calcd. for 43 other substances for which the $C_p$ values have not been directly detd. The relation $c_p = c_v - 1.2$ gives good results for $C_p > 20$ and becomes more accurate as $C_p$ increases. P. T. Newsome

**The indices of refraction of liquids.** Morton Masius and W. E. Lawton. *J. Optical Soc. Am.* 21, 252–9(1931); cf. *J. Optical Soc. Am.* 20, 271(1930).—Math. considerations of the use of the av. of the 3 min. deviations and the use of the interpolation formula are given, together with equations from which the $n$ of a liquid enclosed in a hollow prism or of different liquids in the same prism can be calcd. The covers are not necessarily true plates, but the 3 angles of the prism should not differ by more than 10′ from 60°. H. W. Walker

**The influence of elastic waves of thermal agitation on the interior pressure of liquids.** Tokio Takeuchi. *Proc. Phys. Math. Soc., Japan* 13, 17–8(1931).—A math. derivation of a relation between the pressure term in the van der Waals equation of state and the interior pressure of liquids. P. H. Emmett

**The volume of eighteen liquids as a function of pressure and temperature.** P. W. Bridgman. *Proc. Am. Acad. Arts and Sciences* 66, No. 2, 185–233(1931).—*A new method of measuring compressibility and thermal expansion of liquids* is described in which the liquid is enclosed in a "sylphon" (a flexible metal bellows) which is then exposed to external hydrostatic pressure and the vol. change detd. from the change of length of the sylphon. This method is applied to 18 liquids at 0°, 30° and 95° up to a pressure of 12,000 kg. per sq. cm., or to the freezing pressure and the results are collected in extensive tables giving the vol. as a function of pressure and temp. over this range. Compressions as great as 30% were measured. The pressure coeff. $(dp/dt)_v$ is not a function of vol. only and suggestions are made as to the theoretical significance of this. The liquids measured are pentane, isopentane, hexane, 2-methylpentane, 3-methylpentane, 2,2-dimethylbutane, 2,3-dimethylbutane, heptane, octane, decane, benzene, chlorobenzene, bromobenzene, carbon tetrachloride, bromoform, isopropyl alc., butyl alcohol and hexyl alcohol. Check measurements with previous methods used were made with ether, water and water glycerol mixt. (1:1). A. L. Kilber

**The mixing contraction of liquids.** Nikolai Gerasimov. *Physik. Z.* 32, 226–9(1931).—A math. discussion. C. E. P. Jeffreys

**Visible volume change in castor oil and Baku lubricating oil at low temperature and high pressure, studied by increase in viscosity and thus limited by clogging narrow tubes.** G. Tammann and A. Pape. *Z. anorg. allgem. Chem.* 197, 90–2(1931).—An anomalous pressure-vol. change is observed for castor oil at a temp. of −21° and 3000 kg./cm.² which is not found above 0°. The effect is not due to crystn. but is traced to a stopper effect in the small capillary leading to the compression cylinder. The same effect and cause were noted for Baku lubricating oil. R. H. Lambert

**Boiling-point nomograph.** D. S. Davis. *Chemist Analyst* 20, No. 3, 7–8(1931).—A nomograph is shown, based on Trouton's rule applied to the Clausius-Clapeyron equation, which enables one to find at once the b. p. at atm. pressure when given at some other pressure, or *vice versa*. W. T. H.

**Remarks concerning the work of W. Herz on boiling points and vapor-pressure formulas of organic liquids.** E. W. Madge. *Z. anorg. allgem. Chem.* 195, 335(1931); cf. *C. A.* 24, 3554.—It was shown by Herz that the vapor pressure of org. liquids is given by the formula $\log p = -(A/T) + C$ and that for 2 different liquids $(A_1/A_2) = (T_{a1}/T_{a2})$ where $T_{a1}$ and $T_{a2}$ are the abs. b. ps. at one atm. pressure. Madge points out that the latter relation follows from Trouton's law since $A$ is proportional to the heat of vaporization. P. T. Newsome

**Influence of the boiling temperature on the composition of azeotropic mixtures.** B. Kamienski. *Roczniki Chem.* 11, 1–11(in German 12)(1931).—Merriman's qual. rule (*C. A.* 8, 852) concerning changes in compn. of an azeotropic mixt. with change of the boiling temp. does not always hold. Vrevskii's considerations (*C. A.* 7, 3060) are too complicated. K. replaces these rules by a simple differential equation based on thermodynamics. $-Q' = RT^2(1/p'p'_0)(p'dp_0' - p_0'dp')dT$, where $Q'$ is "partial heat of mixing" of 1 mole of a substance, $p'$ its partial pressure over the mixt. and $p_0'$ its satn. pressure

at the temp $T$ With the aid of this equation it is possible to calc any change of min and max of the total pressure of a mixt at any temp if gas equations can be applied, at least approx., to vapors of liquids A mixt of EtOH and $H_2O$ that does not obey Merriman's rule conforms strictly to this new equation Conditions are set which are indispensable for the validity of Merriman's rule J WIERTELAK

**An extension of Ramsay and Young's boiling-point rule.** T. S. WHEELER. *Phil Mag* 11, 441–9(1931) —For single or pairs of liquids to which the integrated form of the van't Hoff isochore is applicable, the following general rule is deduced "the reciprocals of the abs temp for which 2 given powers of the vapor pressure of a liquid or pair of liquids are in a const. ratio, satisfy a linear equation" Cox's rule (cf *C. A.* 17, 2359) is implied in the Ramsay Young rule which is a special case of the above. The rule was tested and found satisfactory for $H_2O$, Hg, S, $H_2$, and $CH_3COOH$ for ratios from 2:1 to almost 1000:1 It was also found satisfactory for pairs of liquids and held for aq NaOH solns with more than 50% $H_2O$ and for unsatd NaCl and $Na_2SO_4$ solns By plotting the reciprocal abs temp for Hg and $H_2O$ satisfying the equation $p_{H_2O} = \sqrt[4]{p_{Hg}} \times 10^7$ it is possible to express the whole range of Hg from —39° to 1300° From the slope of the reciprocal temp curve it is possible to calc the ratio of the latent heats of 2 liquids A. F.

**Viscous flow and surface films.** RONALD BULKLEY. *Bur Standards J. Research* 6, 89–112(1931) —Various fatty and mineral oils do not clog capillary tubes as small as 0.18–0.13 mm in radius provided the liquids are properly filtered The same statement applies to several other liquids if Pt and glass capillaries of radii 0.35$\mu$ and 5.50$\mu$ are used The liquids retain their bulk viscosities up to at least 0.03$\mu$ distance from a solid surface. S BRADFORD STONE

**A new method of comparing viscosities of liquids by oscillating columns.** G SUBRAHMANIAM *Proc 15th Indian Sci Congr* 1928, 86 —It is shown that in the case of a liquid contained in a U tube and making *small and steady* oscillations the rate of decay of such oscillations is related to the coeff of viscosity by the expression: $\nu = b^2\lambda/2\tau$, where $\nu$ is the kinematic coeff., $\lambda$ the logarithmic decrement, $\tau$ the free period and $b$ a const. which is assumed to be the same for the same tube and different *wetting* liquids As the period of oscillations $\tau$ depends only on the total length of the liquid column and the inclination of the arms of the bent tube to the horizontal the above expression leads to a new method of comparing viscosities by noticing the log decrements of equal lengths of different liquids oscillating in a given tube This relation has been verified in the case of 5 different tubes of 0.3–1.0 cm diams and 7 liquids, namely, water, alc., ether, xylene, benzene, turpentine and $CS_2$, and the results (not given) are in perfect accordance with the theory F J C.

**The influence of the proximity of a solid wall on the consistency of viscous and plastic materials. III.** R K SCHOFIELD AND G W SCOTT BLAIR *J. Phys Chem* 35, 1212–5(1931) —"A solid wall may modify the consistency of clay pastes at an appreciable distance from it but the available data are not sufficiently accurate to est. the thickness of the modified layer" A value of $8 \times 10^{-3}$ cm could escape detection because of exptl uncertainties Even if the effective thickness of the modified layer should amount to 20% of the radius of the tube, the construction proposed in the first paper (*C. A.* 24, 2022) closely approximates the mobility of the material in bulk DON BROWNE

**Methods for determining the density of solid substances, particularly of inorganic salts.** PETER WULFF AND ALOIS HEIGL. *Z physik. Chem.*, Abt A, 153, 187–209 (1931) —A series of d detns on CsCl by the pycnometer method showed that, because of the impossibility of completely freeing the salt from occluded air, results are about 1% low. By using the flotation method, measurements of the ds of a series of salts were made with an av error of only 0.2% By the displacement method, the ds of salts too heavy to be detd. by flotation methods could be measured rapidly with an accuracy of about 1% P. H EMMETT

**Compressibility and pressure coefficient of resistance, including single-crystal magnesium.** P. W. BRIDGMAN. *Proc. Am Acad. Arts Sci* 66, 255–71(1931) —Measurements of compressibility at 30° and 75° are reported on 10 materials All except metallic Mg crystallize in the cubic system so that measurements were made on cryst. aggregates Mg crystallizes in the hexagonal system and single crystals were prepd. and the compressibility was measured parallel and perpendicular to the axis The materials measured were NaF, $BaF_2$, $SrF_2$, $CdF_2$, AlSb, CdTe, HgTe, TiN, TiC and Mg The effect of pressure on the elec resistance was measured for TiN, TiC and Mg A L KIBLER

**Recrystallization and coloring of rock salt.** KARL PRZIBRAM *Sitzb Akad Wiss*

*Wien*, Abt IIa 139, 255–70(1930), cf *C. A.* 24, 1295.—The recrystn. time pressure-temp diagram was carried further. The recrystn. velocity, which was measured directly, often remains const. for several hrs. and then changes suddenly. Measurements were carried over a range from room temps., at which the van't Hoff coeff. is valid, to 200°. The influence of weak radiation, formerly considered significant, is of no importance but, on the other hand, the arresting influence of strong radiation upon salt under high pressures was always confirmed. In regard to recrystn., melted crystals behave as if they contain more nuclei, which, however, show less tendency to grow, than the unheated salt. DON BROUSE

Recrystallization of pressed rock salt. GUSTAV ORTNER. *Sitzb. Akad. Wiss. Wien*, Abt. IIa, 139, 271–4(1930).—Rontgen photographs show a marked crystal growth in rock salt after deformation by pressures of 5000 kg. per sq. cm. Molten crystals, on the other hand, display no grain growth after deformation. There is weak recrystn. in powd. rock salt under high pressures. DON BROUSE

Dispersion in mixed crystals miscible in all proportions. G. TAMMANN AND A. RUPPELT. *Z. anorg. allgem. Chem.* 197, 65–89(1931).—Certain mixed crystals such as those of KCl-NaCl show turbidity, on cooling or on heating, at definite temps. A curve of beginning of turbidity can be obtained in either case which has a max. at some mol. fraction. Measurements of such mixed crystals were made for a considerable no. of salt pairs, the data from which together with others obtained from the literature are collected in tabular form and by graphs. The linear rate of turbidity increase was measured by cooling the salt pair in a glass tube after which on cutting the tube at some spot, turbidity increases into the clear portion of the mixed crystal. A very short range in mol. fraction for turbidity exists for LiBr-NaBr. The presence of water greatly affects the amt. of dispersion, the influence of which quickly disappears at about 100°. The salt pair $KPO_3$-$NaPO_3$ shows a eutectic in the diagram for heating not obvious in the cooling curve. Little turbidity is shown. Mention is made of Na- and K-contg. feldspars. Opalescence can be obtained by controlling either rate of cooling or degree of moisture present. A table is given relating the dependence of miscibility on the relative differences in lattice parameters. If this difference is less than 0.115 A. U., unlimited miscibility exists while miscibility practically disappears at, or above, 0.144 A. U.
R. H. LAMBERT

Diffusion of sodium in rock salt. E. REXER. *Physik. Z.* 32, 215–6(1931).—Na was placed in small holes in rock salt crystals, and diffused into the crystals at higher temps. The distribution and size of the particles after diffusion were studied with the ultramicroscope.
C. E. P. JEFFREYS

Melting point curves of the monobasic fatty acids. ANNIE MILLICENT KING AND WM. EDW. GARNER. *J. Chem. Soc.* 1931, 578–80.—The entropy change on crystn. can be accurately represented by the equation $Q/T = 0.002698n - 0.0061 + 0.00475 \sum_{24}^{n} \log_{10} n/(n-2)$, where $n$ is the no. of C atoms. In order to make a calcn. of the m. p. of an unknown acid, it is necessary to be able to det. a value for $Q$. The manner in which the heat of crystn. varies with the no. of atoms in the C chain has not been interpreted theoretically, so that it is only possible to employ an empirical relationship. For acids having more than 12 C atoms, $Q$ increases at the rate of 2.060 cal./g. mol. for every $2CH_2$ groups added to the chain.
C. J. WEST

Lattice energy and the state of combination. WILHELM KLEMM. *Z. physik. Chem.*, Abt. B, 12, 1–32(1931), cf. *C. A.* 25, 11.—The quotient of the exptl. lattice energy by the normal lattice energy, the latter being calcd. on the assumption that the lattice is formed of ions of the rare gas configuration, gives a more useful comparison than their difference when anions and cations are very different in size or for unsatd. compds. A similar quotient for gas mol. energy is described. The stability of compds. can be predicted from these terms. The transformation from coordination to mol. compds. takes place in a homologous series as the cation increases in wt. or as the valence of the cation increases for solids and from ions to atoms in gases. No distinct boundary appears to exist between these types of union from an energy relationship. Most calcns. were made on halogen compds.
R. H. LAMBERT

The arrangement of the microcrystals in white tin deposited by electrolysis. HIDEKI HIRATA, HISAJI KOMATSUBARA AND YOSHIO TANAKA. *Anniversary Vol. Dedicated to Masumi Chikashige* (Kyoto Imp. Univ.) 1930, 261–73.—The cryst. structures in electro-deposited specimens of white Sn, obtained under various conditions, were examd. with x rays, by the so-called "transmission method." The cryst. structure is influenced by at least 2 factors, c. d. and the concn. of the electrolyte. Smaller c. d. and lower concn. of the electrolyte are the more favorable conditions for the growth of large

crystals When these 2 factors are comparatively large, the microcrystals of white Sn tend to be deposited in a fibrous form The microcrystals have a tendency to be electrolytically deposited with the normals to their octahedral faces arranged parallel to a definite common axis ALLEN S SMITH

**The crystal structure of the inert gases. II. Krypton.** A. NASINI AND G NATTA. *Atti accad Lincei* 12, 141–7(1930) The method of powders was used as with Ne (*C A* 24, 3410 4198) The crystal structure of Kr was detd at the temp of liquid $N_2$ It is a face-centered lattice having 4 atoms with side 5 78 A U., vol $193 \times 10^{-24}$ cc., d 2 83 The radius of the atom as detd by x rays was compared with that detd by viscosity measurements for Ne A Kr $N_2$ CO, $NH_3$ $H_2S$, HBr, Xe, $PH_3$, HI, the ratio of the value found by these 2 methods varying from 1 28 to 1 35, indicating that these 2 methods of measurement are concordant A W CONTIERI

**Structural analogies of binary alloys of transition elements and zinc, cadmium and aluminum.** WALTER EKMAN *Z physik Chem*, Abt. B, 12, 57–78(1931) —Powder x ray diagrams were obtained of phases of the systems Fe–Zn, Co–Zn, Ni–Zn, Rh–Zn, Pd–Zn, Pt–Zn and Ni Cd All correspond to the interference photograph of γ-brass. These phases represent a valence electron concn of 21–13, on the assumption that transition elements may be regarded as of zero valence The homogeneous region for an Fe–Zn phase of this type lies between 19 and 23 atom % Fe. The Co–Zn phase and the Ni–Zn phase are homogeneous between 15 and 22 atom % Co and 15–19 atom % Ni, resp C–Zn shows a phase similar to β Mn in structure A phase analogous to β-brass was found in the Co–Al system Calcn of at. vol indicates that contraction accompanies phase formation FRANK URBAN

**Hydroxide systems in iron oxide colors.** HANS WAGNER. *Kolloid-Z.* 54, 310–4 (1931), cf *C A* 25, 221 —X ray photograms showed the following structures for various com colors (*1*) bright ocher $Fe_2O_3$, goethite lattice; (*2*) Mars yellow contg $CaCO_3$ and $CaSO_4$, $CaCO_3$ lattice (*3*) Mars yellow free of chalk, no lattice. (*4*) Tuscany sienna, goethite lattice (*5*) $Fe(OH)_3$ from $FeCO_3$ weathering, goethite lattice, (*6*) $Fe(OH)_3$ from sericite weathering mica lattice Ochers or citron yellows are characteristic of colors composed of monohydrate Microscopic examn reveals *1* and *3* contg very fine needles with a strong tendency to agglomerate, *4* consists of coarse grains, splinters and angular particles which are transparent in a bright field and shine in polarized light *2* and *3* resemble *4* more closely than *1* Ochers may be classified according to the adsorption of basic dyes, such as Brilliant Green, by the ocher substrate, usually a mixt of $Al_2O_3$, $SiO_2$ and $H_2O$ German ochers adsorb the dye irreversibly (chemosorption) and the substrates are $Al_2O_3$–$SiO_2$ gels, French ochers adsorb the dye reversibly (lyosorption) and the substrates are kaolins. The classification is not absolute and transition types of ocher exist ARTHUR FLEISCHER

**The structure of hydrogen sulfide and hydrogen selenide.** G NATTA *Nature* 127, 129(1931) —A cubic lattice was found with face-centered distribution for S and Se atoms The d of $H_2S$ was 1 166, $H_2Se$ 3 45 The side of the cell (*a*) was found to be 5 778 A U for $H_2S$ and 6 020 for $H_2Se$ Considering both as ionic compds, the most probable space group is $O_h^5$, a fluorite type shown by $Li_2S$. FRANK MARESH

**Spinels. III. The titanates of cobalt and of zinc.** L. PASSERINI. *Gazz. chim. ital* 60, 957–62(1930) cf Natta and P., *C A* 23, 4649, 24, 1311, P., *C. A.* 23, 4167, 24, 4439 —The present paper is a continuation of studies of compds. that crystallize in the cubic system with a lattice structure of the spinel type. *Co orthotitanate*, $Co_2TiO_4$, not heretofore described, was prepd by heating rapidly to 900° an intimate mixt. of $TiO_2$ and $Co(NO_3)_2$ (2 mols) The product was a dark-green, pulverulent substance A little $CoTiO_3$ (cf *Bull soc chim* 15, 194(1893)) may be formed $Zn_2TiO_4$ was prepd by the method of Levy (*Compt rend* 107, 421(1888)) Traces of $ZnTiO_3$ are also formed. Its phys properties do not agree with those described by Lévy; *e g*, it is a white, pulverulent substance, with much higher d than the 4 16 of Lévy Both $Co_2TiO_4$ and $Zn_2TiO_4$ were examd by the powder method, with $K_\alpha$ and $K_\beta$ radiation from an Fe anticathode (Philips tube) Both titanates crystallize in the cubic system, with a lattice structure of spinel type (8*f*, 16*c*, 32*b*, spatial group $O_h^7$) For $Co_2TiO_4$, $a = 8\,420 \pm 0\,005$ A U, $V = 596\,94 \times 10^{-24}$ cc., calcd d = 5 12 (for a cell contg 8 mols) The $Co_2TiO_4$ was not sufficiently pure to det the exptl d. For $Zn_2TiO_4$, $a = 8\,410 \pm 0\,005$ A U, $V = 594\,82 \times 10^{-24}$ cc, calcd d = 5 43 C. C. D.

**Comparison of the crystal structures of an addition and a substitution compound.** EDUARD HERTEL AND KURT SCHNEIDER *Z physik. Chem*, Abt. B, 12, 109–14(1931), cf. *C. A* 24, 2924 —The crystal structures of aniline picrate (addn compd.) and 2,4,6-trinitrodiphenylamine (substitution compd) showed an extensive analogy, according to x ray analyses They agreed with respect to the spatial group and 2 main identity

periods The difference in the third period may be due to a sp orientation of the mol in this direction, and to spatial requirements of the $H_2O$ mol., by which addn and substitution compds differ FRANK URBAN

**Crystals of 3,4,3',4',6'-pentamethoxydiphenylmethane-2-carboxylic acid.** E. LENGYEL. *Acta Sci Univ Francisco Iosephinae, Acta Chem., Mineral., Physica* 1, 68–71(1929) Crystallographic description of rhombic crystals S S DE FINÁLY

**X-ray examination of the crystal structure of resorcinol.** A N SARKAR *Proc 15th Indian Sci Cong* 1928, 92 —X ray examns of crystals of catechol, resorcinol (I) and hydroquinone were undertaken with a view to confirm the structure of the benzene nucleus detd by Bragg from the examn of $C_6H_6$ The data obtained from the powder photographs of crystals of I were insufficient for the detn of mol structure, but it was found that the space group is $C_{2v}^{19}$ and the mols are asym From certain observed accidental interference minima, not characteristic of group $C_{2v}^{19}$, certain relative arrangements of the 4 types of mols in the unit all were deduced S's deductions as regards space group and no per cell confirm Bragg's conclusions, but S suggests a different arrangement of mols E J C

**Polymerization in crystal lattice—crystal structure of trinitroresorcinol and trinitrophloroglucinol.** EDUARD HERTEL AND KURT SCHNEIDER *Z physik Chem.*, Abt B, 12, 139–50(1931), cf *C A* 24, 2021 —Picric acid has 4 double mols in its unit cell (cf Brudig and Möller, *C A* 23, 5368) The entrance of a second OH group as in styphnic acid (I) causes the formation of 2 triple mols in the unit cell but the entrance of a third OH as in 2,4,6 trinitrophloroglucinol (II) does not continue the polymerization " I and II are trigonal, probably space group $C_{3v}^3$, but possibly of $D_{3d}^4$ Their crystal structures are almost identical The unit cell of each contains 6 formula weights and has the dimensions for I; $a$ = 12 7, $b$ = 22 0 and $c$ = 10 0 A U and for II; $a$ = 13 4, $b$ = 23 6 and $c$ = 9 6 A U The structure of each is built up of 2 units of 3 $C_6H_2N_3O_8$ or $C_6H_3O_9N_3$ groups in the unit cell Test for piezoelec effects with both was neg In spite of the far-reaching similarity of the cryst structure of both compds they form no series of mixed crystals, the phase rule diagram shows only a eutectic O E S

**The production of residual double refraction by pressure in certain glasses at atmospheric temperature.** F. C. HARRIS. *Phil Mag* 11, 745–8(1931) —A uniform stress was applied for a period of 3 years on glass disks contg 16, 47, 64 and 79% PbO The first 2 glasses had a pos and the last glass a neg stress optical coeff A definite residual double refraction was observed for the last 3 glasses This residual refraction disappeared 1 month after the stress was removed The time necessary to produce the effect decreases with increase in the PbO content, the effect increases with increase in the PbO content. In no case was an increase in the residual double refraction noted during the time the load was continued ARTHUR I LEISCHER

**The birefringence of safrole.** PAUTHENIER AND BART. *Compt rend* 192, 352–3 (1931) —No appreciable residual birefringence was found for com or carefully purified safrole, either in a const or alternating field The Kerr const for pure safrole is $K = 0.82 \times 10^{-7}$ for the green Hg line $\lambda$ = 5460 A U P W. LAIRD

**The nature of "triatomic hydrogen."** EGON HIEDEMANN. *Z. physik. Chem.*, Abt. A, 153, 210–40(1931) —By passing an electrodeless ring discharge through $H_2$ in a glass reaction vessel a gaseous product is formed that is easily condensible in liquid air, and that shows the chem characteristics ordinarily ascribed to the so-called "triatomic hydrogen " Each vol of it, on reacting with Na gives 2 or 3 vols of $H_2$ It reduces $WO_3$ to $WO_2$, reduces $KMnO_4$ soln., decolorizes indigo blue, gives a yellow coloration with Nessler's reagent that is characteristic of $NH_3$, and causes a brown coloration on lead acetate paper. These same chem properties are characteristic of the mixt of Si hydrides obtained from the reaction of Mg silicide and HCl After a crit review of all previous papers, it is concluded that all of the ' triatomic hydrogen" reported in the literature has been either $H_2S$ or a mixt of Si hydrides, in some expts. both gases probably have been present. P H EMMETT

**The electrical resistivity of silicon.** CH BEDEL. *Compt. rend.* 192, 802–4(1931) — Past detn of the elec. resistivity of Si have been vitiated by the difficulty of obtaining compact specimens of pure Si, and of establishing good elec contact with the specimen These difficulties were overcome, and the av resistivity of pure Si contg only 0 1% Fe was found to be 0 267 ohms per cm. The av resistivity of impure Si contg 1 4% Fe was 0 069, and of a ferrosilicon contg 8 5% Fe, 0 035 For poor contacts involving large surfaces, the resistance changes when the direction of the current is reversed, it decreases if the current intensity is increased, but increases with the duration of flow of the current; and it diminishes with increased pressure. Poor contact has been at-

...ed to a thin layer of $NO_2$ or of adsorbed gas. However, it persists after treatment with HF and the deposition of an adherent coating of Cu or Ag. On the contrary, the electrolytic deposition of Zn or Ni by a current of 0.2 amp. provides good contact. Good contact was obtained also by depositing Cu on the Si by immersion in a soln. of $CuSO_4$, then coating the Cu with a Sn amalgam, Hg:Sn = 15:2, and finally applying the metal. The samples were held under pressure between Cu electrodes during the measurements. R. H. Lombard

**Sulfur free from cerium.** M. Picon. *Compt. rend.* 192, 684-6(1931).—"Cerium sulfide ($Ce_2S_3$) can be prepd. at 1550° in a boat of graphite by the action of $H_2S$ on $CeO_2$. This compd. is remarkably resistant to the action of heat, it melts only above 2100° and it volatilizes only at 2250° under a vacuum of about 1/1000 mm. Hg. It resists equally the action of metals and the non-oxygen salts. $CO_2$ causes a special oxidation at 700° in which Ce is transformed into $CeO_2$, S eliminated, and $CO_2$ reduced to CO." Dov Brotas

**Insolation of Pyrex glass after heating in vacuo.** J. H. Mitchell. *Phil. Mag.* II, 748-53(1931).—Pyrex glass on heating in vacuo shows a rapid increase in cond. at temps. from 55° to 80°, the exact temp. varying with the specimen. At 250° to 300° a decrease and at 350° to 400° a marked increase in the cond. were found. On cooling, the cond. again decreases but is much higher than the original value before heating. Cooling to liquid-air temp. did not decrease the cond. Washing the surface of the glass with HF restored the initial low cond. Heating in air at 500° also decreased the cond. but not to the initial value. The glass treated in this way did not increase in cond. on reheating in vacuo. The permanent increase in cond. is a surface effect, probably due to the chem. changes in the outer layers of the glass. Arthur Fleischer

**The adsorption of ions on a surface film.** R. S. Bradley. *Phil. Mag.* II, 449-53(1931).—Math. The potential due to a uniform plane array of dipoles oriented perpendicularly to the surface is calcd. The results are extended for fatty acids in 0.01 *N* HCl. Arthur Fleischer

**Adsorption of gases by glass walls. VIII. Hydrochloric acid gas.** M. Cantelli and E. Mollica. *Atti della accad. Gioenia Catania* 29, 14-37(1931). cf. *C. A.* 24, 3267.—Adsorption of HCl by the glass walls of the flask used to det. the mass of the normal L. and of the app. used to det. compressibility gave $-1.74 \times 10^{-4}$ g. at 760 mm. for a 1 l. flask, as the correction to be applied. The tests confirmed the McBain theory of both absorption, or solid soln. of gas on the glass surface, and adsorption on the surface. The course of both processes can well be expressed by the Freundlich adsorption equation. Results of others are criticized. E. M. Symmes

**The adsorption of certain vapors by activated charcoal. III.** J. N. Pearce and A. L. Taylor. *J. Phys. Chem.* 35, 1091-1103(1931). cf. *C. A.* 24, 3890.—The adsorption of ethyl, *n*-propyl, *n*-butyl and tertiary butyl chlorides on charcoal was detd. from 0° to 4 consecutive temps. The stability decreases with increase in mol. complexity. The amt. of adsorption in general increases with mol. wt., with branched-chain compds. less than with straight chains. The heats of adsorption are less when calcd. from the curves than the exptl. values. The distribution of potential and d. are calcd. according to Polanyi. Garod M. Evans

**Adsorption of sugars by animal charcoal and vegetable decolorizing carbons.** N. Takeyose. *J. Soc. Chem. Ind., Japan* 30, 790-803(1927). *Mem. Faculty Sci. Eng. Waseda Univ.*, 1930, No. 7, 125-6.—The amt. of sucrose adsorbed from aq. solns. by animal charcoal increases to a max. at a concn. of 0.2 mols. per l. Freundlich's equation applies to the dil. solns. The amt. of adsorption is directly proportional to the charcoal added. Grape sugar is also adsorbed by animal charcoal. Sucrose is adsorbed in appreciable amt. by vegetable decolorizing carbons. L. W. T. Crissman

**Effect of gelatin and salts on Congo red.** Harriet L. Davis and John W. Ackerman. *J. Phys. Chem.* 35, 972-87(1931).—Gelatin exhibits an apparent protective action against ppts. by salts on solns. of Congo red, due to a decreased stability and decreased dispersion of the dye. Frank Urban

**The distinguishing features between adsorption by a substance in a hydrated and a dehydrated condition.** M. P. Venkatarama Iyer. *Proc. 15th Indian Sci. Cong.* 1928, 132-3.—It has been found from measurements that benzoic, cinnamic, salicylic and stearic acids, which are generally dehydrated, show hardly any change in the $p_H$ values or the elec. charge when kept in contact with neutral salt solns., whereas stearic acid which is highly hydrated in the colloidal state shows marked changes in the $p_H$ values and elec. charge when similarly treated. Dehydrated substances like the above adsorb their constituent ions very strongly, whereas hydrated substances adsorb any ions without showing any strong preference for the constituent ions. Irreversible coagulation and

finely divided org substance immiscible with water is introduced into a coazervate system the org droplets are taken inside the coazervate drops Only those droplets so taken up manifest a shift in the field of the elec current The direction of this shift is independent of the nature of the org fluid, of the *p*H or the presence of neutral salts, but is detd by the cataphoretic charge of the coazervate drops If the latter are pos. the shift is toward the neg electrode, and if neg the shift is to the pos electrode

S MORGULIS

**The dialysis of sodium bicarbonate solutions.** F CANALS AND J DAUBAIN DELISLE *Bull soc chim biol* 12, 1158-61(1930).—The $CO_2$/Na value of a bicarbonate soln varied from 1.98 to 1.74 during 2 hrs' dialysis C. G KING

**Ultrafiltration as a test for colloidal constituents in aqueous and non-aqueous systems.** J W. MCBAIN AND S S KISTLER. *J. Phys Chem* 35, 130-6(1931).—Cellophane membranes show unusual properties in dialysis, they retain all but the smallest colloidal particles in diffusion It has been possible to demonstrate with these membranes, that colloidal constituents are commonly present in non aq solns. of the electrolytes $AgNO_3$, $NH_4I$, $AgBrO_3$, CdI, etc., which exhibit anomalies in elec cond. and osmotic behavior The non aq media for $AgBrO_3$ and $AgNO_3$ are $LiNH_2$ and piperidine, resp H R MOORE

**Some chemical reactions of colloidal clay.** RICHARD BRADFIELD. *J. Phys Chem* 35, 358-73(1931).—The base-exchange phenomena and the cation-exchange reactions of colloidal clays were studied experimentally Methods are developed for measuring the solid acidity of H clays, and the significance of titratable acidity of electrodialyzed clays is pointed out Changes in the phys properties of clays may be correlated with changes in electrophoretic potential H R MOORE

**Thermo-senescence effect exhibited by gold sols at elevated temperatures and aging at room temperature.** EMLYN JONES AND W C. M. LEWIS. *J Phys Chem* 35, 1168-73(1931).—In general no *sol is in a suitable state for examn* until it has been dialyzed for about 4-5 days and has then been subjected to about 3 hrs' heat treatment. Thermo-senescence may not be attributed to the further removal of impurities, but is due to the contraction of the sol particles as a result of raising the temp The aging effect, however, may well be due to ionic adsorptions and desorptions FRANK URBAN

**Studies on the formation of silver sol prepared by dispersion in the electric arc.** P. S MACMAHON AND S C. VARMA. *Proc 15th Indian Sci Congr.* 1928, 136.—Attempts were made to det. the properties of finely dispersed Ag The deposit obtained by Furth (*C A* 18, 2449) from an elec. arc struck in air between Ag electrodes gave a sol on treatment with water However, this deposit is by no means pure Ag, it contains large quantities of oxide and nitrate. When the dust is ignited, brown fumes are given out in perceptible quantity The dust was prepd by striking the arc between pure Ag electrodes in either air, O or N. Nitrate was found to be produced in O contg as little as 0.2% N or in N contg a little O In pure N practically no deposit was formed, and it is probable that if the gas were chemically dry there would be no formation of dispersed Ag whatever The conditions under which the sol was produced by the addn. of water to the powder were studied at length, but the results are not given. The properties of the solid powder were also investigated There is evidence that this powder exposed to air or O takes up a further small quantity of O, indicating the oxidation of finely dispersed Ag E. J C

**Colloidal platinum and its behavior as a typical acidoid sol.** S. W. PENNYCUICK. *J. Am Chem Soc* 52, 4621-35(1930).—Evidence is presented for the behavior of colloidal Pt as a typical neg hydrophobe or acidoid sol. Deductions are made on the mechanism of retention of acid on the surface, and the fraction of surface covered by acid preferentially $H_2Pt(OH)_6$ appears to be combined at the surface with oxides of Pt, held together by the usual forces of chem affinity. Ionic replacement of $H^+$ by $Ba^{++}$, for example, can occur, and the surface oxide of the sol $[xPt.yPtO_2.zPt(OH)]^{z-}.2zH^+$ which is acidic may combine to form simple and complex salts An extensive study is made of coagulation phenomena which occur freely with bases and salts but are restricted with acids It is shown that HCN increases the charge carried by the colloidal particle, and likewise displaces the surface $H_2Pt(OH)_6$. H R MOORE

**Preparation of lead and lead phosphate sols.** VICTOR COFMAN *Rev gen colloides* 8, 337-57(1931).—Various methods of prepg Pb and Pb phosphate sols are given The effect of several stabilizing agents (gelatin, glucose, $Na_2S_2O_3$ and various salts) was investigated The particle size was detd from the rate of deposition and by means of the ultracentrifuge Striking lowering of the *p*H occurs in the prepn. of colloidal Pb phosphate FRANK URBAN

**Tungstic acid hydrosol.** A R NORMAND AND M C. MUTHANNA *Proc. 15th*

*Indian Sci Cong* 1928, 137.—It has been stated that tungstic acid sol is indifferent to acids, salts and alcs. But a fairly sensitive sol has been obtained by peptizing the tungstic acid both with an acid and an alkali. The sol of tungstic acid prepared in either of these ways is negatively charged and has the characteristic properties of an emulsoid sol. The order of coagulating power of the chlorides of alkali metals (detd. with the aid of the photoelec. cell) is PbCl > KCl > NaCl > LiCl. The protective influence of the neg. ions is Cl < Br < I. E. J. C.

**The stabilization of blue cupric hydroxide.** Harvey A. Neville and Charles T. Oswald. *J. Phys. Chem.* 35, 69–72 (1931).—The blue substance obtained by the action of alkali on a cupric salt is shown by x-ray analysis with the diffraction pattern obtained by $NiO_2$ to be $Cu(OH)_2$ or the hydrated oxide $CuO \cdot H_2O$. A 5% gelatin soln. stabilizes this colloid. H. R. Moore.

**Ion interchanges in aluminum oxychloride hydrosols.** Arthur W. Thomas and Thomas H. Whitehead. *J. Phys. Chem.* 35, 27–47 (1931).—A technic for the prepn. of Al oxychloride hydrosols of colloidal dimensions is presented. The following set of properties of the sols has been established. (1) Neutral salts of the type $K_2SO_4$, KOAc, KCl and $KNO_3$ increase the $p_H$ of the sols from 5 to 6.8, almost to 7.0 approx. (2) Neutral salt titration of $AlCl_3$ sols of different basicities leads to a rate of change of $p_H$ which is a function only of the no. of hydroxo groups, viz. the series $Al(OH)_2Cl \longrightarrow Al(OH)Cl_2 \longrightarrow AlCl_3$. (3) Several anions vary in their "penetration power" toward the basic Al ion, leading to an order for anions. The authors' extension of Werner's theory adequately explains the formation of the sols, their decrease of acidity on aging, increase on heating and the effect of heat on the soly. of Al hydrates. H. P. Moore.

**Surface processes on coagulating precipitates. II. The mechanism of adsorption in electrolytic solutions.** Ludwig Imre. *Z. physik. Chem.*, Abt. A, 153, 127–42 (1931); cf. *C. A.* 24, 2723.—The process of the adsorption of ions on the surface of aging suspension of Ag halides was examd. The changes with lapse of time of the adsorption values are different and depend on the soly. of the compd. of the corresponding ion with the oppositely charged constituent of the lattice. This different behavior leads to conclusions about the process of adsorption. At certain areas of activity on the surface of the aging ppt., the lattice is loosened because of the tendency to crystallize. A process of interchange is possible with the adsorbed ions which are in the immediate vicinity of the lattice. A. Hirsch.

**Equilibrium phenomena in coagulation of colloids.** E. F. Burton and May Applebey. *J. Phys. Chem.* 35, 498–509 (1931).—An ingenious optical study is made of the scattered and transmitted light from aq. soln. of mastic, Au, and $As_2S_3$. Variations in the d. of scattered light are recorded, as well as a curious *zonal effect* in the coagulation of $As_2S_3$. *Coagulation by stages* is observed on adding traces of electrolyte to the sols, and evidence is obtained for equil. states in the coagulation process. The $As_2S_3$ sol probably has a constitution of the type $(nAs_2S_3 \cdot HS)^- + mH^+$, the H ions diffusing as the outer layer of the Helmholtz double layer. H. R. Moore.

**The mechanism of the coagulation of sols by electrolytes. I. Ferric oxide sol.** Harry B. Weiser. *J. Phys. Chem.* 35, 1–29 (1931).—The coagulation process is studied by following the change in compn. of $Fe_2O_3$ sols by adding pptg. electrolytes stepwise to the sol. Cl is released in the reaction $2[xFe(OH)_3 \cdot yFeOCl \cdot FeO]^+ + 2Cl^- + K_2SO_4 \longrightarrow [xFe(OH)_3 \cdot yFeOCl \cdot FeO]_2SO_4 + 2KCl$, and the increase in $[Cl^-]$ may be followed potentiometrically. In micelles of this type thousands of equivs. may exist for each free charge. Several titration curves are obtained with sols of 3 distinct types and with inorg. salts of different valence types as exemplified by $K_2CrO_4$, $K_2C_2O_4$ and $K_4Fe(CN)_6$. A mechanism of coagulation is proposed from these data, postulating *positively charged* micelles as a consequence of the hydrolysis. These micelles vary in size, compn. and charge depending on conditions of hydrolysis. H. R. Moore.

**The influence of electrolytes on the coagulation of ceric hydroxide hydrosol heated to different temperatures.** A. R. Normand and M. C. Muthanna. *Proc. 15th Indian Sci. Cong.* 1928, 135.—The coagulating powers of the chlorides of alkali metals and metals of the alk. earths on pos. $Ce(OH)_4$ hydrosol, heated to different temps., were studied. The time required for each electrolyte to coagulate the sol was followed by means of a K photoelec. cell. The order of the coagulating power of the electrolyte was found to change with different degrees of dehydration of the sol. The order of the coagulating power of the electrolytes is: (1) With sol dialyzed at 28°, LiCl > NaCl > KCl > RbCl. (2) With sol dialyzed at 28° and heated to 70°, LiCl > NaCl > RbCl > KCl. (3) With sol dialyzed at 28° and heated to 100°, KCl > RbCl > LiCl > NaCl. Thus the coagulating power of the different electrolytes depends upon the temp. condition of the sol. F. J. C.

The vapor-adsorption capacity of silica gels as affected by extent of drying before wet-heat treatment and by temperature of acid treatment and activation. HARRY N. HOLMES AND A. L. ELDER. *J. Phys. Chem.* 35, 82–92(1931).—Eleven $SiO_2$ gels showed a decrease in benzene adsorption on aging for a few years. Four $SiO_2$ gels were heated above 800° without causing serious decreases in their benzene adsorption capacities. Increase in temp. of acid treatment of a gel from 30° to 100° increases the porosity of the gel. A 58% adsorption of benzene by weight was obtained with a gel. Chalky gels have high total adsorption capacities at high partial pressures but are not efficient for adsorption at low partial pressures. A. L. ELDER

Adsorption of acids by silica. M. P. LAKHANI. *Proc. 15th Indian Sci. Cong.* 1928, 154.—In view of the controversy between Joseph and Mukherjee (*C. A.* 21, 544) it appeared that the method of prepg. $SiO_2$ detd. whether it would adsorb acid or not. CaSiO$_3$ and $H_2SO_4$ mixts. were distd. at low temp. The gas was collected under water. The ppt. of $SiO_2$ thus formed and dialyzed for 7 days did not adsorb HCl or $H_2SO_4$, as indicated by analytical elec. cond. and *p*H detns. E. J. C.

Adsorption by silica gel from binary mixtures of liquids. BASRUR SANJIVA RAO AND H. M. CHANNABASAPPA. *Proc. 15th Indian Sci. Cong.* 1928, 133.—Silica gel particles have a water envelope, and B. S. Rao (Thesis, London University, 1926) has shown that selective adsorption from binary mixts. of liquids depends on the energy of the interface that this water envelope forms with each of the 2 liquids. The interface between water and $CCl_4$ has the same energy as that between water and $CS_2$. R. and C. detd. at 30° adsorption by silica gel from mixtures of $CCl_4$ and $CS_2$ in different concns. and in conformity with the above view, found no selective adsorption. Detns. were carried out in 2 ways: by a static method in which the gel was treated with liquid mixts. in a thermostat and by a dynamic method in which air bubbled through the liquid and passed over the gel in a closed system, the circulation of air being effected by a double-action pump of special design, working in an air thermostat and consisting of 2 pulsating Hg columns and 4 Hg valves. A Pulfrich refractometer was employed for the analysis of the mixts. E. J. C.

Alcogel of silica. BASRUR S. RAO AND K. G. DOSS. *Proc. 15th Indian Sci. Cong.* 1928, 133.—Adsorption by silica gel is ordinarily dependent on the water envelope in it; attempts have been made to obtain gel with an alc. envelope. Expts. on the complete replacement of the water by alc. carried out by Graham, by Nanhauser and Patrick, and by Firth and Purse give contradictory results. R. and D. extd. with hot alc. silica gel (placed in a Jena glass thimble) in a Soxhlet app., the alc. in the flask being kept anhyd. by addn. of metallic Ca and BaO. On prolonged treatment the water in the gel was found to be about 1% by org. combustion methods suitably modified. Replacement of water was also attempted by a dynamic method in an app. in which air was continuously circulated in a closed system through anhyd. alc. and the gel. Adsorption curves (not given) for silica gel and water-alc. mixts. indicate that replacement of water becomes progressively difficult with decrease in water content of the gel. Complete replacement of water, though it may not be impossible, is extremely difficult to effect. E. J. C.

The density of water adsorbed on silica gel. DWIGHT T. EWING AND CHARLES H. SPURWAY. *J. Am. Chem. Soc.* 52, 4635–41(1930).—Values obtained for the d. of water adsorbed on $SiO_2$ gel were secured by vol. measurements, a gas dilatometer with He as the inactive gas was used. For small quantities of water up to 4.36%, the measurements show that the d. of water adsorbed at 25.02° is greater than the d. of liquid water at the same temp. H. R. MOORE

The growth of lead crystals in silica gels. ROBERT TAFT AND JESSE STARECK. *J. Chem. Education* 7, 1520–36(1930).—Pb crystals were grown in $SiO_2$ gels. The following exptl. factors were varied: nature of the reducing agent, concn. and compn. of the Pb salt, *p*H of the gel and the viscosity of the intercellular liquid present in the gel pores. By using a device equiv. to a voltaic cell, Ag or Cu could be used as reducing agent. Numerous photographs illustrate the crystal growths. ALBERT L. HENNE

The physical state of water bound by organic colloids and by the tissues. N. MARINESCO. *Compt. rend. soc. biol.* 103, 872–5(1930). *Physiol. Abstracts* 15, 274.—The hydrophil coeff. (no. of g. of water dielectrically satd. and adsorbed per g. of colloid) is 15 with dog hemoglobin, 11–13 with egg albumin and 8–10 with gelatin. The coeff. is lowest at the isoelec. point. The micelles of a hydrophil colloid are formed mainly of water, of which only a small part is free in an animal organism. The water in a colloid is not only fixed but compressed. During swelling of colloids heat is given out, which is a measure of the compression. G. G.

Properties of protein-cellulose membranes. LÉON VELLUZ AND JEAN LOISELEUR.

*Compt rend* 192, 306–8(1931).—The prepn of these membranes, which consist of solid solns. of proteins in cellulose esters, is given in *C A* 25, 1723, 1861. That the membranes are very homogeneous is shown by their even staining with dyes. When treated with a soln. of an Au salt and a reducing agent the Au is pptd. in colloidal form in the membrane which then appears red brown by reflected and deep blue by transmitted light. Each component of the membrane retains its particular properties. The cellulose ester being insol. in $H_2O$ and inert, plays a purely mechanical or static part, but the protein through its activity confers on the membrane properties that make it comparable to a certain degree with natural cell membranes. L. E. GILSON

**Certain observations on the Donnan equilibrium.** A. RONCATO. *Boll. soc. ital. biol. sper.* 5, 1103–6(1930).—Isoelec. gelatin was dissolved in 1% concns. in 0.01 *M* to 0.001 *M* solns. $NH_4Cl$ corresponding to $p_H$ 5 to 6.5 and placed in collodion sacs. The H ion concn. of the internal liquid was greater than that of the external, with 0.001 *M* $NH_4Cl$ the difference in $p_H$ between the external and internal liquid was 0.40; with concd. solns. of $NH_4Cl$ approaching the $p_H$ of isoelec. gelatin (4.7), this difference was not so marked. The membrane potential found corresponded to the calcd. theoretical value. If *M*/100,000 to *M*/1,500,000 HCl was used instead of $NH_4Cl$, although the $p_H$ values of the solns. were similar the difference in $p_H$ on both sides of the membrane was markedly less than that of the corresponding $NH_4Cl$ soln. The supposition is made that $NH_4OH$ and HCl, the products of hydrolysis of $NH_4Cl$ reciprocally influence each other, and being simultaneously present change the Donnan equil. which would have been reached had only one of these products been present. The *production of HCl in the stomach* might be interpreted as the result of a concn. of HCl in the interior of the gastric cells brought about by a state of Donnan equil. reached in the presence of $NH_4Cl$. PETER MASUCCI

**Adsorption of ions and sols by freshly prepared precipitates and its influence on the formation of Liesegang rings. II.** A. C. CHATTERJI AND S. C. VARMA. *Z. anorg. allgem. Chem.* 196, 247–56(1931). cf. *C A* 23, 5380.—No adsorption of $CrO_4''$ by $PbCrO_4$ takes place during formation of the latter. However, adsorption of $PbCrO_4$ sol by well-washed $PbCrO_4$ occurs. This adsorption, in the presence of gelatin, is a function of the gelatin concn., it approaches zero at higher gelatin concns. This explains why it is difficult to prep. $PbCrO_4$ rings in such gelatin gels. FRANK URBAN

**Evidence in favor of the existence of silver chromate in gelatin in the colloidal condition. Electric conductivity of silver chromate in gelatin.** A. C. CHATTERJI AND S. C. VARMA. *Proc. 15th Indian Sci. Cong.* 1928, 142–3.—Bolam and Mackenzie (*C A*. 20, 2772) contest the conclusion of Chatterji and Dhar (*C A* 19, 3191) that $Ag_2CrO_4$ exists in the colloidal condition when pptd. in gelatin and maintain that it exists in the ionic state. Expts. were undertaken to det. accurately the elec. cond. of $Ag_2CrO_4$ of different strengths in gelatin of varying concns. at 35°. The $Ag_2CrO_4$ was produced by the addn. of equiv. quantities of $AgNO_3$ and $K_2CrO_4$. The results (not given) confirm the earlier conclusions. From a study of the results of B. and M.'s e. m. f. detns. C. and V. point out that, except in a very few cases, not more than 40% of Ag exists in the ionic condition. Expts. were also undertaken to det. the elec. cond. of $PbCrO_4$ in agar agar soln. E. J. C.

**Kinetic study of Liesegang rings.** L. BULL AND SUZANNE VEIL. *Compt. rend.* 192, 682–3(1931). cf. *C A* 25, 1142.—The speed of formation of both primary and secondary rings varies as the square root of time. Primary rings form first but the secondary rings, forming more rapidly, finally extend beyond the primary. D. B.

**Diffusivity of colloids—a method of determining the diffusion velocity of very slowly diffusing substances, based on a new measuring principle.** H. R. BRUINS. *Rec. trav. chim.* 50, 121–8(1931).—An interferometer method was developed for measuring the speed of diffusion in colloidal solns., by which diffusion consts. 0.01 of those of *the common electrolytes can be measured in 2 days. With a 0.7% starch sol, the results* obtained were reproducible within 1 to 2%, and agree with the diffusion law. J. H. REEDY

**The diffusion of colloidal particles. I. Abnormally high diffusion velocities in hydrophilic sols.** H. R. BRUINS. *Kolloid-Z.* 54, 265–72(1931); cf. preceding abstr.—Diffusion velocities were detd. by the optical method at 20° for a wheat starch, unknown source, I, wheat starch, Merck *amylum solubile*, II, wheat starch, Huron Milling Co., III and gum arabic, 6% ash on dry basis. The velocities and radii of particles calcd. by the Einstein equation are, I, diffusion velocity $0.024 \times 10^{-6}$ sq. cm./sec., radius 8.2 mμ, II, $0.10 \times 10^{-6}$, 1.9; III, $0.15 \times 10^{-6}$, 1.4, gum arabic $0.25 \times 10^{-6}$, 0.85. The low calcd. radii are not compatible with the viscosity and slight diffusivity through membranes shown by the sols. Measurements on the lowering of the b. p. indicate that the

effect is not due to electrolytes. II. A new ion effect in hydrophilic sols. *Ibid* 272–8.—The diffusion velocity of hydrophilic colloids decreases extraordinarily in the presence of low concns. of electrolytes, as shown for wheat starch III, and gum arabic. Expts. in 0.1 *N* solns. of KCl, $BaCl_2$, and $Co(NH_3)_6Cl_3$ showed that the lowering increases with increase in valence of the oppositely charged ion. For a given ion the lowering decreases with increase in valence of the like charged ion, the negative ion in this case. Gum arabic showed the following diffusion velocities times $10^6$: no electrolyte 0.225; 0.001 *N* KCl 0.078; 0.001 *N* $K_2SO_4$ 0.030; 0.001 *N* $K_4FeC_6N_6$ 0.0244; and 0.001 *N* $K_3FeC_6N_6$ 0.0172. The relative lowering is greatest in the dil. electrolyte solns., but the selective effect of the ions is noticeable at 0.020 *N* solns. ARTHUR J. EISCHER

**Note on the Röntgen diagram of collagen.** (Fiber period.) R. O. HERZOG AND W. JANCKE. *Z. physik. Chem.* Abt. B 12, 225–9(1931); cf. *C. A.* 21, 1213, K. Herrmann *et al.*, *C. A.* 25 [illegible]. The value for the fiber period, about 20 Å. U., for collagen and elastin earlier obtained by H. and J. has been questioned by H. *et al.*, on the basis of their work on gelatin which indicates a value of about 9.5 Å. U. H. and J. emphasize the fact that their preps. from stretched neck ligaments and heel tendons of cattle give much clearer diagrams than they could obtain from stretched gelatin. H. and J. obtained sin θ/2 values of 0.107, 0.191 and 0.270. H. finds values agreeing with the first and the third but then considers only the first value in arriving at a fiber period of 9.5 Å. U. OLEN J. SHEPPARD

**Swelling and syneresis of isoelectric gelatin jelly.** E. J. BIGWOOD AND R. MAJMIN. *Compt. rend. soc. biol.* 104, 815–8; *Physiol. Abstracts* 15, 364(1931).—The swelling of gelatin jelly depends on the total concn. of the protein in the setting liquid and the amt. of free and combined ions in the medium. The jelly consists of a solid reticular phase and a liquid interstitial phase. The elasticity of the former is opposed by the osmotic pressure of the latter. The salts influence the distribution of the protein in these 2 phases at the moment of setting, the protein passing more freely into the reticular phase at low ionic concn. and *vice versa*. In the latter case swelling of the gelatin occurs at lower concns. of gelatin. Curves of swelling made for blocks of jelly in acetic-acetate soln.—the same medium as the solvent—of different strengths and at *p*H 4.8 and temp. 11° to 14° show that there is a crit. value of gelatin concn., for which there is no change of vol. in the blocks. A 3% jelly swells at *N*/5 concn. of ions, does not change at *N*/50 and shrinks at *N*/500. G. G.

**Swelling and hydration of gelatin.** J. H. NORTHROP AND M. KUNITZ. *J. Phys. Chem.* 35, 102–34(1931).—A phase rule treatment of gelatin sols or gels adequately accounts for the various types of swelling characteristic of these sols. On the assumption that the gelatin-water system consists of 2 phases and 3 components, satisfactory explanations are obtained for the curves of osmotic pressure vs. concn. in g. per 100 cc. $H_2O$, the various viscosity and hydration effects and finally the swelling and syneresis of isoelec. gelatin. A detailed picture of the gelatin micelles is deduced from the exptl. properties of the sols. H. R. MOORE

**Hydrolysis of gelatin.** B. N. DESAI AND T. R. BOLAM. *Proc. 15th Indian Sci. Cong.* 1928, 144.—The effect of the hydrolysis of gelatin on its power to prevent the formation of Ag $CrO_4$ from solns. of $AgNO_3$ and K $CrO_4$ was studied. It was found that the inhibitive power of gelatin first decreases, then increases and on further hydrolysis again decreases. The *p*H of the gelatin solns. (as measured by the colorimetric method) is increased to a small extent by hydrolysis and shows little variation with the progress of the latter. By bringing the *p*H of hydrolyzed gelatin to that of unhydrolyzed by the addn. of dil. AcOH the inhibitive power of hydrolyzed gelatin is in no way increased, although the addn. of the same quantity of AcOH to the unhydrolyzed gelatin increases its inhibitive power a great deal. E. J. C.

**X-ray study of the gelatinization of nitrocellulose.** DESMAROUX AND M. MATHIEU. *Compt. rend.* 191, 787–8(1930).—X-ray diagrams were obtained and described for films of nitrocellulose which contain various gelatins such as cyclohexanone, nitroglycerin and acetophenone. MALCOLM DOLE

**Spectrochemistry of solutions of boric acid in glycerol.** MORELLO MORELLI. *Atti accad. Lincei* 12, 451–6(1930).—The refractive indexes of solns. of $H_3BO_3$ in glycerol for the α, β, γ-lines of $H_2$ as well as *D* line of Na were detd. for concns. from 1 to 20% $H_3BO_3$ at 20°. The sp. refractivities $(n-1)/d$ and $\frac{(n^2-1)}{(n^2+2)d}$ were calcd., the sp. grs. of the solns. were also detd. The refractivity decreases with increasing concn., and is greater than in equiv. water solns. When $H_3BO_3$ is dissolved in glycerol there is an increase in vol. of the soln., amounting to 1.883 cc. at 20% concn. (vol. of 100 g. soln. calcd. 78.006 cc., measured 79.889 cc.). A. W. CONTIERI

**Reducing action of sodium upon salts in liquid-ammonia solution.** WAYLAND M. BURGESS AND EDWARD H SMOKER *Chem Reviews* 8, 265–72(1931), cf *C A* 24, 5218 Examples are given of the reduction of inorg salts by Na in liquid $NH_3$ Three types of reaction are illustrated (1) the reduction product is the free metal, *e g*, Ag salts are reduced to Ag by Na in liquid $NH_3$ (2) the reduction product is an intermetallic compd *e g* Na reacts with $Zn(CN)_2$ to form a black metallic ppt which appears to be $NaZn_4$ (3) the reduction product takes part in addnl reactions, *e g*, in the reaction of Na with MnI the free Mn formed not only catalyzes the reaction between Na and $NH_3$ but also appears to react with the $NaNH_2$ formed L K

**Properties of solutions of metals in liquid ammonia.** WARREN C JOHNSON AND ALBERT W MEYER *Chem Reviews* 8, 273–301(1931) cf *C A* 24, 1270 —A discussion of (1) the soly of the alkali metals in liquid $NH_3$ (2) mol wt detns of metals in $NH_3$ and (3) the densities activities and elec and photoelec properties of such solns LOUISE KELLEY

**Acid-base equilibria in non-aqueous solvents with particular reference to glacial acetic acid.** NORRIS F HALL *Chem Reviews* 8, 191–212(1931) —In acid base equilibria solvents may be roughly classed as predominantly acidic (*e g*, AcOH), predominantly basic (*e g*, $NH_3$ and amines) amphiprotic (*e g* $H_2O$) or aprotic (*e g*, $C_6H_6$) Acid base reactions in solvents of these 4 classes are discussed LOUISE KELLEY

**The solubility of mercuric bromide in ethyl alcohol.** KISHEN LAL AND H B DUNNICLIFF *Proc 15th Indian Sci Congr* 1928, 168 —The values found by the method of Chugaev and Khlopin (*C A* 8, 1897) are consistently higher than those recorded by Timofeiew No further information is given F J C

**The solubilities of lanthanum oxalate and of lanthanum hydroxide in water The mobility of the lanthanum ion at 25°.** I M KOLTHOFF AND RUTH LAUQUIST *J Am Chem Soc* 53, 1217–25(1931) — Cond measurements of $LaCl_3$ solns gave a mobility of 77 at 25° for La ion (Cl ion 75 8) A colorimetric method for the *detn of traces of La* using Na alizarinate is described The soly of $La_2(C_2O_4)_3$ at 25° detd volumetrically is 2 08 ± 0 03 mg per l The cond method gave 0 6 0 mg, which is low because of dissocn of the dissolved oxalate The soly of the oxide and of the aged hydrous oxide was detd at 0 7 mg of $La_2O_3$ per l at 25° The cond and volumetric methods agreed within 10% J E SNYDER

**Solubility of acids in salt solutions. IV. The solubility of benzoic acid and the activity coefficient of its molecules in aqueous benzoate solutions.** ERIK LARSSON *Z physik Chem*, Abt A, 153, 299–308(1931) cf *C A* 24, 4689 —The soly of benzoic acid in solns of LiCl, RbCl CsCl, $MgCl_2$ KBr, KI, $LiNO_3$, $NaNO_3$, $KNO_3$, the chlorides and nitrates of Ca, Sr, Ba, $NaClO_4$ Na dichloroacetate, Na trichloroacetate, Na benzene sulfonate and Na β naphthalenesulfonate were detd The activity coeffs of the benzoic acid mol are calcd **V. Temperature coefficient of the activity coefficient of benzoic acid molecules in solutions of sodium chloride, potassium chloride and sodium benzoate.** *Ibid* 466–70 —The soly of benzoic acid was detd in KCl and NaCl solns at 0 2° and 25°, in Na benzoate soln at 25° The activity coeffs of the benzoic acid mol were calcd I U

**The solubility and activity of silver benzoate and silver acetate in concentrated salt solutions.** ERIK LARSSON AND BIRGER ADELL *Z. anorg allgem Chem* 196, 354–63 (1931), cf *C A* 21, 3290L—The soly of AgOBz in solns of Na, K and Ba nitrates and of NaOAc and the soly of AgOAc in solns of $NaNO_3$, and NaOAc were measured In each case except AgOAc in NaOAc soln the soly of the Ag salt increases with increased concn of the other salt Calcns of the av activity coeff of these Ag salts in salt solns show that the dependence of the activity coeff upon the 'ionality' of the soln can be computed by means of the Debye Huckel formula, $-\log f = \frac{0.5\sqrt{\mu}}{1+A\sqrt{\mu}} + B\mu$, by choosing values of suitable magnitude for the consts $A$ and $B$ ($f$ = the average of the activity coeff of the 2 ions, $\mu$ = 'ionality') W C FERNELIUS

**Determination of the molecular weight of cane sugar by the vapor-pressure method.** S OGURI, M MATSUI S SHIMIZU AND G MONYA *Rep Tech Chem Lab, Waseda Univ* 1928, No 8, 6, *Mem Faculty Sci Eng Waseda Univ* 1930, No 7, 93 6 —The mol wt of cane sugar was detd by passing dry air through a soln of known concn and pure water, and noting the decrease in wt of each L W T. CUMMINGS

**The lowering of the vapor pressure of water by dissolved electrolytes.** J J. VAN LAAR *Proc Acad Sci Amsterdam* 33, 1140–60(1930) —Existing data are shown to agree with the general formula $(p_0-p)/p_0x = \iota - \varphi x^{1/3} + \rho x - \sigma x^{3/2}$, where $x$ denotes mol fraction concn, $\iota$ van't Hoff's factor (*e g*, $\iota = 2$ for a binary electrolyte) and $\varphi$ a const that can be calcd from the theory of Debye and Huckel (*e. g*, approx 5 for a

univalent binary electrolyte), while $\rho$ and $\sigma$ are individual consts. for the electrolyte in hand. Eventual assocn of the water has no effect on $s$ and $\sigma$, it can only affect the consts $\rho$ etc. L. Onsager

**The measurement of the conductance of electrolytes. IV. The validity of Ohm's law for electrolytes.** Grinnell Jones and Giles M Bollinger. *J. Am Chem. Soc.* 53, 1207–12(1931), cf *C A* 25, 1725.—If errors due to heating, polarization and the secondary effects of inductance and capacitance are avoided, there is no measurable variation in the real resistance of electrolytes with variation in the applied voltage. The applied voltage was varied from 0.01 to 5 v. John R. Hill

**The mechanism of ion conductivity.** Zoltán Gyulai. *Matematik. és Természettud. Értesito* 47, 770–7. German abstract 778(1930).—A soln of $PbCl_2$ contg 0.005 parts KCl does not follow the law of Ohm in an elec. field of 0–100 v./cm. elec. strength. The law of Ohm becomes valid in fields of larger elec. strength or in a soln. of pure $PbCl_2$. Movable K ions probably increase the cond. because of their contrary charge. They are thrown away in elec. charged fields and leave their former place. Addn. of $BaCl_2$ to PbCl soln. did not cause such irregularity. Disturbance can be caused only by an ion whose contrary charge can loosen the ions that conduct the current. S. S. de F.

**The transference numbers of potassium chloride. New determinations by the Hittorf method and a comparison with results obtained by the moving-boundary method.** Duncan A MacInnes and Malcolm Dole. *J Am Chem Soc* 53, 1357–64(1931).—Transference nos. for KCl were detd. at 25° for the concn range 0.02 to 3 *N* by a slightly modified Hittorf method. The results agree with new values obtained by the moving-boundary method but they do not agree with old data obtained by either method. Malcolm Dole

**The electrical conductivity at high temperatures of solutions of common salt and of concentrated sulfuric acid.** I. J Symon. *J Roy Tech Coll.* (Glasgow) 2, 395–401 (1931).—Measurement of the elec. cond. of aq. solns. of NaCl for concns. up to 1.13% and for temp. from 10° to 230° are described. Above 100° the solns. were necessarily under a pressure which rose to about 400 lb. per sq. in. at 230°. The cond. of $H_2SO_4$ from 94 to 99% was also measured for the temp. range 15–50°. Values given in the Smithsonian Tables (1920) for a few dil. solns. of NaCl may be in error by about 4% at 100° and 17% at 218°. A. L. Kibler

**The influence of sucrose on the conductivity of electrolytes.** J Peller. *Listy Cukrovar* 49, 346–52(1931).—The elec. conductivities of 0.01 *N* HCl, 0.01 *N* $H_2SO_4$, 0.01 *N* KOH, 0.01 *N* $Na_2CO_3$, 0.01 *N* $NH_4Cl$, 0.01 *N* $CaCl_2$ and 10% AcOH were measured in the presence of 0, 5, 10 and 15% sucrose. Sucrose decreased the dissocn. of the electrolytes and hence the cond.; the decrease in elec. cond. was proportional to the sucrose present, ranged from 8 to 67%, and appeared smallest for the highly dissocd. acids and alkalies. The order of decreased cond. was HCl<$H_2SO_4$<$CH_3COOH$<$Na_2CO_3$<KOH. Alkalies formed a compd. with sucrose and decreased the Con. The depression of elec. cond. in salts increased with the valence; $NH_4Cl$, KCl, and NaCl were least affected ($CaCl_2$ and $Na_2CO_3$ more) by the presence of sucrose, the depressions of elec. cond. for the salts were greater than for the corresponding acid of equal concn. Salts of $NH_3$ were not affected in direct proportion to the sucrose addn.; the addn. of an aq. sucrose soln. to $NH_4OH$ increased the elec. cond., the max. cond. was reached with 16% sucrose, the original cond. was reached again with 36% sucrose and for further increased sucrose concns., the cond. continued to fall. AcO$NH_4$ and $(NH_4)_2CO_3$ decreased the elec. cond. for all sucrose concns. but not in a direct proportion to the sucrose concn. The decrease in elec. cond. for mixts. of salts with dil. sucrose showed KOH>KOH+KCl>KCl>KCl+HCl>HCl. In the presence of 50–80% sucrose the elec. cond. decreased in the order KOH<$CaCl_2$<$Na_2CO_3$<$NH_4Cl$<AcOK<HCl, dehydration by the sucrose is the cause for the reversal. The dielec. const. of sucrose (55) is high and decreased the dissocn. of, particularly, the weaker acids, this decrease was only a portion of the total decrease in elec. cond. An increased viscosity, hydration of the ions, of the electrolytes, assocns. of sucrose mols., or of their hydrates and a decreased ionic mobility are the causes of the remaining decrease. Chem. combinations may occur between sucrose and KOH, $Na_2CO_3$ or $NH_3$. Frank Maresh

**Aqueous solutions of sodium aluminate. I. Electrical conductivity.** Mata Prasad, S M Mehta and N G Joshi. *J Indian Chem Soc.* 7, 973–80(1930).—The Kohlrausch method was used to measure the elec. cond. of solns. contg. various ratios of $Na_2O$ to $Al_2O_3$. For dil. solns. no conclusion can be drawn as to the existence of aluminates. In concd. solns. a sharp change in equiv. cond. at a ratio of 3 to 1 is interpreted as indicating the formation of $Na_3AlO_3$ in soln. E J Rosenbaum

**Electrical conductivities of mercury amalgams of potassium and sodium.** G. R.

PARANJPE AND BUHARIWALA *Proc 15th Indian Sci Cong* 1928, 74.—The results (not given) of these detns indicate that in the elec cond curves the discontinuities do exist at the same places as those measured by Bhave in the viscosity curve. This also corroborates the discontinuities measured by Bhatnagar and others as regards other phys properties. E J C

**Neutral salt effect in ion reactions. IV. The specific ion effect.** Á. DE KISS AND I BOSSÁNYI *Acta Sci Univ Francisco Iosephinae, Acta Chem., Mineral., Physica* 1, 59–68(1929); cf *C A* 24, 5582.—Neutral salt effect between persulfate and I ions was examd and data contrary to the theory of Brønsted were again obtained as found previously in concd solns. A theory is advanced in explanation. S S DE FINÁLY

**The boundary layer of dilute electrolytes. II.** MAX PLANCK *Sitzb preuss Akad Wiss* 1931, 113–22; cf *C A* 24, 4979.—The e m f at a liquid junction should slowly change with time from that given by Henderson's formula to that of Planck. The former represents a mixt., the latter a stationary state. Since expt does not confirm this, another formula is presented which has a different concn gradient in the original boundary layer. This shows better agreement with expt. G M M

**The electrocapillary curve of mercury.** K BENNEWITZ AND K KÖCHLER. *Z. physik Chem.*, Abt A, 153, 443–50(1931).—The potential of an isolated dropping electrode may differ from that of a shorted electrode. Nevertheless, the existence of an inversion point at 0.5 v was again demonstrable. The addn of $KNO_3$, KOH, KBr, KI, $H_2S$, KCN and KSH caused considerable displacement of the curve. A change in the direction of current flow occurred at the max. The latter does not necessarily indicate a true zero point. FRANK URBAN

**The advances in the potentiometric determination of hydrogen ions.** V ČUPR. *Chem Listy* 25, 79–83, 104–107(1931).—The H, Sb, glass, $O_2$ and oxidation-reduction electrodes are reviewed. Bibliography of 60 references. FRANK MARESH

**Rapid electrometric determination of $p_H$.** J DI GLÉRIA *Mezogazdasági Kutatások* 2, 439–40(1929).—The value of $p_H$ is read directly on a measuring wire with the aid of a regulable rheostat. S S DE FINÁLY

**Hydrogen-ion concentration.** G SCHAY *Kisérlet Közlemények* 31, 187–222 (1928).—A general description. S S DE FINÁLY

**The use of the antimony-antimonous oxide electrode in the determination of the concentration of hydrogen ions and in potentiometric titrations. The Prideaux-Ward universal buffer mixture.** HUBERT T. S BRITTON AND ROBERT A ROBINSON *J. Chem Soc* 1931, 458–73.—The Sb-$Sb_2O_3$ electrode possesses a wide range of applicability in titrimetric work and can rapidly indicate $p_H$ values with a moderately high degree of accuracy. Electrodes made up with various types of Sb and $Sb_2O_3$ were studied. Those found most satisfactory consisted of a clean bar of Sb dipping into a soln contg suspended $Sb_2O_3$. Vigorous mech stirring was necessary to obtain steady potentiometric readings. The electrode was calibrated as follows. To 100 cc of Prideaux-Ward universal buffer mixt (*C A* 18, 1602) was added 0.2 *N* NaOH so that the soln passed continuously through a range of $p_H$ values from 2 to 12. The $p_H$ values were first obtained with a H electrode and with a quinhydrone electrode up to $p_H$ 9.1. A similar titration was then carried out with the Sb electrode and the e m fs thus obtained were converted into the corresponding $p_H$ values. A *N* calomel electrode was used as the half cell and the junction was made with satd KCl. A series of titrations of acids and salts, some of which could not be used with a quinhydrone or H electrode, *e g*., HCN and $H_2SO_3$, was carried out with the Sb electrode and the dissocn consts were detd where possible. In general, the $p_K$ values agreed well with those of other workers. The titration curve of $H_2TeO_4$ shows that it is a dibasic acid as opposed to the hexabasicity required by the formula $H_6TeO_6$. With $H_2SeO_3$ and $H_2SeO_4$, the $p_{K_2}$ values were in good agreement with those of other workers, but the $p_{K_1}$ values could not be detd., probably because of a reaction of the Sb with the acid. The e m fs obtained in the titration of $H_2CrO_4$ with alkali were not reproducible, in some cases the polarity of the cell being reversed. The Sb electrode was also found applicable in the titration of $NaN_3$ with HCl and the $p_H$ values were correct as far as can be judged from previous data. RUTH BERGGREN

**Electrolytic reduction of dicarboxylic acids.** HISAKAZU NAKATA *Anniversary Vol Dedicated to Masumi Chikashige* (Kyoto Imp Univ.) 1930, 49–55.—The electrolytic reduction of oxalic acid was studied in detail and the investigation was extended to malonic and succinic acids. Electrolysis of oxalic acid at 5–7° yields glyoxylic acid as well as substances more highly reduced. On prolonged electrolysis some glyoxylic acid undergoes further reduction, the yield decreasing from 89% in the second hr to 37% in the 6th hr. The presence of HCHO could not be recognized in the cathode soln. The presence of

dihydroxytartaric acid could not be positively confirmed At 60°, the current efficiency decreases but the yield of glycolic acid increases The yield also increases directly with acid concn The influence of the cathode material is very marked at higher temps Hg is most suitable for obtaining glyoxylic acid, and Pb for glycolic acid It was possible to raise the current and material yield to approx 100% by decreasing the c d to approx 4 amp per sq dm with a Pb cathode Under various conditions no reduction could be recognized in the electrolysis of malonic and succinic acids ALLEN S SMITH

**Interaction between hydrated copper oxide and neutral salt solutions.** M P VENKATARAMA IYER *Proc 15th Indian Sci Cong* 1928, 170–1 —Hydrated Cu oxide thoroughly purified by repeated washing and subsequent electrodialysis to remove the last traces of alkali is found by electroosmotic measurements to be pos charged in contact with cond water It develops appreciable quantities of alkali when shaken with solns of neutral salts The $p_H$ developed depends upon the effect of the anion and not very much on the cation used The variation of the elec charge of the substance with various electrolytes can be correlated with the $p_H$ measurements The total quantity of alkali liberated by repeated shaking of a given quantity of the sample with KCl and $BaCl_2$ was found to be a const quantity The $p_H$, after attaining the value 7 6, remains const on subsequent shaking with KCl The sample of the hydrated Cu oxide was shown to absorb alkalies by measurements of the elec cond of the alkali soln before and after adsorption The results obtained strongly support the theory of the nature of the interface put forward by Mukherjee F J C

**The reduction of manganese oxides by carbon monoxide.** TSUNEO NISHIBORI *Anniversary Vol Dedicated to Masumi Chikashige* (Kyoto Imp Univ ) 1930, 295–8 —The chem equil of the reduction of $Mn_2O_3$ and MnO by CO was investigated The equil const of the reaction at 780° was detd in various stages of reduction In earlier stages of reduction the CO added was oxidized completely to $CO_2$ because of the high decompn pressure of the $Mn_2O_3$ In the stage of reduction before MnO the ratio $[CO_2]/[CO]$ suddenly decreased but the reduction could be followed beyond MnO The latter yields on reduction a substance of strong reducing power capable of reducing $H_2SO_4$ to $H_2S$ ALLEN S SMITH

**The mechanism of the oxidation of acetaldehyde and of hydrocarbons.** MAX BODENSTEIN *Z physik Chem*, Abt B, 12, 151–64(1931), cf *C A* 25, 2088.— The reaction scheme for the oxidation of hydrocarbons, previously discussed with reference to AcH, is applied to the oxidation of $C_2H_2$ (cf *C A* 25, 1147) This is a more favorable example since the intermediate reactions lead to 3 different products The expts agree with the theory except in 2 cases where the concn of the reacting gases was very small The theory is also discussed with reference to explosion phenomena that take place in motors C M MURPHY

**Dissociation constants of nitrogen tetroxide and of nitrogen trioxide** FRANK H VERHOEK AND FARRINGTON DANIELS *J Am Chem Soc* 53, 1250–63(1931) —The dissocn const for gaseous $N_2O_4$ and the influence of pressure were measured at 25°, 35° and 45° The const is proportional to the pressure and is 13% greater at 0 1 atm than at 1 atm , the const is unaffected by $O_2$ or $CO_2$ The dissocn const of $N_2O_3$ was measured at 25°, 35° and 45° at different pressures The influence of pressure on the equil consts is due to deviation from the gas laws The true equil consts were detd by extrapolation to zero pressure $\Delta F$, $\Delta H$ and $\Delta S$ are calcd The dissocns proceed according to $N_2O_4 \rightleftharpoons 2NO_2$ and $N_2O_3 \rightleftharpoons NO + NO_2$ S LENHER

**Heterogeneous equilibria between the sulfates and nitrates of sodium and magnesium and their aqueous solutions.** MOHAMMAD A HAMID AND AMBA PARSHAD *Proc 15th Indian Sci Cong* 1928, 169 —The quaternary system $H_2O$—$Na_2SO_4$—$NaNO_3$—$MgSO_4$—$Mg(NO_3)_2$ has been investigated at 25° In addn to the solid phases in the ternary systems at this temp , a new surface appears in the quaternary system which probably represents the satn field of the lower hydrate or hydrates of $MgSO_4$ I J C.

**Role played by adsorbed gases in initiating reaction chains combination of hydrogen and oxygen.** HUBERT N ALYEA *J. Am Chem Soc* 53, 1324–36(1931) —The adsorption of H on glass increases above 450° Adsorbed H initiates reaction chains extending into the gas phase at 500° Cf Alyea and Haber, *C A* 25, 635 S L

**Are resonance phenomena possible in physical chemical periodicity?** N RASHEVSKY *Z Physik* 65, 270–2(1930), cf *C A* 23, 1041 —"Phys chem resonance" is suggested as a possible result of the interaction of 2 periodic reactions such as are assocd with certain nerve phenomena A math treatment yields amplitude equations that are formally identical with corresponding equations applying to elec and mech systems W G LEIGHTON

**Chemical activity and particle size: rate of solution of anhydrite below 70 microns.** PAUL S ROLLER *J Phys Chem* 35, 1133–42(1931).—The soln curves of 6 homogeneous size groups of cryst anhydrite of surface mean diam of 1 96 to 66 9 microns were detd by cond measurements There is an induction period of 0 1 min Below 25 microns the relative rate of soln per unit surface increases to a max of 17 6 at 2 8 microns and then decreases until at 1 96 microns it is 11 6 The soly of natural cryst anhydrite in $H_2O$ is 0 298 g $CaSO_4$ 100 cc at 20° S LENHER

**Statistical treatment of reaction-velocity data. II.** L J REED AND E J THERIAULT *J Phys Chem* 35, 950–71(1931) cf *C A* 25, 2354.—A statistical treatment applicable to unimol rates of reaction is developed This procedure makes it unnecessary to det experimentally the value of $L$ in the unimol formula, $K = [1/(t - t_0)] \ln[(L - 1_0)/(L - 1)]$ $1_0$ and $t_0$ need not be accurately known The usual methods of calcg unimol consts is criticized The least squares values of the velocity consts of decompn of $N_2O_5$ differ by 0 5 to 12 0% from values of Daniels and Johnston The least-squares procedure should be used when a velocity const is detd within an allowable error of 5% S LENHER

**Kinetics of transformation of the various forms and stages of hydration of calcium sulfate.** WALTER FEITKNECHT *Helv Chim Acta* 14, 85–90(1931).—A comparison of Debye Scherrer diagrams indicates that $CaSO_4 2H_2O$ loses water with a change in lat tice, to form a pseudomorph composed of disperse crystals of $2CaSO_4 H_2O$ between $10^{-4}$ and $10^{-6}$ cm diam. (cf Jung *C* 1 19, 1386) With respect to time, the dehydration of pptd $CaSO_4 2H_2O$ *in vacuo* passes through an induction period which at 20°, persists several hrs without appreciable water loss, although the normal aq tension is 12 7 mm. This suggests that dehydration sets in at isolated centers from which the process slowly spreads The further dehydration of $2CaSO_4 H_2O$ to form sol anhydrite proceeds and may even be reversed, without disintegration of the crystals There is an accompanying change in most of the weaker D S lines Partially dehydrated samples yield intermediate diagrams that do not show the two end lattices superimposed It is concluded that the diffusion of water out of the semi hydrate lattice causes contraction without changing the orientation In effect the semi hydrate is analogous to the zeolites, as pointed out by Linck and Jung (*C A* 18, 3566) The polymorphous transition from *sol* to *natural anhydrite* is appreciable only above 300°, although sol anhydrite is the unstable form Here the transition consists of an abrupt change in the lattice, leading at first to a disperse product and followed by a growth in particle size at high temp. The latter fact explains the inertness of dead burned *gypsum* W G LEIGHTON

**The kinetics of the oxidation of copper. The establishment of sorption equilibria.** F J WILKINS *Phil Mag* 11, 422–32(1931), cf *C A* 24, 2365, 5208.—The quant treatment of the reaction kinetics of Cu oxidation by considering oxidation when the oxide O interface is not satd., yet in equil with the gas phase, leads to the equation $(p_0 - p)^2 = |\alpha[p_0(\ln(p_0/p) - 1) + p]/(p_0 - p)^2| + \beta$, where $p_0$ is the initial O pressure, $p$ the pressure at time $t$ and $\alpha$ and $\beta$ are consts. For a series of expts below the limiting pressure the curves are strictly linear after an initial deviation The time at which linear behavior is reached increases with the no of activations of the Cu This is readily interpreted if activation increases the surface and it is assumed that adsorbed O is able to diffuse laterally ARTHUR FLEISCHER

**The measurement of hydrolysis in beryllium halide solutions.** MILDA PRYTZ. *Z anorg allgem Chem* 197, 103–12(1931), cf *C A* 23, 5086.—$BeBr_2$ and $BeI_2$ were titrated electrometrically with NaOH at a series of water concns. and the data obtained were used to calc the hydrolysis const Although no true const was found the best value was that which corresponds to $2Be^{++} + H_2O = Be_2O^{++} + 2H^+$. The assumption previously made that a monohydroxy ion is primarily formed which passes into a stable double compd was confirmed The av values of $K_0$ found were $5\,9 \times 10^{-7}$ and $4\,4 \times 10^{-7}$ for bromide and iodide, resp The soly products for $Be(OH)_2$ were then calcd as $2\,7 \times 10^{-19}$ and $3\,3 \times 10^{-19}$ as compared to $4\,1 \times 10^{-19}$ previously obtained from BeCl. R H. LAMBERT

**The hydrolysis of acetic anhydride. I. Hydrolysis of acetic anhydride in presence of neutral salts.** J E KOCSIS. *Magyar Chem Folyóirat* 37, 41–9(1931).—Chlorides, nitrates, chlorates and bromides diminished but sulfates increased the velocity of hydrolysis. The salt influence law of Grube and Schmid (*C A* 20, 1548) can be applied to the hydrolysis of anhyd HOAc S S. DE FINÁLY

**Interaction of epichlorohydrin and cyclohexene oxide with alkali and ammonium halides.** HEMENDRA K. SEN, CHITTARANJAN BARAT AND PATIT P. PAL. *Proc. 15th Indian Sci Congr* 1928, 146–7, cf *C A* 21, 2668.—When these oxides act upon alkali and $NH_4$ halides a very interesting reaction takes place with the liberation of alkali

hydrazides and $NH_3$. In fact this can be shown as a lecture expt. With an excess of $NH_4Cl$ the velocity of reaction of epichlorohydrin (I) and cyclohexene oxide was detd. I : ratio 1 $NH_4Cl$ 1 mol 10 mols was used in the first expt. (0.925 g. I, 5.35 g. pure $NH_4Cl$ and 20 cc. pure abs. alc. were made up to 250 cc. with distd. water and placed in a thermostat at 35°. At 1 hr. intervals 10 cc. of the soln. was taken out, at once mixed with an excess of cold water and titrated with 0.01 *N* $H_2SO_4$). The velocity const. *K* after 1, 2, 3, 4 and 5 hrs. resp., = 0.2040, 0.1851, 0.1960, 0.2012, 0.2040, for the ratio 1 : 40 *K* after the same periods resp. = 0.5625, 0.5715, 0.5584, 0.5865, 0.6734. For the ratio 1 : 100 *K* = 0.9023 when the vol. of soln. is made up as described before, i. e., made up to 250 cc. If however the vol. is doubled and the same mol. proportion exists between the reactants *K* = 0.4437 when the vol. is quadrupled, *K* = 0.2442. Tables are given for the first 2 expts. (run in duplicate). F. J. C.

Solubilities in the system water, iodine to 200°. F. C. Kracek. *J. Phys. Chem.* 35, 417–22(1931). Water-I solns. above 112.3° form 2 liquid layers, the mutual soly. increasing with temp. At the invariant temp. the liquid layers contain 0.0517 and 99.3 mol. % I, resp. Below this temp. the solns. are satd. with solid $I_2$. The soly. curves were detd. to temps. above 200° by the use of the sealed tube method, by noting the temp. at which the last trace of the dissolving phase disappears. Invariant points were detd. by the method of thermal analysis. H. F. Johnstone.

Lowering of "ideal" eutectic temperature in *n*-component system. Keizô Iwasé and Noburu Nasu. *Anniversary Vol. Dedicated to Masumi Chikashige* (Kyoto Imp. Univ.) 1930, 223–7.—A math. treatment based on the equation of an "ideal" m.-p. curve which holds in all the cases in which the solvent and solute are completely indifferent to one another. $T = T^0_1/(1 - (RT^0_1/q_1) \log X_1)$, $X_1$ is the soly. of the component $s_1$ at temp. $T$, $T^0_1$ is its m. p., and $q_1$ is its heat of fusion. It is concluded that the eutectic point of *n* components is lower than the eutectic point of any *n* − 1 components. Allen S. Smith.

Melting points and saturation points of sodium thiosulfate and sodium sulfate by the conductivity method. Chetan Anand and Har Gobind. *Proc. 15th Indian Sci. Cong.* 1928, 173.—The method was applied to $Na_2S_2O_3$ and $Na_2SO_4$ in aq. solns. These salts have comparatively low m. ps., are highly sol. in water and can easily be obtained in the supersatd. condition. Therefore if transition occurs at the m. p. in the solns., it will be indicated on the graphs. Resistances of various solns. were measured over a range of temps. which went above and below the m. p. of the salts and the satn. points of the solns. The resistance-temp. graphs for $Na_2SO_4$ show at its m. p. (33°) a clear transition point for all concns. and also a second transition point at the satn. point which varies with the strength of the soln. The graphs for $Na_2S_2O_3$ give two transition points. The m. p. varies between 45° and 50° with different concns. The graphs are not given. E. J. C.

Binary systems. III. J. H. Kobrs and F. L. C. Schieffer. *Rec. trav. chim.* 50, 139–48(1931). *cf. C. A.* 25, 628.—A math. treatment of crystn. of binary compds. from their dissocd. products, gaseous and liquid. J. H. Reedy.

Thermal diagrams of the systems silver-strontium and silver-barium. F. Weibke. *Z. anorg. allgem. Chem.* 193, 297–310(1930).—A thermal analysis of the systems Ag–Sr and Ag–Ba was made. The following compds. with their m. ps. and $d_4^{15}$'s were found: $Ag_5Sr$, 781°, 7.985–.994; $Ag_2Sr_3$, 757°, 6.487–.496; $AgSr_2$, 680°, 5.695–.711; $Ag_2Sr_5$, 666°, 5.151; $Ag_5Ba$, 729°, 7.920–.930; $Ag_2Ba_3$, —, 6.693–.700; and $Ag_2Ba_5$, 648°, 6.597–.603. Evidence of the existence of $Ag_5Ba_2$ was also found. The temps. of the eutectics were: Ag-$Ag_5Sr$, 750°; $Ag_5Sr$-$Ag_2Sr_3$, 693°; $Ag_2Sr_3$-$AgSr_2$, 638°; $AgSr$-$Ag_2Sr_5$, 645°; $Ag_2Sr_5$-Sr, 436°; Ag-$Ag_5Ba$, 726°; and $Ag_5Ba$-$Ag_2Ba_3$, 679°. The m. p. of pure Sr is given as 757° ± 1. Exptl. difficulties did not permit the investigation of the Ag–Ba system for concns. of Ba above 60%. H. F. Johnstone.

X-ray study of the copper end of the copper-silver system. Roy W. Dreier. *Ind. Eng. Chem.* 23, 404–5(1931).—X ray examn. of various Cu samples indicates that Ag is not dissolved in the Cu. It is concluded that under ordinary room conditions Ag is not sol. in Cu. M. McMahon.

The system aluminum-silver. Enrico Crepaz. *Atti III congresso naz. chim. pura applicata* 1930, 371–9.—Using the method of thermal analysis the equil. diagram of the system Al–Ag was redetd. Three compds. are formed (*1*) $Ag_3Al$ at the peritectic temp. of 772° (the β form changes into the α-form at 609°), (2) $Ag_2Al$ at the peritectic temp. of 727° and (3) $Ag_2Al_3$ at the peritectic temp. of 698°. The compd. $Ag_2Al_3$ forms a eutectic with a solid soln. of Ag in Al at 567° and a concn. of 26.5% Al (in the text 39.5 is given which must be a mistake since the table and the diagram clearly indicate

26.5%). The soly of Ag in Al at the eutectic temp is given as 45% Ag as derived from microscopic observation of specimens annealed at various temps. for different lengths of time. At room temp the soly is less than 0.5% Ag. These Al rich alloys exhibit the phenomenon of age hardening. The soly. of Al in Ag at room temp. is 4.2%.

H. S. VAN KLOOSTER

A thermodynamic study of the equilibria of the systems: antimony-bismuth and antimony-lead. CHU PHAY YAP. *Inst. Metals Division, Am. Inst. Mining Met. Eng.* (preprint) 1931, 24 pp.—For a long time the Sb–Bi system has appeared to contradict the phase rule in that it has an anomalous solidus always obtained by cooling down from the melt. Otani, by means of the resistance method, showed that it was a normal solidus characteristic of completely isomorphous systems. Y. applied the thermodynamic laws of the depression of f. p. to the system in order to det. the cause of the anomalous solidus. The nonvariant crystn. is probably due to the formation of $Bi_2$, although Sb and Bi should normally be considered diatomic. The heats of fusion of Sb and Bi are calcd. to be 20.0 and 14.2 cal. per gram, which agrees with the most reliable exptl. values obtained by Umino. The Pb-rich end of the Sb–Pb system also was analyzed thermodynamically. In this range Sb is dissolved in molten Pb in the monatomic form, although it is normally dissolved in solid soln. in Pb as $Sb_4$ down to about 150°. Below that temp., Sb is dissolved in the monatomic form. This suggests a transformation either of Sb or the Pb solid soln. at around 150° (probably less). The heat of fusion of Pb is calcd. to be 5.7 cal. per g., which is likewise in good agreement with reliable exptl. values. Attention is called to a new method of calcg. the heat of fusion of a solute.

C. L. MANTELL

Thermodynamic properties of dichlorodifluoromethane, a new refrigerant. II. Vapor pressure. W. K. GILKEY, FRANK W. GERARD AND MILO E. BIXLER. *Ind. Eng. Chem.* 23, 364–6(1931), cf. *C. A.* 25, 2340.—The vapor pressures of $CCl_2F_2$ from —70° to the crit. temp. (111.5°) were measured by a static method. An equation, suitable for thermodynamic calcns., is given $\log_{10} p = 31.6315 - (1816.5/T) - 10.859 \log_{10} T + 0.007175\ T$, where $p$ is the pressure in abs. atms. and $T$ is the temp. in deg. K. The calcd. normal b. p. is —29.8° C., the Trouton and Hildebrand consts. are, resp., 20.0 and 27.1. A table of calcd. vapor pressures at 10° intervals is given. III. Critical constants and orthobaric densities. F. R. BICHOWSKY AND W. K. GILKEY. *Ibid* 366–7.—The orthobaric ds. of $CCl_2F_2$ were measured up to the crit. temp., and the crit. consts. detd. The satd. vapor ds. below 50° were calcd. from the vapor-pressure equation and the equation of state. Above 50° they were obtained by detn. of dew points. Liquid ds. from —40° to 50° were detd. by a dilatometric method, and above 50° by Faraday's method, with glass floats. The crit. temp., pressure and d. are, resp., 111.5°, 39.56 atms., 0.555 g. per cc.

A. L. HENNE

The crystal structures of the compounds formed in the antimony–cadmium system. MASUMI CHIKASHIGE AND TOSHIMICHI YAMAMOTO. *Arrhenius Vol. Dedicated to Masumi Chikashige* (Kyoto Imp. Univ.) 1930, 195–9.—An x ray examn. to distinguish the stable and metastable compds. belonging to the Sb–Cd system was undertaken. The compd. SbCd exists in two modifications, $\alpha$ and $\beta$ which have the same space lattices with respect to type and dimension, belonging to the hexagonal system, the base and axial ratio of which are 4.42 A. U. and 0.78, resp. The so-called metastable compd., $Sb_2Cd_3$ is a eutectic mixt. of $\beta$-SbCd and Cd. Cf. *C. A.* 24, 1558. ALLEN S. SMITH

Crystalline structure of barium tungstate. II. J. PALACIOS AND I. NAVARRO. *Anales soc. espan. fis. quim.* 29, 21–32(1931), cf. *C. A.* 24, 1261.—The position of the O atoms in the elementary crystal prism of $BaWO_4$ was detd. From the position of Ba, W and ionic rays, approx. values of O coördinates can be deduced. The Moll microphotometer (*Proc. Phys. Soc.* (London) 33, 207(1920–21)) was used. E. M. S.

Quantum mechanics of adsorption catalysis. M. BORN AND V. WEISSKOPF. *Z. physik. Chem.*, Abt. B, 12, 206–27(1931). cf. *C. A.* 25, 21.—By a perturbation calcn., the theory of Born and Franck is elaborated to include interaction between the adsorbed mol. and the adsorbing crystal surface. By applying the method of Weisskopf and Wigner (*C. A.* 24, 5602), the order of magnitude of the reaction rate is found as a function of an at. distance and a vibrational quantum no. An appendix discusses some of the math. difficulties connected with the calcn. of the probability amplitudes and the matrix elements.

G. M. MURPHY

Catalytic decomposition of nitrous oxide. M. S. SHAH. *Proc. 15th Indian Sci. Cong.* 1928, 170.—In the analytical investigation of the reaction C + $N_2O$ at various temps. it was found that $N_2O$ decomps. at a lower temp. in the presence of charcoal than when heated alone. This suggests that the behavior of charcoal is catalytic. On examn. of the catalytic influence of $ThO_2$, $Al_2O_3$, $TiO_2$ and Pt a similar lowering in the

temp of decompn of $N_2O$ was observed Comparison of curves for $N_2O$ decompd in an hr against temp in the presence of these substances showed that these substances act as catalysts in the order $ThO_2$ charcoal, $Al_2O_3$ Pt black, $TiO_2$ and Pt foil I J C

**Reactions at the surface of hot metallic filaments. V. Thermionic emission and catalytic activity at the surface of hot metallic wires: $H_2 + CO_2 \longrightarrow CO + H_2O$ at the surface of platinum, platinum coated with barium oxide and thoriated tungsten.** B S Srikantan *Indian J Physics* 5, 687–98(1930), cf *C A* 25, 1149 —The min temp at which thermionic emission from a Pt wire is perceptible was obtained by extrapolation as 975 Interaction of $CO_2$ and $H_2$ starts at 979° Hence, emission of electrons from a surface has an important influence on activation of gases L P Hall

**Reactions of hydrogen and oxygen on platinum wires at low temperatures and pressures** Herbert G Tanner and Guy B Taylor *J Am Chem Soc* 53, 1289-96 (1931) —A study of the catalytic combination of $H_2$ and $O_2$ at low pressures on Pt wires shows that the reaction is much more complex than ordinarily supposed The consumption of excess $O_2$ from 2 : 1 $H_2$ : $O_2$ gas mixts is attributed to the formation of $H_2O_2$ The rate of reaction varies greatly as a function of the temp difference between the catalyst and the wall of the contg vessel Flashing the Pt wire catalyst in $O_2$, $H_2$ or vacuum at 900° induces a temporary superactivation capable of causing reaction at a temp as low as —120° P H Emmett

**Decomposition of diethyl ether in contact with platinum and tungsten.** H Austin Taylor and M Schwartz *J Phys Chem* 35, 1041-53(1931) —Decompn of $(C_2H_5)_2O$ in the presence of heated filaments of Pt and W is identical with the homogeneous reaction The presence of the filament merely furnishes the necessary stationary concn of active mols S Lenher

**Esterification in the gaseous phase with solid catalysts.** N G Gajendragad *Proc 15th Indian Sci Congr* 1928, 148 —The esterification of MeOH and EtOH with AcOH was studied with K alum and silica catalysts at 230° The equil const (not given) was not far from that obtained by other observers in the liquid phase at lower temps I J C

**Active aluminum.** G Sambamurti and N L Narasimham *Proc 15th Indian Sci Congr* 1928, 168 —Al becomes activated by amalgamation and the activated metal serves as a good reducing agent in a neutral medium The activated metal readily oxidizes in moist air having traces of $CO_2$ I. J C

**Catalytic reaction between stannic oxide and lime.** Setsuro Tamaru and Noboru Ando *J Chem Soc Japan* 52, 36–46(1931), cf *C A* 25, 2045 —Cassiterite and artificial $SnO_2$ are acted on by acids and bases with great difficulty, *e g*, they are made sol by melting with NaOH, $Na_2CO_3$, $NaHSO_4$, etc While no change occurs on heating them with lime at about 900–1000° in the presence of some catalytic substances they react with lime easily at these temps, being transformed into an acid sol form H, C, CO S, Zn, SnO and traces of org vapors with reducing power are very effective as catalyzers. It is interesting that a reaction between solids proceeds smoothly at a temp below the m p of each component The optimal conditions are the proportion 1 mol $SnO_2$ + 7 mol CaO + 0.05 mol H or C, reacting temp 900°, heating for 1 hr, and the presence of $H_2O$ From the fact that the curves of catalytic action of H and C resemble those of reduction, it is inferred that reduction takes place as the first stage of catalysis With catalyzers such as C which produce no $H_2O$ as a reduction product, almost no reaction occurs without addn of $H_2O$, but where $H_2O$ is produced the reaction proceeds smoothly The quantity reacting is proportional to the logarithm of the duration of heating and to the no of mols of CaO, the latter effect depends in reality on the surface area of CaO T Irie

**The entropy and free energy of methane.** H H Storch *J. Am Chem Soc.* 53, 1266–9(1931) —The entropy of $CH_4$ at 25° obtained experimentally checks the value 43.39 entropy units previously calcd from sp heat data R. H. Lambert

**The heats of neutralization of eugenol and isoeugenol.** G Gundu Rao *Proc 15th Indian Sci Congr* 1928, 143 —The heats of neutralization of these 2 isomers were detd to study their acidic behavior The value for eugenol at about 25° when a slight excess of alkali was used was found to be 6476 cal per mol and 6790 cal per mol with a large excess of alkali Because of incomplete soln when an equiv amt of alkali was employed and partial pptn of the salt with a large excess, the value for isoeugenol, 6550 cal per mol, is only approx F J C

**Revision of the free energy of formation of sulfur dioxide.** E D Eastman *Bur. Mines Information Circ* 6454, 6 pp (1931) —Recalcns described lead to the following revised equations $2S\ (rhomb) = S_2\ (g)$ $\Delta F^\circ_{298} = 18\,280$ $\Delta F^\circ = 29\,840 - 0.06\,T \ln T + 4.55 \times 10^{-3} T^2 - 39.81\,T$ $^1/_2S_2\ (g) + O_2 = SO_2\ (g)$ $\Delta F^\circ_{298} = -79\,580$ cal,

$\Delta F^\circ = -84{,}905 + 3.21\,T \ln T - 2.272 \times 10^{-3} T^2 + 0.16 \times 10^{-6} T^3 + 0.25\,T$. S (rhomb.) + $O_2$ = $SO_2$ (g) $\Delta F^\circ_{298} = -70{,}440$ cal. ALDEN H EMERY

**The specific heats of sodium sulfate solutions.** MAURICE AUMÉRAS. *Compt. rend.* 192, 359–61(1931). The sp. heats of aq. solns. of $Na_2SO_4$ were detd. at 20° at concns. ranging from satn. to extreme dilns. The detns. were made by means of a calibrated thermophore which was immersed in the solns. and gave check readings on successive detns. The sp. heat–compn. curve obtained in this manner is somewhat higher than that obtained from the data of other investigators but the two curves approach each other at higher dilns. I. W. LAIRD

**Calculation of the heat of distillation.** M. BARTHEL. *J. phys. radium* [7], 1, 411–5 (1930). By math. analysis an expression is obtained for the flow of heat for vapor and binary liquid in which only the compns. of the vapors entering and leaving are considered. L. P. HALL

# 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W ALBERT NOYES, JR.

Investigations on the structure of matter. B LANG. *Technika* 11, 69-74(1930).—A general summary S. S DE FENÁLY

A rotating light-quantum (photon) model. HANS BAUER. *Physik Z.* 31, 882-8 (1930) LOUIS WALDHAUER

The nature of the chemical bond. Application of results obtained from the quantum mechanics and from a theory of paramagnetic susceptibility to the structure of molecules. LINUS PAULING. *J. Am Chem Soc* 53, 1367-1400(1931).—The electron-pair bond is discussed and from quantum mechanics a set of rules is presented which describes the properties of the bond with special reference to the strength of the bond and the nature of the single electron proper functions These rules give information about the relative strengths of bonds formed by different atoms, the angles between bonds, properties of tetrahedral atoms with single and double bonds, *cis* and *trans* forms, the no and spatial configuration of bonds and other properties Transitions from electron pair to ionic bonds are also discussed A theory of the magnetic moments of mol and complex ions is also developed. For the transition elements the proper functions involved in bond formation show that compds with CN have electron pair bonds, those with F have ionic bonds, and those with $H_2O$, ion dipole bonds Electron structure, bond angles and other properties of mol and complex ions can also be detd from the magnetic data G M. MURPHY

Avogadro's number and electronic charge. SATYENDRA RAY. *Proc. 15th Indian Sci. Cong* 1928, 69 E. J. C.

The rotating electron. M. N. SAHA. *Proc. 15th Indian Sci. Cong* 1928, 82. E. J. C.

The imaginary character of the "mass equivalence of electricity." SATYENDRA RAY *Proc 15th Indian Sci Cong* 1928, 68 E. J. C.

The conception of the Hall effect. H. ZAHN *Naturwissenschaften* 18, 848-9 (1930).—Z concludes that it is necessary to distinguish between an "electron gas" Hall effect and a structural Hall effect. R. H. FERGUSON

Mean free path of electrons. Answer to a notice by C. Ramsauer. J. S TOWNSEND *Ann Physik* 8, 803-8(1931).—T. defends his indirect measurements against the criticism of Ramsauer F J ROSENBAUM

Method of measuring the effective cross section. Answer to J. S. Townsend. CARL RAMSAUER *Ann Physik* 8, 809-10(1931), cf preceding abstr.—R repeats his criticism of Townsend's measurements F J. ROSENBAUM

The electron-beam discharge in argon. J. DUFFEY. *Proc. Leeds Phil Lit Soc*, Sci Sect, 2, 163-8(1931).—The collapse of the electron beam to a glow surrounding the anode as previously described (cf Whiddington, *C. A.* 24, 2044) is due to the neg charging of the walls of the gun When the tube is lined with Cu gauze the beam has a velocity corresponding to the voltage applied The potential distribution in the discharge was investigated with an exploring electrode With a thermionic current of 0 2 ma., a pressure of 0 002 mm., an anode potential of 242 v and a length of glow of 0 95 cm the following results were obtained (the first figure is the distance from the anode in cm., the next is the space potential in v.) 0, 242, 1 06, 60, 1 04, 54, 1 72, 41 5, 2 31, 34, gauze, 2. The edge of the glow is maintained at 60 v and has a neg. space charge. J B. AUSTIN

The potential of the walls in the cathode dark space. JEAN W. BECK AND K. G. EMELÉUS *Phil Mag* 11, 54-64(1931).—The walls and discharge are at the same potential at one place, *i. e.*, the boundary between the neg glow and the cathode dark space The effect of the walls in Brown and Thomson's (cf *Phil Mag* [7], 8, 918 (1929)) work is not of greater uncertainty than the incomplete knowledge of the effect of dissocn of gases or of the interpretation of the consts of Morse's equation A F.

The capture of electrons by protons. KARL WOLF *Ann Physik* 7, 937-48 (1930), cf Mark and Wolf, *C A* 24, 5600.—The procedure previously described was modified by the adoption of a photometric electrometric method of measurement No selective absorption of electrons by the proton stream could be detected under energy relations predicted by analogy to the conditions described in case of $\alpha$ particles, by Davis and Barnes (*C A* 24, 1029) and Barnes (*C A* 24, 3264) W G LEIGHTON

Capture of electrons from mercury atoms by positive ions of helium. C. F. POWELL AND A M TYNDALL *Nature* 127, 592-3(1931), cf *C A*. 25, 456.—Expts in a new app in He at 20 mm pressure show a peak in the current frequency curve for each

type of ion present The higher frequency peak corresponds to the He ions, while a 2nd, lower frequency peak is observed when a trace of Hg is present, indicating the formation of $Hg^{++}$ formed by electron capture from $He^{+}$ The ratio of mobility of $Hg^{++}$ in He to $He^{+}$ in He is calcd to be 0 55 G CALINGAERT

Experiments on the efficiency of an electron gun. J E TAYLOR *Proc. Leeds Phil Lit Soc*, Sci Sect., 2, 169–73(1931).—An improved type of electron gun is described in which better focusing and higher beam efficiency are obtained by interposing between the filament and muzzle a neg screen with a small central hole This screen has low neg potentials applied to it. The device resembles the soft 3-electrode valve in its action J B AUSTIN

The distribution of space-potential in high-frequency glow discharge. D BANERJI AND R GANGULI *Phil Mag* 11, 410–22(1931) cf *C A* 24, 5012.—In rarefied air and in $O_2$ with a current at a frequency of 10 cycles, the potential difference is sym about the middle point of the discharge tube The extension of the glow outside the electrodes is also a sym reproduction of the phenomena inside, with the difference that after a certain distance the potential is reduced to 0 ARTHUR FLEISCHER

The emissivity of liquid iron alloys. GERHARD NAESER. *Mitt Kaiser-Wilhelm-Inst Eisenforsch Duesseldorf* 12, 365–72(1930).—The radiation temps of metals depart considerably from the true temps A correction of the temps detd optically is therefore always necessary, but, because of the uncertainty of the emissivity, the correction is not reliable Expts. were made by the author to redet the emissivity of liquid Fe-C alloys, of several alloy steels and of several slags. R RUMBACH

Positive-ion emission from thin platinum films on glass. R A. NELSON *Rev Sci Instruments* 2, 173–9(1931).—In continuing expts. with Pt plated glass filaments (*C A* 25, 877) variations in pos. ion current were investigated A uniform electrolysis potential was applied to all parts of the emitting surface of the app Curves were obtained showing the variation of pos. thermionic current with electrolysis potential for K and Na glass, the existence of pronounced max and min with these equipotential emitters is apparent. An explanation of the phenomena is offered based on analogous electron emission from oxide-coated filaments and Cs-coated W M MCMAHON

A method of examination of transient glows and their spectra. H. PARAMESWARAN. *Proc. 15th Indian Sci Congr* 1928, 78.—This is a method suitable for the visual observation, photographic and spectroscopic studies of transient glows observed in some rarefied gases under chem. excitation during and after discharge. The device used consists of a Hg break (mounted on a base that can be rotated by a slow motion arrangement) carrying on its extended spindle a disk with an adjustable aperture in it. The glow is observed through this aperture. E J C.

Investigations of the inertia of gas-filled photoelectric cells. FRITZ SCHRÖTER AND GÜNTHER LUBSZYNSKI *Physik Z.* 31, 897–904(1930).—Photoelec. cells, contg Ne or He and KH, show a certain current after the exciting light has been cut off, due to the ionization by collisions of the 2nd kind of the metastable ions. In metastable A, the energy is insufficient to cause further ionization, while in $H_2$, there are no metastable states. Expts. were made with pure A and KH and with A, KH, and traces of $H_2$ Cells of this type gave identical results when used for television, and gave no lag Cells employing K satd with $H_2$ at operating temp gave satisfactory television results LOUIS WALDBAUER

Photoelectric effect on thin layers of potassium and cesium. R. FLEISCHER *Physik Z.* 32, 217–8(1931).—By using a high-vacuum arrangement, a max. yield of $37.9 \times 10^{-3}$ coul /cal. was obtained for K at 436 mμ. Cs gave a max yield of $17.1 \cdot 10^{-3}$ at 492 mμ. The yields were, resp., 25.7% for K and 10.3% for Cs. C. E P J

*Relation concerning atomic nuclei.* WM. D. HARKINS. *J Am. Chem. Soc.* 53, 2009–11(1931).—Comments on Latimer's paper (*C. A.* 25, 2359). C. J. WEST

Structure of the α-particle. O. K. RICE. *J Am. Chem. Soc.* 53, 2011–2(1931).—Comments on Latimer's paper (*C. A.* 25, 2359). C J WEST

Origin of cosmic radiation. J. H. JEANS. *Nature* 127, 594(1931).—In calcg. the frequency ν of cosmic radiation from its absorption μ, nuclear as well as extranuclear *electrons should be taken into consideration This doubles or more than doubles the* absorbing power of all atoms except H A table showing the absorption (per meter of $H_2O$), for the radiation produced by various processes is given. Agreement between calcd and observed values is excellent. This suggests that the most penetrating constituent may originate in the annihilation of an α-particle and its 2 neutralizing electrons, and the next softer one from 1 proton and its one neutralizing electron. G. C.

The age of the earth—radioactivity methods of its determination. ALOIS F.

$AuCl_3$ is volatilized in the tube without removing the deposit of $Re_2O_7$, the presence of Cl brings out the Re spectrum, although no Au lines are visible The Re doublets are repeated 16 32 and 48 units higher as ReO, $ReO_2$ and $ReO_3$ Re consists of 2 isotopes, 185 and 187, estd photometrically to exist in the ratio 1 1 62 Its packing fraction, estd from line 203 of the $Re^{187}O$ is $-1 \pm 2$, the same as that of Os The calcd at wt is 186 22 ± 0 07 G CALINGAERT

**Methods of investigating the intensities of γ-rays.** C D ELLIS AND D. SKOBELTZYN *Nature* **127**, 125(1931) —The Skobeltzyn method (*C. A* **24**, 1573) of investigating the intensities of γ rays depends on observing by the Wilson cloud method the relative no of electrons ejected within a certain angular range by the Compton effect of the different γ rays the Ellis and Aston method depends upon the photoelec effect γ rays of Ra B and C showed intensities of 0 22, 0 46 and 0 26 by the photoelec method after passage through 3 5 mm Pb the corresponding intensities by the Compton effect were 1 1 8 and 1 19, resp This agreement is as good as can be expected FRANK MARESH

**The question of the disturbance of the equilibrium between radium B and radium C in preparations freed from residual emanation.** KARL MARBACH *Sitzb Akad. Wiss Wien*, Abt IIa, 139, 231 9(1930) — The usual methods of removing emanation from prepns have been questioned as to whether or not they disturbed the Ra B–Ra C ratio (cf Braddick and Cave, *C A* **23**, 1048) Removal of emanation by the usual short time washing with alc heating to 400° or blasting with a strong current of air is believed rarely to disturb the Ra B–Ra C ratio as much as 1% O E S

**Scattering of hard γ-rays. II.** L H GRAY *Proc Roy Soc* (London) **A130**, 524–41(1931), cf *C A* **24**, 5220 —*The relative scattering powers of* Mg, Al, Cu, Zn Cd, Sn and Pb for Ra C γ rays filtered through 4 cm of Pb and for Th C γ rays filtered through 3 cm of Pb have been investigated by observing the ionization produced by radiation scattered within the angular range 10–30° For Ra C γ-rays the decrease of scattering power per extranuclear electron from Mg to Pb is 2%, for Th C γ rays there is a gradual increase of about the same amt , but this is of the order of magnitude of error in the application of the correction for reabsorption of scattered radiation in the scatterer Therefore these measurements establish the fact that the binding forces in heavy elements do not influence appreciably the scattering power of extranuclear electrons for radiations of energy corresponding to $2 \times 10^6$ electron v J E A

**Radioactive metamorphic phenomena in fluorspar from Wölsendorf.** LUISE GOEBEL *Sitzb Akad Wiss Wien*, Abt I, 139, 373 91(1930), cf Mügge, *C A* **17**, 3644 —The radioactive "ball" halos of radioactive fluorspar from Wölsendorf are nothing other than aged ring halos as shown by development series studies and range measurements of α particles The colloidal nature of the pigments in Wolsendorf fluorspar is shown by use of the ultramicroscope The colloidal particles are most frequently Ca particles and the color changes according to the size of the particles, small particles correspond to green, larger to blue, violet, etc The radiations from the radioactive materials probably cause the formation of neutral Ca and F from the fluorspar as "stinking fluorspar" (contg free F and usually dark colored) is rather common O. E S

**Nature of the groupings of radioactive atoms.** E. L. HARRINGTON *Compt. rend* **192**, 414–5(1931) —The conclusion of Jedzrejowski that the formation of aggregates of radioactive atoms is facilitated by impurities, groups forming around the nuclei of impurities, has been confirmed But it is found that the impurities are not essential The absence of aggregates on freshly cut mica is explained in a different way The aggregates are more numerous around scratches, detached scales and along edges Either the groups form at the position observed or they form in the atm Polar mols also aid in the formation of groups The grouping of radioactive atoms which form in mixed gases contg Rn are constituted of the radioactive atoms and polar mols around a nucleus It is usually a stable assocn of ionized radioactive atoms The beds of polar mols have a low vapor pressure The detection of aggregates depends on the no of radioactive atoms as well as the no of polar mols L D ROBERTS

**The scintillation of calcium tungstate.** BERTA KARLIK. *Sitzb. Akad. Wiss. Wien*, Abt IIa, 139, 319–26(1930) —The scintillation of a no of specimens of artificial Ca tungstate under α and γ-rays was investigated at various pressures With α-rays the brightness of the scintillated light as measured by a photoelec cell is proportional to the residual range of the α-rays but reaches a satn value for very small bodies The decompn with γ-rays is of the same order as that of ZnS but is unusually small with α rays giving Ca tungstate a unique position as a scintillating substance E A FLOOD

**Quantitative investigations on the photographic action of α- and H-particles.**

MARIETTA BLAU *Sitz. Akad. Wiss. Wien*, Abt. IIa, 139, 327–47(1930).—From the tracks produced by α and H particles striking a photographic plate at an angle (20–24°) the no. of particles and distribution ranges were detd. and found to agree with the values obtained with a tube electrometer. The α particles were from Th C and the H particles from paraffin. "Agfa x-ray dental film" and "Imperial process" plates were used. The range distribution showed a displacement toward smaller values, due to scattering in the emulsion. The no. of H particles obtained on using the dental film was only half that obtained by the "Imperial process" plate or by the electrometer. The apparent distance between the AgBr grains of the dental film for H rays was twice as great as for α rays. F. A. FLOOD

The mechanism of separation of radon from radioactive minerals in liquid medium. V. I. SPITSYN. *Trav. radium et minerais radioactifs acad. sci. U. R. S. S.* 2, 264–71; cf. *C. A.* 23, 1048.—The basic purpose of this investigation was to find general laws which govern the process of transition of Rn from minerals into liquid media so that with their help the variation in radioactivity of various springs could be explained. As far as the qual. side is concerned, the results obtained permit the making of satisfactory conclusions. Thus only tonarite, a mineral which is found comparatively rarely, has no pos. temp. coeff., and therefore it could be said with a sufficient degree of probability that hot springs will be placed in more favorable conditions as to the absorption of Rn than cold ones. This conclusion could not be obtained by the observation of springs proper because several factors act simultaneously which combine to complicate the situation. No results were obtained on chem. compn. of mineral water and radioactivity. It is shown that with typical, purely uranium minerals the concn. of NaCl soln. increases considerably the rate of sepn. of Rn. Samarskite and tonarite liberate in NaCl soln. the same amt. of Rn as in water. In no case is there a considerable decrease in the rate of sepn. of Rn. A. C. NOË

The formation of molecular aggregates in radon-gas mixtures containing polar molecules. E. L. HARRINGTON AND O. A. GRATIAS. *Phil. Mag.* 11, 285–96 (1931); cf. *C. A.* 23, 230.—The formation of aggregates of active deposit atoms in gases contg. radon in the presence of HCl, $SO_2$, EtOAc, *o*-nitrotoluene, *p*-nitrotoluene, $CHCl_3$, $CCl_4$, MeOAc and acetone was studied by the centrifuge, the photographic and the ultramicroscopic methods. The previous work on air radon, $H_2O$ and water free air radon mixts. was confirmed. Aggregate formation in the presence of HCl is of av. magnitude; it is very large in the presence of *o*-nitrotoluene. Polar mols. favor the formation of aggregates in radon gas mixts. ARTHUR FLEISCHER

The absorption of scattered x-rays and Compton's theory of scattering. S. R. KHASTGIR. *Proc. 15th Indian Sci. Cong.* 1928, 88–9.—The most significant feature in the comparison of the absorbabilities of the secondary (scattered) and primary x-rays by the method of Barkla and K. (*C. A.* 20, 146) is the constancy, over a wide range of wave lengths, of the ratio of the ionizations produced by the secondary and primary beams, when the beams are either *unintercepted* or *intercepted* by similar sheets of an absorbing substance. The 2 alternative cases recorded are: *A* (not considered here) in which discontinuities in the "intercepted" ratio $S'/P'$ are obtained and *B*, the only case giving results at all capable of explanation in terms of Compton's theory of wave-length change on scattering, in which the values for the "unintercepted" ratio $S/P$ and the "intercepted" ratio $S'/P'$ for various wave lengths are found to lie on 2 parallel horizontal lines without the slightest sign of any discontinuity. Calculations of the ratio $S'/P'$ were based on C. T. Ulrey's energy-distribution curves (*C. A.* 12, 1530). From these curves of U, corresponding curves were then constructed for both primary and scattered beams intercepted by an equal thickness of an absorbing material. In the case of the scattered beam, the increased value of the absorption coeff., corresponding to Compton's wave length change was used. The presence of an unmodified radiation in the scattered beam was also taken into account. Thus for 6 voltages, 6 pairs of distribution curves for the *intercepted* scattered and primary beams were obtained, the ratio of the areas of each pair giving the value of $S'/P'$ for each voltage. Al and Au were used as absorbers. In both cases, the computed curves (not given) for $S'/P'$ did not agree with the exptl. results of B. and K. E. J. C.

A note on the Compton effect. SATYENDRA RAY. *Proc. 15th Indian Sci. Cong.* 1928, 69. E. J. C.

Röntgen-ray equipment of the Institute for Experimental Physics of Royal Joseph University for Technical Sciences at Budapest. B. POGÁNY. *Technika* 11, 74–80 (1930). S. S. DE FINÁLY

Quantitative x-ray analysis. Copper-silver and copper-zinc alloys. HENRY TERREY AND ERIC GEORGE VICTORY BARRETT. *J. Phys. Chem.* 35, 1156–67(1931).—

The intensities of the $K_\alpha$ radiation in the x ray emission spectra of Cu Ag alloys are detd by measurement of their ionizing power, and of Cu Zn alloys by both the ionization and the "wedge camera" methods The compn of an alloy can be detd. quantitatively by these intensity measurements only when (1) the elements in the alloy are adjacent to one another in the periodic system, and (2) the emission spectrum of any one constituent metal does not fall within the absorption region of any of the others. The $K_{\alpha 1}$ line of Ag falls within the absorption region of Cu thus causing a diminution in the intensity of the Ag radiation and a strengthening in the Cu radiation intensity. No absorption of the $K_{\alpha 1}$ Zn line occurs in the Cu Zn alloys For Cu Ag alloys the relation between intensity and at. concn may be represented over a wide range of concn. by: $I_{Ag}/I_{Cu} = MC_{Ag}/(C_{Ag} + C_{Cu})$ for Cu Zn alloys the relationship is linear The so-called "wedge camera method is developed by the authors for detn. of the relative intensities of lines in an x ray spectrum, being dependent on the measurement of their penetration of an Al wedge J BALOZIAN

**The photographs of powders in relation to the physical and chemical purity of the substance.** GIORGIO R. LEVI. *Atti III congresso naz chim pura applicata* 1930, 118–21.—L claims that soft x rays (2.3 to 1.5 A. U.) are sensitive to surface alteration Thus $Ag_2O$ incipiently reduced but showing no free Ag by chem analysis shows Ag lines in the powder diagram When 20% reduced only the Ag lines are observed. Hard rays (0.75 to 0.60 A. U.) are less sensitive For mixts the powder diagrams give qual but not quant results J B ARDEN

**A note on the relative absorption of the primary and scattered x-rays by silver and tin.** S. R KHASTGIR. *Proc 15th Indian Sci Cong* 1928, 83.—The results (not given) of a few absorption expts not only show that the theory of wave length change on scattering is untenable but that the greater absorbability of the primary radiation, as observed by Gray (*C. A.* 17, 2229) is most certainly due to the *J* transformation in Ag E. J. C.

**X-ray interference by di- and tri-atomic molecules of light gases.** H. GAJEWSKI. *Physik. Z.* 32, 219–21(1931).—Scattering expts were made, with a Cu radiator, on $N_2$, $O_2$, $CO_2$, $NH_3$, and the vapors of $CS_2$ and $H_2O$ Interatomic distances calcd from the data were compared with those from other types of detns The expti scattering curves were compared with the theoretical curves from the Debye scattering formula C. F. P. JEFFREYS

**X-ray dispersion in copper sulfate crystals.** L. JÓZSEF NAGY. *Matematik. és Természettud. Értesitö* 47, 70–7(German abstract 78)(1930).—The absorption limits of the Cu *K* line were studied by means of a Seemann app on 3 different oriented surfaces of $CuSO_4$ crystals Not only the grating space but also the dispersion changes with the reflecting surface Larger dispersion belongs to larger grating space. No dispersion data agreed with the theoretical value of $\delta = 3 \times 10^{-5}$ S. S. DE FIÁLY

**Absorption of x-rays by colloidal solutions.** KAILASH NATH MATHUR AND HARI RAM SARNA. *Proc 15th Indian Sci Cong* 1928, 79 E. J. C.

**"Ghost lines" caused by an adsorbed layer on the grating surface.** SATYENDRA RAY *Proc 15th Indian Sci Cong* 1928, 90–1.—The "ghost lines" are supposed to be caused by a periodic irregularity in the grating ruling To test another theory of the lines R washed the surface of the grating, while in its place on the spectrometer table for viewing the "ghost lines," by means of ale and gasoline, resp In both cases lines more widely spaced than the ghost lines appeared with the film of the liquid on the grating surface, the distance between the lines closing up with evapn of the *film and finally collapsing into the ghost lines as a "limiting position" of sorts* The "ghost lines" for the green line of the Hg lamp were also found with subjective observation to appear violet in color on looking obliquely through the eye piece. E. J. C.

**The temperature radiation of thallium vapor.** K. MAJUMDAR AND P. K. KICHLU. *Proc. 15th Indian Sci Cong* 1928, 84.—The emission spectrum of hot Tl gas contained in a vacuum furnace with temp varying from 1500° to 2300° was investigated with the aid of a small quartz spectrograph No emission line was obtained at 1500°. Emission begins at 1800° At 1900° the $2p_2-3s$ line (5350) was obtained in emission, while $2p_1-3s$, (3775) was obtained in absorption Even at 2300°, the latter could not be obtained in emission E. J. C.

**Spectra of the helium glow discharge.** H. MCN. COWAN, W. L. BROWN, K. G. EMELEUS *Nature* 127, 593(1931).—In the cold cathode glow discharge, the line 4713 of the He spectrum is much feebler than the 5016 line in the neg glow, while the 2 are of comparable intensity in the anode glow From the current voltage characteristics of the probe wire, the distribution of velocities among the electrons is found to be not Maxwellian in the neg glow. It can be fairly well represented by the superposition

and 7 satellites, resp. The line 6907 consists of not less than 5 components and 6234 of not less than 7. On account of the complicated structure the measurements made on the patterns obtained in the 2 quartz Hg vapor plates have not been enough to fix the wave-length intervals of these 2 lines without ambiguity. By assuming that the fine structure of Hg lines is due to quantized nuclear rotation and taking the resonance line 2536 A. U. to consist of 5 components, the $^1S_0$ term gives only one fine structure level and the $2^3P_1$ level splits into 3 levels $n+1$, $n$ and $n-1$, where $n$ is the nuclear impulse moment in units of $h/2\pi$. Hence there can only be 3 components for 2536 A. U. on the assumption that all atoms of Hg have the same nuclear moment. O. C.

**Fine structure in the mercury singlet terms.** S. Tolansky. *Proc. Roy. Soc.* (London) A130, 658-78(1931). Fine structures of singlet and intercombination lines in Hg were investigated to obtain information as to the structure of singlet terms. A high frequency electrodeless discharge in Hg vapor at a pressure of 0.001 mm. was used because in this source the singlet combinations are produced with high intensity without reversal. The observations were made with a Fabry Perot interferometer, with plate separations of 1 to 100 mm. crossed with a Hilger $E_1$ spectrograph. The following structures were found: $7^1S_0$ $8^3P_1$ sextet, $7^1S_0$ $9^3P_1$ septet, $6^1S_0$ $8^3P_1$ octet, $7^1S_0$ $9^3P_1$ septet, $6^1P_1$ $8^1S_0$ quintet, $6^1P_1$ $9^1S_0$ triplet and $6^1P_1$ $10^1S_0$ doublet. Information as to the structures of the $7^1S_0$, $7^3S_1$, $8^3P_1$, $8^1P_1$, $9^3P_1$ levels is derived from the line structures. The structures found for $^1P_1$ — $^1S_0$ lines necessitate more than one value of the spin quantum no., $s$, of the nucleus and this conclusion is supported by the fact that the $7^1S_0$ level is at least double. The septet character of $7^1S_0$ $8^3P_1$ can be accounted for by 3 values of $s$, one of which is 0, the other 2 being greater than $\frac{1}{2}$. The 0 value is probably associated with the even isotopes (196, 198, 200, 202, 204) and the other 2 with the 2 odd isotopes (199, 201). W. F. Meggers.

**Lommel's analysis and continuous spectra.** Nalini N. Bose. *Proc. 15th Indian Sci. Cong.* 1928, 70. Continuous spectra can be explained by resorting to Lommel's analysis, which is capable of giving a continuous train of waves corresponding to a monochromatic radiation. No details are given. F. J. C.

**Rotational structure of light molecules.** W. Weizel. *Physik. Z.* 31, 880-2 (1930). The rotational energy, which may be obtained from the band structure, indicates the electron configuration of light mols. Louis Wolfbauer.

**The anomalous dispersion of crystalline lead chloride in the region of its first ultra-violet frequency.** Karl Hecht. *Z. Physik* 66, 339-41(1930). S. B. S.

**The resonance spectra of sulfur vapor.** J. Pantchechnikoff. *Comp. rend.* 192, 737-9(1931).—S vapor excited by the Hg arc lines at 2968, 3126 and 3132 A. U. shows a resonance spectrum consisting of doublets or quartets in the blue and green. W. F. Meggers.

**Molecular spectra of mercury, zinc, cadmium, magnesium and thallium.** H. Hamada. *Nature* 127, 555(1931). W. F. Meggers.

**Magnetic susceptibility and absorption spectra of complex cyanides.** L. Sacco and F. Gatinelli. *Gazz. chim. ital.* 60, 646-57(1930). cf. Cambi and S., *C. A.* 24, 3021, 3123. In all Fe complexes studied up to now there is a close relation between the magnetic and the optical properties, *i. e.*, in the paramagnetic state the absorption spectrum is richer in bands than is that of the diamagnetic compds. Other cyanides, including those of Cr, Mn, Co and Ni, have now been studied. Measurements of the magnetic susceptibility were made by the method of Gouy as modified by Shaffer and Taylor (cf. *C. A.* 20, 1752), and of the absorption spectra with the app. already described (cf. *C. A.* 25, 1624). $K_3Cr(CN)_6$ is paramagnetic (cf. Hiltz, *C. A.* 22, 4017), with 10 Weiss magnetons, and it has 2 absorption maxima at $\nu \times 10^{-11} = 800$ and 1150, resp. (the latter of great intensity). $K_4Cr(CN)_6$ was too unstable to obtain such reliable data, but its magnetic moment is greater than that of $K_3Cr(CN)_6$. $K_3Mn(CN)_6$ and $K_4Mn(CN)_6$ are paramagnetic with 16 and 10 magnetons, resp. (cf. Hiltz, *loc. cit.*; Freed, *C. A.* 24, 4700). The former shows a strong band at $\nu \times 10^{-11} = 921$, and $K_4Mn(CN)_6$ a band at $\nu \times 10^{-11} = 1271$. The extreme instability of $K_4Mn(CN)_6$ (cf. *C. A.* 22, 2522) made it impossible to measure its magnetic and optical properties. $K_3Co(CN)_6$ has electronic properties like those of $K_3Co(CN)_6$; it is diamagnetic, and its absorption spectrum has 2 maxima $\nu \times 10^{-11} = 975$ and 1162, with low $\epsilon$ values. Contrary to Hiltz, $K_4Co(CN)_6$ is diamagnetic, in spite of the odd no. of electrons in the central atom, which gives origin to a magnetic spin (cf. Lewis, *C. A.* 18, 3511). $K_4Co(CN)_6$ is more active optically than $K_3Co(CN)_6$ and has 2 absorption maxima at $\nu \times 10^{-11} = 932$ and 1070, with $\epsilon$ values 10 times greater than those of $K_3Co(CN)_6$. Accordingly, a notable variation in the optical behavior does not correspond to any appreciable difference in magnetic moment. An electronic explanation of this incon-

gruity is offered The behavior of Ni complexes is still more complex than that of the Co compds $K_2Ni(CN)_4$ is an exception to the general rule (cf Stoner, *Magnetism and Atomic Structure*, C A 21, 859), since it is isoelectronic with $K_2Mn(CN)_4$. Neither does the magnetic susceptibility of $K_2Ni(CN)_4$ vary, and it is diamagnetic in spite of 33 electrons, which by theory should mean a strongly paramagnetic compd To explain these phenomena, different hypotheses are considered Other studies of various Ni complexes make it doubtful whether these incongruities depend only upon the central atom That the diamagnetism does not result from the same causes as that of $K_4Fe(CN)_6$ and $K_3Co(CN)_6$ is proved by the absorption spectra $K_2Ni(CN)_4$ shows 3 bands $\nu \times 10^{-13} = 962$, 1050 and 1125, with very high $\epsilon$ values. The same maxima appear in the spectrum of $K_3Co(CN)_6$, which shows a notable variation in the absorption only in the visible field, where the extinction is approx 10 times that for $K_2Ni(CN)_4$. In general, the magnetic properties of neither the cyanides of $Co^{++}$ nor of $Ni^{+}$ and $Ni^{++}$ satisfy the electronic theory which in the past has been applied to these complexes, and there are great differences between the magnetic and optical behavior in that a diamagnetic state corresponds to great optical activity. Other complexes are being studied C. C. Davis

The mercury band system in the neighborhood of the resonance line. Rayleigh. *Nature* 127, 125(1931).—In spectrograms of a water-cooled Hg are the usual bands at 2540 and 2536.52 A U were observed, addnl bands at 2540.37, 2538.44 and 2537.32 A U shaded from the red were also measured, the bands 2535.62 and 2535.35 on the other side of the resonance line (2536.52) shaded toward the red were also measured. Frank Maresh

A new band system of copper hydride. P. C. Mahanti. *Nature* 127, 557(1931).—A band system consisting of 6 band heads has been found in the region 2900–2200 A U It is different in nature from the 2 systems previously known (*C. A.* 24, 3951). The bands are double headed, indicating that their emitter consists of an odd no of electrons; they have therefore been attributed to the $CuH^+$ mol The band structure has been analyzed and assigned to a $^1\Pi \longrightarrow {}^1\Sigma$ transition W. F. Meggers

Band spectra of bismuth hydride. A Heimer and E Hulthén *Nature* 127, 557(1931).—When a quartz discharge vessel fed with 0.5 amp., 1200 v. d. c. is used with Bi vapor distg at 900° through a narrow end-on tube, a band spectrum near 4722 A. U is excited with great intensity. This band is composed of *P* and *R* branches, the system being assigned to a $^1\Sigma \longrightarrow {}^1\Sigma$ transition in the BiH mol W. F. M

New bands in the secondary spectrum of hydrogen. Dattatraya Shridhar Jog *Phil Mag* 11, 761–86(1931).—A review of the principles underlying the detn. of the theoretical electronic terms of the H mol in its various states of excitation is followed by a presentation of the bands which, as previously announced (*C. A.* 24, 3435), have been found to represent the forbidden transition $3p^3\Pi \longrightarrow 2p^1\Sigma$ The vibrational and rotational structures of $3p^3\Pi$ are known from the work of Richardson and Das (*C. A.* 23, 2096), and those of $2p^1\Sigma$ from Richardson and Davidson (*C. A.* 23, 2883, 3163, 3405) The bands presented in this analysis satisfy the structures of the initial and final terms C. C. Kiess

Fine structure in the hydrogen band lines. O W. Richardson and W. E Williams. *Nature* 127, 481(1931), cf *C A* 24, 1576, 2049.—By examg. the spectrum of $H_2$ with a large Hilger quartz spectrograph crossed by a reflection echelon R and W. find that the alternate strong lines of 2 typical bands which end on the $2p^3\Pi_{a,b}$ levels are all double with the weaker component on the long wave length side The observations establish a correlation between the spectra of $H_2$ and He H W. Leahy

A study of the widths of the lines in the *B* band, due to atmospheric oxygen, in the solar spectrum. R. van der Riet Woolley *Astrophys. J.* 73, 185–93(1931).—The relative widths of 28 lines in the *B* band (6870 to 6920 A. U.) in the solar spectrum, due to $O_2$ in the earth's atm., were accurately measured to det. experimentally the relation between line width and the no of atoms effective in forming the lines. Measurements were made on spectrograms secured at different altitudes of the sun for $r = 1/10$ and $1/4$, where $r$ is the ratio of the intensity of the light at some point inside the line to that of the continuous background just outside the line. The results show that the line widths are approx proportional to the $1/4$ power of the no of atoms in the air path traversed by the sun's rays, which is a small but definite deviation from Unsold's formula in which the widths are proportional to the square root of the no of atoms. C. C. Kiess

Raman effect and ionization in electrolytes. Leonard A Woodward *Physik. Z.* 32, 212–4(1931).—Raman spectra for solns of $HNO_3$, $H_2SO_4$, $CH_3COOH$, $HIO_3$ and HCl were studied. All except HCl solns gave intense spectra excited by the

4358 A U. line of Hg The Raman line ascribed to $NO_3^-$ was found to increase to a max of intensity with increasing concn, then decrease. The $H_2SO_4$ lines also showed such anomalous intensity effects. C E. P. JEFFREYS

Polarization of the Raman spectrum of water. C. RAMASWAMY *Nature* 127, 558(1931).—The Raman spectrum of pure water was studied by the original method of Raman Polarization photographs were taken and the intensities of the bands were estd from a plate contg a series of graded exposures of the Hg spectrum. Conclusion. Three different Raman bands excited by the same incident line are differently polarized, and the degree of polarization appears to increase as the intensity of the band increases W F MEGGERS

The Raman effect in pure water and in several solutions. R BRUNETTI AND Z OLLANO *Atti accad Lincei* 12, 522–9(1930).—Pure water exposed to the Hg arc light gives 3 bands in the visible region green (5050 to 5150 A U), blue (4645 to 4745 A. U) and violet (4135 to 4220 A U), excited by the 4358, 4047 and 3650 A U lines of Hg. The differences in frequency of these bands from the exciting lines are 3225, 3469 and 3589 cm$^{-1}$ In the presence of $Cl^-$ (HCl 50 and 25%, CeCl$_3$ 2 6 and 1.3 *M*) the 3225 and 3589 cm$^{-1}$ bands diminish in intensity, while 3469 cm$^{-1}$ appears to be intensified The following $NO_3^-$ solns were also investigated $HNO_3$ (6 5, 3 5, 2 6), $NaNO_3$ (9 8), $NH_4NO_3$ (12 5), $KNO_3$ (3 96, 1 98), $Ba(NO_3)_2$ (0 64), $Al(NO_3)_3$ (1.86), $La(NO_3)_3$ (1 67), $Ce(NO_3)_3$ (3 1, 1 5) and $Th(NO_3)_4$ (1 65), all expressed as moles per l Contrary to the effect of $Cl^-$, the 3589 cm$^{-1}$ band is intensified, while the 3225 cm.$^{-1}$ band fades till it disappears entirely in the more concd solns A W C

Raman effect of hydroxyl ions. LEONARD A WOODWARD *Physik Z* 32, 261–2 (1931).—10 4 *N* NaOH and 12 6 *N* KOH were investigated with radiation of wave lengths 3654 8 and 3650 2, 4046 8 and 4358 3 A U and showed a common frequency, $\Delta\nu$, of 3615 ± 25 cm.$^{-1}$ This agrees with $\Delta\nu$ for solid NaOH of 3630 cm$^{-1}$ A short discussion is given WILLIAM E VAUGHAN

Energy measurements in the visible and ultra-violet. F BENFORD AND RACHEL F HOWE *Trans Illum Eng Soc* 26, 292(1931).—The photographic, the filter and the monochromator methods of measuring energy throughout the visible and ultra-violet spectra are described The inherent limitations of each method for sunlight and some of the more common sources of light are discussed W T CLARK

The absorption and scattering of light in opal glasses. G M DRESSER *Phil. Mag* 11, 801–46(1931).—Absorption and scattering by a mastic sol with acid fuchsin added was studied since it is not possible to vary $\kappa/\sigma$ for glasses, $\kappa$ = absorption coeff, $\sigma$ = scattering coeff. Intensity measurements were made with a Glan spectrophotometer by substituting a photographic wedge for the Nicol prism, and thereby decreasing the time and labor involved and increasing the range of intensity ratios determinable For a parallel incident beam and over a wide range of concn, the equation $I = I_0 e^{-\sigma x}$ was found to apply, where $I$ = transmitted light, $I_0$ = incident light, $x$ = concn on an arbitrary scale and $\sigma$ includes the thickness of the layer For optically thin layers the coeffs of scattering and absorption affect the directly transmitted light independently and the equation becomes $I = I_0 e^{-(\kappa+\sigma)x}$ For optically thick layers at high concns more light is transmitted than given by the exponential formula, due to the reënforcement of the direct pencil of light by repeatedly scattered light The repeatedly scattered light is detd by measurement of the light intensity at several small angles to the normal The proportion of repeatedly scattered light diminishes as the direction of the parallel rays becomes more definite and measurements carefully made in the same direction Schuster's theory is extended for milk glass with particles of the order of dimensions as the wave length of light For the thick layers the variation of transmission with the optical thickness was found to be exptly and theoretically the same for a parallel as for a diffuse incident beam The advantage of the diffuse beam is the greater intensity obtainable The ratio of $\kappa/\sigma$ for Leerdam opal glass bulbs and Philips Argenta bulbs was found to be small ARTHUR FLEISCHER

The Becquerel effect of copper oxide in alkaline solution. II. YOGORO KATO AND NAGAO HAYAMI *J Chem Soc Japan* 52, 8–19(1931).—A study was made of the Becquerel effect of $Cu_2O$ and CuO prepd by the authors' special method, in alk soln. *The time effect of the Becquerel effect and change of wt of CuO in the soln.* when it was and was not exposed to light were detd The Becquerel effect is said to be due not to photoelectricity but to photochem change The decrease of the wt of CuO when it is exposed to light is proof of this conclusion The Becquerel effect changes with time and for this reason the results of other investigators do not agree R. SAITO

The theory of anisotropic liquids. XIII. The optical activity of twisted structures. C. W. OSEEN *Arkiv Mat Astron Fysik* 22A, No 17, 12 pp (1931), cf *C A.* 24,

3409, 25, 10.—Math. The analytical soln. of the problem of the optical properties of twisted structures in the spectral region outside the limits of iridescent colors is presented. Twisted structures possess no rotatory power in the ordinary sense. An incident linear polarized light wave after transition through a layer leaves as an elliptically polarized wave. The usual method of measuring the optical rotation of a nematic substance, by measuring the rotation of a very thin layer and reducing to a 1-mm. layer, is not applicable to substances with twisted structures. The optical activity of a twisted structure depends on the angle which the vibration direction of the incident light makes with the direction of the mol. axis in the lower boundary layers. XIV. The possible structures of nematic substances. *Ibid.* No. 18, 19 pp.—Math. A. F.

**Light emission from alkali halide phosphors.** Walter Bünger. *Z. Physik* 66, 311–27(1930).—Unity to 80% of the light quanta absorbed from the long wave length absorption band appear in the fluorescent band of a TlCl–KCl phosphor. The max. of this band lies at $\lambda = 300$ mμ. The missing portion is to be sought in a visible emission band with a max. around 470 mμ. The short wave length absorption band gives similar results. At high TlCl concn. there is a retention of 4.5–5.0% of the absorbed light quanta. No photochem. discoloration was observed. S. Bradford Stone.

**New laws of phosphorescence.** Pál. Erdélyi. *Matematik és Természettud. Értesítő* 47, 79–93(German abstract 96)(1930).—Photoelec. expts. with gelatinous soln. of Rhodamin B proved that its phosphorescence bands are polarized. The phosphorescence band emitted by the dye mol. is partially polarized. S. S. de Inály.

**The relation of the intensity of fluorescence to the concentration in the case of solid solutions.** A. A. Dixon. *J. Optical Soc. Am.* 21, 250–8(1931).—Measurements were made for liquid and solid solns. of rhodamine B in collodion, 4 parts of alc. to one of collodion being used. The app. and exptl. procedure with the Hg arc and W lamp as exciting sources are described. Results show that for both liquid and solid solns. the intensity of fluorescence increases exponentially with a decrease in concn. There is evidence of a const. value for the fluorescence power at low concns. The value for liquid solns. is about 2.9 times as large than for solid solns. H. W. Walker.

**Fresh evidence in support of the chemical theory of fluorescence.** S. S. Bhatnagar and Krishna Gopal Mathur. *Proc. 15th Indian Sci. Cong.* 1928, 141–2.—In suport of Perrin's view of the chem. nature of fluorescence, small changes in the *n*s of eosin, fluorescein and acriflavine in their aq. solns. were observed on exposing them to a concd. beam of light from an arc lamp. The changes in the *n*s were detd. by means of the Rayleigh interference refractometer, by which a change in *n* of 1 in 100,000 could be ascertained with accuracy. Expts. were performed at various mol. concns., and the values obtained for the changes in the *n*s were found to diminish at higher concns. as the intensity of the fluorescent light decreased. In the presence of gelatin and NaOH the values for the changes were again observed to diminish, evidently on account of a retarding influence on the photodecompn. of these fluorescent substances. The values are not given. E. J. C.

**Colors of inorganic salts.** M. N. Saha and S. C. Deb. *Nature* 127, 485(1931); cf. *C. A.* 24, 2377.—In continuation of previous work S. and D. have measured the absorption spectra of $CrCl_3$ and $FeCl_3$ between 1000° and 1400° in a vacuum furnace. $CrCl_3$ was found to yield a no. of bands at 4100 A. U., and $FeCl_3$ at 4350 A. U. These bands are ascribed to $Cr^{+++}$ and $Fe^{++}$ and are due to the magnetic transitions in the $d^3$ and $d^6$ shells of the elements. The continuous absorption from 3000 to 2200 A. U. is ascribed to $Cl^-$. H. W. Fahy.

**The absorption of aqueous solutions of tartaric acid.** G. Bruhat. *Compt. rend.* 192, 489–90(1931).—According to B.'s best results these solns. follow Beer's law. The careful measurements of Lucas and Schwob (*C. A.* 25, 2052) indicate a weaker absorption and an increase in mol. absorption with decrease in concn. Both sets of results contradict the conclusion reached from the classical hypothesis that 2 forms of tartaric acid exist in soln., namely, that the mol. absorption in the region 2800–1500 A. U. should diminish as the concn. diminishes. Janet P. Austin.

**The absorption of liquid and solid solutions of rhodamine B in a mixture of alcohol and collodion.** A. A. Dixon. *J. Optical Soc. Am.* 21, 259–61(1931).—By plotting values of $kd$ from the equation $I = I_0e^{-kdc}$ (where $I_0$ and $I$ are the intensities of the incident and emergent light, $d$ is the thickness of the absorbing layer, $c$ the concn. and $k$ the absorption const.) against $\lambda$, absorption curves for liquid and solid solns. at different concns. are obtained. $\lambda$ varies between 5100 and 5900 A. U. In each case there is a shift in the crest of the bands toward longer wave lengths as the concn. is increased. H. W. Walker.

**Electron diffraction in 1,2-dichloroethane.** Ernst Bergmann and Leo Engel.

*Physik Z* 32, 263–4(1931)—Comment on work of R Wierl (*C A* 24, 3439), who claims that 1,2 dichloroethane is a mixt of 2 stereoisomers, and comparison with evidence to the contrary WILLIAM E VAUGHAN

**The absorption of the carbonyl chromophore in the short-wave ultra-violet region.** H LEY AND B ARENDS *Z physik Chem*, Abt B, 12, 132 8(1931)—A min in the absorption curve of pure acetone was found at 2115 A U In a hexane soln of acetone, the max of the short wave band was located at 187 mμ Water causes displacement toward short waves The photolysis of acetone became pronounced below 200 mμ The long wave band cannot be attributed to the C electrons of the chromophore The increase in photolysis below 200 mμ appears to confirm the ideas of Wolf (*C A* 23, 4189) The results also reopen the discussion of results obtained with *compds contg 2 chromophores, i e* carbonyl and ethylene groups FRANK URBAN

**Significance of the structure of the hydrocarbon residue for the velocity and equilibrium position in organic reactions** W HEROLD AND K L WOLF *Z physik Chem*, Abt B, 12, 194 205(1931) cf *C A* 23, 4189, Meerwein *C A* 23, 97—The displacement of the absorption band of a chromophore with respect to its normal position or the displacement of the absorption bands of the group itself is taken as a measure of the effect of the structure of hydrocarbon chains on reactions of org dipolar mols The dipole moment of the group may be increased or a spatially enclosed or electrostatically screened dipole may be set free to increase activity to form suitable complexes Various ketones are studied in MeOH and in aq soln and various ales in EtCHO and $Me_2CO$ soln The consts of esterification and sapon of a no of esters are also correlated with absorption data as are also consts of various other reactions It is shown that a variation of structure of solvent mol which by formation of solvation complexes, changes the velocity and equil position in org reactions also exerts a similar influence on the displacement of the absorption bands Comparison of various series of measurements of this kind with the spectroscopic data in regard to spatial relations of groups should give us a better insight into the space packing of groups O E S

**The photochemical reaction of iodine with hydrogen.** NOBUJI SASAKI AND KENJI NAKAMURA *Anniversary Vol Dedicated to Masumi Chikashige* (Kyoto Imp Univ) 1930, 299–302—Preliminary results on the formation of HI by ultra violet rays of 1800 A U are reported No trace of HI production could be detected with rays longer than 3100 A U It is possible that H atoms are produced by collision of the 2nd kind between $H_2$ and $I_2$ excited by radiation of λ about 1800 A U These H atoms may then react with normal $I_2$ mols ALLEN S SMITH

**The chemical action of ultra-violet light on the alkyl iodides.** GUY EMSCHWILLER *Compt rend* 192, 799–802(1931), cf *C A* 24, 5634—The action of ultra violet light on the liquid alkyl iodides which contain 4C atoms or less liberates I and produces a gas MeI gives $CH_4$ as the gas, EtI, $C_2H_4$ and $C_2H_6$, PrI and iso-PrI, $C_3H_6$ and $C_3H_8$, *n* BuI, *sec*-BuI and iso-BuI, $C_4H_8$ and $C_4H_{10}$, *tert* BuI, $C_3H_6$, $C_2H_4$, $C_3H_8$ and $C_2H_6$ The results are obviously similar except for MeI and *tert* BuI The decompn usually gives I, an olefin and a satd hydrocarbon, it may be formulated thus $2RI \longrightarrow (R-H)+(R+H)+I_2$ A mol of RI loses an atom of H and of I, and the R − H rearranges to give olefins The atoms of H and I act, singly or in combination, on a 2nd mol of RI to give R and $I_2$ These photochem decompns are interpreted to reveal the existence of a H atom of singular properties in the alkyl iodides, attached to the same C as is the I, except, of course, in the tertiary iodides The behavior of this H atom is intimately related to that of the I atom This conception appears to account for certain properties and complex reactions of the alkyl iodides, especially in the syntheses of Wurtz R H LOMBARD

**The photochemical decomposition of nicotine salts.** I PLOTNIKOV AND K. WEBER *Chem-Ztg* 55, 237–9(1931)—Aq solns of nicotine, as free base, salicylate, tartrate or malonate, were treated with org and inorg substances known to be catalysts for photochem reactions, and exposed to sunlight Many substances activate the decompn, particularly $K_2CrO_4$, $AuCl_3$, $Fe(NO_3)_3$, I and chlorophyll The same substances are active toward the tobacco itself, although the rate of decompn is much less Orange-red light (O G filter from Schott & Gen) was most active in the decompn of nicotine in tobacco GEORGE CALINGAERT

**Hydrolysis of acetone in ultra-violet light.** M QURESHI AND N A TAHER *Nature* 127, 522(1931)—For the hydrolysis of acetone in ultra-violet light a direct proportionality has been found between incident light intensity and reaction velocity When an aq soln of acetone in a quartz vessel is illuminated by a Hg arc, HCHO as well as AcOH has been found as a hydrolysis product E J ROSENBAUM

**The photochemical decomposition of nitrous acid.** K S MURTY AND N. R. DHAR.

*J Indian Chem Soc* 7, 985-90(1930).—The kinetics, temp coeff and quantum efficiency of the photochem decompn of $HNO_3$ were studied at wave lengths of 4725, 5650, 7304 and 8500 A. U., according to the method of Bhattacharya and Dhar (*C A* 23, 2887). Explanations are given for the increase with temp of the temp coeff of the thermal reaction and the fact that the temp coeff of the photochem reaction is less than unity. The velocity of the decompn of $HNO_3$ is proportional to the cube root of the light intensity. The Einstein equivalence law does not hold for this reaction. E J Rosenbaum

**The function of $Br_2$ and $I_2$ ions and the influence of Cl ions in some oxidation reactions in light.** R M Purkayastha *J Indian Chem Soc* 7, 991-6(1930).—The kinetics and mechanism of the reaction of lactic and mandelic acids with $Br_2$ in the presence of KBr were studied. Zero mol consts were obtained when radiation of wave lengths 542, 488, 448, 408 or 365 microns was used. Cl ions were found to retard the reactions. The semi mol consts obtained by Dhar (*C A* 23, 5414) for the oxidation by $I_2$ of the Na salts of org. acids in the presence of KI are interpreted as resulting from combined light and thermal effects. The light reaction is calcd. to be of zero order. E J Rosenbaum

**Change of susceptibility of paramagnetic salts under the influence of light.** D M Bose and P K Raha *Nature* 127, 520-1(1931), cf *C A* 24, 3453.—From theoretical reasons it can be expected that activation of an ion of the transition group elements leads to a lowering of the magnetic susceptibility of the soln. B and R obtained qual. evidence of a definite lowering of the magnetic susceptibility when light of wave length 4358 or 5790 mμ was allowed to fall on a green $CrCl_3$ soln. E J Rosenbaum

**The action of light on silver bromide.** P. S MacMahon and A. C. Chatterji *Proc. 15th Indian Sci Cong* 1928, 138-9.—Pure AgBr was sealed in a tube contg. pure ppt of Au as absorbent for Br in an atm of dry O and exposed to sunlight for lengthy periods. Absorption of O in all cases took place in approx. the same amt. as that observed in the case of AgCl. It is suggested that the phenomenon is due not to photochem. synthesis of an oxy compd., but to the direct absorption of O by the dispersed Ag produced in the photochem. decompn. of the Ag halide. F J C

**Ultra-violet absorption spectra of the nitriles and amides of 2-methyl-3-pentene.** A Castille and E Ruppol *Bull sci acad roy Belg* [5], 16, 1129-33(1930).—The absorption spectra of the 2 geometrically isomeric 2 methyl-3-pentene 5-nitriles (I) in hexane soln. and their corresponding amides (in alc. soln.) prepd. by Bruylants and Minetti (cf. *C A* 25, 2909) were detd. and the curves plotted. *trans*-I absorbs more than *cis* I, while the values for their respective acid amides are reversed, that for the acid amide of *cis* I being greater. The crotonic nitriles and acid amides behave in this same fashion (cf. *C A* 20, 708). Odpn F Sheppard

**The absorption of radiation in the lower atmosphere and the amount of ozone.** Ch Fabry and H Buisson *Compt rend* 192, 457-61(1931).—$O_3$ present in the atm. may absorb the radiation of short wave length from the light of the stars. The value 0.0022 cm. of $O_3$ per km. of air at atm. pressure, calcd. from optical absorption measurements, is of the same order of magnitude as that obtained by chem. analysis. The higher layers of the atm. must be richer in $O_3$, since measurements of absorption give values 20 times the amt. calcd. on the assumption that all layers contain the amt. given above. Janet F Austin

**Formation of hydrocyanic acid in the electrical discharge.** Kurt Peters and Hans Köster *Brennstoff Chem* 12, 122-7(1931), cf *C A* 25, 1737.—Yields of 70% HCN have been obtained when 1:1 mixts. of $CH_4$ and $NH_3$ were subjected to the elec. discharge at diminished pressures and rapid gas-flow rates. Increases in the reaction yields resulting from increases in discharge potentials agree with the calcd. thermal equivs. With 15% or less of either $CH_4$ or $NH_3$ the yields of HCN become quant. when calcd. for the smaller constituent of the mixt. Under high charges, excess $CH_4$ and $NH_3$ form $C_2H_2$ or decompose into $N_2$ and $H_2$ resp. With a 3:7 $CH_4$:$NH_3$ mixt. a good yield of pure cryst. $NH_4CN$ results. The addn. of $NH_3$ in the $C_2H_2$ formation from $CH_4$ prevents hydrocarbon formation without diminishing the yield of $C_2H_2$, both tar and hydrocarbons reacting with $NH_3$ to form HCN. The influence of elec. charge, gas flow rate and compn. upon HCN yields is shown in tables and diagrams. The reaction mechanism is discussed at length. F W Jung

**The decomposition of hydrocarbons in the positive-ray tube.** H R. Stewart and A R Olson *J Am Chem Soc* 53, 1236-44(1931).—By the use of a specially designed tube it is shown that the decompn. of the hydrocarbons in pos.-ray analysis is due to dissocn. by the ionizing electrons or to the secondary reaction between ions and neutral mols. Previous expts. with H and $C_2H_4$ gave ambiguous results, since

part of the products reported were found to decompose in the process of analysis. Selective absorption of hydrocarbon ions by propane and butane is observed. *H. W. L.*

**Chemical action in the glow discharge. VI. The oxidation of carbon monoxide.** A. KEITH BREWER AND PAUL D. KLEIN. *J. Phys. Chem.* 35, 1281-92(1931); cf. *C. A.* 25, 32.—The oxidation of CO in a glow discharge has been carried out at pressures as high as 30 mm. of Hg. In the neg. glow the rate of oxidation is proportional to the current and nearly independent of the pressure; it is increased by an excess of CO and retarded by an excess of $O_2$. In the pos. column the rate is proportional to the current and independent of the pressure below 10 mm., but at higher pressures increases to the ignition point. $CO_2$ synthesized in the neg. glow reaches the wall as pos. ions, that formed in the pos. column is deposited as neutral mols. The bands of the first neg. group of CO appear with about equal intensity over a wide pressure range. The data are interpreted as indicating a simple ion cluster mechanism for the neg. glow and an ion chain mechanism for the pos. column. $CO^+$ ions appear much more effective in initiating the reaction than $O_2^+$ ions. An estn. of the rate of production of pos. ions in the neg. glow yields a ratio of *M*/*N* of 2 for the no. of mols. synthesized to pos. ions formed. VII. **The dissociation and oxidation of methane.** *Ibid.* 1293-1302.—$CH_4$ is converted quantitatively into $C_2H_4$ and $H_2$ in the glow discharge at liquid air temps. *Approx. one $C_2H_4$ mol. is formed per $CH_4^+$ ion.* $CH_4$ *in a* 1:2 $CH_4$:$O_2$ *mixt.* is oxidized completely to $CO_2$ and $H_2O$. Reaction seems to be initiated primarily by $CH_4^+$ ions being accelerated by excess $CH_4$ and retarded by excess $O_2$. The max. rate of $CH_4$ oxidation occurs with a 1:1 $CH_4$:$O_2$ mixt. The oxidation reaction is most pronounced in the neg. glow, negligible in the dark spaces and small but fairly const. throughout the pos. column. The efficiency of the pos. column in terms of electron volts per mol. increases rapidly with the pressure above 5.5 mm., indicating the presence of ionic chain reactions. P. H. EMMETT

## 4—ELECTROCHEMISTRY

COLIN G. FINK

**A survey of electrochemical industries of Japan.** YOCOCO KATO. *Trans. 2nd World Power Conference* (Berlin) 1, 306-10(1930).—Brine is electrolyzed to form NaOH, bleaching powder and bleaching liquors. By product $H_2$ is used for the hydrogenation of oil from fish and soy beans. $H_2$ from the electrolysis of $H_2O$ is used for $NH_3$ synthesis, $O_2$ for synthetic AcOH and for oxyacetylene welding. Cu and Fe are purified electrolytically. Electrolytic Zn is produced. Metallic Na is made by the electrolysis of fused NaOH. Au, Ag, Ni and Cr are electroplated. The electrothermic industries are occupied in the production of $CaC_2$, cyanamide, ferro Si, ferro-Mn, ferro Cr, elec. steel, etc. Synthetic AcOH is made from acetylene. Methanol production is partly commercial. Pb storage batteries and dry cells are made. ALDEN H. EMERY

**The new electrochemical laboratories of the University of Grenoble.** R. SEVIN. *J. four elec.* 40, 45-8(1931), 2 illus. C. G. F.

The determination of the transport numbers of metals on electrolyzing their alloys Richard Seinger and Richard Irina *Monatsh* 57, 112–64(1931) —Molten alloys were electrolyzed by the method of Kremann, Muller and Kienzl (*C A* 19, 5, 1379) Longer tubes were used in order to obtain an intermediate layer of unchanged compn The 19 alloy pairs investigated could be divided into 3 groups With K Hg, Pb Hg Sn Hg Sn Pb Sn Sb, Bi Sn, Bi Cd and K Na, one of the metals migrated toward the anode and the other toward the cathode With Na Hg, Bi Hg, Sn Zn, Sn Al, Ag Al, Ag Bi, Zn Sb and Sn Cd, either this same behavior was noted, or else both metals migrated toward the anode, depending upon exptl conditions No definite relation could be established between exptl conditions and the direction of migration except that frequently migration of both metals toward the anode took place at higher c ds With Ag Sn Ag Sb and Pb Na both metals migrated toward the anode It is concluded that in order to det transport nos for molten alloys such as Hittorf obtained for aq solns, many sources of exptl error must be eliminated C L W

The galvanic tension of lead-gold alloys Franz Grengl and Robert Baum *Monatsh* 57, 165–76(1931) —The galvanic tensions of the cells Hg | HgCl | satd KCl | 0.1 *N* HCl satd with $PbCl_2$ | $Au_xPb_{(1-x)}$ were measured at 25° on an Ostwald capillary electrometer With increasing Au concn, the potential remained practically that of Pb at 40% Au it dropped and attained a min at 60% Au, then rose gradually to that of Au It is concluded that the potentials of the 2 compds $AuPb_2$ and $Au_2Pb$ lie close to that of Pb Curtis L Wilson

The cathodic behavior of pyrite and chalcopyrite. Atsushi Matsubara and Jitsutaro Takubo *Anniversary Vol Dedicated to Masumi Chikashige* (Kyoto Imp Univ) 1930, 311–39(in German) —The elec reactions of Fe and Cu pyrites as cathodes were quantitatively investigated The app used permitted measurement of the gases evolved and electrolyte used and sampling of the cathode soln The cathode was prepd by sealing a crystal of the pyrites in a glass tube Expts were made at 6 v and at 20 v Fe pyrites is dissolved in dil $H_2SO_4$ with the evolution of $H_2S$ by passage of current If the sample is anodically polarized either dry or in the electrolyte, a relatively large amt of H is evolved in comparison to the quantity of current consumed in the subsequent cathodic polarization in dil $H_2SO_4$ Pretreatment by cathodic polarization shows the opposite effect Cu pyrites is decomposed, forming $H_2S$, $Cu_2S$ and $FeSO_4$ With preliminary anodic polarization and subsequent cathodic, a relatively small amt of H is evolved and a large amt of the decompn product The effect on the mineral is opposite with preliminary cathodic polarization A greater amt of decompn product was found than would correspond to the current consumption owing to the action of the acid If the cathodic polarization proceeds further, metallic Cu is sepd A theory of ionization of the 2 minerals is advanced to explain the exptl results A S S

The electrolytic preparation of white lead. J F Sacher *Chem.-Ztg* 55, 189–90 (1931) —Various patented processes are reviewed While the electrolytic process possesses the advantages of avoiding dusting and of being continuous and labor saving, there are serious disadvantages such as the difficulty of producing a purely basic Pb carbonate, higher installation cost, complicated chem control and the danger of discoloration by impurities from the electrodes It is claimed that the electrolytic process has not attained the reliability of the corroding process, and probably never will (cf the Sperry process (U S 1 452,620), *C A* 17, 2197) Curtis L Wilson

Electrochemistry of magnesium Sven Bodforss *Z physik Chem*, Abt A, 153, 83–106(1931), cf *C A* 21, 524, 22, 719 —The change of potential of a Mg electrode with time was detd in $MgSO_4$ and $MgCl_2$ solns The effect of varying the acid content and varying the buffer in the presence of neutral salts and $NH_4$ salts or of hydroquinone, resorcinol succinimide, pyrocatechol, CO, $CO_2$ and $H_2$ was detd Mg becomes less noble as the H ion concn of the soln is increased, till a max is reached.

This is explained by the reaction $Mg \cdot \cdot \cdot Mg(ion) + e$ or $2Mg \rightleftharpoons Mg_2(ion) + 2e$ ARTHUR FLEISCHER

**Direct electrochemical production of permanganic acid from manganous salt solutions.** LÁSZLÓ DE PUTNOKY *Matematik es Természettud Értesitö* **47**, 732–48 (in German 749–50)(1930) $MnI_3$ is formed on the anode during the electrolysis of $MnSO_4$ soln with a diaphragm in the presence of $H_2SO_4$ and HI The primary product of anodic oxidation is $HMnO_4$, which reacts with $MnSO_4$ and HI to form $MnI_3$ Only after all the $Mn^{\cdot\cdot}$ salt has been oxidized to $Mn^{\cdot\cdot\cdot}$ can the $HMnO_4$ remain as the final product *$HMnO_4$ is then formed by the oxidation of $MnI_3$, which therefore decreases in amt during electrolysis* The $MnI_3$ could not be detected, probably because it is instantly oxidized S S DE TINÁLY

**Series refining of copper and the economics of the process.** A GLAZUNOV AND N CHVORINOV *Chem Obzor* **6**, 11–7, 62–6(66 English)(1931) The multiple and series systems are described and on the basis of the charts given it is concluded that the series system is more economical only when the price of Cu is high and the anodes contain but a small percentage of impurities J KUČERA

**The Nernst equation I. A new equation for electrode potentials.** MARTIN MEYER *Chem News* **142**, 170–83(1931) Some e m f data were graphically examd A new equation for the e m f of a single electrode or concn cell is derived on the basis of van der Waal's gas equation It is predicted that the function $f = [e\ m\ f - \phi RT \log(P/p)] \div \phi(P - p)$ ($\phi$ = numerical coeff $R$ = universal gas const $T$ = Abs temp, $P$ = soln tension of ions $p$ = soln pressure of metal) should be a const for any substance where intermol attraction can be assumed to be equal to 0 R H CHERRY

**Irreversible phenomena of electrolysis (overvoltage and passivity of the electrodes)** ERNESTO DI NINA *Atti III congresso naz chim pura applicata* **1930**, 414–9.—Review of electrolysis and polarization phenomena G M MURPHY

**Electrodeposition of metals from nonaqueous solvents.** I I AUDRIETH AND H W NELSON *Chem Reviews* **8**, 335–52(1931) Electrodeposition of metals from $C_5H_5N$ HCONH$_2$, AcNH$_2$, liquid NH$_3$ and other nonaq solvents offers many interesting possibilities LOUISE KELLEY

**Chemicals—their functions in electroplating** L C PAN *Brass World* **27**, 79–81(1931) The metal compd, the conductor the anode depolarizer the brightening agent and the buffer and the parts they play in electroplating solns, are briefly discussed W H BOYNTON

**Recovery of silver and gold from plating solutions.** K BIHLMAIER *Metallwaren Ind u Galvano Tech* **29**, 143–5, 169–71(1931) Waste solns are disposed of in 3 ways (1) the solns are given directly to a pptn plant (2) the preliminary pptn is done at the plating plant and the final recovery at the pptn plant, (3) the entire work of recovery is done at the plating plant itself Chem methods of recovering Au and Ag from acid and alk solns, and from liquids which contain the noble metals in the form of dust, are described CURTIS L WILSON

**Work supervision and testing of plating baths.** H KRAUSE *Metallwaren-Ind u Galvano-Tech* **29**, 145–7(1931), cf *C A* **24**, 3445 CURTIS L WILSON

**Electromotive behavior of cupric oxide.** BASRUR S RAO AND N G CHORANNA *Proc 15th Indian Sci Cong* **1928**, 115.—The half cell Pt CuO, Cu$_2$O, *N* NaOH has been observed to give an inconst potential difference by Allmand (*C A* **4**, 1947) and by Maddison (*C A* **20**, 1023) no satisfactory explanation has hitherto been available R and C carried out measurements with cells in which the CuO used had been first warmed to dryness with an alc soln of NaOH and then heated at different temps with suitable precautions Such heating was found to cause an aging effect which tends to give const potential values No appreciable aging effect was noticed with Cu$_2$O under similar treatment F J C

**A low-density cadmium-vapor lamp.** B VENKATESACHAR *Proc 15th Indian Sci Cong* **1928**, 67.—A Cd lamp with a hot solid Cd cathode and a water cooled Cd anode was designed A study of the photographs confirms the results obtained with Hg Particularly striking is the appearance of the higher members of series lines and of the so called "forbidden lines" at a pressure of about 2 mm of Hg Description of the lamp and detailed results are not given I J C

**Electrolytic phenomena in oxide-coated filaments.** J. A BECKER *Trans Electrochem Soc* **59** (preprint), 15 pp (1931) cf *C A* **24**, 4218.—A critical survey of the literature shows that the current through the oxides in oxide-coated filaments is carried by electrons, negative oxygen ions and positive barium ions The proportion of current carried by each depends upon the exact composition and method of preparation of the oxide coating, on the heat treatment and on previous electrolytic effects Pre-

sumably the conductivity is greatly affected by Ba and O dispersed through the oxide. New experimental results show that for a particular BaO + SrO filament, the cond. was given by $1.71 \times 10^{4} e^{-1.73 \times 10^{4}/T} + 5.55 \times 10^{-3} e^{-0.62 \times 10^{4}/T}$. The current is proportional to the voltage only so long as the current is small, otherwise the products of electrolysis alter the cond. Polarization currents are caused by the Ba and O which are produced by electrolysis. These currents decrease rapidly even at temps. near 500° K., thus showing that Ba and O diffuse at low temps. C. G. F.

Accumulators. Compagnie générale d'électricité. Fr. 697,390, May 24, 1930. The edges of fibrous separators for accumulators are coated with a substance resistant to the electrolyte.

Accumulators. Ernst Bergmann. Austrian 121,757, Dec. 15, 1929. Sulfation is prevented by adding $(NH_4)_2SO_4$, $Al_2(SO_4)_3$ and a little org. acid to the $H_2SO_4$ filling. The salts must not be added in alum forming proportions. The org. acid may be added in the form of a salt. A suitable filling contains distd. water 755 and $H_2SO_4$ 240 cc., to which are added anhyd. $Al_2(SO_4)_3$ 18, $(NH_4)_2SO_4$ 4 and basic $Al(OAc)_3$ 5 g. The invention is particularly applicable to starting batteries for automobiles, etc.

Electrodes for accumulators. P. Palánky. Hung. 102,071, March 10, 1930. Positive electrodes for alk. accumulators are made of MgO, $Mg(OH)_2$ or $MgCl_2$ mixed with CuO and 3–15% powd. graphite, charcoal, coke or anthracite. Negative electrodes are formed of the above Mg compds. and ZnO contg. a little HgO. These mixts. are added to powd. resin or pumice, formed into electrodes and heated to redness.

Making electrodes for selenium cells from colloidal graphite. Telefunken Ges. für Drahtlose Telegraphie m. b. H. (Fritz Michelssen, inventor). Ger. 522,291, Feb. 14, 1929.

Selenium cell. Emerich Spielmann. Austrian 121,671, Oct. 15, 1930. Structural features are described.

Selenium cells. Telefunken Ges. für Drahtlose Telegraphie m. b. H. (Otto von Bronk, Fritz Michelssen and Fritz Schroeter, inventors). Ger. 522,002, Dec. 2, 1928. Se cells sensitive to ultra red rays are formed in an atm. of inert gas, *e. g.* A.

Modified Bunsen cell. L. Jeszenszky. Hung. 102,192, Dec. 24, 1929. NaOH or KOH is used as electrolyte with (1) $KMnO_4$ dissolved in $H_2SO_4$ contg. water (potential 2.7 v.), or (2) Na or K dichromate (2.5 v.), or (3) concd. $HNO_3$ (2.4 v.), or (4) $H_2SO_4$ contg. HgO (1.9 v.) or (5) pyrolusite powder moistened with acid water (1.8 v.), as depolarizing liquid.

Electrochemical condenser. Léon Segal and Henri André. Fr. 698,698, Oct. 9, 1929. A Ni-alkali (potash or soda) Sn combination is used.

Electroplating apparatus. John J. Wialin (to General Elec. Co.). U. S. 1,798,994, March 31. Structural features.

Apparatus for electroplating jewelry chains, etc. Max Tessler. Fr. 697,885, June 25, 1930.

Electrolytic metal deposition. Ernst Kelsen (Franz Halla, inventor). Austrian 121,986, Nov. 15, 1930. The electrolytic manuf. of metals is conducted under the influence of high frequency sound waves. Cf. *C. A.* 22, 721, 23, 1573.

Covering metals with aluminum. Soc. anon. pour l'ind. de l'aluminium. Fr. 698,748, July 8, 1930. Metals such as Fe or light alloys are given an adhering coating of Al, by electrolysis. The base metal serves as cathode, and the electrolyte has a m. p. lower than that of Al. One or more metals more noble than Al is pptd. in small quantities at the same time as the Al at the anode, *e. g.*, small quantities of Pb. Before commencing the pptn. the cathode is allowed to function as anode.

**Chromium plating.** Auguste Hollard (to Soc. nouvelle de l'orfèvrerie d'Ercuis). U. S 1,799,851, April 7. See Fr. 661,182 (*C. A.* 24, 28).

**Removing mistiness in electrolytic baths during chromium plating.** Wilhelm Steinhorst. Ger 504,815, May 25, 1927. The mist is dispelled by a high tension electrostatic field applied by pointed conductors outside the bath

**Chromium-stripping bath.** John F. McCullough (to The Ternstedt Manufacturing Co) Can 311,131, May 5, 1931 An electrolytic bath for stripping Cr-plated articles, with the article acting as an anode, comprises an aq soln. contg 60–120 g oxalic acid per l A temp of 77–85°F. and a potential of approx 12 v. are used

**Electrodeposition of the metals of the platinum group.** Baker & Co, Inc. Fr. 698,153, June 27, 1930 See U S 1,779,436 (*C A.* 25, 38)

**Electrolytic production of metallic powders.** Eugene Drouilly (to Soc. anon Trefileries & Laminoirs du Havre, anciens établissements Lazare Weiller, Soc coöperative de Rugles et la canalisation electrique reunis) U S 1,799,157, April 7 Metallic powders such as Cu are produced by electrolyzing a soln of a metal salt such as $CuSO_4$ contg the carbonaceous reaction product of glucose and $H_2SO_4$ substantially in colloidal dispersion

**Electrolytic production of unstable products.** Österreichische Chem. Werke G m b. H Austrian 121,750, Oct 15, 1930 The electrolytic manuf of persulfuric acid or its salts is effected in a cell having a diaphragm arranged close to the anode The anolyte is caused to flow rapidly through the cell in a thin layer, while the main body of electrolyte is cooled and passes slowly through the cell, preferably in counter current to the anolyte Other electrolytic processes yielding unstable end products are similarly conducted, the diaphragm being located close to the electrode yielding the unstable product. Details of the app are described

**Electrolytic cell suitable for caustic-soda production from brine.** Herbert I Allen and Douglas B. Ayerst (to Electron Chemical Co). U S 1,798,575, March 31. Structural features.

**Purifying solutions.** I G. Farbenind A.-G. Fr. 697,900, June 25, 1930 Solns are purified electrolytically by causing a current to act on foreign substances dissolved in low concn. in an electrolyte, the electrolyte being caused to pass through electrodes of metallic gauze, the openings of which are very small Examples are given of the removal of As from $H_3PO_4$, $H_2SO_4$ and AcOH, and Hg from AcOH

**Apparatus for electrolytic decomposition of water or other liquids or solutions under high pressure.** Jacob E. Noeggerath. U. S 1,799,116, March 31 Structural and elec. features.

**Electrometallurgical products.** François C. S Mizgier. Fr. 698,492, Apr. 7, 1930. Electrometallurgical products are made by using primary materials powdered and agglomerated by any means. The current is brought to the furnace by electrodes made of the material to be treated The plasticity of the products before cooling is used for molding the electrodes

**Tantalum.** Clarence W. Balke (to Fansteel Products Co). U S 1,799,403, April 7. Ta is obtained by electrolyzing a fused bath contg tantalic oxide and K fluotantalate.

**Ozone.** Eugène Royer. Fr 697,930, Sept. 25, 1929 Ozone is produced under pressure by a magnetic field created by the dielec liquid of an annular reservoir in a tight chamber having a central metallic mass and receiving the gaseous mixt. under pressure.

**Protective layers on metallic or other electric conductors.** Jonas H Mellquist. U. S. reissue 18,030, April 7 Reissue of original pat. No 1,595,675 (*C. A.* 20, 3271).

**Chemical reactions under electric waves.** Institut für physikalische Grundlagen der Medizin Fr 697,547, June 17, 1930. In chem reactions under a luminous elec. wave of continuous current, the interior of the reaction chamber is such that the vol. of the space occupied by the cathodic fall is approx equal to the vol of the space between the electrodes The reaction is carried out under reduced pressure

**Rotary electric furnace.** Gottfried Trümpler. Ger. 522,004, May 1, 1928.

**Electric resistance furnace.** Gottlieb Keller (to Akt. Ges Brown Boveri & Cie). U. S. 1,798,678, March 31. A system of power-input control is described.

**Electrically heated furnace suitable for dental work.** Paul Manternach. U. S 1,799,695, April 7. Structural features

**Iron-coupled electric induction furnaces.** Hirsch, Kupfer- und Messingwerke A.-G. (Manuel Tama, inventor). Ger. 522,198, Nov. 15, 1927. Elec. features are described.

**Electric annealing, etc., furnace.** SIEMENS-SCHUCKERTWERKE A.-G. (Hans Gerdien and Werner Juhatz, inventors) Ger. 522,081, Jan. 12, 1928.

**Electrically heated annealing apparatus for coiled iron bands.** HIRSCH, KUPFER- UND MESSINGWERKE A. G. (Franz Linnhoff, inventor) Ger. 522,199, Nov. 25, 1928.

**Hardening high-speed steel.** HERAEUS VACUUMSCHMELZE A. G. and WILHELM ROHN. Ger. 522,003, July 9, 1929. Hardening is effected in an electrically heated tube of cast Cr, to which current may be conveyed by water cooled tubes of Ni or Fe welded on to the Cr tube. The tube may be closed at one end and filled with a protective gas.

**Heating charges such as tungsten filaments and supports in electric furnaces.** LLOYD C. KELLEY (to General Elec. Co.). U. S. 1,799,102, March 31. The charge in the furnace is heated to the furnace temp. and is then kept in the furnace while further heated by heat generated in the charge itself (as by a high frequency coil) independently of the furnace temp. App. is described.

**Heat-exchange apparatus suitable for use as a jet heater in electrolytic copper refining.** JOHN P. RAHBEN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,799,391, April 7. Structural features.

**Packing crucibles of electric metal melting furnaces.** MAGNUS UNGER (to General Elec. Co.). U. S. 1,800,031, April 7. In packing crucibles to prevent leakage, the crucible is surrounded with a layer of granulated, refractory, heat insulating material which is agitated while being applied to the crucible so as to compact it tightly against the crucible.

**Gas rich in hydrogen from carbide furnace.** KATUZI HIBI. Japan 90,215, Feb. 9, 1931. Gas contg. about 80% of $H_2$ is manufd. by introducing $H_2O$ vapor into the mixt. of CaO and C in the $CaC_2$ furnace. The process has no bad effect on the quality of $CaC_2$ produced.

**Head construction for electric resistance detectors for combustible gases.** ALBERT N. ERICKSON (to Union Carbide Co.). U. S. 1,798,977, March 31.

**Gas purification.** METALLGESELLSCHAFT A.-G. (Jakobus R. Gies, inventor). Ger. 516,763, Jan. 3, 1930. An elec. gas purifying plant in which a gas canal is arranged between two filter groups is described. *Cf. C. A.* 25, 2061.

**Cleaning gases electrically.** SIEMENS SCHUCKERTWERKE A. G. (Carl Buff, inventor). Ger. 522,166, Dec. 5, 1928. The cleaning of the insulators, *e. g.*, by a rinsing gas, is automatically regulated in accordance with the amt. of dust that has settled on them. *Cf. C. A.* 25, 463.

**Cleaning furnace gases electrically.** METALLGES. A.-G. (Hermann Fiesel, inventor). Ger. 522,389, Apr. 19, 1929. The electrically neutral gases are supplied to the electrofilter at a temp. above 150°, *e. g.*, 200–250°, and at a relatively low velocity generally less than 1 m. per sec. The tension in the electrofilter may increase in the direction of flow of the gases. The method is particularly intended for *rotary cement kiln gases*.

**Apparatus for electrical precipitation of suspended particles from gases.** HARRY A. WINTERMUTE and CARL W. J. HEDBERG (to Research Corp.). U. S. 1,798,964, March 31. Structural features.

**Apparatus for electrical precipitation of suspended particles from gases.** HARRY A. WINTERMUTE and CARL W. J. HEDBERG (to Research Corp.). U. S. 1,798,511, March 31. Structural features.

**Precipitating electrode for electric gas cleaner.** "ILGA" ELEKTRISCHE GASREINIGUNGS G. M. B. H. Ger. 522,479, June 26, 1926.

**Electrode support for dust precipitators.** HOWARD D. SALISBURY. U. S. 1,798,761, March 31. Structural features.

**Arc lamp electrode.** STEPHEN W. ORNE (to The Canadian National Carbon Co., Ltd.). Can. 310,628, Apr. 21, 1931. A cored electrode in which the shell is made of a slowly burning form of C, as petroleum coke, contains small quantities of $H_3BO_3$ with a suitable binder, and the core consists of 10 parts of rare earth fluorides, 60 parts $CaI_2$, 30 parts high grade carbon flour and sufficient tar to serve as a binder. Instead of rare earth fluorides other compds. may be used as oxides, chlorides, silicides or carbides. *Cf. C. A.* 25, 885.

**Incandescent electric-light bulb.** SAMUEL LYMAN. U. S. 1,798,745, March 31. The base of the bulb has a reentrant portion provided with a silvered reflecting surface. Various details of construction are described.

**Electric incandescent lamp filament.** TED E. FOULKE (to General Elec. Co.). U. S. 1,800,012, April 7. Structural features.

**Getter for incandescent electric lamp.** EWALD DIETZ (to The Canadian Westing-

house Co., Ltd.) Can 310,383, Apr 14, 1931 Residual deleterious gases in an incandescent elec lamp are cleaned up by effecting the thermal decompn therein of copper phosphide A getter compn for evacuated incandescent elec lamps comprises cryolite contg about 0.3–40% phosphorus as copper phosphide

## 5—PHOTOGRAPHY

E P WIGHTMAN

**Early history of photography.** E STENGER *Phot Ind* 29, 32–5(1931).—English photographic literature from 1839 to 1870 is covered It is essentially a bibliography treated chronologically C E MEULENDYKE

**Mechanism of the photographic process** H BAINES. *Chemistry and Industry* 50, 256–60(1931) A review (without references) is given of the more recent theories of photographic sensitivity and latent image formation, with a brief discussion of some other phases of the photographic process, such as development and fixation F P W

**Photographic emulsion for dry plates** MICHIO MIYATA AND A SASAKI *Rep't Imp Ind Research Inst., Osaka, Japan* 11, No 18 (1931).—The method of prepn of the photographic emulsion together with the effect of the concn of halogen salt and gelatin is given F I NAKAMURA

**Measurement of sensitivity of emulsions and a comparison of the results of the various methods.** L LOBEL AND M DUBOIS. *Photographe* 18, 85–6, 108–11(1931).—Twenty one emulsions were compared for sensitivity by the methods of Hurter and Driffield, Scheiner, Jones and Russell, and Labussière and a practical test is made under standardized conditions for min exposure For the emulsions tested, which were mainly orthochromatic and compared at a gamma 1.6, the H & D inertia method gave values which agreed best with the practical exposure test, but generally were of lower value W WESTWATER

**Toning of photographic pictures by sulfur and selenium.** J MILBAUER AND F MASIN *Chem Obzor* 6, 17–20(20 English)(1931).—By controlling all methods of direct as well as indirect S and Se toning on images obtained by the development of AgCl AgBr and AgBr papers, it was found that the direct toning is most readily accepted by images obtained by colored development, *e. g.*, to brown tones A series of new methods, direct and indirect, is described by using a combined bath of thioarsenate and thioantimonate and a very efficient bath with $H_2SeO_4$ Thiostannates, thiomolybdates and thiotungstates cannot be applied for toning, as such baths give permanent colors to the light parts of images The same is true for the sol arsenates and antimonates of Se Colloidal solns of Se do not attack practically the Ag granulation, thus differing from the S solns Images toned by Se can be bleached by using a bath of $KMnO_4$ + KBr, acidified with a trace of HCl, and then retoned J KUČERA

**Conversion of Scheiner speeds into H. & D.** M BILTZ *Phot Ind* 29, 95(1931).—An exact conversion is not possible because of fundamental differences in the 2 methods of detg speeds In a practical way, B has separately detd the 2 speeds for a large no of com plates and films He plotted the Scheiner speeds as abscissas and H & D speeds as ordinates The wide errors resulting from the use of conversion tables are apparent C E MEULENDYKE

---

New photoelectric recording microphotometer (CARROLL, MOSS) **1.** Quantitative investigations on the photographic action of $\alpha$- and H-particles (BLAU) **3.** Energy measurements in the visible and ultra violet (BENFORD, HOWE) **3.** The action of light on AgBr (MACMAHON, CHATTERJI) **3.** Films (Fr pat 698,727) **23.**

---

**Color photography.** SPICERS, LTD Fr 698,145, June 27, 1930. Photographic prints are obtained in natural colors by exposing to light a printing material contg a photographic emulsion on a screen carried by a translucid detachable support, the emulsion being away from the source of light After development of the image, the print and the roller are transferred by inversion to a 2nd support, the translucid detachable support being detached before or after this transfer Cf. *C A* 25, 2653 and following abstrs

**Color photography.** SPICERS, LTD *Fr. 698,220, June 30, 1930* A film of celluloid, viscose, cellulose nitrate, etc., for use in color photography is coated (1) with a layer of insulating material, such as a soln of cellulose acetate with or without plastifiers,

to prevent the penetration into the support, of the film of dye solns and agents for removing dyes, (2) with a layer of material compatible with the dyes and removers, such as cellulose nitrate, collodion or regenerated cellulose and (3) with a multicolor screen

**Color photography.** Siccus, Ltd Fr 698,258, July 1, 1930 Multicolored screens are applied to a film of cellulose acetate, nitrocellulose, etc., by applying on the surface of the film a constituent of coloring material and afterward printing successively on the surface of the film lines or other geometric designs, by means of one or more agents each contg a compd capable of reacting with the said constituent to form a differently colored dye

**Photographic developers** Gustav Reddelien and Werner Müller (to Agfa Ansco Corp) U S 1,799,648, April 7. Photographic developers contg as a developing agent a *N* monohydroxyethyl deriv of nuclear substitution products of 4 amino-1 hydroxybenzene are stable very sol and capable of developing the latent photographic image in a Ag halide emulsion without formation of fog, even in solns free from KBr Examples are given of developers contg 4 hydroxyethylamino-2-chloro-1 hydroxybenzene, 4 hydroxyethylamino-3 methyl 1 hydroxybenzene and 4 hydroxy ethylamino 1 hydroxybenzene 2 carboxylic acid *Cf C A*, 24, 3186, 25, 1749

**Developing light-sensitive layers with gases such as ammonia.** Emil Grovau (to Eugene Dietzgen Co) U S 1,798,411, March 31. During development with a gas such as $NH_3$, the paper being developed is slightly moistened with a liquid such as water contg the developing gas App is described

## 6—INORGANIC CHEMISTRY

A R Middleton

**Advances in the preparation and utilization of a few rare elements.** Walter Noddack *Metallborse* 21, 1683–4 1751 2(1931).—A brief summary covering Ge, Hf, protoactinium, W, I, Re and the Pt group Re is obtained from molybdenite by soln in $HNO_3$ Pptn of $(NH_4)_3PO_4 \cdot 12MoO_3$ leaves Re in the filtrate, from which it is removed as the sulfide The process, repeated many times, finally yields a 1% Re concentrate This is oxidized and the oxide removed by sublimation Reduction in H leaves the metal as a heavy, gray powder, m slightly above 3400° Abs Analytically Re belongs to the $H_2S$ group, pptg as $Re_2S_7$ from aq solns of $ReO_4^-$ This ion is not readily reduced B A Soule

**Rhenium.** Ida Noddack and Walter Noddack. *Z angew Chem* 44, 215–20 (1931), *cf C A* 24, 3959.—A review covering the chem properties of Re, its detection and detn and the prepn of $HReO_4$ and $ReO_2$ To recover Re from residues, these are dissolved in dil $HNO_3$, boiled down and converted into chlorides by treating with HCl The soln is evapd to dryness, the salts are dissolved in water, the soln is made slightly alk with KOH, treated with $(NH_4)_2S$ and then acidified with dil $H_2SO_4$ After standing 1 day the supernatant soln is again treated with $(NH_4)_2S$ and $H_2SO_4$ to ascertain whether the pptn was complete The ppt is filtered, washed with 5% $H_2SO_4$, then hot water, dried washed with EtOH, then $Et_2O$ and dried again The product is then pulverized and treated for 1 day with $CS_2$, which dissolves the excess S The residue is again pulverized and then added slowly to 4 parts of a 1 1 molten mixt of KOH and $KNO_3$ in a Ni or Ag crucible The cooled mass is dissolved in an excess of water and the soln is filtered After concn and cooling the Re seps as a heavy cryst powder of $KReO_4$ very sparingly sol in KOH This is filtered, washed with a little water and 96% EtOH The KOH soln contains not more than 0.1 g of $KReO_4$ per l A test has shown that when the alk soln contains 100 times as much Cr, Mo, W, Cb, Ta, Ru Os, Zn Ga, Ge, As or Pb as Re, the first crystn yields $KReO_4$ which contains not more than 0.2% of any of these elements Georges Calingaert

**Zirconium II. Zirconium oxalate and diphenyldinitrogen zirconium.** Howard S Gable *J Am Chem Soc* 53, 1276–8(1931), *cf C A* 24, 4996.—The use of MeOH solns allows Zr compds to be prepd without danger of hydrolysis Normal $Zr(C_2O_4)_2$ (I) has been prepd for the 1st time by the interaction of solns of $ZrCl_4$ and oxalic acid in MeOH The white gelatinous ppt is quite sol in water, the basic salts of other workers being insol Jefferson's work (*J Am Chem Soc* 24, 540,(1902)) on the pptn of Zr salts by aniline was repeated with identical results in water or MeOH, the reaction being $2C_6H_5NH_2 + ZrCl_4 \longrightarrow C_6H_5N{=}Zr{=}NC_6H_5$ (II) $+ 4HCl$ The solubilities of I and II were observed as follows $CCl_4$, $CS_2$, MeOH, EtOH, $NH_4OH$ and HCl, both I and II insol, $C_6H_5NH_2$, I slightly sol, II insol, HCOH, I and II react,

$H_2O$, I very sol, II insol. AcOH, I slightly sol, II insol $Me_2CO$, I slightly sol, II insol $HNO_3$, I insol II sol ALBERT THOMAS FELLOWS

**Synthesis of gas-metal compounds by sputtering.** L. R INGERSOLL. *J. Am. Chem Soc* 53, 2008–9(1931).—Ni sputtered in N under special conditions gives a nitride film, decompd by heating at 350°, on heating to 150° in H, $NH_3$ and Ni are formed. Compds of Co and Fe with N and of Ni and H have also been prepd C J WEST

**Higher oxygen compounds of the eighth group of the periodic system. II. Compounds of nickel.** D K GORALEVICH *J Russ Phys-Chem Soc* 62, 1165–88(1930), cf *C A* 25, 654.—In the fusion of NiO with $KNO_3$ or with $KClO_3$ in the presence of alkali, there is formed aside from $K_2NiO_4$, a small amt of a gray-green material which liberates $O_2$ on treatment with hot $H_2O$ or with $H_2SO_4$ or $HNO_3$. This material is sol in hot concd HCl without decompn but seps from the acid on cooling. Large yields of this material can be obtained by fusing in a silver cup a mixt of NiO and $KNO_3$ and then adding to the hot fused mass $K_2O_2$, heating further, cooling, powdering and washing the product with ice water on a filter paper. The same reaction was repeated by fusing NiO with $NaNO_3$ and $Na_2O_2$, also with $Ba(NO_3)_2$ and $BaO_2$. The product of the reaction with Na compds behaves in the same manner as the product with K compds in regard to hot $H_2O$ or $HNO_3$, $H_2SO_4$ or HCl. The product of the reaction with Ba compds is not decomposed by hot $H_2O$ or by heating to redness, but $HNO_3$ and $H_2SO_4$ liberate $O_2$ from it. When concd HCl is added, $Cl_2$ is liberated on prolonged heating. Analysis of the fusion products showed them to be mixts of compds. After repeated washing of the mixts with dil AcOH the residue remaining on the filter paper was a definite compd., *e. g.* in the case of the Ba fusion it was $BaO_2 Ni_2O_3$, in which Ni is octavalent. The pure $BaNiO_3$ is completely sol in warm concd HCl. On heating $Na_4NiO_5$ in concd HCl there forms a green ppt of $Ni_2O_3$ which is unstable and decomposes into NiO and $O_2$. $K_2NiO_3$ and $BaNiO_3$ behave similarly. On careful heating of $Ni_2O_3$ with concd HCl a white unstable compd $NiO_4$ forms, which decomposes in air into NiO and $O_2$. III. **Nickel oxides.** *Ibid* 1577–1625.—Expts were conducted to establish the existence and phys and chem properties of various Ni oxides, in regard to which there is confusion in the literature. (1) Oxides of Ni prepd by electrolysis of powdered metallic Ni in strongly alk. Na pyrophosphate soln contained Ni 67–73%, O 27–34%, no $H_2O$ of crystn., active O by action of $H_2O$ at 50° 6–16%, active O by action of $H_2SO_4$ 7–16%. Heating caused decompn to NiO. (2) *Hydrated NiO oxidized in alk. soln. in which $Cl_2$ was liberated electrolytically* gave a product contg Ni 66–73%, O 27–34%, active O by action of $H_2O$ at 50° 5–16%, active O by action of $H_2SO_4$ 7–16%. (3) Ni salts, including chlorides, oxidized by means of $K_2S_2O_8$ in the presence of alkali gave products contg $H_2O$ 9–10%, Ni 64%, O 26%, active O in $H_2O$ at 50° 9%, active O by action of $H_2SO_4$ 9% and Ni 66–73%, O 27–34%, active O by action of $H_2O$ at 50° 7–16%, active O by action of $H_2SO_4$ 7–16%. (4) NiO oxidized by gentle heating with dry $KNO_3$ gave a product contg Ni 67–72%, O 28–34%, active O by action of $H_2O$ at 50° 8–15%, active O by action of $H_2SO_4$ 7–15%. Heating NiO with $KClO_3$ gave a product contg Ni 66–70%, O 30–34%, active O in $H_2O$ at 50° 11–16%, active O in $H_2SO_4$ 10–17%. (5) Heating $Ni(NO_3)_2$ or $NiCO_3$ gave products contg Ni 71%, O 29%, active O by action of $H_2SO_4$ 9.5–10%. From these expts the following oxides were established $NiO$, $Ni_2O_3$, $Ni_3O_4$ and $NiO_2$. In addn some evidence was found for the existence of the following composite and less stable oxides $Ni_4O_5 = 4NiO_2 \cdot NiO$, $Ni_6O_{11} = 5NiO_2 \cdot NiO$, $Ni_3O_5 = 2NiO_2 \cdot NiO$, $Ni_8O_{17} = 8NiO_2 \cdot NiO$, $Ni_7O_{12} = 5NiO_2 \cdot 2NiO$, $Ni_8O_{15} = 7NiO_2 \cdot NiO$, $Ni_4O_8 = 3NiO_2 \cdot 2NiO$, $Ni_{11}O_{17} = 6NiO_2 \cdot 5NiO$, $Ni_9O_{16} = 7NiO_2 \cdot 2NiO$, $Ni_{17}O_{23} = 6NiO_2 \cdot NiO$, $Ni_2O_5 = NiO_2 \cdot Ni_2O_3$, $Ni_8O_{11} = 2NiO_2 \cdot 3Ni_2O_3$, $Ni_2O_7 = 2NiO_2 \cdot NiO$, $Ni_4O_7 = NiO_2 \cdot NiO$, $Ni_2O_3 \cdot H_2O = NiO_2 \cdot NiO \cdot H_2O$ and $NiO \cdot Ni_2O_4 = NiO_2 \cdot 2NiO$. Structural formulas for these compds are suggested. S L MADORSKY

**The preparation and structure of lower oxides of tungsten.** J A M VAN LIEMPT. *Rec trav chim* 50, 343–6(1931).—An investigation to det which oxides between W and $WO_3$ are stable was made by passing mixts of CO and $CO_2$ and of H and $H_2O$ over $WO_3$ at fixed temps. Analysis of the products formed showed that of the lower oxides only $WO_2$ (brown) and $W_4O_{11}$ (blue violet) are stable. The latter is somewhat volatile. The heats of combustion of each of these oxides ($WO_2$ = 64,520 g cal per g mol, $W_4O_{11}$ = 61,380) show that the structure is in fair agreement with the structural formulas proposed by Spitzin (*C A* 21, 544). M MCMAHON

**The structure of ferric thiocyanate and the thiocyanate test for iron.** H I SCHLESINGER AND H B VAN VALKENBURGH *J Am Chem Soc* 53, 1212–6(1931).—In aq. solns of $Fe(CNS)_3$ the color migrates to the anode during electrolysis. The absorption spectra of aq. solns of $Fe(CNS)_3$, of aq. solns contg $[Fe(CNS)_4]^{---}$ and of ether

solns of anhyd $Fe(CNS)_3$ are identical In ether and benzene ferric thiocyanate has twice the mol wt of the simple salt On the basis of these results the authors conclude that the red color in the thiocyanate test for Fe is due to $[Fe(CNS)_4]^{---}$.

Ammoniates of salts of the oxygen acids. M A RAKUZIN *Bull. soc. chim* [4], 49, 363–6(1931).—By the action of dry $NH_3$ gas on dehydrated sulfates R has prepd a no of ammoniates $MnSO_4 4NH_3$ (brown), $ZnSO_4 5NH_3$ (white), $CuSO_4 5NH_3$ (blue) $NiSO_4 6NH_3$ $CoSO_4 6NH_3$ (white with a reddish tint), $CdSO_4 6NH_3$ (white), $Ag_2SO_4 2NH_3$ *Except with* $MnSO_4$ *and* $Ag_2SO_4$ *the reactions are energetic.* $MgSO_4$ does not react With the exception of $CuSO_4 5NH_3$, which forms $CuSO_4.4NH_3.H_2O$, $H_2O$ decomposes all of the ammoniates with the formation of the oxide or hydroxide of the metal These ammoniates lose $NH_3$ when exposed to the air and more rapidly on heating $Ag_2SO_4 2NH_3$ on heating gives some $(NH_4)_2SO_4$ as well Although $AgNO_3$ forms $AgNO_3 6NH_3$ dry $NaNO_3$ and $Ba(NO_3)_2$ do not react with $NH_3$ $Cu_3(PO_4)_2$ and $K_2Cr_2O_7$ likewise do not react.
W C EBERTLIUS

High-carbon carbides of the iron group. F. FISCHER AND H BAHR *Ges Abhandl Kenntnis Kohle* 8, 255–69(1928).—When CO is passed at 270° over finely divided Co or CoO there is obtained a mass which appears to contain the carbide $Co_3C_2$ This substance is decompd by H at 270°, half the C (presumably derived from the carbide $Co_3C$) being evolved as $CH_4$ Similar addn of C to an equimol mixt of CuO and $Fe_2O_3$ affords the carbide $Fe_3C_4$ in addn to Fe carbonyl H liberates $CH_4$ in proportion corresponding with the formula $Fe_2C$, formed apparently by separation of C from the unstable carbide $Fe_3C_4$ Small quantities of hydrocarbons are also formed The Fe, but not the Co, carbide affords, when treated with acids, a mixt of hydrocarbons
B C A

The sulfides of carbon. KENNETH A KOBE *J Chem Education* 8, 867–74, (1931), cf *C A* 25, 889.—K has reviewed the literature concerning these compds and called attention to the similarity of the sulfides and the oxides of C Unlike O, S exists on the surface of charcoal both in an adsorbed state and chemically combined The phys properties of COS are midway between those of $CO_2$ and $CS_2$ Thirty-two references are given
E R SCHIERZ

Phosphonates. II. Action of phosphine upon aluminum and beryllium halides. ROBERT HÖLTJE AND FRITZ MEYER *Z anorg allgem Chem* 197, 93–102(1931); cf *C A* 24, 3721.—Mol compds of $PH_3$ are quite similar to the corresponding thiohydrates, and salts which add on $H_2S$ are also capable of taking up $PH_3$. By heating $AlCl_3$ and $AlBr_3$ with $PH_3$ at 70°, $AlCl_3.PH_3$, m 81–3°, and $AlBr_3.PH_3$, m 114–8°, were formed. In the case of $AlI_3$, it was necessary to raise the temp to 120–30° to obtain $AlI_3.PH_3$, m. 148–50° *In no case was the amt. of* $PH_3$ *taken up increased* by increasing the pressure Similar compds. with $PH_3$ were not obtained in the case of Be halides The phosphonates mentioned above are white cryst. compds which readily sublime and are decompd by water to give $PH_3$ and the Al salt These compds are readily fused, and in fusing they deposit a small quantity of a yellowish red solid assumed to be $P_{11}H_4$ Vapor pressure detns showed that $PH_3$ was firmly held in these compds., this high degree of stability being attributed to the great deformability of $PH_3$
H STOERTZ

Calcium oxalate from calcium cyanamide GEORGE BARSKY AND G H BUCHANAN *J Am Chem Soc* 53, 1270–6(1931).—Autoclaving $Ca(CN)_2$ and $CaCN_2$ with water gives $CaCO_3$, $CaC_2O_4$ and $Ca(COOH)_2$ and if the $H_2O$ is replaced by $Ca(COOH)_2$ solns. increased yields of oxalate are obtained Although the yield of oxalate from cyanide is low, the process has com value because small amts of cyanide can be added to cyanamide which is being autoclaved for $NH_3$, as all the N of both compds is liberated as $NH_3$ and a part of the C of both compds is converted to valuable by products Simple treatment of the ordinarily discarded autoclave solids yields $CaC_2O_4$ The process is protected by U S P. 1,717,353, (Am Cyanamide Co; *C A* 23, 3933) The reaction taking place is represented $2CaCN_2 + Ca(CN)_2 + 10H_2O = 6NH_3 + 2CaC_2O_4 + Ca(OH)_2$, the mechanism being a sort of mixed polymerization, $H_2NCN$ and HCN reacting with each other, the reaction velocity being dependent upon the H ion concn. of the soln., just as cyanamide reacts with itself to give dicyanamide (cf *C A* 24, 1085) and HCN reacts to give azulmic compds This reaction is thus represented $H_2NCN + HCN \longrightarrow H_2NCNH\,CN$ (hypothetical), $H_2NCNH\,CN + 4H_2O \longrightarrow (NH_4)_2C_2O_4 + NH_3$
ALBERT THOMAS FELLOWS

Copper quadrantoxide. M J. MURRAY *J Phys Chem* 35, 1011–24(1931).—By a study of the rate of reduction of CuO in $H_2$, it is shown that Cu quadrantoxide

does not exist Conclusion The olive-green ppt reported in the literature is probably a mixt of metallic Cu and hydrous or anhyd $Cu_2O$ B E TIFFANY

**Anhydrous copper halide carbonyls.** OTTO H WAGNER *Z anorg allgem Chem* 196, 364–73(1931).—The reaction between solid cuprous halides and CO was studied at elevated pressures and the existence of $Cu_2Cl_2$ 2CO and $Cu_2Br_2$ 2CO was established In the case of the iodide, the reaction was so sluggish that less than 1 mol of CO was taken up per atom of Cu The absorption of CO occurred even in the complete absence of water, although water does exert a catalytic effect upon the reaction velocity H STOERTZ

**Iron titanates.** B PESCE *Gazz chim ital* 61, 107–11(1931).—A survey of the literature shows that $FeTiO_3$ (ilmenite) is the only Fe titanate the prepn, compn. and properties of which are definitely known A systematic study was therefore begun of Fe titanates, and as a beginning $FeTiO_3$ was prepd in a new way A mixt of $FeC_2O_4$ (free of $Fe_2O_3$), $TiO_2$ (calcd quantity) and NaCl (3 times as much) was heated 1.5 hr at 900° in a current of $CO_2$ and cooled in the absence of air, the product was digested in water, treated with very dil HCl and washed until there was no longer a reaction for Cl A black powder of the compn $FeTiO_3$ was obtained The method of Rossi for the detn of Ti (pptn by boiling of $H_2TiO_3$ in a current of $SO_2$) was used The $FeTiO_3$ was dissolved by treatment with $KHSO_4$ Under the same conditions but with proportions of $FeC_2O_4$ and $TiO_2$ corresponding to 2FeO $TiO_2$, a black powder was obtained, which analysis showed to be *ferrous orthotitanate*, $Fe_2TiO_4$ Likewise $TiO_2$ (2 mols), $Fe_2O_3$ (3 mols) and NaCl heated at 1000° and washed free of NaCl yielded *ferric orthotitanate*, $Fe_4(TiO_4)_3$, dark maroon red, birefringent, yellowish by transmitted light Attempts to prep $Fe_2(TiO_3)_3$ under the same conditions gave in all cases mixts of $Fe_4(TiO_4)_3$ and $TiO_2$ $Fe_2TiO_4$ was described by Doss (*Z Krystallographie* 1892, 566) and its structure confirmed by Pauling (*C A* 24, 2693) By using for its prepn the method with $Fe_4(TiO_4)_3$ (*loc cit*), the results obtained were neg The results in general show that of all the titanates, $Fe_4(TiO_4)_3$ is the most easily formed The compd obtained by Hautefeille (*Ann chim phys* 4, 172(1864)) was probably $Fe_4(TiO_4)_3$ By following the procedure used by Konig and von der Pfordten (*Ber* 22, 1405(1889)) only complex mixts contg chiefly $Fe_2O_3$ were obtained X ray examn (powder method) of $Fe_4(TiO_4)_3$, $FeTiO_3$ and $Fe_2TiO_4$ showed that all 3 are definite compds rather than mixts The rontgenographs are shown in simplified form C C DAVIS

**Ferrous ferrite. I. Ferrous ferrite from ortho- and meta-ferric hydroxide.** ALFONS KRAUSE AND J TULECKI *Z anorg allgem Chem* 195, 228–38(1931).—Ferrous ferrite was made at 18° from metaferric hydroxide, dispersed in 0.01 *N* HCl, and $FeCl_2$ soln. by the addn of $NH_4OH$ (I) or from $FeCl_3$ and $FeCl_2$ solns with excess $NH_4OH$ (II). Two types of compds result, (I) being blue black in color, stable in the air and approaching $Fe(FeO_2)_2$ aq in compn (FeO $Fe_2O_3$ $H_2O$, 1.1:13.0:5.4), while (II) varied considerably in compn in consequence of oxidation, contained more water, and was brownish black All ferrous ferrites prepd were magnetic L P. HALL

**Potassium chlororhenate.** E ENK *Ber* 64B, 791–7(1931).—$K_2ReCl_6$ is prepd according to the reaction $KReO_4 + 3KI + 8HCl = K_2ReCl_6 + 2KCl + 3I + 4H_2O$ This salt is analogous to others of the type $M^I_2M^{IV}X_6$ It cryst d in yellow-green octahedra with the following physical consts $d_{18}$ 3.34, sp cond at 25°, *N*/32 soln., $3.47 \times 10^{-3}$ $\Omega^{-1}$, equiv cond 119.7 $\Omega^{-1}$ It is but slightly sol in water It dissociates into $2K^+$ and $ReCl_6^{--}$ MARY F LEAR

**The reduction of potassium perrhenate.** HENRY V A BRISCOE, PERCY L ROBINSON AND ERIC M STODDART *J Chem Soc* 1931, 666–9.—The reduction of aq $KReO_4$ solns by Zn, hydrazine hydrate and other reducing agents is reinvestigated, previous workers gave conflicting results It was shown that the first product of reduction of $KReO_4$ with Zn or hydrazine hydrate is a yellow colloidal soln, most probably of hydrated $ReO_3$ From these solns the black $ReO_2$ $2H_2O$ is then pptd This material can be quantitatively pptd and, also, can be dehydrated without decompn The charge on the colloid is shown to be pos J BALOZIAN

**Formation of sodium hydrosulfide from sodium sulfide.** M O KHARMANDARYAN AND K I BRODOVICH *Zhur Prikladnoĭ Khim* 3, 1023–30(1930).—For $Na_2S$ (in water soln) + $H_2S \leftrightarrows$ 2NaHS the const of the reaction is 0.0126 The max yield of NaHS is 89.7% Adsorption of $H_2S$ by cryst $Na_2S$ yields pure NaHS in soln, but its crystn. is difficult Adsorption of $H_2S$ by dried $Na_2S$ yields dry NaHS The reaction is speeded up if $Na_2S$ is wetted with NaHS soln V. KALICHEVSKY

**Reactions with sodium nitroprusside.** TITO PAVOLINI. *Boll. chim.-farm* 69,

713-6, 719-22(1930).—P reviews the reactions given by Na nitroprusside (I) + alkali with the following groups of compds: alkali sulfides, sulfites, derivs of $NH_2NH_2$ and $H_2NOH$, aldehydes and ketones, hydantoin and derivs., pyrrole and indole and some cyclic dinitro derivs. He reports original work with compds of these and some other groups. The blue color given by alkali hydrosulfides is caused by colloidal Berlin blue, which is formed by the interaction of I with $H_2S$. $Na_2Se$ gives a deep blue green color with I, the soln. decolorizes rapidly and a red ppt. of amorphous Se appears. With $Na_2Te$ black, amorphous Te is pptd. The Bödecke reaction is not only very sensitive but is specific for sulfites. The aliphatic α diketones give pos. reactions, the liquids rapidly turn yellow since in the presence of alkali the α diketones are converted into *p*-quinones. With β- and γ-diketones reddish violet colors which then turn to bright red were observed. Paraldehyde, metaldehyde, chloral, glucose and fructose do not react with I. Carvone, pulegone, ionone and citral gave red colors of various hues, while the results with camphor, fenchone, menthone and citronellal were neg. This difference in behavior is explained by the assumption that double bonds in the close vicinity of the CO group favor the occurrence of the reaction. $Me_2CO$ in the presence of I and piperazine gives a rose violet color, with piperidine and I there appears an intense red color, which becomes purple with AcOH. This reaction allows the differentiation between $Me_2CO$ and AcH, because the latter gives an intense dark blue color with I and piperidine. Expts. with compds. with a structure similar to that of hydantoin showed that pos. reactions are given by uracil, 4 methyluracil, 5-methyluracil and allantoin. Barbituric acid and veronal gave neg. results. Neg. results were obtained with α methylindole, β methylindole, oxindole, dioxindole, carbazole, acridine, diphenylamine, pyridine, quinoline, benzimidazole, furan and thiophene. On the basis of these results P. concludes that the reaction is characteristic for the grouping —C(=)C NH.CH CH

Some cyclic dinitro derivs. with the $NO_2$ groups preferably in the *m* position, *e. g.*, *m* $(O_2N)_2C_6H_4$, react with I and alkali. *o*-, *m*- and *p*-$O_2NC_6H_4OH$, $(O_2N)_3C_6H_2OH$ and *o*-$O_2NC_6H_4CHO$ do not react. $(O_2N)_2C_6H_2Me$ in alc. soln. gave a rose-violet color on addn. of KOH alone. Thiourea, diphenylthiourea, *o*-phenylenethiourea and to a less degree also thiosinamine in alc. soln. give red violet colors with I and alkali. This reaction is due to the decompn. of the compds. by the addn. of alkali with the subsequent formation of alkali sulfide. The reaction is neg. with KCNS, $NH_4CNS$ and $Et_2S$. Some polyhydric phenols give color reactions with I and alkali. Intense green colors were obtained with pyrocatechol and resorcinol, while green colors of various hues, generally with a tendency toward brown, were observed with hydroquinone, pyrogallol, phloroglucinol and hydroxyhydroquinone; the color changed to a bluish green on addn. of AcOH. The reactivity of I is especially due to the tendency of Fe to become bivalent, and of the coordinated nitroso group to convert itself into a nitrito group by the absorption of O. Thus in the case of the formation of Na nitritopentacyanide the reaction takes the course $Na_2Fe(CN)_5NO + 2NaOH = H_2O + Na_4Fe(CN)_5(NO_2)$. This latter compd., which crystallizes with 10 mols $H_2O$, has a certain analogy with the alkali ferrocyanides, even with respect to the color. The bright red compd. obtained in the Bodecke reaction was analyzed and its compn. was established as $Zn_2Fe(CN)_5NO \cdot SO_3$. The reaction mechanism between I and aldehydes and ketones was studied in particular. A pos. color reaction requires at least the presence of the structure > CH CO and occurs as a rule with compds. with short chains or with a double bond in the immediate vicinity of the CO group. From a mixt. of I + NaOH in concd. aq. soln. and $Me_2CO$ or AcH in abs. alc., P. succeeded in pptg. the colored compds. by addn. of an excess of alc. A pos. reaction was obtained with I and ether which had been exposed to light, this is due to the presence of a small quantity of $H_2C(OH)CHO$, which is formed by photooxidation of the ether. In general there must exist a certain relation between the compds. giving a pos. reaction with I and the facility with which they are transformed into the enol form, *e. g.*, AcH ⟶ $H_2C{=}CHOH$, $Me_2CO$ ⟶ $Me(HO)C{=}CH_2$. The same color reactions observed with I, alkali and AcH or $Me_2CO$, resp., were also obtained by treating Na nitritopentacyanide with AcH or $Me_2CO$, resp., in alc. soln., the reaction with $Me_2CO$ is rather slow. Both reactions are accelerated by the addn. of a small quantity of alkali. G. Schwoch

Nitrogenation of chromium. L. Duparc, P. Wenger and W. Schusselé. *Helv. Chim. Acta* 13, 917-29(1930).—By following the same procedure used in the prepn. of the nitrides of Mn (*C. A.* 23, 4604), the nitrides of Cr were investigated, 2 different samples of Cr were used. The absorption threshold, optimum temp. and max. amt. of N fixed varied with the Cr employed. The absorption thresholds for the 2 samples

examd. were 650° and 750° The amt of N fixed was independent of time but increased with pressure *$Li_3N$ used as a catalyst lowered the absorption threshold but appeared* to diminish the fixation of N, possibly on account of the formation of an easily dissociable Cr-Li-N complex C H PEET

The action of sulfuric acid on copper. F DE CHAVES. *Anales soc españ fis quím* 29, 177–81(1931).—Pure, concd $H_2SO_4$, free from As, was caused to react with electrolytic Cu at 55° for 6 hrs The residue contained anhyd $CuSO_4$, S and a deposit contg S 8 5 and Cu 69 7, the balance being O or O and H The deposit does not correspond to the Maumene oxysulfides or to any known Cu ores E M S

The decomposition of carbonyl chloride by heat. II. ALFRED STOCK, WERNER WUSTROW, HERMANN LUX AND HANS RAMSER *Z anorg allgem Chem* 195, 140–8 (1931), cf *C A* 19, 3228.—$COCl_2$ was heated at 400° in a glass tube with and without catalysts. Decompn to CO and $Cl_2$, detd from the resulting CO content, was 23 6% in 143 hrs in glass alone, 23 6% on $AlCl_3$ in 90 hrs., 23 3% on $SiO_2$ in 115 hrs No decompn to $CO_2$ and $CCl_4$ was observed in these cases. On activated charcoal the decompn CO was 22 7% in 88 hrs $CCl_4$ was formed by a secondary reaction of C and Cl An attempt to produce $COCl_2$ from $CO_2$ and $CCl_4$ at 400° to 500° was unsuccessful L P HALL

The thermal decomposition of silver subfluoride. R SCHOLDER AND K TRAULSEN *Z anorg allgem Chem* 197, 57–64(1931).—An improved method of manufacturing $Ag_2F$ is given as follows Add silver carbonate to a hot 40% HF soln until no more dissolves Add 2 g of $NH_4F$ and filter in the dark Electrolyze the filtrate in a 100 cc Pt dish at 50° with a silver anode, 1 4 v tension and 0 07–0 10 amps In 48 hours 20 g of pure cryst $Ag_2F$ is obtained Dry the crystals on filter paper $Ag_2F$ decomposes into Ag and AgF between 100° and 200°, no F is evolved, even at 700° A L HENNE

The reduction of nitric oxide. M L NICHOLS AND C. W MORSE *J Phys Chem* 35, 1239–52(1931).—NO dissolves in water to form nitrohydroxylamic acid ($H_2N_2O_3$) or a compd of the same constitution The authors studied the reduction of NO in soln by $SnCl_2$ and $TiCl_3$ $H_2N_2O_2 \longrightarrow H_2N_2O_2 \longrightarrow H_4N_2O_2 \longrightarrow NH_2OH \longrightarrow NH_3$ At temps above 0° the reduction by $SnCl_2$ depends on the rate of formation of $H_2N_2O_2$. At temps below 25° the rate of reduction by $TiCl_3$ depends on the rate of the reducing reaction, while at temps. above 25° the rate of formation of $H_2N_2O_2$ is the limiting factor $NH_2OH$ is apparently the end point of the $SnCl_2$ reaction Some observations were made on the catalytic effects of reagents or their oxidation products. B. E TIFFANY

A complex cyanide of quadrivalent vanadium. AL. YAKIMACH *Compt rend.* 191, 789–90(1930).—Addn of concd $V(OAc)_4$ to KCN of the same concn., with stirring, causes the soln to become green, and after several weeks, green tetrangular prisms are obtained The crystals decompose rapidly; so they are washed with EtOH. An excess of $V(OAc)_4$ destroys the compd., as does an excess of the KCN (albeit more slowly) The crystals decompose at 150° with blackening; they also decompose on soln in water Detns. of K, V and $(CN)_2$ gave the formula $K_3V(CN)_6$. I J PATTON

## 7—ANALYTICAL CHEMISTRY

W T HALL

Hydroxylamine as a precipitating agent. JOSÉ CASARES ROLDÁN *Anales soc españ fis quím* 29, 158–61(1931) cf *C A* 25, 261.—$NH_2OH$ reacts with $Cu_2Fe(CN)_6$ to discharge the color and give a beautiful fluorescence. A complex of $K_4Fe(CN)_6$ $NH_2OH$ and $NH_3$ with Cu salts is being investigated. E M SYMMES

Studies concerning the relations between reaction sensitivity and molecular size in the case of organic reagents. JOSEF V TANCHYNA *Mikrochemie* 3, 229–41(1931).—The tests for Cu and for molybdate with xanthogenates and the test for Ag with derivs of rhodanic acid were studied It was found that by increasing the mol wt., the solv of the resulting compds. was diminished so that the test became more sensitive In the tests with various rhodanates there was also a marked deepening of the color which also made the test much more sensitive The general conclusion is drawn that increase of mol wt. increases the sensitiveness and the introduction of the benzene ring increases the depth of color. W T. H

Systematical qualitative analysis by means of modern drop reactions. C. J. VAN NIEUWENBURG *Mikrochemie* 3, 199–219(1931).—A method is given of systematic

examn by means of drop tests suitable for the detection of about 0.5% of 25 cations and 18 anions not over 0.2 g of substance is used for the complete analysis. Attempts to avoid the use of $H_2S$ as reagent proved unsuccessful, in the sepn of the sulfides pptd in acid soln the use of KOH is preferred to alk polysulfide. Another new feature is the pptn of Al and Zn from alk solns by neutralizing to $p_H$ 8.5 with thymol blue as indicator. The advantages gained by the use of the centrifuge in place of ordinary filtration are also emphasized. The procedure in the hands of students has shown that the time required for a complete qual analysis is at least halved. The following tests are recommended. For Ag the fresh ppt of AgCl is treated with a 0.03% soln of rhodanine in acetone a red color results. Hg gives the same test but cannot be present when the chloride ppt has been properly treated; a little KCN prevents interference by Hg. For Hg the HgS ppt is dissolved on the spot plate in a drop of Br aq., the excess Br is removed by treatment with $H_2SO_4$ and phenol and a small drop of 1% diphenylcarbazide soln in alc. is added; a blue color results. For Pb the hydroxide or sulfate is treated on the spot plate with NaOH and $H_2O_2$; the supernatant liquid is removed from the dark brown $PbO_2$ by filter paper after which $NH_4Cl$, a drop of dil. AcOH and a drop of 0.5% tetramethyl diaminodiphenylmethane soln in alc. + 5% AcOH is added, a bright blue color results. For Bi the alk. stannite test is used in the presence of a little $Pb(OAc)_2$, which accelerates the reduction to metallic Bi. For Cu, to the soln on the spot plate a drop of 10% $ZnSO_4$ soln is added and a white ppt (bluish violet in the presence of Cu) of Zn Hg thiocyanate formed by adding a soln 30 g $HgCl_2$ and 33 g $NH_4CNS$ in 100 cc of water. Cd is detected by heating in a closed tube with soda, collecting the sublimate in a restriction of the tubing and converting it into CdS by passing S vapors over it. As is detected by the Gutzeit test and Sb by the deposit formed on Sn. Sn is proved present by reducing the HCl soln with Al and adding a little 0.25% soln of cacotheline, a brown violet color results. For Al, the tests with alizarine S and with the $NH_4$ salt of aurinetricarboxylic acid are both recommended. For Fe, the thiocyanate test is used. Cr is detected by converting the hydroxide to chromate with KOH and Br and adding a 1% soln. in alc. of diphenylcarbazide after removing excess Br with phenol. U is detected by the $K_4Fe(CN)_6$ test and Co by the reaction of Vogel or by the von Knorre test with α nitroso-β-naphthol. For Ni the familiar glyoxime test is used and for Mn the red color formed in AcOH soln with a 1% soln of benzidine acetate in dil. AcOH. The formation of $MnO_4^-$ by the persulfate reaction in the presence of $Ag^+$ is also recommended. Zn is detected by adding a trace of $Cu^{++}$ and testing with the $NH_4$ Hg thiocyanate soln used in the test for Cu. Mg is detected by boiling an alk. suspension of $Mg(OH)_2$ with a little titan yellow. For Ba, Ca, Sr, Na, K and $NH_4$ the usual tests are recommended. The tests for the anions involve well known procedures, but particular attention is paid to distinguishing between nitrite and nitrate, formate and acetate and the various forms in which S can exist. Blow pipe tests, flame tests and closed tube tests are used to an extent that will please all the older chemists. The procedure for making a complete qual. examn. is given in detail.

W. T. H

**New method to decompose rocks containing sulfur.** T. Gerecon. *Magyar Chem. Folyóirat* 37, 71–4(1931).—Mix 1 g of the sample with 6–8 g of a mixt. contg equal parts of $Na_2CO_3$, $KMnO_4$ and MgO, cover with 3 g of the above mixt. and heat the crucible gently on an asbestos plate for 15 min. Then apply the full flame of a Bunsen burner for 6–8 min. Cool, leach out the contents of the crucible with hot water and reduce any $MnO_4^-$ by adding a few drops alc. Filter, make acid with HCl and det $SO_4^{--}$ by pptn with $BaCl_2$ as usual. The method was tested with bauxite and with coal, the results agreed with those obtained by 7 other standard methods.

S. S. de Finály

**Use of grid electron valves for potentiometric titration.** G. Hatos. *Kisérlet Közlemények* 31, 299–307(1928).—The method of Treadwell was used with the help of a Philips A 409 valve with good results. *Ibid* 32, 654–62(1929).—Results obtained with the method of Treadwell and Kohlrausch were quite as exact as those obtained by the app. of Kohlrausch.

S. S. de Finály

**Telephone as zero instrument in the electrometric compensating method.** G. Hatos. *Kisérlet Kozlemenyek* 33, 17–9(1930).—A 4000 ohm telephone was used with 1000-mm app. Data agreed to 0.1 $p_H$ in case the inner resistance of the app. was not larger than 12 000 ohms.

S. S. de Finály

**Electroanalytical separations in ammoniacal fluoride solutions. I. Separation of copper from arsenic and antimony.** N. Howell Furman. *Ind. Eng. Chem., Anal. Ed.* 3, 217–8(1931).—Dissolve the mixt. of Cu, As and Sb in 3 to 5 cc of 48% HF and 25 cc of $HNO_3$ (1 vol. of acid of d. 1.42 and 4 vols. $H_2O$). Add 1 to 2 g of $K_2S_2O_8$. Boil the acid soln. 2 to 3 min. and neutralize immediately with $NH_3$. Sb and As are thus

brought to a quinquevalent state and will not be reduced during the electrolysis of the cold, strongly ammoniacal solution the correct amount of Cu is deposited A. L. H.

**Microchemical determination of nitrogen.** I. Fleischner. *Kisérlet Közlemények* 32, 113–22(1929).—Description of present methods and data. S. S. de F.

**Colorimetric determination of phosphorus.** László Urbanek. *Mezögazdasági Kutatások* 4, 39–59(1931).—Factors influencing the detn of P by the blue color of reduced phosphomolybdic acid are discussed The development of the color depends also on the $p_H$ of the soln and on the duration of the reaction Generally it takes 2 hrs to reach the final color Oxalic and citric acids retard the reaction materially, $HNO_3$, HCl, $H_2SO_4$ and $CCl_3CO_2H$ have little effect and AcOH has practically none Salts do *not affect the reaction except by their buffer effect The influence of reducing materials* is annulled in 2 hrs Z. I. Kertesz

**Determination of iodine in morganic material by microchemical methods.** Gulbrand Lunde *Mikrochemie* 7, 337–66(1929).—A description is given of the many papers published on this subject from 1876 to the present time W. T. H.

**Influence of nitrites, thiocyanates and some organic substances on the iodine-starch reaction.** Z. Ernst *Biochem. Z.* 232, 346–51(1931).—The acid nitrite-starch reaction for detecting I is much more sensitive with saliva than with pure aq. solns because of the presence of KSCN in the saliva The I starch reaction in an acid soln is inhibited by nitrite, and the inhibiting action is removed by thiocyanates Uric acid, peptone and to a lesser degree also leucine, trypsin and serum albumin act like the thiocyanates S. Morgulis

**A color test for cobalt.** M. Gutiérrez de Celio *Anales soc. espan. fis. quim.* 29, 262–3(1931).—The blue color resulting from the formation of a double thiosulfate of Co and Na can serve as a sensitive test for Co As little as $2.3 \times 10^{-4}$ mg. of Cr can be detected E. M. Symmes

**Reactions of the nitroso derivative of R salt with various inorganic salts.** A. Bernardi and M. A. Schwartz *Ann. chim. applicata* 21, 45–50(1931).—R salt has been proposed as a reagent in the identification of Co (van Klooster, *C. A.* 15, 1671) It has been found that the following compds. of Pb, Ag, Ba and Ca are also obtained from aq. solns of R salt on adding the nitrates of the first two, and Ba and Ca as chlorides: $(C_{10}H_4O_4NS_2Na_2)_2Pb$ $Pb(NO_3)_2$ (red), $(C_{10}H_4O_4NS_2Na_2)Ag$ $AgNO_3$·$5H_2O$ (lemon-yellow), $(C_{10}H_4O_4NS_2Na_2)_2Ba$ $BaCl_2·6H_2O$ (orange), and $(C_{10}H_4O_4NS_2Na_2)_2Ca$ $CaCl_2$ (green) The Ba salt is insol. in HCl solns as well as EtOH solns., while the Ca salt is sol. in HCl, but insol. in alk. ($NH_4OH$) EtOH soln. In this way these 2 elements can be sepd A. W. Contieri

**Determination of manganese in ferrosilicons by the volumetric method.** J. H. D. Bradshaw. *Foundry Trade J.* 44, 311(1931).—Fe-Si alloys with not over 18% of Si can be attacked satisfactorily by a mixt. of 30 cc. HCl, 15 cc. $HNO_3$ and 5 cc. of $H_2SO_4$. After fuming, to remove HCl and dehydrate $SiO_2$, the silica can be detd and the persulfate method for Mn applied to the filtrate from the $SiO_2$ With higher Si contents, the original material must be fused with alkali carbonate at the start W. T. H.

**Analyzing chromium solutions.** I. L. Newell and W. H. Keefe. *Metal Ind.* (N. Y.) 29, 206–7(1931).—A complete scheme of analysis is given for analyzing plating solns. for $CrO_4^{--}$, $Cr^{+++}$, $SO_4^{--}$, $Cu^{++}$, $Fe^{+++}$, $Ni^{++}$ and $Zn^{++}$. The $CrO_4^{--}$ is detd by taking 1 ml. of the soln., adding 400 ml. of water, 5 ml. of 85% $H_3PO_4$ and 0.6–0.8 ml. of a soln. obtained by dissolving 0.1 g. of diphenylbenzidine in 10 ml. of concd. $H_2SO_4$ and 90 ml. of AcOH After a few min. add 3 g. of NaOAc and titrate with 0.2 *N* soln. of Mohr's salt to the disappearance of the blue color To det. $Cr^{+++}$, dil. 25 ml. of the soln. to 200 ml. and ppt. with $NH_4OH$ Dissolve the $Cr(OH)_3$ ppt. in $H_2SO_4$ and oxidize to $CrO_4^{--}$ by adding $Na_2O_2$ After boiling to decompose excess $Na_2O_2$, treat as described above for detg. $CrO_4^{--}$ To det. $SO_4^{--}$, dil. 10 ml. of soln. with 20 ml. of water, add 7 ml. of HCl, 25 ml. of AcOH and 15 ml. of alc. Boil 30 min. and add 10 ml. of $BaCl_2$ reagent To det. Cu, take 10 ml. of soln., dil. to 200 ml., add an excess of $Pb(NO_3)_2$ soln. and filter off the $PbCrO_4$ To the filtrate add an excess of $Na_2O_2$ and filter off insol. hydroxides of Cu, Fe, Ni, etc., using the filtrate for the Zn detn Dissolve the ppt. in HCl and $H_2SO_4$, sat. with $H_2S$ and filter off the CuS ppt. Dissolve this in $HNO_3$ and det. Cu electrolytically Det. Ni in the filtrate from CuS by the dimethylglyoxime method after first pptg. Fe as $Fe(OH)_3$ and weighing as $Fe_2O_3$ In this final filtrate, combined with the filtrate from the $Na_2O_2$ treatment in the detn of Cu, det. Zn as phosphate W. T. H.

**The determination of germanium.** W. Geilmann and K. Brünger. *Z. anorg. allgem. Chem.* 196, 312–20(1931).—The smallest amt. of Ge which could still be detected spectroscopically was 0.25γ in 0.025 cc. of soln. The *C electrodes* (boiled in HCl) used

*in obtaining spark spectra* at 12 000 v a c were superior to Au and Pt electrodes, which decreased the sensitivity 75 times A table shows the *changes in the Ge spectrum with concn* (1.0–0.001 g of Ge in 100 cc) Ge could be concd by pptg it in 3–4 *N* HCl soln with $H_2S$ and redissolving the ppt in *N* KOH When As, Se and Sb were present, *Ge was sepd* by distn from 3–4 *N* HCl in a current of Cl, into 3–4 *N* HCl at 0°. Ge in the latter soln was concd by pptn with $H_2S$ in the presence of $Na_2SO_3$ The colloidal S formed brought about better pptn of GeS Suitable methods for the detn of Ge in oxides silicates cassiterite sulfide ores and metals are outlined FRANK URBAN

**Tests for sodium with the Streng-Kolthoff reagent.** R MONTEQUI AND R. DE SINADA *Anales soc españ fis quim* 29, 255–61(1931) —The Streng Kolthoff reagent is (1) 1.0 $(C_2H_3O)_3$, 10 30% AcOH 6, $H_2O$ to make 50 cc. and (2) $Zn(C_2H_3O_2)_2$ 30, 30% AcOH 3 $H_2O$ to make 50 cc 1 and 2 being mixed hot and filtered after standing 24 hrs To det Na in a sol salt dissolve 0.15 g of sample in 0.5 cc of $H_2O$, add 1.5–2.0 cc of $Zn(ClO_4)_2$ soln, stir and filter This serves to remove $K^+$, which is likely to ppt with Na when much K is present Add 2 cc of the Streng Kolthoff reagent to 0.5 cc of the filtrate Turbidity of pptn begins in a few min Microscopic examn shows typical crystal formation Detns are accurate on 0.15 g KCl in 0.2 cc of 0.01 *N* NaCl F M SYMMES

**Use of phenolic acids in the detection, separation and estimation of metals. V. Separation of copper from cadmium, and their subsequent estimation.** PARITRA NATH DAS GUPTA AND HARIDAS SAHA *J Indian Chem Soc* 8, 19–21(1931) — By adding a 1% soln of gallic acid to the boiling soln of Cu and Cd in the presence of alk acetate, a voluminous brown ppt is formed which can be filtered off and ignited to CuO The ppt is bulky and can serve for the detn of small quantities of Cu The Cd is not pptd by gallic acid under these conditions W T. H

**Delicate microchemical reaction of copper salts and certain of the other heavy metals.** I M KORENMAN *Pharm Zentralhalle* 72, 225–6(1931) —The delicate test for picric acid by pptn with Cu salts in the presence of $NH_3$ as suggested by Rymsza is reversed in testing for Cu Ag Co Ni Cd Hg, Au and Pb The reagent consists of 2 parts of a satd aq soln of $C_6H_2(NO_2)_3OH$ to 1 part 10% $NH_3$ This reagent produces in highly dild solns of Cu salt a bright greenish yellow ppt of characteristic type The test is delicate to 0.05$\mu$ g Cu (1$\mu$ g = 0.000001 g = 1 microgram) With Ag, Co, Ni, Cd, Hg, Au the test is sensitive to 20$\mu$ g, 0.3$\mu$ g, 0.1$\mu$ g, 1$\mu$ g, 0.15$\mu$ g and 0.2$\mu$ g, resp W O F

**Quinoline as a microchemical reagent for certain heavy metals.** I M KORENMAN. *Mikrochemie* 3, 223–8(1931) —See *C A* 25, 557. W T. H

**Rapid industrial methods for the analysis of metallurgical products.** ROGER ARZENS *Bull assoc tech fonderie* 5, 31–8(1931) —A general review is given of rapid methods for plant control in the analysis of steel for Si Mn, P, S and C. The advantages of using factor weights and reagents in the form of compressed lozenges are emphasized W T. H

**Determination of titanium in alloy steels.** J AREND AND H SCHNELLENBACH. *Arch Eisenhüttenw* 4, 265–7(1930) —The sepn of Ti from Fe'', Cr, Mn, Co and Ni is accomplished by pptn with $BaCO_3$, filtering and washing the ppt. with hot AcOH The remaining alloy constituents are removed by fusion with $NaKCO_3$ and $NaNO_3$ The residue, contg Ti as the metatitanate, is dissolved in concd HCl, the soln made ammoniacal and traces of Fe and Cu removed by pptn with $H_2S$ in the presence of tartaric acid Finally, the Ti is pptd with o-hydroxyquinoline, ignited and weighed as $TiO_2$ Colorimetric estn may be substituted for the gravimetric after sepn of the alloy constituents If only Cr and Ni are present the colorimetric method eliminates the sepn with $BaCO_3$ as the former may be removed by decantation as chromate and Ni up to 5% and Cu up to 0.5% have no effect on the detn H F JOHNSTONE

**Determination of chromium in special steels.** P KLINGER *Arch Eisenhüttenw* 4, 7–15(1930), *Stahl u Eisen* 50, 1166–7(1930) —The Cr contents of 12 special steels with 1.5–12% Cr have been detd by 9 different methods. Methods involving alkali fusions give the best results when the Cr is detd iodometrically, and of those based on soln of the steel in acids followed by oxidation to chromic acid the persulfate-$AgNO_3$ procedure is the most satisfactory The effect of other metals on the results given by the various procedures is briefly discussed B C. A

**Data on the determination of boric acid.** G VASTAGH *Magyar Chem Folyoirat* 37, 55–71(1931) —The titration of $H_3BO_3$ in neutral solns contg 1% of mannitol was studied Acids (except $H_3PO_4$ and $SiO_2$) do not interfere if neutralized previously with KOH in the presence of methyl red It was found that 2 distns with $H_2SO_4$ and MeOH served to remove $H_3BO_3$ from cations, 0.06 mg of $H_3BO_3$ could be detected in 2 g of

$Al_2(SO_4)_3$ crystals The macro and microchemical detn of $H_3BO_3$ is described in detail S S DE TINAIY

A rapid and sensitive method for the volumetric estimation of phosphoric acid. R BIAZZO *Ann chim applicata* 21, 75–81(1931) —Phosphate is detd volumetrically by adding an excess of a standardized soln of $(NH_4)_2MoO_4$ and titrating the excess with $Pb(OAc)_2$ soln These solns are standardized by means of solns of known phosphate concn Tannic acid is used as an outside indicator for the titration Amounts of phosphate from 0 1 to 1 0 cg may be detd within less than 2% by the above method A W CONTIERI

The measurement of cuprous oxide with permanganate solution G BRUHNS *Centr Zuckerind* 39, 13(1931) —The possible advantages of Müller's soln in the detn of invert sugar are discussed J F LEETE

Manometric determination of hydrogen peroxide. AKIJI FUJITA AND TAKESHI KODAMA *Biochem Z* 232, 15–9(1931) —$H_2O_2$ is detd manometrically either by decompg it in a strongly acid medium with $KMnO_4$ or with catalase By using vessels of 15–20 cc capacity the O evolution $X_0$ is measured by Warburg's method from the rise in level of the manometer fluid By both methods an accuracy of about 3% is attained S MORGULIS

The determination of moisture in liquid sulfur dioxide. A L FLENNER AND W R CAVERLY *Refrigerating Eng* 21, 344–5(1931) —The moisture in $SO_2$ is detd by passing the $SO_2$ through $P_2O_5$ contained in a chain of Fleming absorption jars The method may be used for the detn of very small amts of $SO_2$ of the order 0 002% The exptl error is not greater than 0 0002% absolute A H JOHNSON

Use of buffered ammonia in the iodometric thiocyanate determination. H ARMIN PAGEL AND HERMAN J KOCH *J Am Chem Soc* 53, 1774–8(1931) —To the neutral soln of $CNS^-$ in a vol of 150–300 cc, add $NH_4OH$ until faintly alk to litmus if heavy metals forming insol hydroxides with $NH_4OH$ are present As buffer soln add 1 g of $NH_4$ sulfate, chloride or nitrate dissolved in 20 cc of *N* $NH_4OH$ and treat with standard I soln, using a min excess of 5 cc After 4–5 min add 5 cc of 6 *N* HCl and titrate with standard $Na_2S_2O_3$ Before acidification the products of the reaction between $CNS^-$ and $I_2$ are $SO_4^{--}$, $I^-$, $H_2O$ and ICN but upon acidifying the ICN, reacts with $I^-$ liberating free $I_2$ so that the complete reaction can be expressed by the equation $CNS^- + 3I_2 + 4H_2O \longrightarrow SO_4^{--} + CN^- + 8H^+ + 6I^-$ Certain modifications are necessary if $KIO_3$ is used as a source of $I_2$ W. T. H.

Determination of mercurous ions with potassium chloride solution. L DE ZOSBORY *Acta Sci Univ Francisco Iosephinae, Acta Chem., Mineral., Physica* 1, 1–4(1928) —A 0 4% soln of Na alizarinsulfonate is added to a 0 1 *N* soln of KCl and is used in titrating the $Hg^+$ soln to be tested The results agree with gravimetric data S S DE F.

Reactions of harmine. O FERNÁNDEZ AND F E RAURICH *Anales soc espaÑ fis quim* 29, 74–6(1931) —Harmine is oxidized to *m* nitroanisic acid, which is reduced to amine, then converted into a diazo compd which gives a purple color on treatment with β naphthol Another test is the development of a carmine color when hydroharmine, obtained by hydrogenation of harmine with Na and EtOH, is acted upon by *p*-nitrodiazobenzene chloride E M SYMMES

*Quantitative estimation of mixtures of isomeric unsaturated compounds. III.* Review of the iodometric methods and a new bromometric method. REGINALD P LINSTEAD AND JASON T WM MANN *J Chem Soc* 1931, 723–5 In a mixt of 3 C tautomerides, the iodometric method is likely to require modification because the introduction of negative groups into the β-γ acids greatly diminishes the activity toward I For the analysis of a mixt of itaconic and mesaconic acids, consistent results can be obtained by the following empirical method provided the temp is kept const and the titrating reagent is standardized in the same way against known mixts of these acids. As reagent, 0 05 *N* Br dissolved in 40% KBr soln is recommended First det. the Br equiv by adding 25 cc. of the reagent to 10 cc of water in a glass-stoppered bottle and after 10 min in the dark add 10 cc. of 10% KI soln and titrate with 0 05 *N* $Na_2S_2O_3$ In titrating known and unknown mixts of itaconic and mesaconic acids, use 10 cc. of 0 067 *N* soln of the acids in place of the $H_2O$ and add an equiv quantity of Br. A temp of 16 8° was used in testing the procedure W. T. H.

Detection of very small quantities of acetylene. E PIETSCH AND A. KOTOWSKI *Z. angew. Chem* 44, 309–12(1931) —By means of a soln prepd by dissolving 1 g. of blue vitriol in 8 cc. of 10% $NH_3$ soln, adding slowly 3 g of $NH_2OH$ HCl and dilg to 50 cc, it is possible to detect as little as $3\,7 \times 10^{-4}$% by vol, or $1\,7 \times 10^{-5}$ g of $C_2H_2$ in 4 l of gas which is allowed to stream through the reagent under normal pressure at the rate of 1.7–1 9 l per hr. The sensitiveness of the test is increased by adding 3–5 sq mm of

filter paper with fibrous edges, the colloidal ppt. of $Cu_2C_2H_2O$ being adsorbed by the fibers of paper and made more visible. W. T. H.

New gravimetric determination of benzidine and its homologs. Some new complex salts of these bases. W. Herz. *Chem. Fabrik Marquardt & Salzer*, No. 15, 1–9 (1931).—A complex salt is produced by adding 7% $HgCl_2$, $HgBr_2$ or $HgI_2$ soln. and filtering the ppt. on a sintered glass filter. Results with benzidine and o-tolidine were satisfactory. S. S. DE FINALI

The estimation of pyruvic acid. B. H. Krishna. *Proc. Indian Acad. Sci.*, *Chem.* 1935, 164–4, method suitable for estn. of small quantities of pyruvic acid (2–3 mg.) in biol. fluids consists in reducing the acid by Zn and $H_2S$ in the presence of a trace of $CuSO_4$, and oxidizing the resulting lactic acid to AcH which is estd. by Clauser's method of titration against I. By means of the condensing unit used the aldehyde can be transferred into the receiver by aeration with $CO_2$ without any water's passing into the receiver. J. J. C.

---

Titration tablets. Fay H. Gifford (to The Electric Smelting and Aluminium Co.). Can. 310,651, Apr. 21, 1931. The oxidation value of a hypochlorite soln. is estd. by rendering the soln. acid in the presence of available combined I and measuring the quantity of free I released by the addn. to the soln. of tablets, each containing a standard quantity of a thiosulfate of an alkali metal with $NaHCO_3$. The tablets are added one by one at intervals long enough to enable disintegration of the tablets and agitation of the soln. by the escape of gas from the soda, whereby the strength of the hypochlorite soln. will be indicated by the number of tablets required to eliminate the color caused by the free I.

---

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

Sulfur crystals from Ajka and Pilis-Szent-Ivan. Sándor Koch. *Ann. Hist. Nat. Musei Nationalis Hungarici* 25, 451–3 (Hung.), 454–5 (Ger.) (1928). *Mineralog. Abstracts* 4, 330.—Small S crystals, showing 15 forms, were produced by burning heaps of lignite. J. F. SCHAIRER

A notable example of Spanish pyrite. F. Díaz Tosaus. *Mem. soc. españ. hist. nat.* 15, 13–5 (1929). *Mineralog. Abstracts* 4, 330.—Acicular pyrite crystals occur at Mercadal. J. F. SCHAIRER

Notes on some Spanish arsenopyrite crystals. Julio Garrido and Carlos Valenzuela. *Mem. soc. españ. hist. nat.* 15, 123–34 (1929). *Mineralog. Abstracts* 4, 331.—Crystallographic. J. F. SCHAIRER

Some bismuth minerals of Vaskő (Hungary). Sándor Koch. *Matematik. es Termeszettudomanyi Ertesito* 47, 219–25 (German abstract 257) (1931).—Analyses of bismuthinite gave: S 18.45, 18.62, Cu 0.57, 0.93, Pb 0.69, 3.29, Fe 0.42, 0.11, Bi 80.04, 76.74, $SiO_2$ —, 0.45; sums 100.16, 100.12%. Cosalite showed: Ag 0.32, Cu 3.41, Pb 37.68, Fe 0.68, Bi 41.75, S 15.92, sum 99.76%; formula $Pb_2Bi_2S_5$ or $2PbS.Bi_2S_3$ (Fe content deducted as chalcopyrite). Analyses of rezbanyite gave: Cu 4.17, 4.09, Pb 14.38, 15.10, Fe 0.46, 0.42, Bi 59.23, 59.22, S 17.55, 17.80, $SiO_2$ —, 0.12; sums 100.14, 99.81%, corresponding to $CuPbBi_2S_4$ or $CuS.3PbS.5Bi_2S_3$. One-mm. balls of bismuthosphenite were found on bismuthinite. S. S. DE FINALI

Ramdohrite, a new mineral from Bolivia. Friedrich Ahlfeld. *Centr. Mineral. Geol., Abt. A*, 1930, 305–7. *Mineralog. Abstracts* 4, 341–2.—*Ramdohrite* is found as bluish, grey-black prisms in quartz with accompanying pyrite, stannite, sphalerite, jamesonite and pyrargyrite at the Chocaya la Vieja mine, Potosí. They show "alteration twinning", sp. gr. = 4.15, hardness = 2. Analysis gave: S 21.1, Sb 31.1, Bi 2.5, Pb 30.3, Ag 10.1, Cu 0.3, Fe 0.3, gang ($SiO_2$) 5.5, sum 100.2%, formula $Ag_2S.3PbS.3Sb_2S_3$, near fizelyite. J. F. SCHAIRER

Proustite and xanthoconite from Nagyág. L. Tokody. *Centr Mineral. Geol.* 1930A, 117–23, *Matematik es Természettudomanyi Értesito* 46, 644–51(in German 652–6).—In the locality of Nagyág, Hungary, quartz like material has been mined, consisting primarily of nagyagite (Au 7 61, Pb 54 50, Fe 0 93, Te 17 80, Sb 8 62, S 9 10 and quartz 2 12%), quartz crystals, dolomite rhombohedrons, covered by native As, a little pyrite and chalcopyrite, proustite and xanthoconite The last two have not been previously discovered in Nagyág, and are found but seldom in other parts of Hungary They are fully described here with diagrams of cryst structure J Pinchack

The relations of etch-hills on an etched sphere of fluorite. E Ernst *Fest chr Victor Goldschmidt, Heidelberg* 1928, 89–97, *Mineralog Abstracts* 4, 353 —Minute etch-hills are present on the rounded trisoctahedral faces produced by the solvent action of $HNO_3$ on a sphere of fluorite J F Schairer

Zambonimite, a new mineral species. Francesco Stella Starrabba *Boll soc geol ital* 48, 259–63(1930) *Mineralog Abstracts* 4, 249 —The new mineral, *zambonimite*, occurs as mamillary masses with gypsum in an old fumarole channel in the scoria of 1669 on Monti Rossi, Etna The masses have a grey, stony crust, but the interior is white, friable and radially fibrous with d 2 98–3 00, *n* 1 405–1 411, very weak birefringence with straight extinction and + elongation Analysis gave Mg 24 26, Ca 17 94, Mn not d td , Al 0 41, Fe trace, Na 0 31, K 0 05, F 55 57 $H_2O$ 1 63, sum 100 17%, formula $CaF_2 2MgF_2$ It is probable that the mineral was not formed by direct sublimation, but by the action of F vapors on descending solns contg Mg and Ca J F Schairer

Two mineral notes on Moravia. Jiskra Londýnova *Vestnik Státního Geol Ustavu Československ Rep* 5, 125–30(1929), *Mineralog Abstracts* 4, 379 —Occurrences of *fluorite*, *calcite* and *aragonite* are noted J F Schairer

Some minerals of the Broken Hill Lode. G Smith *Chem Eng Mining Rev* 23, 179–82(1931) —S has been unable to verify the presence of cerargyrite, though other Ag haloids, embolite and iodyrite have been found to be present. Neither was cerussite found Crystals of iodyrite were found deposited on 1895 slabs of limonite In quantity pyromorphite ranked as the 3rd and last of the great Pb-producing minerals of the Lode Calamine was mined but as part of the gang, it was not treated with the object of obtaining Zn Erythrite and smaltite were found in small quantity Cobaltite was the most important Co mineral and was plentiful at various periods from 1890 to 1898 Some of these deposits were of considerable economic value because of their high Ag content H. C. Parish

Mode of formation of spiral groups of dachiardite. G D'Achiardi *Atti accad Lincei* (Cl. Sci fis mat. nat.) [6], 9, 182–7(1929), *Mineralog Abstracts* 4, 318–9 — Crystallographic. J F Schairer

Stamierite (cobaltic hydroxide), a new mineral. A Schoep and V. Cuvelier *Bull soc belg géol pal hydrol* 39, 74–82(1930), *Mineralog. Abstracts* 4, 347–8 — *Stainierite* occurs in some quantity in the upper oxidized portion of a mineral vein at Mindingi, Katanga, Belgian Congo Analysis of material separated as far as possible from intermixed malachite, hematite, kaolin and quartz gave $Co_2O_3$ 68 72, $Fe_2O_3$ 9 45, $Al_2O_3$ 6 87, CuO 2 68, $SiO_2$ 2 67, $H_2O$ 10 15, *sum* 100 54%, *corresponding to* $(Co,Fe,Al)_2O_3 H_2O$ This compn approaches that of transvaalite The mineral is readily sol in HCl with evolution of $Cl_2$ It is black and compact with, in places, a shining mamillary surface It has black streaks, sp gr 4 137, hardness 4½ It is opaque with a granular or banded concentric texture In reflected polarized light it is birefringent and pleochroic The mineral is regarded as the cryst. equivalent of the colloidal heterogenite, and a preliminary x ray examn by W F de Jong suggests that it is isomorphous with goethite J F Schairer

Etch-figures on calcite from Roth. Julius Holzner. *Festschr. Victor Goldschmidt, Heidelberg* 1928, 163–9, *Mineralog Abstracts* 4, 354 —Isolated calcite crystals from a clay seam in a limestone quarry at Roith, Lower Austria, are deeply corroded The etch grooves along cleavage cracks, etch pits, etch-hills and flow-channels are described J F. Schairer

The nature of lublinite and its solubility in distilled water. Stanislaw J. Thugutt. *Arch min soc sci Varsovie* 5, 97–104(in French 105–7)(1929), *Mineralog. Abstracts* 4, 334 —Lublinite from Mt Pulawski on the Vistula gave on analysis CaO 54 56, $Fe_2O_3$ + $Al_2O_3$ 0 18, insol 0 76, $CO_2$ 44.37, loss at 160° 0.21, sum 100 08% This material finely powdered and heated with water in an autoclave for 72 hours at 233° gave a colloidal suspension containing 0 0137 g $CaCO_3$ per 100 cc. This on evapn deposited rhombohedra of calcite J. F. Schairer

Barytocalcite and its structural relations to other materials. B. Gossner and

F. Mussgnug *Centr. Mineral Geol.*, Abt. A, 1930, 321–8, *Mineralog. Abstracts* 4, 304.—Barytocalcite (sp. gr. 3.689) has a unit cell of dimensions $a = 8.15$, $b = 5.22$, $c = 6.58$ A. U. ($a:b:c = 1.561:1:1.2605$, $\beta = 81°52'$) containing 2 mols. of $CaBaC_2O_6$. The space group is $C_3^2$. These cell dimensions are compared with those of $NaNO_3$, $CaCO_3$ (calcite), dolomite and barite. J. F. Schairer

Alstonite and mularite—a contribution to the study of complex crystals. Balthasar Gossner and Franz Mussgnug *Centr. Mineral Geol.*, Abt. A, 1930, 220–38, *Mineralog. Abstracts* 4, 305.—X-ray photographs of *bromlite* (alstonite) (sp. gr. 3.707–3.715) give a unit cell of dimensions $a = 8.77$, $b = 4.90$, $c = 6.11$ A. U. ($a:b:c = 1.787:1:1.224$) containing 2 mols. of $CaBaC_2O_6$. The x-ray data suggest that the mineral is a double salt ($CaCO_3 \cdot BaCO_3$) rather than an isomorphous mixt. of aragonite ($CaCO_3$) and witherite ($BaCO_3$). Mularite gives data conforming with hexagonal symmetry and the space group $D_{6h}^1$. The unit cell of dimensions $a = 10.46$, $c = 13.90$ A. U. ($c/a$ 1.329) contains 2 mols. $(Si_2O_6)_4Al_2Ca_3KH$. The crystals show optical anomalies with a division into orthorhombic sectors. J. F. Schairer

The Fedorov method in the determination of feldspars. Viktor Zsivny. *Földtani Közlony* 58, 93–108(1929).—The method and some detns. by it are given. S. S. de Finály

Determination of the species of plagioclase by the theodolite microscope. S. K. Chatterjee *Proc. 15th Indian Sci. Cong.* 1928, 288. E. J. C.

Notes on minerals from the Canaries. Rafael Candel Vila *Mem. soc. españ. hist. nat.* 15, 265–8(1929), *Mineralog. Abstracts* 4, 314.—Crystallographic notes on olivine and hornblende. J. F. Schairer

The formula of eucolite. Felix Machatschki *Centr. Mineral Geol.*, Abt. A, 1930, 300–4, *Mineralog. Abstracts* 4, 358.—From Cleve's 1890 analysis of eucolite (eudialyte) from Norway the formula is deduced as $X_6Y_2Si_4(O,OH)_{18}$ where X = Ca, Na, Yt, Ce and Y = Zr, Fe, Mn, Mg, Cb. Four such mols. are contained in the unit cell of Gossner and Mussgnug. (Cf. following abstract.) J. F. Schairer

The structural and molecular unit of eudialite. B. Gossner and F. Mussgnug *Centr. Mineral Geol.*, Abt. A, 1930, 81–3.—In an attempt to det. the mol. structure of eudialite, the authors studied the uniformity of the structure and mol. wt. by measuring the lattice structure of the crystals and by estg. the mol. wt., assuming eudialite to have 6 possible chem. compns. The density, $s \times M$, was assumed (suspension method) to be about 2.929. The elementary substance was found to be rhomboidal in character, the crystals showing the form (111), (100), (110), (101), (211), (111). The d. of this substance was estd. at 3.145. The mol. uniformity could not be ascertained on the basis of the accepted structural uniformity; all 6 possibilities presented contradictions to exptl. work, *e. g.*, the formula $2Na_2SiO_3 \cdot CaFeSi_2O_6 \cdot ZrSi_2O_6$ showed the best relationship, but did not agree with the structural uniformity. J. Pinchack

Remarks on the work of B. Gossner and F. Mussgnug. William H. Zachariasen *Centr. Mineral Geol.*, Abt. A, 1930, 315–7, *Mineralog. Abstracts* 4, 307–8.—X-ray rotation and Laue photographs of a crystal of eudialyte from Naujakasik, Greenland, gave a rhombohedral cell of edge $a = 13.01$ A. U. and axial angle 66°44'. The space group is $D_{3d}^5$. Splinters from the crystal had d. ranging from 2.826 to 2.888, and they show differences in optical character, being isotropic or weakly birefringent with blue-violet interference colors, the material is therefore presumably variable in chem. compn. Z from later analyses suggests a formula $R_5Si_6X_{18}$ (where X = O, OH, Cl) or $(Na,Ca,Fe)_6ZrSi_6O_{18}(OH,Cl)$, for which there would be 4.13 mols. in the unit cell. J. F. Schairer

Sulfatic cancrinite from the Ilmen Mts. (South Ural). A. N. Zavaritzkii *Mém. soc. russe mineral.* [2], 58, 201–7(1929), *Mineralog. Abstracts* 4, 379.—Blue cancrinite occurs as nests and veinlets in nephelite crystals in pegmatite veins in the nephelite-syenite of the Ilmen Mts. Two analyses gave $SiO_2$ 34.78, 35.29, $Al_2O_3$ 28.77, 28.79, $Fe_2O_3$ 0.10, 0.19, MgO 0.12, 0.10, CaO 1.27, 1.49, $Na_2O$ 15.59, 15.65, $K_2O$ 4.90, 4.15, $H_2O$ 7.01, 7.62, $CO_2$ 0.89, 1.01, $SO_3$ 6.25, 5.76, sums 99.68, 100.05%. The $SO_3$ content is rather high. J. F. Schairer

Eulytite from Dognácska. Sandor Koch *Matematik. es Természettudomanyi Értesito* 46, 640–2(German abstract 643)(1929).—The forms {100}, {111}, {1$\bar{1}$1} and {211} were observed on 1 mm. crystals. Larger crystals were of a hexaedric, the smaller of a trialstetraedric habit. S. S. de Finály

Mode of occurrence and chemical composition of garnet from Nellore district, Madras. V. S. Swaminathan *Proc. 15th Indian Sci. Cong.* 1928, 288.—Garnet is a common constituent mineral of both the schistose and the pegmatitic rocks and often

occurs as an accessory of the granitic and gneissic outcrops exposed in the country. Crystals as well as massive forms are found, the latter being generally heavy, granular and of a comparatively large size. Dodecahedra, trapezohedra and combinations of these 2 are the most common crystal forms. The dominant colors are red, dark red and varying shades of brown. The sp. gr. varies from 3.52 to 4.15. E. J. C.

**Chemical composition and physical constants of spessartite from Publice near Jihlava.** Radim Nováček. *Časopis Moravského Zemského Musea* 27, 4 pp. (preprint) (1930). *Mineralog. Abstracts* 4, 320.—This garnet has a sp. gr. 4.212, $n_r$ 1.8096, $n_D$ 1.8131, $n_v$ 1.8175 and gave on analysis $SiO_2$ 36.83, $TiO_2$ 0.12, $Al_2O_3$ 20.70, $Fe_2O_3$ 0.78, FeO 12.11, MnO 29.06, MgO 0.14, CaO 0.27, $H_2O$ 0.02, sum 100.31%, corresponding to spessartite 68.21, almandite 30.56, pyrope 0.47 and grossularite 0.76%. J. F. S.

**The general formula of vesuvianite and its relation to garnet.** Felix Machatschki. *Centr. Mineral. Geol., Abt. A* 1930, 284–91. *Mineralog. Abstracts* 4, 377. Published analyses of vesuvianite are calcd. to at. ratios and a general formula deduced as $X_{19}Y_{13}Si_{18}(O,OH,F)_{76}$, i. e., 6 garnet + $CaMg(OH)_2$. The unit cell contains 2 such mols. The unit cell of vesuvianite has dimensions near to those of garnet, indicating a close relation. J. F. Schairer.

**Vesuvianite from the ejecta of Sabatini.** Maria Piazza. *Periodico Mineral.* (Rome) 1, 8–37(1930). *Mineralog. Abstracts* 4, 330. A detailed description. J. F. S.

**The general formula of melilites.** Felix Machatschki. *Centr. Mineral. Geol. Abt. A*, 1930, 278–81. *Mineralog. Abstracts* 4, 357. From the analyses tabulated by Berman (*C. A.* 24, 4181) a general formula for minerals of the melilite group is deduced as $XYZ(O,OH)_7$, where X = Ca or Na, Y = Mg, Fe'', Fe''' or Al and Z = Si with some Al. J. F. Schairer.

**Mineralogical notes. IV.** T. Hodge-Smith. *Rec. Australian Museum* 17, 408–13(1930). *Mineralog. Abstracts* 4, 345–6. *Sturtite*, a new mineral from Broken Hill, New South Wales, is jet black and compact, very brittle, friable, with a yellowish brown streak, hardness 3, sp. gr. 2.051. Thin sections are pale brown and optically isotropic. It fuses with difficulty to a black magnetic glass and is decompd. by acids with sepn. of granular $SiO_2$. Analysis gave $SiO_2$ 42.35, $Al_2O_3$ 0.11, $Fe_2O_3$ 10.22, MnO 25.18, MgO 0.65, CaO 2.10, $H_2O$ (105°) 23.01, $H_2O$ (140°) 1.02, $H_2O$ (+110°) 4.11, insol. ($SiO_2$) 0.79, sum 99.98%, leading to the formula $Fe_2O_3.6(Mn,Ca,Mg)O.8SiO_2.2H_2O$ or $Fe(R_2''H_2SiO_4)_2.H_2O$. J. F. Schairer.

**Zeolites in extrusive rocks—a contribution to the problem of "Sonnenbrand."** K. Hoffer. *Z. prakt. Geol.* 38, 17–20(1930). *Fortschritte Mineral. Kryst. Petr.* 14, 37(1929). *Mineralog. Abstracts* 4, 374–5.—*Many basalts, apparently uniform when* freshly broken, show numerous pale patches after a short exposure to the air (Sonnenbrand). This behavior is due to a hydrous, apparently glassy groundmass, which has been supposed to be zeolitic in nature. The pale patches give a more continuous dehydration curve than does the normal basalt. By centrifuging the finely powdered material of the light patches in Clerici soln. of sp. gr. 2.45 the groundmass was approximately isolated. The material gave a definite base-exchange with NaCl and $CaCl_2$ solns. H. concludes that these basalts contain an alkali glass which is readily decomposed by moisture to form a zeolitic mixt. J. F. Schairer.

**Zeolites from Chibino Mountains and Luyavrurt in Russian Lapland.** A. N. Lamunzov. *Trav. musée acad. sci. U. R. S. S.* 2, 91–100(1927); *Mineralog. Abstracts* 4, 373–4.—Zeolites found in the Khibinsky and Lovozersky tundras, Kola, include natrolite, analcite, chabazite, heulandite and mesolite. Analcite is always associated here with aegirite and may be either primary or secondary after sodalite or aegirite. The *following equations are suggested* $2(3Na_2Al_2Si_2O_8.2NaCl)$ *(sodalite)* $+ nH_2O = 3.(Na_2Al_2Si_4O_{12}.2H_2O)$ *(analcite)* $+ 3(Al_2O_3.nH_2O) + 4NaCl + 6NaOH$. *Earthy white* masses of hydrated alumina are found. From aegirite of the second generation: $n(Na_2(Fe,Al)_2Si_4O_{12})$ *(aegirite)* $+ Na_2Al_2Si_4O_{12}.2H_2O$ *(analcite)* or $Na_2Fe_2Si_4O_{12}$ *(aegirite)* $+ Al_2O_3.nH_2O + 2H_2O = Na_2Al_2Si_4O_{12}.2H_2O$ *(analcite)* $+ Fe_2O_3.nH_2O$. J. L. S.

**Leucophyllite.** Miklós Vendl and A. Romwalter. *Allt. berg u. hüttenmänn. Allt. kgl. ung. Hochschule Berg u. Forstw. Sopron, Ungarn* 1930, 369–73.—Leucophyllite from Sopron Mountain was analyzed $SiO_2$ 75.64, $TiO_2$ 0.15, $B_2O_3$ 0.11, $Al_2O_3$ 14.31, $Fe_2O_3$ 0.62, FeO 0.17, MnO 0.01, MgO 2.07, CaO 0.48, $Na_2O$ 0.22, $K_2O$ 3.50, $H_2O^+$ 2.10, $H_2O^-$ 0.06, sum 100.40%. Osann parameters, Niggli nos. and further optical and petrographic data are given. S. S. de Finaly.

**New localities for zeolites in Moravia.** Bruno Kučera and Božena Novotná. *Časopis Moravského Zemského Musea* 25, 211–27(1927). *Mineralog. Abstracts* 4, 318.—A complete list of old and new zeolite localities in Moravia and Czech Silesia is given. J. L. Schairer.

Analcite and laumontite from Murlo (Tuscany). GIACINTA CURLO *Atti mem. soc. sci. nat. Geron.* 52, 413–6 (1928). *Mineralog. Abstracts* 4, 376.—Clear ico-tetrahedra of analcite gave $SiO_2$ 53.69, $Al_2O_3$ 22.91, $Na_2O$ 14.27 (by difference), $H_2O$ 9.13%. Laumontite $SiO_2$ 50.90, $Al_2O_3$ 21.51, CaO 11.76, $H_2O$ 15.22, sum 99.69%. At 100° the laumontite lost 3.80% $H_2O$ and at 130° 4.15%. J. F. SCHAIRER

Nontronite from two southern Russia graphite deposits. D. P. SERDYTCHENKO. *Centr. Mineral. Geol.*, Abt. A, 1929, 47–55. *Mineralog. Abstracts* 4, 327.—Seams of nontronite occur in pyroxene-graphite-gneiss in the Stary-Krym graphite mine near Mariupol. The mineral is decomposed by cond. HCl with sepn. of $SiO_2$. Analyses on impure material are given. The material has been derived, perhaps, from the direct decompn. of Fe-bearing silicate or may have been formed by the action of solns. of Fe sulfate (from decompn. of pyrite) on secondary kaolin. J. F. SCHAIRER

The geological history of coal. GEORGE A. HICKLING. *Can. Mining J.* 52, 428–9 (1931).—A brief graphic description. W. H. BOYNTON

A new mineral of the nontronite-beidellite group. I. JA. MICKEY. *Centr. Mineral. Geol.* Abt. A, 1930, 293–303. *Mineralog. Abstracts* 4, 342.—A new mineral called *elbrusite* was found in a vein in liparite-pumice-tuff in the ravine of the Chubchur river, near Mt. Elbrus, northern Caucasus. It is chocolate-brown, sp. gr. 2.28, hardness 2, optically uniaxial, $n$ = about 1.56. Analysis gave $SiO_2$ 39.74, $Al_2O_3$ 14.44, $Fe_2O_3$ 7.44, FeO 6.90, MgO 5.11, CaO 0.55, alkalies 2.80, $H_2O$ (110°) 17.69, sum 94.67%, the deficiency being $H_2O$ (above 110°). Over $H_2SO_4$ there is a loss of 14.89% $H_2O$. The formula is given as $1RO \cdot 0.8R_2O_3 \cdot 0.1R_2O \cdot 2.7SiO_2 \cdot 5.5H_2O$. This mineral differs from those of the nontronite-beidellite group in the presence of FeO, MgO and alkalies, in its lower $n$ and absence of pleochroism. J. F. SCHAIRER

Mesolite. A. CAVINATO. *Atti soc. ital. sci. nat.* 65, 104–14 (1926); *Mineralog. Abstracts* 4, 319.—Mesolite from Iceland was studied by optical, goniometric, chem. and x ray methods. Analysis gave $SiO_2$ 44.96, $Al_2O_3$ 26.30, CaO 11.15, $Na_2O$ 4.10, $H_2O$ 13.20, sum 99.71%. Crystallographic measurements and Laue-grams indicate monoclinic symmetry. The optic axial plane is perpendicular to the elongation, the sign is +, $2V$ = 70°, dispersion is strong, $Bx_a$ $c$ = 9½° and birefringence is low. Laue-grams of natrolite and scolecite indicated orthorhombic and monoclinic symmetry, resp. J. F. SCHAIRER

The minerals of the Karviná sphaerosiderites. FRANTIŠEK SLAVÍK. *Sborník Přírodověd. Společnosti v Moravské Ostravě, Moravské Ostrava* 4, 90–3 (1929). *Mineralog. Abstracts* 4, 325.—The succession of minerals in the sphaerosiderite septaria in the coal mines at Karviná, Czech Silesia, is the same as that in those of the Kladno coal basin in central Bohemia, *i. e.*, quartz, ankerite, calcite, sulfide ores, nacrite. An *analysis of nacrite* is given. J. F. SCHAIRER

Phillipsite of the basalts in the region of Lake Balaton. BÉLA MAURITZ. *Matematikai és Természettudományi Értesítő* 46, 657–61 (German abstract 662) (1929).—A crystallographic description is given of phillipsite found in company of aragonite, chabazite and calcite. S. S. DE FINLY

Analysis of monazite from Jun-an, Korea. KENJIRO KIMURA AND SAKAE SHINODA. *J. Chem. Soc. Japan* 52, 47–54 (1931).—Hitherto there being only partial investigations and fragmental statements as to monazite from Jun-an, Korea, a complete analysis was performed, giving the following results: $d_4^{25}$ 5.106, $n$ 1.78, CaO 0.53, PbO 0.09, $Al_2O_3$ 0.28, $Fe_2O_3$ 1.65, $Ce_2O_3$ 28.25, $Nd_2O_3$ etc., 27.87, $Y_2O_3$ etc., 2.47, $ThO_2$ 9.49, $SnO_2$ 0.15, $SiO_2$ 1.85, $UO_3$ 0.15, $P_2O_5$ 26.07, $Sb_2O_3$ 0.06, $H_2O$ 0.79, $CO_2$ 0.23, sum 99.93%. By a spectral analysis by arc light and x ray the existence of La, Ce, Pr, Nd, Sa, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu and Yt is confirmed, and Eu and Sc probably exist. In addn. Ba, Ti, Nb and Ta are detected by arc spectrum. From the Pb, U and Th contents, the age is calcd. as $1.8 \times 10^8$ years (formula of A. Holmes and R. W. Lawson). T. IRIE

New data on lepidolite from Rožná, Moravia. JOSEF SEKANINA AND JOSEF VYSLOUŽIL. *Acta Soc. Sci. Nat. Moravicae* (Brno) 5, Pt. 2, 25–31 (1928). *Mineralog. Abstracts* 4, 379–80.—Analyses of pink lepidolite from Rožná gave: $SiO_2$ 47.63, $Al_2O_3$ 28.69, $Fe_2O_3$ trace, FeO 0.33, MnO 0.75, MgO 0.18, CaO 0.35, $Na_2O$ 1.05, $K_2O$ 11.29, $Li_2O$ 4.57, F 6.81, $H_2O$ (+105°) 1.28, $H_2O$ (−105°) 0.31%, the analysis agreeing with $H_4Li_2(K,Na)_2Al_4Si_8O_{28}F_{16}$. J. F. SCHAIRER

Crystals of magnesium sulfate hexahydrate (hexahydrite). V. V. DOLIVO-DOBROVOLSKII. *Mem. soc. russe mineral.* [2], 58, 3–63 (1929); *Mineralog. Abstracts* 4, 378.—In the Saki salt lakes, Crimea, after the sepn. of NaCl, spear-shaped crystals of $MgSO_4 \cdot 7H_2O$ (detd. by analysis), which differ from epsomite in form, separate. Thick, tabular, monoclinic crystals of $MgSO_4 \cdot 6H_2O$ also occur. Optical and crystallographic data on hexahydrite and on artificial $MgSO_4 \cdot 6H_2O$ are given. J. F. SCHAIRER

Blödite from Kalusz. ANTONI LASZKIEWICZ *Arch min soc sic Varsovie* 5, 79–94(in French 95–6)(1929), *Mineralog Abstracts* 4, 334.—Crystallographic Optical constants, for Na light, are $\alpha = 1.4826$, $\beta = 1.4855$, $\gamma = 1.4869$, $2V = 69° 24'$, $Bx_a$ $(\alpha)$ $c = -42° 11'$ J. F. SCHAIRER

Recent minerals from the mines of Karvinná. VACLAV MAŠTALÍŘ *Sborník Přírodovědecké Společnosti v Moravské Ostrave, Moravská Ostrava* 4, 183–90(1929), *Mineralog Abstracts* 4, 326.—The coal mines have yielded calcite, gypsum, mirabilite, epsomite and mixtures of aluminum and iron sulfates. The descriptions given, with incomplete chem. analyses and no optical data, are insufficient to det. the species exactly. J. F. SCHAIRER

Wulfenite crystals from Almalyk. O. G. PADUROVA *Mem. soc. russe minéral* [2], 58, 109–15(1929), *Mineralog Abstracts* 4, 378.—Microchem. tests showed the presence of Mo, Pb and Ba in crystals of wulfenite from Almalyk in the Tyuya-Muyun district, Fergana. J. F. SCHAIRER

The minerals of the uranium deposit of Katanga. A. SCHOEP *Ann. musée Congo Belge, Sér. I. Minéral., Tervueren* 1, No. 2, 43 pp. (1930), *Mineralog Abstracts* 4, 313.—The Kasolo radium mine is on Kasolo hill, 22 km. S. S. W. of Kambove. Two kilometers to the N. E. is a hill called Shinkolobwe (or Chinkolobwe) in which there is a Cu vein. These 2 mines are on the same mining block. The U ore occurs in veins 20–30 cm. thick in bedded dolomites and slates. Twelve new species have been described from this locality, viz. becquerelite, curite, dewindite, dumontite, fourmarierite, ianthinite, kasolite, parsonsite, renardite, schoepite, sklodowskite and soddyite. Other minerals present are uraninite, torbernite, quartz, talc, magnesite, heterogenite, linnaeite, Au, wulfenite and monazite. J. F. SCHAIRER

Whewellite from the tertiary strata of the Maykop region (northern Caucausus). N. B. VASSOEVICH AND N. K. RAZUMOVSKII *Mem. soc. russe mineral.* [2], 57, 275–300(1928), *Mineralog Abstracts* 4, 377–8.—Yellowish tabular crystals of whewellite ($CaC_2O_4 \cdot H_2O$) were found in crevices in calcareous concretions from bituminous Eocene clay near Khodyzhenskaya in the Maykop district. Sp. gr. 2.22, hardness $3^1/_2$. $\alpha = 1.49$, $\beta = 1.55$, $\gamma = 1.65$, $2V = 82^1/_2°$, optically +. Analysis gave CaO 35.80, $C_2O_3$ 46.92, $H_2O$ 10.60, $CaCO_3$ 6.68%. The mineral is partly replaced by quartz and $CaCO_3$. A summary of the literature on whewellite is given. J. F. SCHAIRER

A meteorite from Oesede near Osnabrück. K. BUSZ *Veroffent. Naturw. Ver. Osnabrück* 21, 4 pp. (reprint)(1929), *Mineralog Abstracts* 4, 258–9.—Thin sections of the meteorite show the ground mass to consist of broken fragments of bronzite and olivine, and chondrules of the same minerals with a granular or eccentric radial structure. The stone is a spherulitic chondrite. Analysis gave: Fe 18.17, Ni 1.90, FeS 5.77, $SiO_2$ 35.57, $Al_2O_3$ 2.71, FeO 7.99, MgO 23.24, CaO 2.96, $Na_2O$ 1.31, $K_2O$ 0.40, P trace, sum 100.03%, corresponding with nickel-iron 20.07, troilite 5.77, feldspar 22 and olivine 52%. J. F. SCHAIRER

Meteorite from Ojuelos Altos. L. FERNÁNDEZ NAVARRO *Bol. soc. españ. hist. nat.* 29, 19–24(1929), *Mineralog Abstracts* 4, 259.—Thin sections of the meteorite show hypersthene, limefeldspar, olivine, much magnetite with a border of hematite and some glass. The stone resembles a basalt tuff and is classed as a hypersthene oligochondrite. Sp. gr. 3.54–3.89. Bulk compn. by analysis: $SiO_2$ 40.02, $TiO$ nil, $Al_2O_3$ 2.77, FeO 11.34, MgO 25.34, CaO 2.49, $Na_2O$ 0.76, $K_2O$ 0.23, $P_2O_5$ 0.34, $H_2O$ (105°) 0.09, FeS 6.76, Fe 8.17, Ni 1.12, Co 0.04%. J. F. SCHAIRER

The meteorite of Olmedilla de Alarcón (Cuenca). L. FERNÁNDEZ NAVARRO *Mem. soc. españ. hist. nat.* 15, 859–65(1929), *Mineralog Abstracts* 4, 259.—The meteorite is classed as an oligo-sidiferous hypersthene-chondrite with a marked brecciated texture and veined, approaching the eucrites, but perhaps representing a new type. There are chondrules of hypersthene, monoclinic pyroxene and basic feldspar, and magnetite bordered with hematite is abundant. Sp. gr. 3.712. Analysis gave the bulk compn.: $SiO_2$ 36.92, $TiO_2$ nil, $Cr_2O_3$ 0.38, $Al_2O_3$ 2.52, FeO 9.39, MnO 0.26, MgO 23.59, CaO 2.16, $Na_2O$ 0.87, $K_2O$ 0.19, $H_2O$ (105°) 0.09, $P_2O_5$ 0.31, FeS 4.66, Fe 17.06, Ni 1.58, Co 0.02%. J. F. SCHAIRER

Our mineral wealth [Paraguay]. GENARO ROMERO. *Rep. Paraguay, Cartilla Informativa* No. 18, Asunción, 70 pp. (1930), *Mineralog Abstracts* 4, 314.—A brief sketch is given of the rocks and minerals of Paraguay with special mention and chem. analyses of ores of Fe and Mn. J. F. SCHAIRER

Notes on the iron ore of Mandi State. S. K. ROY *Proc. 15th Indian Sci. Cong.* 1928, 288.—The unfossiliferous Krol slates of the Mandi state are characterized by the presence of a magnetite-chlorite-schist in which, at certain places, magnetite attains such an enrichment that the rock may then be considered as an Fe ore, *magnetite-haematite-*

*quartz schist* The transition between the ordinary Simla slates and the magnetiferous slate is gradual Characteristic is the presence of a blue slate contg beautiful cubes of pyrite just on both sides of the Fe-ore bed, which is about 400 ft in thickness The ore with the greatest concn of Fe is found in the Chichot Subdivision of the state Inferior types of magnetite-chlorite schist have been traced in the northern parts of the state near Barot, Panjaund, Dhamteth, etc The better type of ore has been followed for about 12 miles between Pansar and Sangalwara, Chichot Near Charan the strike direction has apparently been affected by the intrusion of the Mandi granite gneiss massif, which is therefore younger than the Krol beds Magnetite, sepd by washing from the disintegrated ore, on analysis showed 73.28% of metallic Fe with very little P and S, and a sample of Maroti ore gave about 61% Fe This Fe deposit of Chichot was not reported previously E J C.

Ilmenite and titaniferous iron ore from Nellore District, Madras. V. S Swaminathan *Proc 15th Indian Sci Cong* 1928, 287.—Ilmenite occurs in the form of large segregated masses in a pegmatite vein, situated a mile N E of Gulmcherla village, Rapur Tq The associated minerals are feldspar and biotite Individual masses often weigh 30–50 lbs The mineral breaks up easily into thin plates and tabular pieces, and the freshly broken surface reveals a submetallic luster The sample gives, on analysis, 49.82% of $TiO_2$ The mineral is available in fairly large quantities and could, with profit, be exploited, as it is extensively used in the manuf of ferrotitanium alloys and titanium white Titaniferous Fe ore is met with in limited quantities closely assocd with another pegmatitic vein near the Patragunta mica mine (Gudur Tq) The specimens are tabular and have a dull steel gray luster The results of the analysis of the mineral are $SiO_2$ 0.65, $TiO_2$ 28.71, $Al_2O_3$ 0.48, $Fe_2O_3$ 0.00, FeO 67.71, MnO 1.89, MgO 0.90, CaO 0, $P_2O_5$ 0, sum 100.34%. Only very limited quantities of the mineral are available E J C.

Climax molybdenum deposit of Colorado—with section on history, production, metallurgy and development. B S Butler, John W Vanderwilt and Chas. W. Henderson *Proc Colo Sci Soc* 12, 311–53(1931).—The broken ore reserve (Jan., 1931) is sufficient to furnish 2000 tons daily for 3 years, and plans are under way for increasing production with the demand The Mosquito fault seps the Paleozoic rocks of the western part of the district from the pre Cambrian rocks to the east, the Climax Mo deposit being in the granite of the latter The mineralized area includes a central core, largely quartz, and an envelope consisting of moderately altered rocks cut in all directions by closely spaced veinlets The molybdenite ore occurs in a zone of the envelope consisting of silicified rock surrounding the central core Assocd minerals are pyrite, a little chalcopyrite, brown sphalerite, hubnerite, topaz, quartz and fluorite. W. L. Hill

Mineral resources of Palestine and Transjordan. G S Blake *Jerusalem* (Pub Works Dept.) 1930, 41 pp., *Mineralog Abstracts* 4, 311.—A short outline of the geology is given The most important mineral product is the Dead Sea brine, which is rich in KCl, $MgCl_2$ and $MgBr_2$ Exptl production of salts by solar evapn in large pans yielded first NaCl, then carnallite and last $MgCl_2$ with bromide ($MgBr_2$ 1.46%) Pure KCl can be separated by recrystn from the carnallite Petroleum, bitumen and bituminous limestone are of some importance in the region. In Transjordan occur small deposits of Cu and Fe ores and considerable gypsum and phosphate. J F. Schairer

A deposit of barite in Orchha State, Central India. M K. Roy *Proc 15th Indian Sci Cong* 1928, 289.—In the Orchha State in Central India, in the village Surajpur, formerly called Khura, occurs a deposit of barite in Bundelkhand gneiss The vein is traceable for more than 0.25 mile in length and is over 8 ft. in thickness It is a quartz barite vein, in which barite appears to have been deposited later, filling up the cavities of the quartz vein and, in places, also of the adjoining country rock. A little Cu pyrite and malachite are found in the vein but no Pb ore The deposit is of hydatogenetic origin and apparently belongs to a series of several pyritic ore bodies occurring in the neighborhood and all having the same N E.—S W. direction. E J C.

The origin of coal. Walter Fuchs and Otto Horn *Z angew Chem* 44, 180–4(1931).—The opinions of different investigators on the origin of coal are discussed, with a repetition of some exptl. work. Some new data are given, and numerous tables for comparison are added A Hirsch

Geologic survey of the environments of the radium mine of Tyuya-Muyun. D I Mushketov *Trav radium et minerais radioactifs acad sci U R. S S* II, 3–13(1926).—The only dependable and scientifically recognized deposit of radioactive minerals in the Fergana Co., formerly Skobeleff Co., is the deposit of ores contg V, U, Ca and Cu in the region of Tyuya-Muyun The residue from this ore after treatment contains a con-

siderable amt of Ra salts Several hot springs which are located along Kisil Kungei-Karatash have a temp of about 16° with an emanation content from 1 to 2 21 Maché units Hot springs of the southern slope of Tuya-Muyun have temps from 21° to 25° with an emanation content from 0 1 to 0 3 and finally other hot springs with a temp. of 18 2° and 20 2° contain the max amt of emanation, 6 26 and 4 17 Maché units, resp The temp of all of the hot springs exceeds 16° while the av yearly atm temp could not exceed 10° A C Noé

**The paleozoic deposits in the valley of the Aravan River.** D V Nalivkin *Trav. radium et minerais radioactifs acad sci U R S S* II, 14–20(1926) —The Aravan River crosses the Tuya Muyun ridge which contains deposits of radioactive minerals on the walls of many of its caves The massif of the ridge consists of Silurian, Devonian and Carboniferous rocks The specific radioactive minerals which are found in the walls of the caves are discussed in another paper A C Noé

**Petrographical particularities of Tuya-Muyun radioactive deposits in Fergana.** V I Lucchitzkii *Trav radium et minerais radioactifs, acad sci U R S S* II, 21–50(1926), cf *C A* 17, 3059 —At the beginning of the Kirgis Atan River are strongly developed sediments which are of light gray color They are formed by an aggregate of quartz and feldspar of uniform grain structure Quartz is found in small irregular grains. Microline is represented by large irregular grains which are evenly distributed throughout the strata Plagioclase and oligoclase appear in the form of sharply defined plates with (010) cryst grains and are included in microcline Brown biotite, which often is transformed into chlorite or green hornblende, occurs in large quantities These deposits are of Lower Carboniferous age A C Noé

**The eruptive rocks of the Tuya-Muyun district.** L F Atsberg *Trav radium et minerais radioactifs acad sci U R S S* II, 51–72(1926) —The Tuya-Muyun Ridge is located in southeast Fergana in the region of the northern approach to the Alai Mountains It is a part of an elevated plateau which extends to the South in the deep Naukat Valley The entire district from Tuya-Muyun up to the northern edge of the plateau is composed of Paleozoic slates, which are either bright flints or jasper, or of black carbon-like slates These deposits are characteristic deep sea deposits In some places one could find bituminous limestones, layers of black flint slates and layer like deposits of diabasic porphyrites The following primary and secondary mineral components were found by microscopic examn (1) rock-forming minerals Augite and feldspar, (2) accessory minerals, contained in the compn of the main strata Titanic iron oxide, pyrite, magnetite, apatite; (3) secondary minerals calcite, chlorite and quartz, most commonly found, sericite and epidote, found but seldom A very peculiar characteristic is common to all those types where feldspar is found The feldspar appears in all cases as *albite* A C Noé

**The gypsum in the calamine deposits of Sardinia.** Piero Bonate *Resoconti assoc mineraria sarda* 36, No 1, 39–41(1931), cf Chinaglia, *C A* 25, 899 —Gypsum is rarely present in the deposits of Sardinia, because it was formed in earlier periods and then carried away by the action of the waters This action is also shown by the existence, at the lowest levels, of sedimentary rocks, very similar to the alluvial deposits The gypsum, if protected from the action of the waters, is found in well defined crystals accompanied by blende and calamine Its formation was probably the following the pyrite was oxidized to $FeSO_4$ and $Fe_2(SO_4)_3$, which reacted with ZnS to form $ZnSO_4$ This, by reaction with $CaCO_3$, gave $ZnCO_3$ and $CaSO_4$ G. A. Bravo

**Materials related to the distribution of radioactivity in the western part of Fergana.** A N Snesarev *Trav radium et minerais radioactifs acad sci U. R S S.* II, 121–200(1926) —Every deposit of radioactive ore changes the ionization of air or its elec cond Therefore, a study was made of these 2 valuable sources of information to locate radioactive ores A C Noé

**Investigations in the region of limestone contacts of the Kirghiz-Ata ridge in Fergana.** V I Lucchitzkii *Trav radium et minerais radioactifs acad. sci U. R. S S* II, 201–63(1926) —The purpose was to det the geological and mineralogical character of the limestone contacts These contacts are of interest, because certain traces of Cu ore are found, and the Cu ore in turn is usually found in connection with U compds Particular minerals found are hornblende, porphyrite and hornblende-granites Along the line of contact of syenitic-dioritic magma which formed the ridge of Kirghiz-Ata with Paleozoic limestones pronounced changes took place, as well as within the limestones which were exposed to different changes, as well as in the magma which in the middle part of the ridge gave birth to syenites and at the ends of the ridge gave birth to various diorites, among which the most important roles are played by hornblende and diorites. The first minerals formed during this process were ferric calcite rocks Later, there

appeared plagioclases Considerably younger are the ore minerals as, for instance, magnetite During contact metamorphism no change took place which was due to the influence of pressure The chief role has been played by the high temp of the magma Secondary changes in contact minerals took place chiefly in granite, which gave during its transformation 2 new secondary minerals serpentine and chlorite During these changes, hydrothermic agents were of considerable importance A C Noé

Notes on rocks from Sihor Hills, Bhavnagar, Kathiawar. V. S Swamynathan *Proc 15th Indian Sci Cong* 1928, 291 —Thirty hand specimens collected from the Sulidhar, Lamdhar and Tharsingra hills situated west of Sihor town were examd Barring a few dike rocks, rocks of a more or less acidic compn (differentiation products from a basaltic magma) seem to be prevalent in the area. The more interesting types are rhyolites, pitchstones, etc. E. J C.

Some rocks of the Rajmahal Hills. P C Datta *Proc 15th Indian Sci Cong* 1928, 291 —A study of rocks collected from a group of small conical hills called Gandesuri in the Rajmahal Hills These rocks were first described by Ball as trachyte and subsequently as andesite by McMahon From a phys and chem study of the specimens D has reached the conclusion that the rock is a basalt. E. J C.

The volcanic rocks of the Irrawaddy Delta, Manngmya District, Lower Burma. H L Chibber and M M Wadiwana. *Proc 15th Indian Sci Cong* 1928, 290 — The area which has been geologically mapped is situated on both sides of the Bassein river On the east of the river the volcanic rocks form a plateau with an average height of about 100 feet presenting a steep scarp toward the river The geology of the area has been described as follows (5) Alluvium (4) White and greenish fine tuffs These tuffs enclose purplish or grayish nodules and boulders of trachytic lava (olivine-trachyte) It has been suggested that the eruptions were of a very explosive nature. (3) Coarse-grained grayish tuffs with *Nummulites* (2) Grayish volcanic tuffs and ashes. These rocks were seen exclusively developed in the hills situated east of the village of Zyat Chaung (1) Nummulitic limestones, sandstones and shales. The limestones are remarkable for containing a number of *foraminifera* The area represents the southernmost occurrence of volcanic rocks in Burma situated on the igneous line connected with the Arakan Yomas and their continuation to the north and the south where numerous patches of serpentine occur E J C

The hornblende lamprophyres and associated rocks of Mokpalin quarries, Thaton district, Lower Burma. H L Chibber *Proc. 15th Indian Sci. Cong* 1928, 290 — The petrography of the rocks is as follows (*a*) Contact rocks, *e g*, veins of epidote rock contg a little quartz and feldspar (*b*) Quartz veins, occurring as irregular veins or lenses. (*c*) Acidic pegmatites and aplite veins. (*d*) Lamprophyres. The common rock is a hornblende lamprophyre (camptonite) merging sometimes into a dark quartz-diorite-gneiss (*e*) Hornblende-biotite gneiss, quartz diorite-gneiss and biotite-granite E. J C.

Magma types in the Deccan Trap K K Mathur and V. S Dubey. *Proc 15th Indian Sci Cong* 1928, 291 —The authors have studied a number of occurrences of igneous rocks, usually regarded as part of the Deccan Trap, in Gujrat, Kathiawar and Cutch These can be classified into 3 groups (1) the mafelsic or basalt magma type. (2) the mafic or ultra basic magma type and (3) the felsic or acid magma type. The first group is represented by the common Deccan Trap of the typical plateau basalt facies ranging in the later stages of eruption to an alkali rich basalt. This was followed by intrusions of highly basic rocks The acid type appeared much later and is represented by rhyolites, granophyres, etc., in various parts of Western India. These groups appear not to have any immediate genetic relationship through a process of magmatic differentiation, but probably have their source deep down in distinct zones in the earth's crust They have been traced in South India, the Himalayas, Burma and Western Asia. E. J C.

*Petrochemical data of the environment of Szarvaskö* (Hungary) Zsigmond Szentpétery and Kálmán Emszt *Földtani Kozlony* 58, 109–14(in German 216–22) (1928)(Published 1929) —Data for 12 rock analyses are given with a short explanation of conclusions drawn from them. S S de Finály

Recent lava types of Etna. E. Lengyel. *Földtani Kozlony* 59, 26–34(1929) — Lava of the 1928 eruption of Etna is an extreme in lava types, being the most basic rock of all eruptions It consists of an olivine-labradorite basalt with significant content of nepheline S S de Finály

Granites in the region of Mórágy. F. Papp and R. Reichert. *Földtani Kozlony* 59, 35–41(1929) —A petrographical study combined with 3 analyses of rocks from Mórágy (Hungary) S. S. de Finály

**Oligoclase rocks in the region of Szarvaskö (Hungary).** ZSIGMOND SZENTPÉTERY. *Matematik es Természettudomanyi Értesito* 47, 432–65(in German 466–7)(1930) — Rocks consist of 70–80% oligoclass feldspars Seven analyses are published with strikingly large $Na_2O$ values, 8 05 to 9 12% ($K_2O$ content being 0 30 to 0 75%) Rocks show many similarities to the gabbroidal mass of the environment Analogous rock occurrences are found in Transylvania, at Koswa in North-Ural, in Central Asia, at Mariposa, Coalings, Colorado, etc S S DE FINÁLY

**Petrographic examination of the paleolithic splittings of Cave Budöspest, Borsod (Hungary).** AALDÁR VENDL *Matematik es Természettudomanyi Értesito* 47, 468–83 (German abstract 484)(1930) —Splittings consist mostly of chalcedony, contg generally fibrous chalcedony The occurrence of crystals of calcite is characteristic S S DE FINÁLY

**A study of the eruptive rocks of Lammersdorf (Hautes Fagnes)** PAUL RONCHESNE *Ann soc sci Bruxelles Ser B* 51, 52–7(1931) —The rock of Lammersdorf is apparently similar to the rock of Greece They differ especially by larger cryst texture, less abundance of biotite and the presence of large crystals of plagioclase in recurrent zones In general, the rock of Lammersdorf is the equiv of the rock of Greece Attention is called to the identical situation of the 2 eruptive masses of Greece and of Lammersdorf, on the north side of the anticline. These rocks are evidence of a contemporaneous intrusion and elevation by the same geodynamic process This study is especially directed to chem and microscopical examn of the rock Tables of chem compns are given, and mineral constituents are classified ALICE W EPPERSON

**Andesite bomb with bread-like crust from Tusnádfurdö.** VIKTOR ZSIVNY *Matematik es Termeszettudomanyi Értesitö* 46, 277–90(in German 291–)3(1929) —Microscopical and crystallographical examn of a volcanic bomb of Tusnádfurdo (Transylvania) Chem compn (analyzed by K Emszt) $SiO_2$ 65 15, $TiO_2$ 0 44, CaO 4 41, MgO 2 19, FeO 2 85, $Fe_2O_3$ 1 57, $Al_2O_3$ 16 13, $Na_2O$ 3 02, $K_2O$ 2 14, SrO 0 08, $H_2O$ (—110°) 0 19, and $H_2O$ (+110°) 1.33, total 99 51% S S DE FINÁLY

**Origin of the mica-pegmatites of Kodarma (Hazaribagh).** S L BISWAS. *Proc 15th Indian Sci Cong* 1928, 289 —The country rock of Kodarma constitutes the mesozone of the metamorphic belts and consists of mica-schist with subordinate amts of sillimanite, andalusite, etc The proportion of the last minerals increases with the depth as the katazone is approached B suggests that the residual plutonic magma which form the pegmatites and was rich in volatile magmatic substances and rare earth compds was initially at such a high temp and under such a pressure as to be able to assimilate rocks of the deeper region, whereby it became specially rich in compds producing muscovite, feldspars, etc. Injections through rocks other than mica-schist with sillimanite, andalusite, etc, do not appear to have such enrichment in the Kodarma mica area This accounts for the occurrence of marketable mica in pegmatite veins within mica-schist and not in those cutting through other rocks When the melt was forced up to its present position in the upper region, its thermal activity was so exhausted that no pyrometamorphism was effected The magmatic emanation, however, produced marked pneumatolytic effect by the formation of minerals like tourmaline in the country rock. E J C

**Volcanic-ash showers.** L I GRANGE *New Zealand J Sci Tech* 12, 228–40 (1931) —Showers of volcanic ash, each usually not more than a few feet thick, ejected from craters in the Rotorna-Taupa-Tongariro zone, cover the central part of the north island of New Zealand A general reconnaissance is given of the characteristics of the soil forming showers Tables show mech and chem analyses of air-dried soils from these areas W. H. BOYNTON

**The so-called ophiolitic rock of the mountains of Livornese and Castellina.** G. DE GUIDI *Boll ist super agrario Pisa* 6, 53–68(1930) —A geological, micro- and macroscopical description of this arenaceous rock and of its constituents G A B

**Two new occurrences of crystalline limestone from Madura and Tinnevelly districts.** C. K. KRISHNASWAMY AND V S SWAMINATHAN *Proc 15th Indian Sci Cong* 1928, 298 —The authors think that the rocks were originally sedimentary in origin and have been subsequently subjected to metamorphism E J C.

**The siliceous oölites from the Cuddapah formation.** L RAMA RAO *Proc. 15th Indian Sci Cong* 1928, 292 —A microscopic study of the oölites was undertaken with the special object of finding out whether any definitely recognizable org remains could be detected as forming the nuclei of these oölitic grains Several interesting microstructural peculiarities are shown by these oölites One or two types of structures are very persistent, and the question is raised whether they may not be due to some very primitive organism E. J. C.

A short note on the sedimentary petrography of some sandstones of the Raniganj stage from the Raniganj coal field. A. K. BANERJEE. *Proc. 15th Indian Sci. Cong.* 1928, 291–2.—Four specimens of sandstone were examd. microscopically and macroscopically. The result of the microscopic study shows the presence of quartz, feldspar, garnet, calcite, biotite and limonite. Portions of the hand specimens were crushed and sepd. by $CHBr_3$ and the minerals with a sp. gr. greater than 2.8 were, in the order of their frequency, garnet, zircon, rutile, limonite, tourmaline, monazite, apatite and an undetd. black mineral. The 4 specimens of sandstones examd. were obtained from the upper, middle and lower divisions of the Raniganj stage, and B is of the opinion that the heavy minerals do not furnish any data for distinguishing the beds from one another. Conclusions. The beds of the Raniganj stage were derived from the degradation products of a gneissic area with a granite intrusion, and there was no change in the direction of drainage during the Raniganj stage. E. J. C.

## 9—METALLURGY AND METALLOGRAPHY

R. J. REYNOLDS, H. W. GILLETT AND RICHARD RIMBACH

Secondary metals in 1929. J. P. DUNLOP. Bur. Mines, *Mineral Resources of the U. S. 1929, Pt. I*, 179–201 (preprint No. 9, published February 24, 1931). E. H.

Lead in 1929. ELMER W. PEHRSON. Bur. Mines, *Mineral Resources of the U. S. 1929, Pt. I*, 231–64 (preprint No. 11, published March 7, 1931). E. H.

Gold, silver, copper and lead in South Dakota and Wyoming in 1929. CHAS. W. HENDERSON. Bur. Mines, *Mineral Resources of the U. S. 1929, Pt. I*, 265–73 (preprint No. 12, published April 20, 1931). E. H.

Iron ore beneficiation. CLYDE E. WILLIAMS. *Mining Met.* 12, 187–8 (1931).—Methods are surveyed and the possibilities of application to Lake Superior ores discussed. In 1930 over 15% of the ore of this district was beneficiated by washing, drying and sintering and over 25% by crushing and screening. Beneficiation is increasing and should be further increased to conserve rich ores. Gaseous reduction to sponge iron is not recommended. The district will be a leader in iron ore production long after the date of predicted exhaustion. A. BUTTS

Mineragraphic aid in the concentration of manganiferous iron ores. W. H. COGHILL, WARREN HOWES AND S. B. COOKE. *Eng. Mining J.* 131, 371–5 (1931).—Two manganiferous ores, representative of large deposits in the Cuyuna district, in Minnesota, were studied by table concn., flotation, roasting and magnetic sepn., and mineragraphic methods. The ores were quite similar in compn. and appearance, but differed widely in results of sepn. by the methods mentioned. A microscopic study led to the conclusion that ore A did not give good flotation concentrates because of the presence of carbonates intimately assocd. with siliceous gang. Ore A responded to table concn. because the greater portion of the Mn and Fe minerals was fairly well liberated from the gang at table size. Ore B could not be tabled satisfactorily because of the intimate locking of the ore minerals with the quartz gang. Magnetic sepn. was impossible, because the Mn and Fe minerals were closely interlocked. Many photomicrographs and camera-lucida drawings are shown. W. H. BOYNTON

Fine chemicals as precious-metal precip. tests. E. T. ELLIS. *Metal Ind.* (London) 38, 377–8 (1931); cf. C. A. 24, 5006.—Chemicals that may be employed to ppt. Au are: $NH_4$ salts such as oxalate and sulfide, $SbCl_3$, $FeSO_4$, MgO, K salts, Na oxalate, $SnCl_2$ and ZnO. Other pptg. agents for Au and some of the other precious metals are formic acid, gallic acid, $HgNO_3$, oxalic acid, AcOK, K citrate, KSCN, K tartrate, $Na_2S$, Na

tartrate, $Na_2S_2O_3$, tannic acid and tartaric acid. In all cases the chemicals should be of high purity W. H. BOYNTON

Milling test of an oxidized gold ore from vicinity of Rockford, South Dakota. FLOYD C LLLINGSON. *Black Hills Eng* 19, 121–9(1931).—Amalgamation tests showed 50% Au recoverable by amalgamation in bottles, with prospects of larger yields by using a muller Cyaniding on 100-mesh ore gave 96% recovery The ore does not produce enough slime to interfere with percolation Cyanide consumption was about 0 6 lbs per ton of ore, lime consumption was 20 lbs. H C DUUS

Group research among gold producers. R M P HAMILTON *Eng Mining J.* 131, 356–8(1931).—A plea is made for coöperation by producers in Northern Ontario Direct operating costs and metallurgical results of 9 mills are tabulated and a flow sheet is shown for a 500 ton combination flotation and cyanide plant Some of the successes of the group research plan in the Transvaal in Western Australia are touched upon. W. H BOYNTON

The preparation and laboratory control of foundry sands J D BURLIE *J. Western Soc Eng* 36, 80–9(1931).—An outline is given of the general characteristics, source, prepn, requirements and methods of control of foundry sands Sands have 2 main classifications those contg little or no natural bonding material and those contg it The first group is used essentially in the production of synthetic molding sands and cores and the latter as a molding sand Sand testing and control equipment are discussed and many data tabulated Conclusions drawn are The introduction of controlled properties of molding sand has contributed to the realization of a more pos. control of casting technic By the use of suitable sands, the scrap losses may be reduced, and improved quality of castings results Accurately controlled sand properties bear a close relation to an increased rate of production. W H BOYNTON

Natural gas for metallurgical furnace. BANCROFT GORE *Black Hills Eng* 19, 103–12(1931).—The assay furnaces in the South Dakota School of Mines were converted from coal firing to natural gas firing The advantages were found to be greater speed of bringing cold furnace to working temperature, more even heating, control to within 10°F over any temperature between 500°F and 2500°F, low cost of operation (500 cu ft per hr as against 60 lbs coal), and possibility of checking up slovenly student work by metering gas used in furnaces H C DUUS

The mathematical basis of the foundry shaft furnace, the determination of its size and mathematical regularity. ALBERT ACHENBACH *Die Giesserei* 18, 217–25, 241–5 (1931).—By making use of recent literature, math relations involving the 4 principal factors in foundry shaft furnace practice (coke and Fe charged, amt. and velocity of blast, time of passage of charge and the height and capacity of shaft) are derived from considerations of theory and practice It is shown that none of these factors can be changed arbitrarily without causing a corresponding change in the fusion process J. BALOZIAN

Desulfurization [of pig iron] in the basic open-hearth furnace. K. KÖHLER *Stahl u Eisen* 50, 1257–64(1930).—The effect of CaO and Mn in the slag on the desulfurization of Fe in the basic open-hearth furnace has been studied The S content of the finished steel is inversely proportional and that of the slag directly proportional to the CaO content of the slag The rate of removal of the S is also a linear function of the CaO content of the slag between 25 and 40% CaO A further increase in CaO increases the viscosity of the slag and, therefore, reduces its reactivity. No definite relation between the Mn content of the slag and its efficiency as a scavenger for S could be established Slags with a low CaO and a high Mn content have no desulfurizing action, and a deficiency of Mn in no way impairs the desulfurizing action of the CaO. Addn of a large excess of Mn does, however, appear to have some accelerating action on the removal of S from the metal bath B C. A

The fundamental study for the production of low-carbon semi-steels from the standpoint of cupola operations. II. MASAYASU HORIKIRI *Tetsu to-Hagané* (*J. Iron Steel Inst Japan*) 16, 935–60, 1063–86(1930), *Metals & Alloys* 2, Abstracts 74; cf. *C. A* 24, 45, 1605.—H reports the result of an investigation on the production of low-C semi-steels on a large scale Pig Fe and mild steel scrap were melted together in a large cupola The temp in the inner part was measured The combustion gas at that place was sampled, and $CO_2$, CO and $O_2$ were detd. The results thus obtained clearly showed that the C in semi steels is absorbed by contact of red-hot coke with the molten Fe It is, therefore, necessary to use the min quantity of charged coke and to reduce the oxides in the charge with Si in order to obtain the low-C semi steels Moreover, the molten Fe contg high Si dissolves only a small amt. of C, so that high-grade low-C semi steels, generally, contain much Si. The oxidation of Fe by gases

gradually decreases from the tuyère level to the upper part, and increases on approaching the furnace wall but decreases at the center part There is no significant relation between the depth of the cupola hearth and the C absorption of molten Fe When many tuyères with small sectional area are used and the blast is passed through at high speed, the conditions are satisfactory, the atm in the melting zone being oxidizing and considerable C being absorbed by the melt On the other hand, with large sectional area and small nos of tuyères the atm. is reducing, and the absorption of C decreases The C content in the product depends on the contact condition of the gases with the melt and red hot coke at the melting zone; that is, the oxidation takes place by the gases, according to the following: $2Fe + O_2 \longrightarrow 2FeO$, or $Fe + CO_2 \longrightarrow FeO + CO$, and the reduction by the red hot coke, thus $FeO + C \longrightarrow Fe + CO$, $2FeO + Si \longrightarrow 2Fe + SiO_2$ and $SiO_2 + C \longrightarrow Si + CO_2$ G G

The fusion process in the cupola furnace according to views and conceptions of technical investigators. Carl Reis *Die Giesserei* 18, 33-7, 58-64, 78-83(1931) —A lecture J. Balozian

Cupola malleable cast iron. H H Shepherd *Foundry Trade J.* 44, 83-4, 102-4, 109, 125-9(1931) —A general discussion of the manuf of white heart and black heart malleable irons, their compn and structure and also of molding sands used and methods of testing them for bond strength, permeability, etc. H C. Parish

What reasons compelled the Prague Ironworks Company to introduce thin-walled blast furnaces? J Sarf *J. Iron and Steel Inst*, Sept, 1930, Advance copy, 33 pp — The theory of blast furnace working is discussed In connection with the irregular working and severe corrosion of the walls it was observed that places where the lining had been melted off to only a few cm thickness would last well for a comparatively long time. Five furnaces of the thin walled type have been erected on practically the original lines and have been eminently successful, as the lining has a long life, troubles in operation have been decreased, and the consumption of coke has been reduced, contrary to general conceptions The original thickness of the lining of the latest furnace was 250 mm., and after 18 months the lining was 180–200 mm thick in the middle of the shaft and 120–40 mm. in the belly. The only disadvantage is the increased consumption of cooling water. Construction costs are not higher than are those of the older type, as the decreased amt. of firebrick covers the extra cost of armoring the furnace. B C. A

Charging installations of blast furnaces and their effect on the behavior of the run. Hubert Hoff *Rev métal* 27, 604-14(1930) H S van Klooster

Metallography. P. Depossez *Camera* (Luzern) 9, 134(1930) —D describes the service of photomicrography in the study of metals and alloys The prepg of the sample and the arrangement of the microscope are briefly indicated M W. S

Applications of x-rays to the study of metals. James B Friauf. *Rev Sci Instruments* 1, 361–96(1930) —A general popular account is given including the subjects of radiography, metal crystals and alloys, orientation, grain size, internal strain, thermal expansion, fiber structure and the effects of mech and heat treatment. A bibliography of 44 references is appended Notice is given of the publication of a complete bibliography on x ray studies of ferrous materials involving more than 300 references George L. Clark

The recrystallization of metals. P Beck. *Technika* 11, 151-3(1930) —In case of homogeneous deformation, true grain no /temp or grain-size/temp diagrams can be obtained if (1) not only the geometric but also the phys characteristics of deformation (*i. e.*, the original structure and temp.), remain unchanged during the expt., (2) the tested bodies are heated quickly to the resp temps and (3) heating is stopped immediately at the end of recrystn S S de Finály

Microscopic investigation of metals. V. N. Krivobok. *Proc Eng Soc. West Penn* 47, 45–62(1931) —A non-technical review is given emphasizing the purposes of metallurgy and the specific uses of metallography related thereto With regard to inspection of metals and alloys, microscopic studies reveal the characteristics, the previous history of the sample and its suitability for a given purpose, but only when the samples are properly prepd by an experienced operator This is illustrated by 7 photomicrographs The second phase of the metallographist's work is the inspection and investigation of material after a failure has occurred. Under the third category of work, K. discusses the development of new materials, and the illustrations show how to recognize definite changes in properties The fourth function dealt with is true research or scientific metallography, under which 5 illustrations of martensite decompn are discussed M. F. Behar

Plasticity of metals. Zay Jeffries *Mech Eng* 53, 252–6(1931) —Plasticity is defined as "the quality by virtue of which a substance may undergo a permanent change

in shape without rupture" Metals are cryst., and plastic flow is the result of the movement of one position of a crystal with reference to another along crystallographic planes Industrial metals are useful because of their high plasticity, without which metal-working processes could be not carried on M F BEHAR

Gases in metals. C J SMITHELLS *Metal Ind* (London) 38, 261–4, 268(1931) — The soly of gases in molten metals usually becomes greater at higher temps, and is generally much less in solid than in liquid metals With $H_2$, Ni, Pb, Fe, Co, Cu and Pd for alloy systems, alk earths and alkali metals form hydrides, and Au, Ag, Be and Mg show practically no absorption Comparatively few metals absorb N as a gas The total vol of gas that can be extd from brass, Cu Al or duralumin is of the same order as the volume of metal Removal of gases from metals involves melting in vacuum, or with Al alloys slow pre-solidification with or without bubbling dry N or Cl gas through the metal, followed by rapid remelting to pouring temps P R KOSTING

Recent metallurgical research in relation to marine engineering S L ARCHBUTT *Trans Inst Marine Eng* 42, 295–346(1930) —The limiting *creep stress* should be considered for design purposes at elevated temp The nature of the atm seems to influence the rate of creep and the mode of deformation *Intercryst fracture* was found in some creep tests A graph showing the relation between temp, tensile strength, limiting creep stress and limit of proportionality for 0.17% C steel is given Higher pressures and degrees of super heat require a material superior to C steel Creep characteristics are given for various alloys *Ni Cr alloys* and their deriv are most suitable for temp ranges of 600–1000° Limiting creep stress at the highest temp increases with increasing Cr content ANN NICHOLSON HIRD

Use of non-ferrous metals in the aeronautical industry D HANSON *J Inst Metals*, Adv copy, No 545, 24 pp (1930) —The alloys of Al and of Mg now used in the aeronautical industry are considered Mg is inferior in comparison with Al in that it has a lower modulus of elasticity and is not as resistant to corrosion J L GREGG

Magnetic method for testing of wire ropes, especially wire cable. FRANZ WEVER AND ARNOLD OTTO *Mitt Kaiser-Wilhelm Inst Eisenforsch, Dusseldorf* 12, 389–90 (1930) —The device developed for boiler tubes was investigated as to its suitability for cables It proved to be sufficiently sensitive to permit the certain detns of single wire fractures even in the interior of the cable R. RIMBACH

Pickling and burning. I. HERBERT KURRFIN *Chem.-Ztg* 55, 133–4(1931) — Pickling serves to remove foreign material from metal surfaces The mechanism of the process consists of 3 stages loosening of the scale, soln of the scale and, to some extent, soln of the metal Scale is loosened by H evolved from the metal. $H_2SO_4$ is preferable to HCl in pickling, because it may be heated without increasing the vol of objectionable fumes Some portions of the scale are more tenacious than others and require longer pickling Unless inhibitors are added, the clean metal will be dissolved, and diffusion of H from the reaction will embrittle the metal Inhibitors should not materially increase pickling time or remain on the metal surface The metal concn. in the pickle should not be allowed to become higher than 50–60 g per l After pickling, the metal should be rinsed to remove reaction products and the excess acid neutralized with dil $Na_2CO_3$ to prevent fresh attack on the metal II. *Ibid* 150–1.— "Burning" is the process of treating metals with strong mixed acids for the purpose of obtaining dull, colored or shiny finishes Various formulas are given for "burning" solns The acids used are $H_2SO_4$ and $HNO_3$ in varying proportions NaCl, $K_2Cr_2O_7$ and $H_2F_2$ and various forms of lampblack are sometimes added to obtain different finishes. Precautions for operating are discussed B E ROETHELI

Metal-ware pickling data. WALLACE G IMHOFF *Am Metal Market* 38, No 54, 5, 10(Mar 20, 1931), No 55, 5(Mar 21, 1931), No 56, 5, 10(Mar 24, 1931) — Data included in 28 tables showing the results in a no of plants of the pickling of hot galvanizing of 12-qt light water pails are discussed Details are given for wts of pails, pickled wts, the strength of pickles used, etc. The wts of Zn deposited differed by 19½ lbs per gross deposited as coating W H BOYNTON

Modern case-hardening practice. FRANCIS W ROWE *J West Scot Iron Steel Inst* 38, 27–42(1930) —The correct choice of steel for case hardening depends on the character of the stresses to which the part will subsequently be subjected in service. These steels are C steel, 3% Ni, 3.5% Ni, 3.5% Ni-Cr, 5% Ni, 4% Ni-1% Cr, Ni-Mo and Cr-Mo steels Plain carbon steels are subjected to abnormality Ni case hardening steels give higher yield point and tensile strength than plain C steels The presence of 3% Ni enables a satisfactory hardness to be developed by a final quench in oil, and the case is rendered tougher. In order to insure proper hardening of the core the steel

must contain 0.13% C and 3–4% Ni, and be quenched from 780°. A class of case hardening steel which is becoming increasingly popular is that with 4% Ni and 1% Cr, with 0.16% C and with 0.20–0.30% Mo. This material in the water-quenched condition has a strength 90–95 tons/sq. in. and 80–85 tons/sq. in. in the oil-quenched condition. This is associated with an impact value of about 30 ft. lbs. Such steel is capable of withstanding the highest surface stresses, even with a comparatively shallow case, and is used for gear-box gears. The disadvantage of this steel is that, even in the fully annealed condition it is relatively hard to machine. It is also much more prone to over-carburizing than the lower alloy-content steels, and for this reason the carburizing temp. should be low. G. T. Motok

The nitriding process of nitrogen case hardening. J. F. Hurst. *Iron & Steel Ind. Brit. Foundryman* 3, 351–4, 379–80(1930).—The steels used in nitriding and the details of this process are discussed. Leopold Pessel.

Properties of meehanite metal—a pearlitic iron. A. G. Lambert and F. M. Robbins. *Can. Foundryman* 21, No. 9, 14–5(1930).—Data are given on compn. and phys. properties. E. I. S.

Influence of the emissive power on the temperature measurement of liquid iron. Rudolf Hase. *Arch. Eisenhüttenw.* 4, 261–4(1930).—The influence of oxidation on the emissive power of liquid Fe, and therefore on optical temp. measurements, was studied by optical, thermoelec. and photographic methods. Optical measurements made on oxidized surfaces agree more nearly with thermoelec. measurements than those made on unoxidized surfaces. The latter may vary as much as 80–140°. Between 1250° and 1600° the radiating power of bare iron is 0.44 ± 0.03, while that of oxidized iron is 0.95 ± 0.05. These values are practically independent of temp. Deoxidation due to the dissolving of the oxide begins at 1400° and increases with temp. until at 1580° an oxide coating is no longer produced by air. H. F. Johnstone

Results of operation and fields of application of various types of malleable iron recently produced. Rud. Stotz. *Die Giesserei* 18, 1–8(1931).—A lecture. J. B.

High-quality malleable iron. E. Piwowarsky. *Die Giesserei* 18, 19–24(1931). cf. *C. A.* 24, 5264.—A lecture. J. Balozian

The influence of nickel and nickel chromium on the properties of malleable iron. Leon Thiéry. *Rev. métal.* 28, 1–18, 61–78(1931). cf. *C. A.* 24, 4744.—White irons prepd. to contain C 3, Si 0.4, Mn 0.10–0.20 and S 0.018–0.09% were alloyed with 0.5, 1.4 and 2.5% Ni. They were tested together with the original base and an alloy produced by alloying it with 1.37% Ni and 0.34% Cr. Specimens were cast in sand but removed from it rapidly enough to produce chill. On plain C stock, the dilation curves show the effect of quenching. The decompn. of cementite in them begins at 1100°. On repeated heating, the cementite begins to decompose at Ac. The pptn. of graphite on the first heating can be seen under the microscope. With 0.5% Ni, the dilation curves have the same appearance, at least on the first heating, but the cementite begins to decompose at Ac. The presence of 1.4% Ni lowers, by 100°, the temp. of graphitization, reduces the temp. of γ to α transformation and lowers, by 50°, the Ar point. Addn. of 2.5% Ni considerably increases the quenching action of the Fe, reduces Ac below 700° and causes graphitization at 870°. The addn. of 1.37% Ni and 0.34% Cr increases the cementite anomaly and raises the temp. of graphitization, reducing the tendency toward quenching by raising the Ar point. Malleabilizing treatments showed that Ni helps to stabilize the system by decompg. the cementite. It prevents changes on cooling and decreases the size of the constituents proportionally to its content. Cr exerts an opposite action. From 1 to 2% Ni increases the tensile strength by about 30% and almost doubles the elongation. Toughness also increases, reaching 0.430 kg./m. for 1.5% Ni. J. D. Gat

Accelerated annealing of malleable cast iron. V. V. Uson and N. N. Pustumikov. *Vestnik Metallopром.* 10, 97–103(1930). *Chimie & industrie* 25, 352(1931).—The American process is too long, requiring 100–120 hrs. The General Electric Co. has succeeded in reducing the time required to 28–30 hrs., but this requires the use of an elec. furnace. U. and P. have endeavored to render the process suitable for application in ordinary case-hardening furnaces. Their work has shown that (1) In order to accelerate graphitization of the free cementite, it is merely necessary to keep the iron above 1000° for 2 hrs., at the end of which time the metal consists exclusively of the solid soln. and of graphite, (2) To reduce the time required for graphitization of the cementite which seps. on cooling, the metal must be cooled rapidly to 710° and maintained 4 hrs. at this temp. to decompose the pearlite formed by cooling into ferrite and graphite. This process required only 8–10 hrs. in the lab. and 16 hrs. in a petroleum-heated muffle furnace. A. Papineau-Couture

**Graphitization in cast iron.** Otomar v Keil *Arch Eisenhüttenw* 4, 245–50 (1930).—The development of graphite in cast Fe depends on the position of the eutectic. Carbidic congelation at the min of the arrest point shows very fine granular graphite sepn, while at the max needle-like formation occurs The cooling velocity before the eutectic is retarded by increasing C content because of the decreasing work of diffusion The transition of the carbidic forms after the stable congelation has a crit velocity dependent upon the C content, a fact which indicates a mol transformation to a stable phase Overheating reduces the crit cooling velocity Overheated cast Fe congeals throughout in the metastable form and remains in this condition after remelting H F Johnstone

**Nickel cast iron and its uses in the electrical industry** W C Hirsch *Elec Mfg* 5, No 2, 55–7(1930).—Marked improvement obtained in the quality of steels by addn of Ni led to an intensive investigation of benefits obtainable from its use in gray iron Ni cast iron offers a solution to many problems in the manuf of elec. machinery and domestic appliances E I S

**The theory of the tempering of cast iron according to American methods.** N Hekker. *Die Giesserei* 18, 14–9, 39–45(1931).—A theoretical paper J B.

**Fatigue tests on iron and steel** Axel Lundgren *Jernkontorets Ann* 115, 1–70 (1931).—Besides a detailed review of the most important results obtained in different countries by studies on the fatigue of metals, a report is given on investigations carried out at the Government Testing Inst, Stockholm The results of these investigations, which were made with the 'Alpha' testing machine, may be summarized as follows: Test bars for one-sided load were made with radius of fillet 0, 1, 2 5 and 10 mm A radius of 10 mm gave 90% higher fatigue limit than a radius of 0 mm and 2% higher than a radius of 5 mm Tests with const moment gave a 2–3% higher fatigue limit than tests with one-sided load A number of steels were investigated with the object of studying the relation between endurance and heat treatment, as well as between endurance and other mech properties Widely differing annealing temps were found to have a very slight influence on the fatigue limit On the other hand the endurance is considerably increased by quenching and varies with the degree of tempering No marked relation was found between the fatigue limit and the limit of proportionality or the yield point The relation between endurance and ultimate stress is more pronounced A scrutiny of the results of this and previous investigations indicated that the ratio $K$ of fatigue limit to ultimate stress varies within certain limits and increases with reduction of area. By plotting $K$ against reduction, diagrams were obtained for steels with different microstructure, from which the following conclusions may be drawn *Pearlitic C steels*—$K$ = 0 37 for a reduction of area less than 36% Above this value $K$ increases with reduction *Pearlitic Ni and Cr steels*—Values of $K$ than in pearlitic C steels *Sorbitic steels*—Values of $K$ are considerably higher than in pearlitic steels Increase of $K$ with reduction of area is not so pronounced as in pearlitic steels *Steels contg a mixt of sorbite, pearlite and ferrite*, with the ferrite in the form of network $K$ is considerably lower than in sorbitic steels, sometimes even lower than in pearlitic. *Martensitic-troostitic steels* with high ultimate stress Values of $K$ are lower than in sorbitic steels A one-page English summary is given. (43 references) H. C Duus

**The influence of various elements on the carburization of iron and steel.** Genské Takahashi *Kinzoku no Kenkyu (J for Study of Metals)* 8, 102–26(1931).—The influence of various elements on the degree of carburization of special iron and steel and also the same influence on the hardness of carburized products have been systematically investigated M Kuroda

**Optical investigations on the passivity of iron and steel.** L Tronstad *Nature* 127, 127–8(1931), cf *C A* 24, 1566.—Using mirrors of Fe and steel, T treated them electrolytically in baths of alk, neutral and acid $Na_2SO_4$ solns, different c. ds were used During the passive state all mirrors showed a change in the reflected light, this corresponded to the formation of a surface film with a mean refractive index of 3 0 and a mean thickness of 30 A U This agrees with a film of $Fe_2O_3$ Reactivation did not completely remove the oxide skin More of the film was destroyed on ferrite than on cementite grains Alternating cathodic and anodic treatments 3 times in 3 hrs left microscopically visible dark brown spots on the cementite, and faint yellow interference colors could be detected only by employing slanting incidence over the ferrite particles Frank Maresh

**Intercrystalline fractures in soft steel.** Enrico Crepaz *Atti III congresso naz chim. pura applicata* 1930, 380–7.—An attempt was made to explain the formation of intercryst cracks in soft steel (0 14% C) after immersion of the steel in liquid metals

or alloys, such as Cu, Zn, brass (30% Zn), bronze (15% Sn) and Al bronze (7% Al). Steel rods of 1 cm diam were immersed for 2–3 min. in the molten bath and were bent after removal from the melt (1) when the adhering melt had not yet solidified and (2) after complete solidification of the molten alloy. In both cases transverse cracks appear which are deepest at the places where the curvature of the rod is greatest. Microscopic observation of transverse sections showed that the cracks were intercryst. and filled with the solidified metal or alloy. The cracks are due to the internal stresses set up as a result of localized heating of the steel in contact with the liquid alloy. This is also brought out by the fact that bending of the rods inside the bath after immersion for several min. does not, as a rule, produce cracking, whereas bending immediately after immersion causes, in most cases, pronounced intercryst. cracks. The dissolving action of the melt is not a contributing factor, since the fractures appear more readily in brass and bronze than in Zn, although the latter has greater dissolving power.

H. S. VAN KLOOSTER

Mechanism of coalescence in steels. R. K. THAKORE. *Proc. 15th Indian Sci. Cong.* 1928, 92.—In considering the phenomenon of coalescence in alloys with special reference to coalescence of carbide in steel from the viewpoint of theoretical physics, K. makes 2 assumptions: (1) slight soly. of carbide in ferrite below the $A_1$ point, and (2) diffusion in solid state subsequent to state of inequil. Both are well supported by the well known researches of Benedicks, Roberts-Austen and others. K.'s observations (not given) show that the acceleration in coalescence in steels due to cold working is not primarily due to breaking up of cementite lamellae. K. made, but does not include here, a quant. record of progress of coalescence of carbide in sorbitic steels, as measured by degradation of mech. properties of steel.

E. J. C.

New process of quenching steel. N. F. BOLKHOVITINOV. *Vestnik Metalloprom.* 10, 88–90(1930). *Chimie & industrie* 25, 352–3(1931).—B. exptd. with Lewis' process, which consists in heating the steel above the crit. temp. and then quenching in a bath of molten salt or of oil heated to 230°. When treated in this way, the steel is at first soft, it consists of austenite, and becomes hard only about 5 min. after having reached ordinary temp. It then expands, becomes magnetic and is transformed into martensite. Owing to this slow change in structure, all the transformations produced by the variations in vol. have time to take place, which completely eliminates the usual defects of the ordinary quenching process, giving great hardness and homogeneity. But from a practical standpoint, the greatest advantage of the method lies in the fact that pieces quenched in this way can undergo all the requisite deformations and flexions in 1–2 min. after quenching.

A. PAPINEAU COUTURE

Interpretation of the complex phenomena observed during the reversion of highly tempered steel. ALBERT PORTEVIN AND PIERRE CHEVENARD. *Compt. rend.* 191, 1008–10(1930).—Two reactions take place simultaneously: (1) Supersatd. $\gamma$-iron decompg. into cementite and $\alpha$-iron, with less C causing contraction and (2) $\gamma$ soln. decompg. into cementite and $\alpha$-soln. with little C causing expansion. Any change in dilatometric manifestation is due to a preponderance of one reaction or the other, according to the temp.

O. M. SMITH

The resistance of steel to cyclic stresses. W. SCHNEIDER. *Stahl u. Eisen* 51, 285–92(1931).—The importance of the resistance of steel to cyclic stresses in construction work is pointed out. The difference between the long- and short-time testing methods and the effect of surface irregularities and of combined stresses on the results of the tests are discussed.

J. A. SZILARD

Annealing of steel in a protective atmosphere of producer gas. A. JOHANSSON AND E. VON WACHENFELDT. *Jernkontorets Ann.* June 1929, 141–79, 180–9.—Results of an investigation of the possibility of bright-annealing steel with charcoal producer gas show that this can be done. The app. used is described.

E. I. S.

Coarse-grained recrystallization of cold-drawn low-carbon seamless tubes. Annealing tests with critically cold-rolled rods of low-carbon steel. ANTON POMP AND ERWIN HOLWEG. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Dusseldorf* 13, 1–28(1930).—It was detd. that the grain size of critically cold rolled rods was considerably smaller after annealing at 750° than after annealing at about 700° or about 800°.

R. R.

Effect of various annealing temperatures on cold-worked low-carbon steel. H. E. PUBLOW, C. M. HEATH AND R. A. GEZELIUS. Mich. Eng. Expt. Sta., *Bull.* No. 35, 17 pp. (1931), cf. *C. A.* 24, 3975.—Without appreciable change in microstructure, low C steel (analysis not given) changes in hardness from 58 to 85 Rockwell B on drawing into brake drums. Olsen ductility tests for such a steel give 0.17 in. deflection at 9000 lb./sq. in. max. load. Annealing at 1150–1250°F. for ½ hr. and cooling at the rate of 70°F. per min. dropped the hardness to 60 and raised the deflection to 0.36 in., max.

load to over 11,000 lb /sq in This gave better ductility than raising above the crit. point and cooling at that rate Various other times and temps were tried Much of the hardness produced by drawing into brake drums is acquired before the microstructure shows apparent distortion of the grains Annealing at 800°F increases the hardness instead of decreasing it, prolonged heating below 1000°F does not relieve internal strains, the best annealing temp is 1250–1300°F, *i e*, just below the lower crit. point. H W GILLETT

**The sensitiveness to overheating of low-carbon ingot steel.** E POHL, E KRIEGER AND F SAUERWALD *Stahl u Eisen* **51**, 324–6(1931) —Annealing tests between 950° and 1400°, in 50° steps, were carried out on 4 low C ingot steel samples and one Mo steel The temp at which oxidation occurs after 1 and 5 hrs of annealing, the depth of the oxidized layer and the change in grain size as a function of the annealing temp were detd After 1 hr annealing the temp of overheating was found to be between 1200° and 1400 for the various samples and the thickness of the oxidized layer 0 1 0 2 mm After 5 hrs annealing the temp of overheating was found to be between 1150° and 1200 and the depth of the oxidized layer 0 4 1 4 mm Ingot steel with a coarse grain structure is less resistant to overheating than steel with a fine grain structure J A SZILARD

**Copper steel for dynamo and transformer sheets.** A KUSSMANN, B SCHARNOW AND V S MESKIN *Stahl u Eisen* **50**, 1194 7(1930) —Addn of up to 0 7% Cu to steel with 1 5 and 4% Si has practically no effect on the magnetic properties, but a larger proportion of Cu has a deleterious effect Less than 0 7% Cu improves the hardness and tensile strength and the resistance to corrosion of these steels and is therefore a desirable addn B C A

**Fatigue strength of carbon- and alloy-steel plates as used for laminated springs.** R G C BATSON AND J BRADLEY *Engineering* **131**, 405–6(1931) Conditions of the surface layer of spring-steel plates cause fatigue resistance of complete laminated springs to be lower than the mech properties of material would indicate Fractures of laminated springs may be due to very low limiting ranges of stress obtained from unmachined plates compared with those from machined specimens Deleterious layers could be removed by machining 1/16 in from the surface Surface effect was found to be produced by hardening and tempering Only very slight improvement was obtained by heat treating spring plates after a thin layer had been machined from the surface of the rolled material Tables are given summarizing the results of tests made LOIS F MCCOMBS

**Cobalt magnet steels.** H E KERSHAW *Edgar Allen News* **9**, 701–5(1930), *Metals & Alloys* **2**, Abstracts 63 —There are 2 classes of Co magnet steels the low- and medium-Co chrome steels and the high-Co steels The Co chrome steels are subdivided, one contg 9% and the other 16% Co, but both contg Cr 9–10, Mo 1.5 and C 1.0–1 15%, these are air hardening, and the best results follow a triple heat treatment. The high-Co steel usually has Co 36, Cr about 6, W 4–6 and C 0 9% these are oil hardening, only a single treatment is necessary, but accurate temp control is essential This alloy has better magnetic properties than any other known at present, *B H* max. values of 900,000–1,000,000 are regularly obtained. The high frequency elec crucible furnace is very efficient for the manuf of Co magnet steels and can also be used for cast magnets With Co-Cr steels better magnetic results are obtained from forged than from cast magnets the higher the Co content, the greater the discrepancy between the magnetic results With the 36% Co alloy, cast magnets can be produced having as good, sometimes better, magnetic properties than forged magnets Some special magnets are described G G

**Properties and application of nickel and nickel-chromium steels.** J GALIBOURG. *Rev metal* **28**, 30–9, 85–100(1931) —A review of the properties of plain C, Ni, Ni Cr and stainless Ni Cr alloys J D GAT

**Suppressed constitutional changes in alloys.** G SACHS *Am Inst Mining Met Eng, Preprint Inst Metals Division* **1931**, N Y meeting, 10 pp —X ray analysis and single-crystal study have been utilized in recent years as a new means of following constitutional changes in alloys If such transformations can be suppressed by rapid cooling, they can be followed at room temp in a particularly convenient manner This paper considers changes in soly and polymorphic transformations with particular reference to phenomena of the age hardening type A thermodynamic viewpoint is developed for examg such transformations C. L MANTELL

**The structure of cast alloys.** MARIE L. V GAYLER. *Metallwirtschaft* **10**, 141–4 (1931) —An Al alloy contg 7% Cu was melted in a high frequency induction furnace and held in a vacuum, in the presence of air, N, H and furnace gases for 25 min. One

set was cast at 740° and another at 840° Each heat was cast into 4 different molds steel, graphite, water cooled Cu and sand Photomacrographs of the structures are shown The furnace atm has little effect on the specimens cast at 740°. The macrostructure in all is fine grained, in those melted in vacuum and under H it is the finest. Those cast in sand are somewhat coarser than those cast in steel The microstructure is the same in all The macrostructure of the set cast at 840° into steel molds is coarser than that cast at 740°, and there is much more difference between different furnace atms Furnace gases produce the coarsest grain, and the difference is still greater when cast in sand The microstructure is finer grained, at the higher casting temp Both series cast in water cooled molds have a similar fine grained macrostructure, with little difference between the various furnace atms C. E. McPARLANE

An investigation of wrought light alloys. BUNTARÔ ÔTANI. *Kinzoku no Kenkyu (J for Study of Metals)* 8, 89–101(1931).—A relative test of forgeability for 40 kinds of special light alloys was carried out, and the effect of heat treatment on the hardness of these alloys was also investigated For the alloys which showed good mech and working properties, the effect of natural and artificial aging on the hardness of quenched alloys was investigated, several mech tests were also carried out on the bars and plates of these alloys M KURODA

Production and application of the light metals and of their alloys in Italy. A W BONARETTI *Metalli leggieri* 1, 7–17(1931).—A monograph ROBERT S POSMONTIER

Aluminum and its alloys. F. LIBERA *Metalli leggieri* 1, 19–28(1931).—A description with photographs ROBERT S POSMONTIER

Influence of antimony in aluminum alloys. A. W. BONARETTI. *Metalli leggieri* 29–52(1931).—A description is given of the phys and chem properties and compns of various Al alloys contg Sb, especially treating of the resistance of such alloys to action by sea water Many photographs are given ROBERT S. POSMONTIER

Changes in properties during the cooling of supersaturated silver-copper alloys. N. V. AGEEV, M HANSEN AND G SACHS *Z Physik* 66, 350–76(1930).—In general the changes proceed in the same manner whether the alloy is rich in Ag or in Cu In addn to the normal changes in resistance due to the altered compn there is an anomalous effect producing an increased resistance At low concn and at high temp, the change in hardness and the anomalous resistance are related to the amt of sepd crystals At high concn and low temp there is a marked increase in hardness in the initial stages of sepn without any corresponding change in resistance S BRADFORD STONE

The structure of copper-zinc alloys. W. BRONIEWSKI AND J STRASBURGER *Rev metal* 28, 19–29, 79–84(1931), cf *C A* 24, 4747.—Literary data do not definitely establish the compn of the definite compds of the Cu-Zn system To obtain the necessary equil specimens cast in chills and contg less than 49% Zn were annealed at 400° for 1000 hrs, and those with higher content of Zn for 3000 hrs The treatment was conducted in an elec furnace well luted with fireclay, so that the changes in the compn were found only in a very thin outside layer of specimens Parallel series of tests were made on cast and so-annealed specimens Elec cond, thermoelectric power, e m f of the soln, dilation and Brinell hardness were detd These tests and microscopic evidence placed the limits of solid soly of the $\alpha$ phrase between 0 and 35 at % of $\beta$ between 46 and 49%, of $\gamma$ between 59 and 67% After 3000 hrs' annealing the $\delta$ phase was never perfectly homogeneous, this interfered with the detns of its limits of solid soly which tentatively can be given as 79 and 87% The range for $\epsilon$-phase is within 98 and 100% Zn The existence of $CuZn_3$, $CuZn_2$ and $CuZn_4$ at room temps. was reasonably well established The shifting of the maxima of corresponding curves from theoretical 50% to about 49.6% can be explained on the assumption of the partial decompn of CuZn into $\gamma$- and $\alpha$ phase. J D GAT

Platinum-iridium alloys. FRANZ KORN *Metal Ind* (London) 38, 309–10 (1931).—Pt-Ir alloys have high strength and a faint blue color and are resistant to tarnishing The tensile strength varies from 30 tons/sq in with 5% Ir to 97 tons/sq in with 30% Ir Alloys contg more than 12% Ir increase in tensile strength when annealed between 600° and 800°. Annealing temps should never be above 950° especially for alloys with more than 15% Ir, some of which is lost by volatilization Corrosion resistance to hot aqua regia and $H_2SO_4$ increases with Ir addns Pd does not harden Pt alloys as effectively as Ir Au increases both hardness and brittleness of Pt, but the brittleness is counteracted by Pd. The Pd content should be 2 or 3 times the Au content to obtain the best results with Pt Pd Au alloys P R KOSTING

Development of zinc-base die-casting alloys. D L COLWELL *Proc Am Soc Testing Materials* 30, Pt II, 473–92(1930).—The history of the improvement of Zn base die casting alloys is illustrated in series of charts, which show the effects of nor-

mal and accelerated aging on size and phys properties of Zn base die-castings The data from the tests and the conclusions are given H W GILLETT

**Equilibrium diagram of the system: lead arsenic.** MOHAMMAD OMAR FARUQ *Proc 15th Indian Sci Cong* 1928, 176—Arsenic alloys with Pb in all proportions The diagram was studied up to 60% As Pb does not dissolve any As at its m p, but at higher temps 2 layers are formed The lower layer is Pb contg a small quantity of As in it, and the upper layer is As with a small quantity of Pb dissolved in it W J C

**Thermal analysis of the system: lithium-copper.** S PASTORELLO *Gazz chim ital* 60, 988-92(1930) Since the publication of a paper on Li Ag alloys (cf *C A* 25, 270) a *method for the thermal analysis* of such systems has been developed, which requires only 0.3-2.0 g of Li and permits verifying a eutectic almost to the limit of its formation A systematic series of thermal analyses of binary alloys of Li and heavy metals of the same group was therefore begun There is no earlier literature on Li Cu alloys and the constitutional diagram of such a binary system is unknown Preliminary to the thermal analysis of Li Cu an x-ray examn was made by photographing an alloy contg approx 50 at % of Li This gave a rontgenograph with only diffraction lines which correspond to the normal lattices of Cu and of Li Consequently no intramol compd and no solid soln of Li with Cu were formed This behavior, which was then confirmed by thermal analysis, is quite different from the behavior of Li with Ag as already shown (cf *C A* 25, 270) and of Li with Au as x-ray examn, to be described later, shows The Li Cu alloys (1.71 to 94.01 at % of Li) were prepd by *fusion in a Ni-Cr steel crucible in an A atm., and the cooling curve was obtained by* temp measurements with a Pt-Pt-Rh thermocouple and a Hartmann and Braun galvanometer If special Ni-Cr steel is not used, the mixt attacks the crucible badly, particularly with alloys rich in Cu Even with Ni-Cr steel, several preliminary fusions must be carried out until the % Fe in the alloys has become low enough (Cu contg 3% Fe is only 10° different from pure Cu—cf Ruer and Goerens, *C A* 12, 577, Sahmen, *C A* 2, 1549—so 0.1% Fe in the Li-Cu alloy is low enough) Alloys contg 1.71, 9.90 and 14.38 at % Li had a color resembling pure Cu, whereas with higher and increasing % Li the color approached the metal gray of Li All alloys were ductile, and those with high % Li were almost as soft as pure Li All were readily attacked by water, leaving cryst Cu of unusual appearance with alloys high in Li A *eutectic* was formed at the m p of pure Li, even for alloys contg less than 2 at % Li In this latter case the m p was approx 50° below that of Cu From 10 to 90 at % Li, the m p depression was almost linear The 2nd arrest in the m p of pure Li was found with all the alloys. Pure Li melts at 180°, which agrees with the data of the majority of investigators Alloys rich in Li did not show any marked liquidation, as would be expected from the great difference in d C. C. DAVIS

**The solid solutions of the copper-silver system.** D STOCKDALE *J Inst Metals*, Advance copy No 559, 14 pp (1931)—The solid solubilities of Ag in Cu and Cu in Ag were detd by microscopic and elec methods. The solv of Ag in Cu is 8.2% at the eutectic temp, 4.7% at 700°, 0.7% at 400° and probably almost zero at room temp The solid solv of Cu in Ag is 8.8% at the eutectic temp, 5.8% at 700°, 1.1% at 400° and about 1% at room temp The Cu rich solidus curves downward sharply near the limit of solid solv The Ag rich solidus is nearly a straight line. J. L. GREGG

**The effect of rate of bending in notched-bar bending tests.** JAMES G DOCHERTY. *Engineering* 131, 347-50(1931)—The expts. were undertaken to establish the relation between the slow bend and the Izod notched bar test, and to discover whether the results obtained in the Izod test measure the resistance of the material to impactive loading or to the stress concn produced by the notch A special testing machine, devised by D., was used The materials tested were C steels, 3% Ni steel, Monel metal, naval brass, phosphor bronze In the more brittle metals, *i e*, those with Izod impact strength less than 30 ft lb, it has been possible to test at ½ the Izod speed in the standard Izod machine by reducing the available energy to 30 ft lb These tests help to bridge the unexplored gap between the fastest slow bend" test (150 in /min) and the standard Izod test (7000/min) For all the ductile metals tested the energy absorbed in bending or in fracture increases with the speed of test Impact brittleness is considered as a velocity effect, and there is no discontinuity between the slow bend and Izod test *Ibid* 414-5—The relation between the notched bar test and the ordinary tensile test is *energy absorbed in ft lb* divided by ultimate tensile strength in tons per sq in G T. MOTOK

**Measurements on the degree of orientation in hard-drawn copper wires.** W. A. WOOD *Phil Mag* 11, 610-7(1931)—The results confirm Schmid's (cf. *C. A.* 23,

1029) The degree of orientation was estd by the measurement of photographic film intensity at convenient points on the diffraction rings where max or min occur The drawn wire may be described as consisting of a randomly oriented cylinder surrounding a highly oriented core This is characteristic of all drawn wire The effect of drawing is to slowly increase the degree of orientation in the interior of the wire Orientation is highest along the axis of the wire The change from oriented to non-oriented is quite sharp ARTHUR FLEISCHER

Cold-working and annealing of α brass. J. NAVARRO ALCÁCER. *Anales soc espaÑ fÍs quím* 28, 1429–34(1930).—The process of recrystn of cold-worked brass was studied, and the optimum annealing temp detd There were detd the x ray diagrams, which fixed the positions of the elementary lattices, the temp of beginning of recrystn., Laue grams and the progressive increase of grain at different temps Mech tests gave data on improvement of coeffs of cold working by repeated annealing and recrystn. processes which agreed well with the above In stamping and the like the best results are obtained between 800° and 900°. E M SYMMES

The recrystallization of technical lead. F LOOPS-RASSOW *Metallwirtschaft* 10, 161–5(1931).—The grain sizes of 17 grades of Pb were detd after casting them into strips, reducing them 50% by rolling and annealing for 15 hrs at 200°. Electrolytic Pb has a grain size considerably above 1 mm., com Parkes Pb about 1 mm., and Pattison Pb and Pb alloys less than 1 mm Elements like Cu and Ni which are not sol. in Pb reduce its grain size, while Bi, which is sol., does not. Samples of one of each of the 3 grades of Pb were reduced 6–87% and annealed at 18–310°. Grain size was detd. and recrystn diagrams constructed. The increase in grain size with rising annealing temp is gradual for the first 2 grades, but Pattison Pb hardly changes up to 280°, then suddenly becomes larger than the other 2 The lower recrystn limit is above room temp for very low deformations, below for higher deformations. There was no difference in the recrystn grain size of samples rolled at room temp and at −70°. Long aging of rolled samples at room temp produces normal recrystn. with higher deformations and grain recovery with low deformation. C. E. MCFARLANE

The influence of impurities in soft lead on its behavior toward acids. ARTHUR BURKHARDT *Metallwirtschaft* 10, 181–7(1931).—Forty-one com. grades and alloys of Pb contg small percentages of Cu, Ni, Bi, Sn, Sb, Te, Zn, Cd, Ag, Tl, Fe, Hg or Li, or combinations of these were tested for corrosion resistance against various strengths of $H_2SO_4$ and HCl at 20°, 90°, 130°, 170° and 220°. Tensile tests are not a suitable measure, as the strength drops in proportion to the reduction in cross sections of the test bar Loss of weight was detd instead Seventy % $H_2SO_4$ at 170° attacks com Pb contg Bi, Zn or Ag most, then those contg little or no Cu, and those contg Ni or Cu the least. Cu can compensate for the bad influence of Bi At 90° Sn, Sb and Ag are no worse than Cu alloys, and at 20° there is very little difference between any of the grades With 98% $H_2SO_4$ similar results were obtained. Fe, Sb, Sn, Te, Cu and Ni retard corrosion of Pb in $H_2SO_4$. Tl and Hg have no effect, Li, Ag, Zn, Cd and Bi increase corrosion Tests were also made in 10 and 20% HCl and in moist $Cl_2$ at 20° and 90°. In HCl brands which contain Cu, Ni and Te are attacked most and the purest grades least. In 20% HCl the attack is greater than in $H_2SO_4$, but in 10% HCl it is slight, in moist $Cl_2$ it is a little greater Attempts to obtain greater resistance to HCl by alloying failed No theory for the effect of impurities on the corrosion of Pb has been worked out, it must be detd empirically. C. E. MCF.

The oxidation and intercrystalline brittleness of nickel. N.-V. AGEEV. *Trans Inst Metals* (Moscow) No 7, 61–79(1930).—Two grades of com Ni showed that Ni is brittle after having been annealed under atm. conditions at 800° and 1000°. Intercryst oxidation is the cause of this brittleness E. I. S.

Sprayed aluminum coatings. LEOPOLD PESSEL. *Metal Ind* (London) 38, 288 (1931).—A blister type of corrosion, occuring on rolled Al sheet, is described and theoretically explained These corrosion exfoliations can be prevented by the application of an Al coating by the metal spraying process LEOPOLD PESSEL.

Standards and exposure tests for plated metals. WILLIAM BLUM. *Brass World* 27, 57–60(1931).—A series of exposure tests of electroplated surfaces has been started. Points considered include the location of the tests, order of tests, solns and conditions to be used in plating, size, shape and arrangement of specimens, prepn for plating, conditions of exposures, methods of inspection, etc. Any general specifications must be prepd with respect to certain types of use or service and adopted or modified by mutual agreement for any specified article. W. H. BOYNTON

Estimating galvanizing pot life. WALLACE G IMHOFF. *Iron Age* 125, 1154–5 (1930); cf. *C. A.* 24, 2373.—The temp. of the bath is the most important single factor

influencing the destruction of the galvanizing pots. They should be designed in such a manner that no part can possibly be heated above 900°F. The regular operating temp of the pots should be as low as possible and should never go above 875–85°F. The use of an elec. pyrometer for indicating and recording the pot temp is recommended. A table is given showing the relationship between the bath temp. and the loss of thickness of the steel walls, from which deductions as to the estd life of galvanizing pots with a wall thickness of 1 in and 1.25 in are drawn. Practical experience was found to check up with these theoretical figures. LEOPOLD PESSEL

Galvanizing-pot destruction. WALLACE G IMHOFF *Iron Age* 125, 633–6(1930); cf. *C. A.* 24, 2973.—The attack of molten Zn upon steel sheets was studied at different temps The attack becomes very strong at 900°F. LEOPOLD PESSEL

Comparison of rust protection of iron by zinc, by cadmium and by zinc-copper alloys and the electrodeposition of such alloys. FRANK C MATHERS AND RUSSEL L HARDY. *Proc. Indiana Acad. Sci* 38, 183–5(1928).—Measurements were made of the relative degree of protection against rusting of an Fe surface given by Zn, by Cd and by Zn-Cu alloys. The metals were sprayed with 5% salt soln to induce rapid rusting The presence of Cu in Zn deposit on Fe lessens the time of protection in the salt spray. Cd gives almost twice as long a protection as does an equal wt. of Zn Cost of rust protection by Cd is 7 times that by Zn A method is given for controlling the compn. of electrodeposited alloys by using anodes of 2 different compns and switching the current alternately from one to the other. H M STARK

Apparatus suitable for control determinations of the total zinc coating on steel. GOEKE. *Chem Fabrik* 1931, 147–8.—The vol of H evolved by acid is measured Cf. Cushman, *C. A.* 15, 1123, 1882 J. H MOORE

Corrosion and its prevention. J VESZELKA *Bányás Kohás Lapok* 63, 9–14, 35–41(1930).—A brief account of corrosion and non-corrosive metals and alloys which may be used in boilers, etc. S S. DE FINÁLY

The corrosion resistance of copper-bearing steels. W MARZAHN AND A PUSCH *Korrosion Metallschutz* 7, No 2, 34–9(1931).—Lab tests of Cu-bearing steels showed the addn of 0.35–0.45% Cu to diminish the wt. loss in 5% $H_2SO_4$, 5% HCl and $H_2O$ Greater addns. did not increase the protection, which was about 90% in $H_2SO_4$, 50% in HCl and 80% in $H_2O$. Addns of 0.36% or more Cu brought about a reduction in tensile-strength loss which was ½ that of Cu-free steel Service tests, in which the plates were located in the roof of a steam railroad tunnel, showed that Cu-bearing steels were about 15–20% more resistant than Cu-free steels. B E. ROETHELI

The role of hydrocyanic acid vapors in the corrosion of iron. J. F G HICKS. *J. Phys Chem* 35, 893–904(1931).—Investigations were made to det. the part played by HCN gas in the corrosion of Fe (particularly in the internal corrosion of gas mains), the app and procedure used being essentially those used previously (*C. A.* 23, 3199) From graphs of the corrosive effects (mg /sq cm.) of various gaseous mixts against the time of test (days), it is concluded that: (1) HCN, although not a cause, is the chief contributory factor in the internal corrosion of gas mains, $H_2CO_3$ and O following in order, and (2) HCN possesses the greatest intensity of effect and is 1st in order of priority of attack. It is shown that in the cases studied HCN does not initiate the corrosion. The mechanism of the "cyanide corrosion" of Fe is similar to other Fe-corrosion processes. Prussian blue is the final product in the corrosion of Fe in the interior of gas mains. The conclusions drawn from the graph are checked electrochemically by the methods in the previous investigation. J. BALOZIAN

Corrosion "danger" with light metals (aluminum alloys). P. SCHWERBER. *Metallwirtschaft* 9, 158–60(1930).—A comparison of the corrodibility of iron (steel) and of light alloys. The latter are found, generally speaking, much less subject to corrosion. LEOPOLD PESSEL

The use of aluminum for oil-lease tanks. I. Field tests. LUDWIG SCHMIDT, JOHN M. DEVINE AND C. J. WILHELM Bur. Mines, *Rept of Investigations* 3066, 17 pp (1931).—Al has promising possibilities as a material for the construction of lease tankage because of its resistance to $H_2S$ corrosion The use of Al steam coils in contact with salt water is not practical The Al tank plate used did not prove highly resistant to the corrosive action of concd brines. When used in conjunction with steel, extreme care must be taken that no electrolyte is present ALDEN H. EMERY

Condenser-tube corrosion. D. HANSON. *Nickel Bull* 3, 81–5(1930); *Metals & Alloys* 2, *Abstracts* 64.—*A theoretical consideration of corrosion is given, particularly of* the mechanism of condenser-tube corrosion, the theory of electrolytic corrosion and the factors influencing corrosion It is concluded that the soln. of the corrosion problem lies in the use of corrosion-resistant alloys. The possibility of the use of Ni-Cu alloys

is treated It contains a schematic illustration of a jet test app used for detg the comparative corrosion resistance of various condenser tubes. G G

A magnetic method for testing boiler tubes. FRANZ WEVER AND ARNOLD OTTO *Mitt Kaiser-Wilhelm Inst Eisenforsch Duesseldorf* 12, 373-87(1930).—The introduction reviews the history and literature of magnetic testing Two methods of testing were investigated (1) the method developed by Sanford and Kouwenhoven, (2) methods developed by the authors The influence of magnetization field strengths and magnetization in weak and strong fields are discussed R. RINBACH

Atomic hydrogen welding. C. J MACGUFFIE *Baltimore Engr* 5, No 5 15-6 (1930).—General notes on development, process and equipment E I S.

Investigations on the influence of covered welding electrodes on the mechanical properties of the welds. K BALMGAERTEL. *Forschungsarbeiten Geb Ingenieurw* No 336, 33 pp (1930), *Metals & Alloys* 2, Abstracts 70.—The absorption of O and N from the surrounding air during welding reduces the mech properties of the weld, to exclude or to reduce this influence the welding rods are provided with a kind of covering or are dipped Tests were made with the following kinds of welding rods (1) bare rods, (2) dipped rods of the American Welding Process Co., (*a*) intermediate, (*b*) normal, (3) asbestos covered rods of the same company, (*c*) special A, (*d*) special B, (*e*) low volt, (*f*) standard The rod itself had the following compn. in all cases: C 0.11, Si 0.01, Mn 0.41, P 0.023, S 0.037%, and the remainder Fe. In the covered rod, asbestos takes the place of a flux The chem compn of the coating is given in detail for every kind of rod used The 2 light coverings *a* and *b* do not materially influence the tensile properties and simply facilitate welding The asbestos-covered rods covered with a flux, however, show a decided favorable influence as illustrated by phys., chem., metallographic and x ray tests The least influence was found in the Brinell test, while tensile strength and elongation showed considerable improvement compared with bare electrodes, the same was true also for bending tests, some of the samples could be bent 180° without fracture X ray tests showed finer-grained structure for covered electrodes. G G

Thyratron control equipment for high-speed resistance welding R C. GRIFFITH *Gen Elec Rev* 33, 511-3(1930).—In interrupted line welding service requirements of the control device are particularly severe, for this reason application has been made of the Thyratron tube as make-and-break device in control equipment. Metallurgical coke. ALFRED DUFRAINE Fr 689,738, Feb 11, 1930 The reactivity of metallurgical coke is reduced and economy of the coke is secured by immersing it in a soln of lime or cement or by dusting it with powd lime or cement.

Ores. METALLGES A.-G Fr 697,783, June 23 1930 Ores in the form of slimes or mud are freed from their water by mixing them with substances such as coke which allow the water to run off

**Ores of the rare earths.** Deutsche Gasglühlicht-Auer G m b H Ger 516,852, May 24, 1927 To facilitate the $H_2SO_4$ decompn of oxide ores of Zr, Ti and the rare earths, the ores are powd and heated in a rotary furnace with $SO_2$ and $SO_3$ The ores are then pptd with $H_2SO_4$ and the S recovered as $SO_2$ and $SO_3$ as usual The recovered $SO_2$ and $SO_3$ gases may be used for the pre-treatment of further ore in the rotary furnace

**Ore-flotation reagent.** Ira H Derby and Orin D Cunningham (to P C Reilly). Can. 310,929, Apr 28, 1931 An ore flotation reagent comprises an oily frothing material and a mono or a di ester or an alkali metal salt of a mono ester of di- or tri-thiometasilicic acid Cf *C A* 24, 4752

**Apparatus for flotation separation of ores.** Wm A Butchart U S 1,798,451–2, March 31 Structural features

**Flotation separation of metallic ores** Robert W Loyd and Bertch W Moye Can 310,001, Apr 7, 1931 An ore pulp is treated by flotation for the extn of Pb products by introducing to the pulp proportionate quantities of NaCl, $ZnSO_4$, pine oil and xanthate

**Mechanical ore separator.** Colorado Iron Works Co Fr 697,428, June 14, 1930

**Sluicing apparatus for ore washing.** Antoine France Ger 516,860, June 27, 1926

**Inclined vibrating concentrating table.** Martin J Lidf U S 1,799,694, April 7 Structural features

**Distributing crushed ore on supports for extraction of metals.** Harold W Aldrich and Walter G Scott (to Inspiration Copper Co) U S 1,798,715, March 31 App and mech features of operation are described

**Preparing materials such as ores for sintering** John E Greenawalt U S 1,799,163, April 7 The material is segregated into 3 or more components of graded sizes, and these are placed in a treating holder in layers in a manner to preserve their respective voids, the component of smallest sized particles constituting the top layer and the components of successively increasing size constituting the succeeding layers and the percentage of voids increasing from top to bottom of the charge App is described

**Copper extraction from ore.** Wm E Greenawalt U S 1,798,255, March 31. Cu ore is treated to sep a high-grade and a low-grade Cu concentrate The low-grade concentrate is roasted, the high-grade concentrate is smelted to produce highly concd CuS and the latter is roasted to produce concd. Cu oxide A portion of the latter is leached with acid to ext the Cu and the soln thus obtained is electrolyzed to deposit Cu and regenerate acid, which is returned to the concd Cu oxide The roasted low-grade concentrate is leached to ext a portion of the Cu; the resulting Cu soln is treated with a portion of the concd Cu oxide, and the resulting purified Cu soln is electrolyzed with the Cu soln obtained from leaching the concd Cu oxide

**Chromium ores.** Zahn & Co Bau chemische Fabriken G m b H and Ludwig Wickop. Ger 516,992, July 14, 1926 Cr ores are disintegrated by heating with an insufficient amt of alkali carbonate and lixiviating the sintered mass The residue is mixed with 2–3 parts of burned lime or an equiv amt of limestone, 1 part of $Fe_2O_3$ and alkali carbonate and roasted An example is given

**Treating zinc-bearing concentrates.** Wm C Hooey (to New Jersey Zinc Co) U S 1,799,166, April 7 See Can 308,893 (*C A* 25, 1790)

**Treating zinc sulfide concentrates.** Walter O Borcherdt (to New Jersey Zinc Co) U S 1,799,278, April 7 ZnS concentrates contg water-insol Ca compds are treated, as an aq pulp, with $H_2SO_3$ under such conditions as to convert the Ca compds into minute particles of suspended $CaSO_4$ without materially attacking the ZnS, and the suspended $CaSO_4$ particles are sepd from the ZnS concentrate.

**Zinc.** Alexander Roitzheim and Wilhelm Remy U S 1,798 986, March 31. A charge of zinciferous material such as ore and a reducing agent is subjected to external heating, and a small quantity of O is admitted into the charge to increase its temp, thus forming a small quantity of $CO_2$. By chem reaction of the $CO_2$ with some of the Zn vapor, some ZnO in vapor phase is formed, and the ZnO is sepd from the Zn-metal vapor before the Zn is condensed App is described

**Slags.** Norske Aktieselskab for Elektrokemisk Industri Fr 697,403, June 3, 1930 An app is described for agitating slags to liberate the gases adsorbed or dissolved therein and form bubbles whereby a cellular structure is obtained

**Production of metals and their compounds** Axel S Burman and Ivar Rennerfelt. *Fr. 698,060, June 24, 1930* A soln of one or more metal compds. or salts,

free from $SiO_2$, is mixed with a sol substance contg C, which when heated leaves a residue consisting principally of C. The soln. is evapd. and calcined to form a homogeneous mixt. which is leached with an acid or treated with a gas to sep. one or more of the metals contd. therein. The process may be used to sep Fe from oxides of other metals such as $Al_2O_3$. The calcination step is carried out in an inert or reducing atm. An app is described.

Spongy metals. Henning G. Floody Ger. 522,180, Dec. 25, 1928. Spongy metals are prepd. by briquetting a mixt. of finely ground ore and reducing agent, packing the briquets in a shell or casing, and heating them to a temp. sufficient to reduce the ore without softening the resulting metal. Thus, spongy Fe may be prepd. from a briquetted mixt. of Fe ore, C and a binder at a temp of 1100°, or spongy Cr from a briquetted mixt. of Cr ore, ferrosilicon and a binder at a temp of 1200°. Cf. *C. A.* 24, 330

Wet-dressing plant for metal foundries. Badische Maschinenfabrik & Eisengiesserei vormals G Sebold and Sebold & Neff. Ger. 516,793, Jan. 25, 1930 Details of nozzle tubes are given.

Forming sand molds for metal casting. Otto Harms. Ger. 516,792, June 20, 1929

Feeder for ingot molds. Bloomfield H Howard and Ernest J. Turner. U. S. 1,800,073, April 7. Feeders are composed of self-supporting combustible material such as wood or paper adapted to burn sufficiently slowly on contact with the molten metal to supply heat to the molten metal within the feeder during the solidification of the ingot, so that the molten metal within the feeder is available to compensate for the shrinkage of the ingot.

Vessel for molding metals. Allgemeine Elektrizitäts-Ges. Ger 515,948, April 12, 1929

Die-casting apparatus. Nathan Lester (to P. & R. Tool Co) U S. reissue 18,014, March 31. Reissue of original Pat. No 1,673,833 (*C. A.* 22, 2733).

Casting stereotype plates. Schnellpressenfabrik Frankenthal & Cie A.-G Ger. 516,740, Oct. 15, 1925 Details of supplying hot gases are described.

Drawing metals. Rudolf W. Moll and Hugo von Bruck. Fr. 698,282, July 2, 1930 Metal to be cold-drawn is cleaned with acid, washed in water, treated with a lye of $Na_3PO_4$, then dried and drawn, residual mineral oils being used as lubricants.

Open-hearth furnace. Niklas F. Egler. U. S. 1,798,871, March 31

Open-hearth furnace. Roy L. Leventry. U. S. 1,798 611, March 31.

Open-hearth metallurgical furnace. Stanley H. McKee. U. S. 1,798,618, March 31.

Down-blast oil-burning smelting furnace suitable for treating ores of iron, lead, mercury, copper, zinc, etc. Matthew S Rogers (one-half to F. E. Kennedy). U. S. 1,799 643, April 7. Structural features.

Furnace and conveyor suitable for heating small metal articles. Frank T. Cope (to Elec. Furnace Co.) U S 1,799,956, April 7.

Furnace suitable for the heat treatment of metals. Frank T. Cope and Arthur H. Vaughan (to Elec. Furnace Co) U. S. 1,799,957, April 7

Siemens-Martin furnace. Friedrich Siemens A.-G Ger. 516,887, Mar. 9, 1930 The furnace is made from moldable fireproof material.

Furnace for annealing metals. Akt.-Ges. Brown, Boveri & Cie. Fr. 698,497, April 11, 1930.

Continuous-heating furnace suitable for heating metal sheets. Samuel E. Diescher (to S. Diescher & Sons). U. S. 1,800,170, April 7. Structural features.

Means for preventing burning of blast-furnace tuyères. Ernest H. Holzworth. Ger 522,179, Oct. 8, 1929 Brit. 331,464 (*C. A.* 25, 65).

Discharge device for grate shaft furnaces for roasting lump ore. Hermann Gleichmann Ger. 522,422, Oct. 27, 1929

Heat treatment of metal articles in fused salt baths. Walter Beck (to Deutsche Gold & Silber Scheideanstalt vorm. Roessler). U. S. 1,799,945, April 7. Articles such as tools are heated in a bath of fused salts such as NaCl and KCl in the presence of finely divided charcoal at temps. low enough to prevent any chem. reaction between the metal articles and the constituents of the bath. An alk. compd. such as NaOH may also be added.

Use of gas jets for cutting slots in metal plates. Clarence J. Coberly (to Kobe, Inc.) U. S. 1,799,612-13-14, April 7. Various details of app and procedure are described.

Manganese pig iron. Samuel B Sheldon (First and American National Bank

of Duluth, executor). Can 311,152, May 5, 1931. A mixt. of a siliceous ore and basic-open hearth slag, the latter contg Mn, is charged into a blast furnace, and is so proportioned as to give a pig iron contg approx 8% Mn. This pig iron is charged into another blast furnace with Fe ore to give a pig iron contg approx 2% Mn. This latter iron is suitable for making steel

Reducing oxides of iron. MARIO AMOROSO and SOCIETÀ ANON METALFER Fr 697,626, June 18, 1930 The reduction of oxides or other compds of Fe is accelerated by submitting the mass, during reduction, to the action of a magnetic field for orientation of the atoms of Fe

Magnetic iron. I G FARBENIND A G Fr 698,642, July 8, 1930. Fe with excellent magnetic properties is prepd by heating Fe in pieces (prepd without fusion by pressure or heat or both from finely divided Fe) in a vacuum to a temp below the m p, preferably in an atm of H The finely divided Fe may be obtained from Fe carbonyl

Steel. GEORGE A. CODE Can 310,972, May 5, 1931 In a single-step process of producing steel or its alloys, iron ore is reduced in molten condition while associated with a flux and mucic acid

Steel. KARL ENGEL Austrian 121,797, Sept 15, 1930 Corrosion after welding of austenitic Cr-Ni steel is avoided by applying an acid-resistant coating at and about the welded parts.

Steel. M. STERN A -G Fr 697,811, June 23, 1930 Valuable steels are made by adding waste or scrap metal contg Cu or Cu and Ni to the fusion bath

Coloring steel. SCHOELLER BLECKMANN STAHLWERKE A G (Karl Thomis, inventor). Austrian 121,991, Nov 15, 1930 Steel articles are colored brown by successively steeping in 3 solns. contg (1) oxalic or saccharic acid, *e g*, a 10% soln, (2) an alkali, alk. earth or $NH_4$ sulfide or hydro- or poly-sulfide, *e g*, a 1% soln. of $Na_2S$, and (3) a manganate or permanganate, *e g*, a 5% soln. of $KMnO_4$ The articles may be rinsed after each steeping and should be first polished and degreased The method is particularly applicable to rustless steel articles. Treatment with $H_2S$ may be substituted for the second steeping.

Thermal treatment of alloys. SOC. ANON. DE COMMENTRY, FOURCHAMBAULT ET DECAZEVILLE. Fr. 698,724, Oct. 11, 1929. Alloys contg Ni (or Ni and Co) 6–80, Cr 0–40, Mn 0.3–4, W 0–10, Mo 0–10, V 0–2, Ti 0–0.5, Si 0–3% and Fe the rest in the $\gamma$ state have their elastic limit increased by tempering between 800° and 1200° and then heating for 2 to 200 hrs. between 400° and 900°.

Aluminum-base alloy. ROBERT S ARCHER and LOUIS W. KEMPF (to Aluminum Co. of Am.). U. S. 1,799,837, April 7. An alloy which is suitable for engine pistons, etc., comprises Al together with Si 7–15, Mg 0.2–3 0, Ni 0 5–7 0 and Cu 0.3–4 0%. Cf. *C. A.* 25, 909

Lead alloys. FELTEN & GUILLEAUME CARLSWERKE A -G. Ger. 522,364, Dec. 4, 1926. Pb for sheathing a. c. single-conductor cables is alloyed with more than 5% of Bi and (or) Sb, so as to increase its elec. resistance by at least 25%.

Alloys of magnesium. I G FARBENIND A -G. Fr. 697,747, June 21, 1930 The resistance qualities of alloys of Mg are improved by heating the alloys once or more to a temp of at least 800° before casting Cf *C A* 25, 909

Iron-nickel alloys. ELECTRICAL RESEARCH PRODUCTS, INC. Ger 516,696, Aug 25, 1925 A Fe-Ni alloy for magnetic purposes contains 75–83% Ni. A small addn. of Cr or Mo may be present, *e. g.*, up to 7%.

Nickel-chromium-iron alloy. NORMAN B PILLING (to The International Nickel Co., Inc.) Can. 310,670, Apr. 21, 1931 To an alloy of 1–95% Ni, 1–50% Cr and the rest Fe is added a very small quantity of Ca before pouring to enhance its working properties.

Nickel steel or nickel-iron alloys. THOMAS W HARDY, JR., and CHARLES E. PARSONS. Can 310,951, May 5, 1931 A sulfide ore contg Ni, Fe and Cu is subjected to selective flotation to provide a Ni-Fe sulfide concentrate. The concentrate is roasted to remove S and the mass agglomerated. The mass is heated to a temp. below its sintering point in a reducing atm. to reduce it to the metallic state, and the metallic product is melted to produce steel or alloy.

Steel alloy. THEODOR CZEPL. Fr 697,801, June 23, 1930. A steel resistant to fire and corrosion contains C up to 1, Ni 25–40, Mo 8, Cu 1–8% and Fe the rest The Ni may be replaced more or less completely by Co, and the alloy may contain up to 10% of Ta.

Alloy steel resistant to corrosion and to oxidation at high temperatures. PERCY

Soldering aluminum. RAYMOND ALPHONSE FRÈRE Fr 698,683, Oct 5, 1929. An alloy of Al, Zn, Sn and Cu with a secondary alloy of Al and Zn, or an alloy of Sn, Zn, Pb and P with a secondary alloy of Sn, Zn and Pb (or Cd) or a single alloy of Zn and Cd (or Sn) is used for soldering Al

## 10—ORGANIC CHEMISTRY

CHAS A ROUILLER AND CLARENCE J WEST

The first hundred years of synthetic organic chemistry. F MASTRANGIOLI *Ann soc pharm chim Sao Paulo* 2, 119–33(1931) —A review M H SOULE

Thermal decomposition of organic compounds from the standpoint of free radicals. I. Saturated hydrocarbons. F O RICE *J Am Chem Soc* 53, 1959–72(1931) —When a hydrocarbon decomps we may assume that it dissocs into 2 free radicals which fly apart Comparison of the strength of a C—H bond (93 3 kg cal ) with that of a C—C bond (71 0 kg cal ) shows that the dissocn occurs only through rupture of a C—C bond, any breaking of a C—H bond is wholly negligible compared with that of a C—C bond The probability that the 2 radicals collide again is negligibly small and therefore, free radicals produced in this way can only decomp or react with the surrounding hydrocarbon mols *E g*, a free Me group can take a H atom from the surrounding hydrocarbon and form $CH_4$ and a hydrocarbon radical An Et group produced in this way can undergo 2 reactions the 1st is similar to the Me group and produces $C_2H_6$ and a hydrocarbon radical the 2nd is a dissocn into $C_2H_4$ and H atoms Radicals higher than Et can decomp in a similar manner into an $C_2H_4$ hydrocarbon and either a H atom or a free radical This dissocn of free radicals is possible because, in the process, a single bond becomes a double bond, this process of internal compensation releases 52 800 cal which can contribute to the min activation energy (93,000 cal ) necessary to break a C—H bond or to the min activation energy (71,000 cal ) necessary to break a C—C bond The decompn of paraffin hydrocarbons is represented as a chain type of reaction in which free H atoms or free radicals combine with 1 of the H atoms of the surrounding hydrocarbon mol The hydrocarbon radical then decomps into a compd and either a smaller free radical or a H atom Thus we have a cycle of changes in which certain groups called carriers are regenerated and start a new cycle and this process presumably may go on for a great no of times The composition of the products is detd therefore almost exclusively by the chain cycle and is practically independent of the primary decompn of the hydrocarbon It is possible to calc. the compn of the products when a hydrocarbon is allowed to decomp to a small extent. In these calcns all primary C—H bonds are considered to have the same strength, all sec. C—H bonds 1200 cal less and all tertiary C—H bonds 4000 cal less than a primary C—H bond The only arbitrary assumption made in the calcns is the assignment of the relative strengths to the different classes of C—H bonds The following hydrocarbons are discussed $C_2H_6$, $C_3H_8$, iso-$C_4H_{10}$, $C_4H_{10}$, $C_5H_{12}$, iso-$C_5H_{12}$ and $CMe_4$ C J WEST

Physical properties of the normal paraffin hydrocarbons, pentane to dodecane. A F SHEPARD, A L HENNE AND T MIDGLEY, JR *J Am Chem Soc* 53, 1948–58 (1931) —The samples were prepd from a special gasoline with a normal paraffin hydrocarbon content of about 70%, this was roughly sepd into fractions by distn and then treated with $ClSO_3H$, the progress of the further purification was checked by the total boiling range and the total freezing range, details of the abs temp measurements are given. B ps., m ps., $d_4^{20}$, $d_4^{25}$, $n_\alpha$, $n_\beta$ and $n_D$ at 20°, 25° and 45.3° each, viscosities at 25°, fluidities at 25°, critical soln temps in aniline, and Nekrasov's consts (cf *C A* 23, 3390) are given for $C_5H_{12}$, $C_6H_{14}$, $C_7H_{16}$, $C_8H_{18}$, $C_9H_{20}$, $C_{10}H_{22}$, $C_{11}H_{24}$ and $C_{12}H_{26}$. C J WEST

Alternation in properties of long-carbon-chain compounds. T MALKIN *Nature* 127, 126–7(1931) —The concept of alternation in all long-chain compds is modified so that the zigzag chain is tilted with respect to the terminal planes Nonalternating series possess vertical chains (hydrocarbons, Me ketones, alcs ) alternating series possess tilted chains (mono- and di basic acids, iodides, nitriles) The concept permits a longer spacing for odd numbered compds than for even ones and greater mol vol for odd numbered solid fatty acids FRANK MARESH

The catalytic addition of gaseous hydrochloric acid to unsaturated hydrocarbons. W. J. PIOTROWSKI AND J WINKLER. *J. Inst Petroleum Tech* 17, 225–41(1931) —See *C. A.* 25, 1794 G G

Pyrolysis and condensation of hydrocarbons. I. Ethylene. E. Berl and W Forst *Z angew Chem* 44, 193–7(1931) —$C_2H_4$ is decompd. by recirculating 45 l. of it through a tube furnace Around 800–900°, 43% of the $C_2H_4$ is condensed into liquid products giving $C_6H_6$, $C_{14}H_{10}$, anthracene and their homologs, with traces of cyclopentadiene Metals and oxide catalysts decrease the yield of liquid products and increase the decompn of $C_2H_4$ into its elements The formation of the liquid product proceeds in 2 steps the pyrolysis of the mol into free radicals, and the subsequent hydrogenation or condensation of the latter. George Calingaert

Rate of polymerization. I. Mechanism of polymerization of diethylene hydrocarbons. E N Gapon *J Russ Phys-Chem Soc* 62, 1385–93(1930) —G discusses the mechanism of polymerization of org compds. having 2 double bonds and draws the following conclusions (1) The essence of activation of a hydrocarbon mol. in the process of polymerization consists in the breaking of one double bond and the changing of quadrivalent C atoms at the rupture into tervalent. (2) The theoretical value of the energy of activation is equal to the energy of breaking of one double bond under conditions where chain reactions are absent. (3) Active mols on reacting with normal ones, give products of polymerization, while they cannot react among themselves. II. Rate of polymerization of isoprene. *Ibid* 1395–1406 —By using the method of heating samples of isoprene in sealed tubes in a thermostat, in the absence of light, a study was made of rate of polymerization at 100°, 110°, 130° and 150°. In the activation of the mols of isoprene there appear 3 active forms giving rise to 4 primary products dipentene, 1,3-dimethyl-3-vinyl-6-cyclohexene, and 2 polymers. An equation is developed for a process which goes on simultaneously in various directions independently of each other The consts. of rates of reaction of the primary products and their temp coeffs are detd The values of the heat of activation and the reaction consts. for all 3 reactions are calcd The consts. of the rate of formation of the primary products are in the same order to each other as the heats of formation *E* and the reaction consts. *S.* S. L. Madorsky

Formation of methanol by the direct oxidation of methane. William A Bone. *Nature* 127, 481(1931) —Studies on the slow combustion of $C_2H_6$ by B and Hill (*C. A.* 25, 1360) showed that the initial product was not a peroxide but either EtOH or some less oxygenated substance It has now been found that direct oxidation of $CH_4$ at 360° and 100 atms. gives rise to MeOH as the initial product. In mixts. of $CH_4$ and O in the ratio of 9 1 the action was complete in a few min About 17% of the $CH_4$ burnt was recovered as MeOH, 0.6% as $CH_2O$ and the remainder as CO, $CO_2$ and $H_2O$ No H was liberated and not even a trace of peroxide was formed The MeOH was identified by conversion into $HOC_6H_4CO_2Me$ and $p$-$NO_2C_6H_4CO_2Me$ and was estd. as the nitrite H. W. Leahy

Action of hydrogen peroxide upon simple carbon compounds. I. Methanol, formaldehyde and formic acid. H Shipley Fry and John H Payne *J. Am. Chem. Soc* 53, 1973–80(1931) —$HCO_2H$ (I) is oxidized by $H_2O_2$ to $H_2CO_3$ and $H_2O$, 76% of the acid reacting, no H or CO was found HCHO (II) reacts in 2 ways: $2\,II + H_2O_2 = 2\,I + H_2$ (a), $II + H_2O_2 = I + H_2O$ (b), the I is also oxidized, giving $H_2CO_3 + H_2O$ (c) With 1/16 mol $H_2O_2$, no I is oxidized, with 1/8 mol $H_2O_2$ I is only oxidized to a slight extent, with increasing concn of $H_2O_2$, the extent of the occurrence of reactions (c) and (b) regularly increases while that of (a) regularly decreases, the liberation of H is apparently favored by the lower concn of $H_2O_2$ In the oxidation of MeOH, the first reaction is $MeOH + H_2O_2 = II + 2\,H_2O$ (d); the other reactions (oxidation of I and II) also occur, so that the oxidation of MeOH gives I, II, $H_2CO_3$ and H The reactions represented by equations (a) and (b) decrease in extent while those represented by (c) and the decompn of $H_2O_2$ into $O_2$ and $H_2O$ increase in extent with increasing concns of $H_2O_2$ Reaction (b) always occurs to a greater extent than reaction (a), again showing that the liberation of H is favored by the lower concns of $H_2O_2$ The results are given in a series of tables II. The mechanism of the reactions. *Ibid* 1980–4 —In the oxidation of AcH the yields of the 2 chief reaction products, AcOH and $H_2CO_3$, increase as increased quantities of $H_2O_2$ are used Since separately conducted runs with AcOH and $H_2O_2$ gave $HCO_2H$ and $H_2CO_3$ without the liberation of H or of $CH_4$, it follows that the H arises from the oxidation of AcH to AcOH ($2\,AcOH + H_2O_2 = 2\,AcOH + H_2$) While the max yields of H were obtained with equimol. concns of AcH and $H_2O_2$ another striking parallel to the HCHO reaction is found in the fact that the vols of $CH_4$ liberated according to the proposed equation, $2\,AcH + H_2O_2 = AcOH + HCO_2H + CH_4$, decrease with increasing concns. of $H_2O_2$ The formation of AcOH and $HCO_2H$ with the concurrent liberation of both H and $CH_4$ appears to be in conformity with the equations for the reactions which

were predicted in extending the proposed reaction mechanism to AcII. The term *perhydrolysis* is defined as a double decompn reaction involving $H_2O_2$ in precisely the same manner that hydrolysis is a double decompn reaction involving $H_2O$. The reduction of $H_2CO_3$ by $H_2O_2$ with the liberation of O may likewise involve perhydrolysis, forming percarbonic acid, which, in turn yields $HCO_3H$ through the liberation of O. All reactions of $H_2O_2$ do not involve perhydrolysis. C. J. West

**Isomeric isoprene sulfone. II.** Ernst Eigenberger *J. prakt. Chem.* 129, 312–20(1931), cf. *C. A.* 25, 270. The action of 0.5 *N* aq. or alc. KOH upon isoprene sulfone A (I) in the light of a quartz light for 20 min. gives *isoprene sulfone B* (II), m. 70°, which is less sol. in $Et_2O$ than its isomer. In the absence of KOH light has no action, the 2 isomers form a mixt. m. 30°. Br does not add to II in the light or at 100°. Heating with *N* EtOH KOH for 2 hrs. causes about 50% sapon., giving an amorphous, brown substance. Oxidation with *N* $KMnO_4$ in $K_2CO_3$ gave no definite cryst. product. I and K in dry $Et_2O$ give the *K salt*, very hygroscopic, of 3,6-dimethyl-2,4-octadiene-1,8-disulfinic acid, oily, very unstable and reactive; the most pronounced property of which is its tendency to polymerize; the products being an $Et_2O$ insol., AcOH sol. oil and an amorphous compd., insol. in the ordinary solvents. The acid gives an unstable Br addn. complex; the oily polymer also gives a solid bromide, but this was not investigated because of its insolv. The *Ca salt* and *Zn salt*, m. 70.5°, were also prepd. The K salt and MeI heated 1 hr., give *dimethylisoprene disulfone*, $b_{18-19}$ 130–40°, which polymerizes in part during the distn. Oxidation of the K salt gives $H_2SO_4$ and acetonylacetone. II gives a sulfinic acid which yields the same oxidation products. I and K in moist $Et_2O$ give $Me_2C:CHCH_2SO_2H$. C. J. West

**α-Chloroethane-α-sulfonyl chloride.** Ernst Müller and Hermann Raudenbusch *Ber.* 64B, 99–101(1931).—Chlorination of β-trithioacetaldehyde (I) in aq. suspension had given an oil whose reactivity toward $NH_3$, $PhNH_2$, $N_2H_4$ and $PhNHNH_2$ indicated that it was an ethanesulfonyl chloride, a conclusion confirmed by analysis (*C. A.* 21, 2872). A more thorough study has shown that it $b_{18}$ 70° and is not identical with the known $ClCH_2CH_2SO_2Cl$; it can therefore be only *α-chloroethane α-sulfonyl chloride* (II). It is also obtained in glacial AcOH, but in dry $CCl_4$ there is formed only a dark yellow oil, $C_4H_5Cl_3S$ (III), which is very probably a *heptachlorodiethyl sulfide*. In $H_2O$, along with II are formed $H_2SO_4$ and AcOH and the yield of II is only 50%. II is also formed with HOCl but the formation of $H_2SO_4$ and AcOH is greatly favored in this reaction, the preformed II is also much more readily oxidized by free HOCl than by Cl in $H_2O$. II readily dissolves in the common org. solvents but boiling $H_2O$ converts it into the *acid* (IV). II is sol. in NaOH and in $Ba(OH)_2$, and with $NH_4OH$ gives the *amide* (V). With $H_2O$ in sealed tubes it gives only IV. Boiling EtOH does not attack II while hot anhyd. MeOH gives IV, possibly through the *Me ester* (VI) as an intermediate product which is saponified by traces of $H_2O$ formed by the action of *the liberated HCl on the MeOH. EtOH in sealed tubes at 130° likewise gives IV instead* of the ester. With NaOMe instead of MeOH, VI can be obtained in almost pure form, together with considerable amts. of the Na salt of IV, probably formed according to the equation $MeCHClSO_2Me + MeONa = MeCHClSO_2Na + Me_2O$. With $PCl_5$ at 200° in sealed tubes, II gives $MeCHCl_2$, at room temp. or on heating in an open test tube no reaction occurs. Like other sulfonyl chlorides II is formed from the Na salt of IV with $PCl_5$ and is reduced to the mercaptan by nascent H, but with Zn dust it gives $EtSO_2K$ (VII), instead of a sulfinate when the mixt. is neutralized with $K_2CO_3$ at the end of the reaction. Traces of $H_2O$ are essential for the reaction, which takes place in alc. and $Me_2CO$ but not in abs. anhyd. media like $CHCl_3$ and $C_6H_6$, in abs. $Et_2O$ it sets in immediately when a drop of $H_2O$ is added. III, $b_{15}$ 35–6°. V, m. 66°. *Phenylhydrazide*, IV, thick, gray brown liquid which retains $H_2O$ after long standing over $H_2SO_4$. VI (impure, C 21.93, H 4.23, Cl 23.73%), $b_{18}$ 91–3°. VII, hitherto described as cryst. with 2 mols $H_2O$, was obtained in anhyd. needles.

C. A. R.

**Ethylenic nitriles.** The 2-methyl-3-pentene-5-nitriles. P. Bruylants and H. Minetti. *Bull. soc. chim. roy. Belg.* [5], 16, 1116–28(1930).—Henry (*Chem. Zentr.* 1898, II, 662) described 2-methyl-3-pentene-5-nitrile, $Me_2CHCH:CHCN$ (I), as a liquid, b. 154–5°, but his material was a mixt. of the 2 geometric isomers and 3-methyl-3-pentene-5-nitrile because he started with ordinary fusel oil. Iso-AmOH (II), obtained in 4.4 kg. yield by hydrolysis of 15.0 kg. $(Me_2CHCH_2CH_2OSO_2)_2Ba$ $2H_2O$ (prepd. from fusel oil by the method of Marckwald) with $H_2SO_4$, $b_{18}$ 131.5–2.5° (polarimetric measurements indicated 0.8% active alc.), $d_4^{20}$ 0.80788. $Me_2CHCH_2CHO$ (III), obtained in 1850 g. yield by oxidizing 4.4 kg. II in 130 g. lots with 110 g. $Na_2Cr_2O_7$,

220 g $H_2O$ and 150 g 66° Bé $H_2SO_4$ (yielding about 35% III and 37% II returned for oxidation), $b_{744}$ 91.9–2.1°, $d_4^{22}$ 0.70770, $n$ 1.38710, 1.38930, 1.39121, 1.39351 for $\alpha$, D, $\beta$ and $\gamma$ at 20°. $Me_2CHCH_2CH(OH)CN$ (IV), obtained in 2150 g yield from 1870 g III, $b_5$ 107°, $d_4^{22}$ 0.91852, $n$ 1.42317, 1.42514, 1.43018 for $\alpha$, D and $\beta$ at 20°. I was obtained from IV by dehydration with $P_2O_5$ in $CHCl_3$ but in better yield (64%) and more easily purified without the use of a solvent. Repeated fractionation of about 500 g I yielded chiefly 2 fractions: (1) $b_{744}$ 137.5–8°, $d_4^{22}$ 0.80781, $n$ 1.42186, 1.42433, 1.43246, 1.43891 for $\alpha$, D, $\beta$ and $\gamma$ at 20°, probably the *cis* modification of I, and (2) $b_{747}$ 160–0.5°, $d_4^{22}$ 0.82131, $n$ 1.43296, 1.43620, 1.44199, 1.45010 for $\alpha$, D, $\beta$ and $\gamma$ at 20°, probably impure *trans* I since both correspond on analysis to $C_5H_7N$, and appreciable quantities of a higher boiling material (VI) where the exaltation of the mol. refraction decreases with the b. p., indicating the presence of 2-methyl-2-pentene-5-nitrile (V), formed by isomerization of I. The I absorption method of Kandiah and Linstead (cf. *C. A.* 24, 76) and a better Br absorption method to indicate the relative amts. of type I and V nitriles confirmed the structure assigned to V. The Br absorption method applied to *cis* I indicates 0.7% (within the accuracy of the method) of V in it, 21% in impure *trans* I and 38% in a fraction $b_{747}$ 164.5°. Fractionation of VI under reduced pressure was not successful in sepg. V, and fractional crystn. at −80° to −110° did not appear promising (from the difference in the rate of Br absorption), though the lower melting material is somewhat higher in V. To a soln. of 40 g VI ($b_{747}$ 160–0.5°) in 60 cc. $CHCl_3$ in an ice bath was added 27 g. Br (about 100% excess), the excess Br removed with bisulfite soln. and the $CHCl_3$ soln. dried and distd., the product, $b_{744}$ 48.5–9°, $b_{747}$ 156–7°, $d_4^{22}$ 0.82131, $n$ 1.43075, 1.43419, 1.44190, 1.45150 for $\alpha$, D, $\beta$ and $\gamma$ at 20°, is probably pure *trans* I. It undergoes slight decompn. when distd. at atm. pressure and its b. p. and d. rise. This repeated distn. is not responsible for the formation of V, but the dehydration with $P_2O_5$ produces it as shown by a sep. expt. *cis*- and *trans* I add HCl easily to form $Me_2CHCHClCH_2CN$ (VII), $b_{11}$ 94.4 (probably error for 90.4°—Abstractor) —1.4°, $d_4^{22}$ 1.0186, $n_D^{22}$ 1.44375. Treatment of 60 g. VII with quinoline gave 31 g. crude unsatd. nitrile, most of which b. 159–61°, the Br absorption indicated 17.6–21.6% V and probably the remainder was *trans* I as the b. p. did not indicate any *cis* I. Refluxing for 2 hrs. 30 g. impure *trans* I ($b_{747}$ 160–0.5° and by Br absorption contg. 21% V) with 1 g. phenol and 0.1 g. Na yields a product, b. 164–6°, $d_4^{22}$ 0.83873, $n_D^{22}$ 1.43634 and by Br absorption contg. 43% V. Refluxing 28 g. *cis* I with PhONa under the same conditions gave a fraction b. 164.6°, $d_4^{22}$ 0.84082, $n_D^{22}$ 1.43406 and by Br absorption contg. 51.8% of V, while a fraction b. 166–8° contained 67.7% V. Ultra violet light does not bring about isomerization as does the PhONa. *trans* I was converted by treatment with $H_2SO_4$ for 14 days, into the corresponding amide, m. 87.6–8.2°. *cis* I required 60 days with $H_2SO_4$ to produce the corresponding amide, m. 80°. Equal amts. of the 2 amides m. 55–61°. ODELL E. SHEPPARD

Production of s-trichloroaniline and tetrachloroquinone from aniline in hydrochloric acid solution. J. ERDÉLYI. *Chem. Rundschau Mitteleuropa u. Balkan* 6, No. 14, 83–4 (1929); cf. *C. A.* 23, 4896.—Aniline is dissolved in concd. HCl and chlorinated at 35–40°. s-Trichloroaniline is formed without any colored or resinous secondary products. Tetrachloroquinone is formed if aniline in HCl is treated with a mixt. of Cl and O. S. S. DE FINÁLY

The preparation of trialkylbismuthines. W. C. DAVIES, I. NORVICK AND W. J. JONES. *Bull. soc. chim.* [4], 49, 187–94 (1931).—*Tripropylbismuthine*.—PrMgBr was prepd. by the addn. of 61 cc. of PrBr in 100 cc. $Et_2O$ to 16.2 g. of Mg in 100 cc. $Et_2O$ in a specially arranged Grignard app. permitting the maintenance of a $H_2$ atm., and also the withdrawal of the sepd. layers into a separatory funnel provided with $CO_2$ intake and outlet tubes. To the cooled Grignard reagent, under $H_2$, was added dropwise 30 g. $BiCl_3$ in 350 cc. $Et_2O$. The mixt. was heated for 30 min., then cooled and after decompn. with aq. $NH_4Cl$ the ether layer was transferred to the $CO_2$-filled separatory funnel. After drying over $Na_2SO_4$, and evapn. of the $Et_2O$, both operations being carried out in a $CO_2$ atm., the residue was fractionated *in vacuo*, the main fraction consisting of 16.5 g. of clear liquid, $b_8$ 86–7°, $d_4^{17}$ 1.621. By operating in a closed box provided with flexible sleeves for the arms of the operator, and a glass observation window, the manipulation of this fraction was carried out in a $CO_2$ atm., tubes for C, H and Bi analysis being filled and sealed in this way. By similar procedure, *tributylbismuthine*, $b_7$ [illegible], $d_4^{17}$ 1.456, and *triamylbismuthine*, $b_7$ 157–8°, $d_4^{17}$ 1.281, were prepd. Some hexane, 3 [illegible]-tane, $b_{744}$ 126°, and 10 g. of decane, $b_{744}$ 169°, were formed by

the synthetic action of the Mg Though the bismuthines obtained as main fractions of distn were remarkably pure, bismuthine halides were produced when the Grignard reagent was not in 2-fold excess The trialkylbismuthines are clear liquids which oxidize readily and are thermally unstable Their b ps rise progressively in the series but their ds diminish Tables of b p, b p reduced to 50 mm and ds. are given, together with a résume of the comparative chem. and phys. properties of the trialkyl derivs. of the elements of the 5th group C R. ADDINALL

New compounds of titanium. H A GARDNER AND E BIELOUSS Am Paint & Varnish Mfrs' Assoc., *Circ* No 366, 327–37(1930) —$Ti(OEt)_4$, prepd. by dropwise addn of 132 6 g $TiCl_4$ to a cold soln of NaOEt with subsequent refluxing, contained 31.7% $TiO_2$, calcd 31 5% The product was sol in alc, $C_6H_6$, toluene and mineral spirits. $TiCl(OAm)_3$, *HCl* and $Ti(OAm)_4$ were prepd by dropwise addn of 19 g $TiCl_4$ to 40 g pentasol (mixed amyl alcs contg 26% secondary alcs) The product was dark and viscous Distn (30 mm) below 100° yielded 12 g alc., from 100° to 240° it yielded 5 g $Ti(OAm)_4$, which hydrolyzed rapidly in the air *Ti compds of glycol and glycerol* of varying compns were prepd by dropwise addn of $TiCl_4$ to an excess of the corresponding polyhydric alc at temps from 80° to 145° The products were sol in water and alc but not in toluene Films of $Si(OEt)_4$, hydrolyzed as directed by King (*C A* 24, 2313) and of $Ti(OEt)_4$, hydrolyzed *in situ*, applied to various surfaces were unsatisfactory as they lacked adhesion and continuity $TiCl_4$ converts tung oil to a gelatinous mass A white-pigmented lacquer was formed when Ti glycolate in alc. (1 4) was added to nitrocellulose in AcOBu, the Ti compd hydrolyzing with the formation of $TiO_2$ $Ti(OEt)_4$ gave unsatisfactory results as an *antiknock agent* in gasoline because of pptn of $TiO_2$ on the walls of the passages between the carburetor and the cylinders G G SWARD

State of formaldehyde in aqueous solutions. FREDERIC WALKER *J Phys Chem* 35, 1104–13(1931) —The object of W 's paper was to correlate the scattered data on the subject of the state of $CH_2O$ in $H_2O$ In doing this, W has found that the theories and data of Auerbach (A and Barschall, *Arbb Kais. Ges A* 22, 584–629) enable one to explain quantitatively the vapor pressure of $CH_2O$ in $H_2O$ as recently detd by Ledbury and Blair (*C. A* 19, 1214) In addn W has shown (1) that such solns follow Henry's law, in that the partial pressure of the $CH_2O$ vapor is proportional to the concn of solute in the form of $CH_2(OH)_2$, and (2) that the gas in equil with aq solns is probably the unhydrated monomol $CH_2O$. LOUISE KELLEY

Action of ozone upon aldehydes. F G FISCHER, H DÜLL AND J. L VOLZ *Ann* 486, 80–94(1931), cf *C A* 24, 2106 —The action of $O_3$ on aldehydes gives a mixt of the corresponding acid and peracid; it may be assumed that the aldehyde adds 1 mol $O_2$ and that the RCHO $O_3$ then reacts with 1 mol RCHO to give $RCO_2H$ and $RCO_3H$; with 2RCHO to give $3RCO_2H$ or with $O_2$ to give $RCO_2H$ and $O_2$ The best yields of peracids are obtained by ozonization of small amts of aldehyde in dil soln at —15° to —20° Thus PrCHO (8 g) in 400 cc. $CCl_4$ gives 71 8% $PrCO_3H$, $b_{12}$ 26–30°, iso-$BuCO_3H$, $b_1$ 31–2° (92 7% yield), $BzO_3H$, m 39–40° (2 65 g yield from 8 g BzH) The yield of peracid is affected by the dilu of the aldehyde, by the temp and by the solvent, the yield decreases with increasing concn, a higher yield of peracid is obtained at 10° than at —65° C. J. WEST

Reactions of certain carboxylic acids. LAD EKKERT *Pharm Zentralhalle* 72, 228–9(1931), cf *C A* 25, 2389 —The behavior of $HCO_2H$, AcOH, propionic, butyric, isobutyric, valeric, capric, caprylic, palmitic, stearic, oleic and ricinoleic, acids has been studied with respect to their behavior toward alc. solns (1%) of $CH_2O$, Ph-$CH_2CHO$, BzCHO, furfural, anisaldehyde, salicylaldehyde, vanillin, PhCH.CHCHO, piperonal and sucrose when treated with 1 cc conc'd $H_2SO_4$ A long series of color changes is reported. W. O E

Lignoceric acid from the seeds of Adenanthera pavonina. I. P RAMASWAMI AYYAR *Proc 15th Indian Sci Cong* 1928, 161 —The above seeds yield 14% of a fixed oil equiv to 13% of mixed acids From the latter pure lignoceric acid, $C_{24}H_{48}O_2$, m 80–1°, has been prepd. with a yield of 1 5% on the seeds. The acid on bromination by Volhard's method yields a Br acid, $C_{24}H_{47}BrO_2$, m 70–1° The lignoceric acid thus appears identical with the acid previously obtained from other sources E J C.

Synthesis of straight-chain unsaturated acids. R BHATTACHARYA AND J L SIMONSEN *Proc 15th Indian Sci Cong* 1928, 153 —It has been recently suggested that isoerucic acid is an inseparable mixt of 2 unsatd acids which may be synthesized from (*a*) octine, and 14-iodotetradecanoic acid, and (*b*) hendecin and 10-bromoundecylic acid. As a preliminary to their prepn the synthesis of homologous acids has been tried 12-Iodododecanoic acid was prepd as follows and condensed with the

Na compd of decine to yield behenolic acid castor oil ⟶ undecylenic acid ⟶ 10-bromoundecylic Me ester ⟶ cyanoundecylic Me ester ⟶ decamethylene dicarboxylic Me ester, K salt of the half hydrolyzed ester ⟶ 12 hydroxylauric acid ⟶ 12 iodolauric acid Decine was prepd by the action of $C_5H_{11}Na$ on octyl iodide. No details are given E. J. C.

Constitution of hydroxyoleic acid from oil of ergot. Hermann Matthes and Otto H. Kerschner *Arch. Pharm.* 269, 88–101(1931).—Hydroxyoleic acid, isolated for the 1st time by M. and Schutz (*C. A.* 21, 4017) from oil of ergot, is available in large quantities from this source The ozonide of this acid is split by water on heating into azelaic aldehydoacid and β hydroxypelargonic aldehyde, which are subsequently converted into azelaic acid, *l* β hydroxypelargonic acid, and a 2nd undetd liquid acid. The HO acid of oil of ergot was recognized as 9-octadecen-12-oleic acid, $Me(CH_2)_5CH(OH)CH_2CH{:}CH(CH_2)_7COOH$, identical with ricinoleic acid Both acids possess like chem. and phys. consts., yielding like derivs. on oxidation with $KMnO_4$ according to Hazura and splitting of their ozonides The β hydroxypelargonic acid resulting from the scission of hydroxyoleic acid is unexpectedly *l*-rotatory, while that obtained from ricinoleic acid has been reported as *d* rotatory (cf. following abstr.). W. O. E.

Scission products of ricinoleic acid ozonide. Hermann Matthes and Otto H. Kerschner. *Arch. Pharm.* 269, 101–4(1931).—The ozonides and perozonides of ricinoleic acid and its Me ester are all liquid Furthermore, the azelaic half-aldehyde yields with $NaHSO_3$ no cryst. solid, thus preventing a sepn. of this aldehyde from hydroxypelargonic aldehyde, as carried out by Haller and Brochet (*C. A.* 4, 2091) Scission of ricinoleic acid ozonide yielded in addn. to β hydroxypelargonic acid a liquid acid of insufficient purity for purposes of identification. Contrary to the findings of Haller and Brochet the β hydroxypelargonic acid from the ricinoleic acid ozonide is not *d*-, but *l*-rotatory. W. O. E.

Hydrogenation of linolenic acid. H. van der Veen. *Chem. Umschau Fette, Oele, Wachse u. Harze* 38, 89–90(1931).—V. hydrogenated the Me ester of linolenic acid, prepd. by Rollet's method (*Z. physiol. Chem.* 62, 411(1919)) from the solid hexabromostearic acid of linseed oil He hydrogenated for 20 min. (for 1 mol. H) at 180° in a Normann beaker with 1.0–1.5% Ni, using a Ni kieselguhr catalyst with 20% Ni (reduced at 500°), hardening until 1 and 2 mols. H had been absorbed The resulting products may contain (1) unchanged linolenic acid, (2) octadecadienic acids, (3) octadecenic acids, (4) stearic acid. The amts. of these could be calcd. from the 3 known quantities I nos. (Wijs), percentage of satd. acids (Bertram method), and the Kaufmann thiocyanate nos. The latter were found to be too low and too irregular for a quant. calcn.; only qual. results were obtained by ozonizing the unsatd. acids at the end of the hydrogenation and by analyzing the ozonides formed. The methods of ozonization and the derivation of the final conclusions are clearly outlined. *Conclusions*.—The original linolenic ester showed a double bond at the 9,10-, 12,13- and 15,16-C atoms In the hydrogenation with 1 mol. H the double bond 12,13- is first satd., forming the 9,10,15,16- linolic acid, then by a partial shifting of these double bonds, a quantity of the isomeric 10,11,14,15-linolic acid is formed In the hydrogenation with 2 mols. H the newly formed 10,11,14,15-linolic acid sats. its 14,15-bond, forming a 10,11-elaidic acid, the 9,10,15,16-linolic acid sats. its 15,16-bond and should thereby form the normal 9,10-oleic acid, but instead the 9,10-bond is shifted to 8,9 and possibly some to 10,11, forming isomeric oleic acids. Extended comments are made on the Hilditch-Vidyarthi paper (*C. A.* 23, 2422) and the Bauer-Erdmann paper (*C. A.* 24, 5721) P. Escher

Preparation of aliphatic amides James A. Mitchell and E. Emmet Reid. *J. Am. Chem. Soc.* 53, 1879–83(1931).—Amides may be prepd. by passing $NH_3$ gas through aliphatic acids kept at a suitable temp. in such a way that the $H_2O$ formed is continually removed, the equil. is displaced far to the amide side The reaction velocity is appreciably slower with the higher acids, lauric acid, heated at 185° for 16 hrs., gave only a small fraction of the amide, no amide was obtained with palmitic or stearic acid at 125° or 190° $ZnCl_2$ did not catalyze the reaction with the lower acids AcOH, 8 hrs. at 190°, gives 90% of the amide, EtCO-H, 5 hrs. at 190°, 95%; $PrCO_2H$, 7 hrs. at 185°, 88%, valeric, 15 hrs. at 180°, 82%, caproic, 7 hrs. at 160°, 75% heptoic, 7 hrs. at 160° and 4 hrs. at 190°, 75%, caprylic, 11 hrs. at 180°, 80% Dimethylamides may be obtained in a similar way, using $Me_2NH$, the following yields are reported $HCO_2H$, 3 hrs. at 95°, 73%, b. 130–5°, AcOH, 3 hrs. at 150°, 84%, b. 165–75°; $EtCO_2H$, 3 hrs. at 155°, 78%, b. 165–78°, $PrCO_2H$, 2.5 hrs. at 155°, 84%, b. 180–94°, valeric, 3 hrs. at 165°, 87%, b. 205–15, caproic, 3 hrs. at 155°, 88%, b. 220–30°;

heptoic, 3 6 hrs. at 100°, 81%, bp 165-75°. Cor m ps of the amides are given

C. J. West

**Mechanism of organic reactions. III. The nature of the mechanism of migration of the acyl radical.** Harold Hibbert and Margaret E Grieg *Can J Research* 4, 254-63(1931). cf *C A*. 24, 4266.—The mechanism first proposed by Emil Fischer to explain the migration of acyl radicals in the case of glycerides of fatty acids receives strong confirmatory support in the isolation by H and G of a product analogous to the intermediate dioxolane deriv postulated by him From the theoretical consideration it seemed highly probable that with any glycol monoester contg. a C O group of very pronounced negative polarity, the tendency to undergo cyclization would be so pronounced as to permit of the isolation of the corresponding dioxolane ring It is shown that all attempts to synthesize $HOCH_2CH_2O_2CCCl_3$ gave, instead, the ring isomer, viz., 2 hydroxy-2-trichloromethyl-1,3 dioxolane The latter is quite stable at temps below 90°, but at 100 110° decomps into ethylene carbonate, $CHCl_3$, and a certain amt of higher-boiling, unidentified products In presence of a trace of pyridine the decompn into $CHCl_3$ and ethylene carbonate takes place smoothly and apparently quantitatively Similarly, when ethylene oxide is treated with $Cl_3CH$-$CO_2H$, 2-hydroxy-2-dichloromethyl-1,3 dioxolane is produced On the other hand, AcOH and $CH_2ClCO_2H$ react to give the normal half-esters Epichlorohydrin and glycidol on treatment with $CCl_3CO_2H$ give the corresponding ring compds., viz., 2-hydroxy-2 trichloromethyl-4-chloromethyl-1,3-dioxolane and 2-hydroxy-2-trichloromethyl-4 hydroxymethyl-1,3 dioxolane, resp The last-named compd thus represents the cyclic deriv postulated by Fischer as the intermediate product formed in acyl migration occurring in the case of glycerol derivs. $CH_2(CH_2OH)_2$ treated with $CCl_3$-$COCl$ gives 2-hydroxy-2 trichloromethyl-*m*-dioxane They are all mobile, pleasant-smelling, transparent liquids which decomp when heated at ordinary pressure The reaction of AcOH, $CH_2ClCO_2H$ and $CCl_3CO_2H$ on 1,2-anhydromannopyranose and 1,2 triacetylmannopyranose is under investigation. Preliminary work appears to indicate the formation of the corresponding 1,3-dioxolane deriv of mannose in each case The conclusion is drawn that all org. monoesters of multivalent alcs., carbohydrates, polysaccharides, *o*-aminophenols, etc., contg a free OH group, the H atom of which is spatially in close proximity to the C O group of the acyl radical, tend to pass over into a ring isomer Theoretically, at least, there must exist in all of these cases an equil between the open-chain and its corresponding cyclic isomer Investigations of the structure of the monoacyl derivs of glycerol, of carbohydrates, polysaccharides, aminophenols, etc., should permit of the isolation, in many cases, of the intermediate dioxolane or other ring concerned in the migration of the acyl radical. The existence is postulated of a definite equil between the open chain ester and the corresponding ring isomer in all monoesters of poly-alcs in which spatial proximity of a OH to the C O group exists, and the prediction is made of the probable isolation of many new cyclic isomers under investigation when appropriate consideration is given to their phys. and chem. properties, such as stability, behavior toward acids, alkalies, etc.

J. W. Shipley

**Physicochemical investigation of amino acids. IV.** Gakuji Takahashi, Tokuzo Yaginuma and Kentaro Hayakawa *Proc Imp Acad Tokyo* 7, 57-60(1931). cf. *C. A*. 24, 4266.—*l*- and *d* Leucine have practically the same crystallographic consts: the av value for the 2 are $a:b:c = 1.5139:1:1.0025$, $\alpha$ 1.5331, $\beta$ 1.5361, $\gamma$ 1.5514, V 23° 37′ The values for *d*- and *l* norleucine are $a:b:c = 1.3021:1:1.2866$, $\alpha$ 1.5071, $\beta$ 1.5104, $\gamma$ 1.5400, V 18° 0′. Histamine picrate, monoclinic, $\beta$ 100° 30′, $a:b:c = 1.2216:1:1.2266$, the values for $\alpha$, $\beta$ and $\gamma$ for $\lambda$ 665.9, 591.9 and 433.0 are: 1.6851, 1.6022, 1.7122, 1.7009, 1.7135, 1.7308, 1.7632, 1.7535, 1.7568 Histamine forms a mono HCl salt

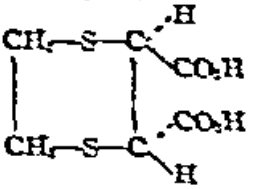
**The behavior of polypeptides, containing lysine with substitution in α- and ε-position, toward *N* alkali, erepsin and trypsin.** Emil Abderhalden and Friedrich Schwitzer *Fermentforschung* 12, 350-75(1931).—The ε $NH_2$ group of the lysine component of proteins is generally believed to be unsubstituted, although no convincing proof has yet been offered This paper deals with the enzymic cleavage of lysine peptides in which the α- or the ε $NH_2$, or both, occur in acid amide linkage. The α lysine peptides were obtained by the usual peptide synthesis, starting with ε-benzoyllysine in which the ε-$NH_2$ was already occupied by Bz and thus excluded from the coupling reaction Similarly, the ε peptides were made from α-methyllysine in which only the ε $NH_2$ was free to react The α,ε diaminoacyllysines were obtained directly from unsubstituted lysine. ε Benzoyllysine (I), which served as the starting material, was prepd from benzoylpiperidine by the v. Braun method

(*C A* 3, 1273) I ⟶ ε *N benzoyl α (dl α bromopropionyl)-dl lysine* (II), m 129-30°, ⟶ ε *N benzoyl α-dl-alanyl-dl lysine* (III), m 240°, ⟶ ε *N benzoyl α (N benzoyl-dl alanyl)-dl lysine*, m 145-6° I ⟶ ε *N benzoyl α (dl α bromoisocaproyl)-dl lysine* (IV), m 148-50°, ⟶ ε *N benzoyl α-dl leucyl-dl lysine*, m 232-3°, ⟶ ε *N benzoyl α-(N benzoyl-dl leucyl)-dl lysine*, m 155-6° IV + $PhCH_2NH_2$ ⟶ ε *N benzoyl α-(N benzyl-dl leucyl)-dl lysine*, m 190-1° I ⟶ ε-*N-benzoyl α (dl α-bromocaproyl)-dl-lysine*, m 140°, ⟶ ε *N benzoyl α-dl norleucyl-dl lysine*, m 251-2° III ⟶ ε-*N-benzoyl α (dl α bromoisocaproyl-dl-alanyl)-dl lysine*, m 154-5°, ⟶ ε *N-benzoyl-α-(dl leucyl-dl-alanyl)-dl-lysine* (V) decomps 90° I ⟶ α ε dibenzoyl-*dl* lysine, m 146-7°, ⟶ I, m 252°, ⟶ II, hence this method is unsuitable for the prepn. of α benzoyllysine *dl*-ε-Benzoylamino-α bromocaproic acid (v Braun) + $MeNH_2$ ⟶ ε *N benzoyl α methyl-dl-lysine* m 233-4° ⟶ α *N methyl-dl-lysine HCl salt* (VI), m 244-5° (*III salt* m 230-41° (decompn.)) ⟶ ε-(*dl α bromopropionyl*) α-*N-methyl-dl-lysine* ⟶ ε-*dl-alanyl α N methyl-dl-lysine* (VII) m 115°. VI ⟶ ε-(*dl α-bromoisocaproyl*) α *N methyl-dl-lysine*, m 119-21°, ⟶ ε-*dl leucyl α N methyl-dl lysine* (VIII) decomps 120° *dl Lysine mono HCl salt* (IX), m 235-6°, is more easily handled than the di HCl salt because of its lower soly and greater readiness of crystn IX ⟶ α ε-*di(dl bromopropionyl)-dl-lysine* ⟶ α ε-*di(dl-alanyl)-dl-lysine* (X) IX ⟶ α ε-*di(dl bromoisocaproyl)-dl lysine*, m 93-4°, ⟶ α ε-*di(dl-leucyl)-dl-lysine* (XI), m 130° Trypsin attacked III, V and X, the extent of cleavage indicating that only the α-linkage was broken Trypsin kinase attacked V and XI, the latter only to 25% Here again it appears that only the α peptide linkage is broken The 10.7% cleavage of VIII is considered questionable All of these derivs were hydrolyzed more or less by *N* alkali at 37° The important observation is that the ε peptide linkage of lysine polypeptides is resistant to enzymes A typical illustration is the ereptic cleavage of III and non-cleavage of VII. These observations support the view that the lysine component of proteins is linked only through its α-$NH_2$ A W Dox

**Further studies on the behavior of polypeptides containing proline toward the erepsin trypsin-kinase complex.** Emil Abderhalden and Otto Zumstein *Fermentforschung* 12, 341-9(1931). cf *C A* 25, 77.—The proline peptides were prepd by coupling 1,4-dibromovaleryl chloride with the amino acid or dipeptide and closing the proline ring by amination The above acid chloride was obtained by condensing $CH_2(CO_2Et)_2$ with $(CH_2)_2Br_2$ and brominating, sapong the $Br(CH_2)_2CHBrCH(CO_2Et)_2$ with HBr, extg with $Et_2O$ and distg., and repeating the operation several times with the residue *dl Prolylglycine* (I), m 222-3°, *dl prolyl-d-alanine* (II), m p not stated, *dl prolyl-dl leucine* (III), m 225-6°, *dl prolylglycylglycine* (IV), *dl prolyl-dl-leucylglycine* (V), m 245° (decompn.) III + *dl* $Me_2CHCH_2CHBrCOCl$ ⟶ viscous resin ⟶ *dl leucyl-dl prolyl-dl-leucine* (VI), m 255-6° (decompn.) Enzyme expts indicate that polypeptides which contain no $NH_2$ but rather an NH as in proline require a special enzyme complex for cleavage Trypsin does not attack I or VI; it attacks II and IV only slightly, but III and V more readily Trypsin kinase did not hydrolyze any of the proline peptides III and VI are resistant to *N* alkali while I undergoes 50% cleavage in 2 hrs., then reaches an equil II and IV are slowly hydrolyzed, V more readily The expts show that enzymes do not merely accelerate hydrolyses already in progress but initiate reactions not otherwise occurring The enzyme-substrate complex can behave differently from the substrate alone toward a given H ion concn A W Dox

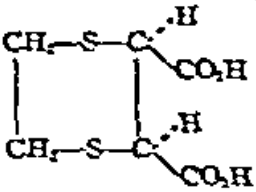
**The isomerization of E. Fischer's "carbethoxydiglycylglycine ester."** M V Cerchez *Bull soc chim* [4], 49, 324-8(1931). cf *Ber* 36, 2094, 2106(1903).—Fischer prepd carbethoxydiglycylglycine ester, $EtO_2CCH_2NHCOCH_2NHCOCH_2NHCO_2Et$ (I), m 160-1°, from $EtO_2CNHCH_2CONHCH_2COCl$ and $NH_2CH_2CO_2Et$ in $CHCl_3$ and by the action of $ClCOCH_2NHCO_2Et$ on $NH_2CH_2CONHCH_2CO_2Et$ On sapon I formed first the acid ester, $HO_2CCH_2NHCOCH_2NHCOCH_2NHCO_2Et$ (II), m 208-10°, and then the diacid, diglycylglycinecarboxylic acid, $HO_2CCH_2NHCOCH_2NHCOCH_2NHCOCH_2NHCO_2H$ (III), m 206° (decompn.) I found that the esterification of III gave an ester (IV) with the compn of I, but m 146-8°, and considering isomerization to have taken place, designated I and IV as α- and β forms Leuchs and La Forge (*C A* 2, 3078) held the opinion that they could be regarded as the tautomers, $EtO_2CCH_2NHCOCH_2NHCOCH_2NHCO_2Et$ and $EtO_2CCH_2N{:}C(OH)CH_2N{:}C(OH)CH_2NHCO_2Et$ The possibility of carbamidodiacetic acid $OC(NHCH_2CO_2H)_2$, m 205-10°, and its di Et ester, m 147-8°, being identical with III and IV was disposed of when the latter compds were prepd according to the original directions Analysis showed that III was a diacid, $C_7H_{11}O_6N_3$, and mixed m p dets demonstrated the non identity of the pairs of compds in question C R Addinall

**Hydroxy aldehydes. IX. Synthesis and properties of a 6-hydroxy aldehyde.** BURCKHARDT HELFERICH AND GEORG SPARMBERG *Ber* 64B, 104–9(1931), cf *C A*. 19, 2931 —It was shown in earlier papers that 4 and 5-HO aldehydes exist, in large part, at least, as lactols (*i. e.*, in a cyclic form) which on acetalization with acid MeOH give lactolides (cyclohemiacetals) Two derivs or forms of glucose are known in which a 1,6 lactole formation may be assumed, viz levoglucosan and Pringsheim's remarkably stable "γ glucose" It seemed of interest, therefore, to study a 6-HO aldehyde with respect to its ability to form a lactol and lactolides The prepn of such an aldehyde from 1 methylcyclohexene by $O_3$ cleavage and subsequent partial reduction did not prove feasible as the ozonide is very explosive and could be prepd only in small quantity and in dil soln $O_3$ cleavage of dihydrogeraniol (rhodinol), which is present along with its isomer, $HOCH{\cdot}CH_2CHMe(CH_2)_2C(CH_2)Me$, in natural citronellol and hydrogenated geraniol, gave no better result $O_3$ cleavage of acetyl dihydrogeraniol (I) was somewhat more satisfactory, but here too, it was not possible to obtain with certainty the pure (+)-*4 methylhexan 6 ol 1 al acetate* (II), presumably because the *dl* compd was used as the starting material, for pure, sterically quite homogeneous (+)-citronellol (III) yielded the desired II. The free *HO aldehyde* (IV), obtained from II by catalytic sapon with NaOMe, is a very viscous liquid of faint odor which distils *in vacuo* without decompn, reduces hot Fehling soln and is sol to the extent of 1 1% in $H_2O$ at room temp as detd by the Bertrand method Its *n* agrees with the value calcd for the lactol form, but a very dil aq soln gives a color with fuchsin $SO_3$ as rapidly as an equimol soln of AcH in $H_2O$ Its rotation in $CHCl_3$ is much higher than that of the intermediate open form dihydrogeraniol, I and II. The free IV is apparently a desmotropic mixt of the open HO aldehyde and the lactol form which in the concd substance and in $CHCl_3$ lies far toward the lactol, in very dil $H_2O$ soln toward the HO-aldehyde form It gives in very good yield an easily volatile, strongly rotatory *Me lactolide* (V) of peppermint odor which does not reduce Fehling soln and is rapidly and completely hydrolyzed to IV by aq *N* HCl Acetate of III (prepd from a III with $n_D^{20}$ 1 45678, $d^{20}$ 0 8568, $[\alpha]_D^{20}$ 4 1°), $n_D^{20}$ 1 44383, $d^{20}$ 0 8901, $[\alpha]_D^{20}$ 2 5° II (41% yield), $b_{-4}$ 112–3°, $n_D^{19.1}$ 1 43675, $d^{19}$ 0 9892, $[\alpha]_D^{19}$ 1 7°, soly. in $H_2O$ 1 5%, gives no color with 1 1 NaOH even on long standing, but quite rapidly turns yellow in concd $H_2SO_4$ IV (yield, 30%), $b_{14}$ 103–6°, $n_D^{15.8}$ 1 46883, $d^{17}$ 1 0204, mol wt in AcOH 125 5–127, $[\alpha]_D^{13.7}$ 14 8° (no solvent), $[\alpha]_D^{15.5}$ 27 5–7 7° ($CHCl_3$), unchanged by NaOH, rapidly turns yellow and brown in $H_2SO_4$, can be titrated quantitatively with Fehling soln V (yield, about 40%), faintly yellow, $b_{13}$ 35–41°, $n_D^{17.2}$ 1 43549, $d^{17.2}$ 0 9370, $[\alpha]_D^{17}$ 110 6°, mol wt in AcOH 141 C A R



**The constitution of so-called cyanoacetoacetic ester and a disputed synthesis of citric acid.** GEORGES FAVREL AND CHARLES PREVOST *Bull soc. chim* [4], 49, 243–61 (1931), cf *Compt rend* 111, 647(1890) —The prepn of the Et monochloroacetyl acetate of Haller and Held (*Ann chim* 23, 145(1891)), considered by them to be $ClCH_2COCH_2CO_2Et$, was repeated and the fraction b 188 9° and contg 21–38% of Cl was isolated On treatment with $(NH_2)_2CS$, only the thiazole, $MeC\overline{C(CO_2Et)\ N\ C(NH_2)\ S}$, m 174–5°, characteristic of the α Cl deriv could be sepd On diazotization only the hydrazone derived from $AcCHClCO_2Et$ (I) was formed and F and P conclude that the ester of H and H is composed entirely of I. The CN deriv (II) of I, prepd according to the directions of H and H, was identical with the compd made by the action of aq KCN on the true α Cl deriv (*Ber* 23, 2339(1890)) whereas treatment of $NCCH_2COCH_2CO_2Et$ with KCN gave di Et succinylsuccinate, $EtO_2C\overline{CH\ CO\ CH_2\ CH_2\ CO\ CH}CO_2Et$, m 127–8° From the products of the reaction of alc HCl with II, 50% of I was recovered together with a non-volatile portion, free from $CO(CH_2CO_2Et)_2$, which on boiling with HCl for 2 hrs yielded $MeC(CO_2H)(OH)CHClCO_2H$, m 105–6° This diacid was also obtained by the action of KCN and HCl on I, its formation being similar to that of $MeC(CO_2H)(OH)CH_2CO_2H$ from the reaction of KCN and HCl with $AcCH_2CO_2Et$ (*Ber* 24, 2544(1891)) The formula $MeC\overline{(CN)\ CH(CO_2Et)\ O}$ (III) is assigned to II, and its formation is explained by the assumption of an intermediary cyanohydrin and consequent splitting out of HCl By the action of the calcd amount of aq KCN on I, agitation of the soln with air for 1 hr per g mol of material, extn with $Et_2O$ and distn under reduced pressure, yields in excess of 50% of III, $b_{10}$ 108°, were obtained By treatment of 50 g of III

with 100 cc. of 4 *N* KOH for several min., addn. of a slight excess of 4 *N* $H_2SO_4$ and heating to 90°, $MeC(CN)(OH)CH(OH)CO_2H$, m. 185° (decompn.) was formed. Br hydrolyses of III with KOH at 70° until 90% of the theoretical amt. of $NH_3$ was evolved, and neutralization with $H_2SO_4$ a viscous non-crystn. non-distillable residue resulted which was divided. One portion was decomposed by heat into $CO_2$, $H_2O$, $EtCHO$ and $MeCOCO_2H$. The remainder, treated in MeOH with 10 vols. of $Et_2O$, gave an amorphous hygroscopic ppt. m. 110°, identified by its Pb and Ag salts, its reactions with $CuSO_4$, $FeCl_3$, resorcinol and β-$C_{10}H_7OH$, and by comparison with a synthetic product, as $MeC(OH)(CO_2H)CH(OH)CO_2H$. It is concluded that III can lead only to methylglutaric and derivs. and not to derivs. of acetonecarboxylic acid as maintained by H. and H., that though it is conceivable that III might add HCN to give derivs. of $MeC(CO_2H)(CH(OH)CO_2H)$ or $MeC(CO_2H)(OH)CH_2CO_2H$, i. e., derivs. of isomers of citric acid, such isomers have not been isolated in this repetition of the original synthesis. C. R. Addinall



Extension of Michael's reaction. P. C. Guha and M. N. Chatterjee. *Proc. 15th Indian Sci. Cong.* 1928, 150.—Michael's reaction takes place between Na derivs. of $AcCH_2CO_2Et$, malonic ester and $NCCH_2CO_2Et$ and compds. of the general formula RCH:CHX or RC:CX in which R is an org. radical and X is a strongly neg. radical like $CO_2H$ or CN. G. and C. studied the action of the same Na derivs. on mustard oils and isocyanates. The compds., *e. g.*, $RNHC(:S)CH(CO_2Et)_2$, formed from mustard oils are easily decompd. by acids to yield compds. of the general formula RNH-CSMe together with $CO_2$ and ale., isocyanates form compds. of the type $RNHCOMe$. No details are given. E. J. C.

Condensation of ortho esters with acetoacetic ester and malonic ester. Peter P. T. Sah. *J. Am. Chem. Soc.* 53, 1899–9 (1931).—$MeC(OEt)_3$ (1.2 g.) and $AcCH_2CO_2Et$ with 2 mols. $Ac_2O$, boiled 4 hrs., give 3 g. *Et methylethoxymethylenediacetoacetate*, yellowish white glycol-thick liquid, b$_{15}$ 170–73° (decompn.), the low yield is probably due to partial decompn. during distn., on standing the color deepened, addn. of $ZnCl_2$ during the condensation period produced no favorable effect upon the yield. The Cu salt, $C_{18}H_{26}O_6Cu$, greenish blue, is characteristic. $C_5H_5N$ gives a violet color; warm $H_2O$ hydrolyses the salt to CuO. $CH(CO_2Et)_3$ gives 5 g. *di Et methylethoxymethylenemalonate*, glycol-thick liquid, b$_{15}$ 125–8°. Cu salt, greenish blue. $EtC(OEt)_3$ (D., b$_{15}$ 128–30°, b. 240°, $d_4^{15}$ 1.0225, $n_D^{15}$ 1.4168 (12.4 g.) and $AcCH_2CO_2Et$ give 40 g. *Et ethylethoxymethylenediacetoacetate*, b$_{15}$ 185–6°, $d_4^{15}$ 1.0449, $n_D^{15}$ 1.4512, addn. of $ZnCl_2$ increased the yield slightly. Cu salt, light blue. I (7.5 g.) and $CH_2(CO_2Et)_2$ give 25 g. *di Et phenylethoxymethylenedimalonate*, b$_{15}$ 180–90°, $d_4^{15}$ 1.0738, $n_D^{15}$ 1.4925. Cu salt, light blue. $ZnCl_2$ increased the yield considerably. C. J. West

*cis-trans*-Isomerism in closed-ring compounds having two sulfur atoms in the nucleus. Chittaranjan Barat. *Proc. 15th Indian Sci. Cong.* 1928, 156.—Dibromosuccinic acid occurs in two different isomeric forms according as it is obtained by brominating fumaric or maleic acid. The assumption, therefore, that they still retain their steric characteristics, is justifiable. If now they are made to condense (after protecting the $CO_2H$ groups, in the form of a salt or an ester) with $(CH_2SH)_2$, the

formation of and

from dibromofumaric

and dibromomaleic acids, resp., may be expected. The condensations have actually been effected in the presence of NaOEt in ale. suspension (the mercaptan working best as an alkali mercaptide). The products of condensation, though different, have not yet been obtained in a sufficiently pure form. E. J. C.

The interaction of sulfuric acid and bromine on ethyl benzylidenediacetoacetate. B. M. Gupta and S. C. Roy. *Proc. 15th Indian Sci. Cong.* 1928, 158.—With a view to obtaining α-Br derivs. of variously substituted Et glutarates, Et benzylidenediacetoacetate was treated with concd. $H_2SO_4$ and Br. A cryst. compd. m. 159° having the empirical formula $C_{11}H_{11}BrO_5$ was obtained. By studying the products of hydrolysis and oxidation, the constitution of the compd. has been fixed as mono-Et α,α'-diketo-α-bromo-β-phenylglutarate. This formula has been further confirmed by the study of the product of its interaction with aniline, which is a cryst. compd. having the empirical formula $C_{23}H_{20}N_2O_4$ and m. 131°. E. J. C.

*cis trans*-Isomerism in ethyl carbethoxythiocarbamate. Synthesis of four-, five-, six- and seven-membered heterocylic compounds from ethyl carbethoxythiocarbamate. P. C. GUHA AND N. C. DUTT. *Proc 15th Indian Sci. Cong* 1928, 157; cf. *C. A.* 24, 1113.—Et carbethoxythiocarbamate has been isolated in 2 isomeric forms, one m 44° and the other 141°, and the latter has been found to be convertible into the former by boiling with water contg. a drop of HCl. With $(CH_2NH_2)_2$ the lower-melting variety gives NH CO N C(OEt) NH $CH_2$ $CH_2$ (insol in alkali), whereas the higher-melting variety gives NH N C(SH) NH $CH_2$ $CH_2$ CO (sol in alkali). Et carbethoxythiocarbamate has been made to react with aromatic amines, $N_2H_4$, $PhNHNH_2$, urea, phenylurea, thiourea, semicarbazides and $o$-$C_6H_4(NH_2)_2$ and thus a large no of interesting heterocyclic compds have been obtained. E. J. C.

Oxidation of carbohydrates and fats by air in presence of yellow phosphorus. SACHINDRA NATH CHAKRABARTI AND N. R. DHAR. *J. Phys. Chem.* 35, 1114–22(1931); cf. *C. A.* 24, 380.—P can be used as an inductor in the oxidation of carbohydrates and fats. *Finely divided P was found to be most effective, colloidal P next and small pieces of P least.* Colloidal P should have been most effective, but its action was retarded by the alc. in the soln. from which it was prepd. The order of oxidation of the carbohydrates and fats investigated is given by C. and D. The fact that starch is more easily oxidized than glucose shows that in slow photochem. or induced oxidation, starch does not pass through the stage of glucose before its oxidation to $CO_2$.

LOUISE KELLEY

Optical rotation and atomic dimensions. IX. Halogenotetraacetyl derivatives of mannose. Their configurational peculiarities. D. H. BRAUNS. *J. Am. Chem. Soc.* 53, 2004–5(1931); cf. *C. A.* 23, 3114.—Preliminary note, pointing out that mannose derivs. differ from other monosaccharides studied in that ratios of the differences in sp. rotation Cl-I, Br-Cl and I-Br (41 : 25 : 35) are not the same as the ratios of the corresponding differences in at. diameters. It is suggested that for the mannose derivs. the halogens *on the 1 hand and the atoms of the 2nd C atom on the other influence each other.*

C. J. WEST

Unsaturated reduction products of the sugars. XV. Structure of the pseudoglucals. MAX BERGMANN AND WERNER FREUDENBERG. *Ber.* 64B, 158–61(1931); cf. *C. A.* 24, 5027.—The velocity of cleavage of glucosides is influenced by the HO groups of the sugar components. The chemistry of the pseudoglucals affords valuable information on this influence. Diacetyl $\psi$-glucal (I) on hydrogenation of the double bond gives an aldehyde which does not reduce Fehling soln. and it was therefore assigned the structure AcOCH$_2$CH CH(OAc).CH CH CH(OH) O. It is converted by HC(OMe)$_3$ into its *α-Me lactolide* (II) which with $Ba(OH)_2$ at room temp. gives *ψ-glucal α-Me lactolide* (III). III is also obtained with emulsin from the Me lactolide of *ψ*-cellobial (IV). It follows that in *ψ*-glucal and IV the unsatd. sugar residue has *the same structure and IV is 4 glucosido-ψ-glucal. Since in IV the glucosido residue* is on C atom 4, the furoid structure for the unsatd. part of the mol. is excluded. Furthermore, I, as well as III and the pentaacetate of IV, give $(CHO)_2$ (identified as the phenylosazone) with $O_3$, showing that the double bond in these glucals lies between C atoms 2 and 3 and fully confirming the above structures. As the lactolides are converted by catalytic hydrogenation into the lactolides of 2,3 bisdesoxyglucose and 2,3-bisdesoxycellobiose, these latter must also have a pyroid structure. All these lactolides, highly sensitive to very dil. acids, have the same ring structure as *α*- and *β*-Me glucoside, and their sensitivity is in full agreement with the theory that it is due to the absence of HO groups on C atoms 2 and 3. II, $b_{0.5}$ 110°, $n_D^{20}$ 1.4570, $[\alpha]_D^{21}$ 143.0° ($C_6H_6$), rapidly decolorizes Br. III (67% yield), $b_{0.5}$ 118–20°, $n_D^{21}$ 1.4915, $[\alpha]_D^{18}$ 102.3° ($H_2O$), does not reduce Fehling soln. but rapidly decolorizes Br.

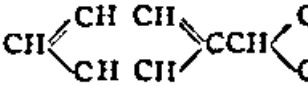
C. A. R.

Synthesis of a tetrasaccharide acetate. BURCKHARDT HELFERICH AND RICHARD GOOTZ. *Ber.* 64B, 109–14(1931).—The improvement in the method of coupling acetohalogenosugars with tetraacetylglucose (*C. A.* 24, 3763) has made it possible to prep. a synthetic tetrasaccharide in somewhat greater yield than had hitherto been obtained and to study it somewhat more thoroughly. Gentiobiosidogentiobiose (I) was chosen in order to have a uniform chain of 4 glucose mols. *β* Gentiobiosido-*d*-glucose hendecaacetate (*II*) was converted, by specially cautious treatment with AcOH-HBr, into the *aceto-bromo compd.* (III) which, when coupled with 1,2,3,4-*β* tetraacetyl-*d*-glucose (IV),

gave the *desired β-gentiobiondo-β-gentiobiose tetradecaacetate* (V), in well-crystd form. Cleavage of the Ac groups from both the tri- and the tetrasaccharide has thus far given only amorphous sugars easily sol. in $H_2O$. The purity of the V was established not only by analysis and Ac detns. but also by titration according to Willstätter-Schudel. Its soly. in 100 cc. alc. at 0° is 0.0040 g., but only when it is very pure, while a product which has been recrystd. 8–12 times gives satisfactory results on analysis and mol. wt., Ac and rotation measurements, the above low soly. is obtained only after 20 crystns. This shows the difficulty of sepg. and purifying such sugar acetates and points to the necessity for caution in judging of their homogeneity, especially when dealing with products of the partial hydrolysis of polysaccharides. II, obtained in 59% yield from acetobromogentiobiose and IV in $CHCl_3$ with $CaCl_2$, $Ag_2CO_3$ and I, m. 219–20°, in ice-cold $CHCl_3$ with AcOH satd. at 0° with HBr it gives 61% III, m. 193–4° (cor.), $[\alpha]_D^{17}$ 62.0–3.3° ($CHCl_3$). V, sinters around 135°, resolidifies and m. 207–9° (cor.), $[\alpha]_D^{20}$ −11.1° ($CHCl_3$), mol. wt. (titration according to Willstätter-Schudel) 1200–2%, mol. reducing power (Bertrand) (glucose = 100) 97. C. A. R.

Reactions relating to carbohydrates and polysaccharides. XXXIV. The constitution of levan and its relation to inulin. Harold Hibbert, R. Stuart Tipson and F. Brauns. *Can. J. Research* 4, 221–37 (1931); cf. *C. A.* 25, 723.—A description is given of the properties of levan, a polysaccharide obtained by the action of *Bacillus mesentericus*, and of its enzyme, on sucrose, in particular, its complete hydrolysis to fructose, and behavior when subjected to acetylation and methylation. By hydrolysis of trimethyllevan, a cryst. trimethylfructose was obtained. This yielded a trimethylmethyl fructoside on condensation with MeOH contg. HCl. The properties of these compds. are described for the first time. On methylation and subsequent hydrolysis of the glucoside, a tetramethylfructose was obtained having properties identical with those of the tetramethylfructose obtained by hydrolysis of heptamethylsucrose. Oxidation of the new trimethylfructose yielded a dibasic dimethyllactol acid, and esterification of the latter, followed by methylation and treatment with dry $NH_3$, gave a cryst. diamide. These results show that the new cryst. trimethylfructose is 1,3,4-trimethylfructofuranose. It follows from this that levan is a polymerized anhydrofructofuranose with linkages at positions 2 and 6 of the fructose chain, thus differing from inulin which has been shown to be an anhydrofructofuranose with linkages at positions 1 and 2. The synthesis of levan thus represents a further example of the polymerization of an anhydro sugar taking place through the medium of the γ,4-HO groups. J. W. S.

Carbon rings. XVI. Relationship between density and molecular arrangement in a homologous series of normal aliphatic and cyclic hydrocarbons. M. Stoll and G. Stoll-Comte. *Helv. Chim. Acta* 13, 1185–1200 (1930); cf. *C. A.* 25, 922.—The article is a math. study of the characteristic d. curves of the normal cyclic hydrocarbons and ketones at 20°. Based on this study, S. and S.-C. build up a theory concerning the mol. structure of these compds. A. Wieden.



Competitive hydrogenations. II. P. F. Diworky and Homer Adkins. *J. Am. Chem. Soc.* 53, 1868–75 (1931); cf. *C. A.* 24, 94.—The rates of hydrogenation (listed in order of decreasing rate) of quinoline, $C_6H_6$, PhMe, PhOH, $PhCH_2OH$, $C_5H_5N$, $Ph_2NH$, $BzNH_2$ and $PhNH_2$ have been detd. over a Ni catalyst at 125–75° and under pressure of H from 125–200 atms. Thirty two mixts. of these compds., each mixt. contg. 2 components, were subjected to the action of H over a Ni catalyst and the mixt. allowed to take up as much H as would have been sufficient to completely hydrogenate 1 of the components of the mixt. The rate of absorption of the H and its distribution between the components of the mixt. were detd. by analysis of the reaction mixt. It was found that if the compds. were listed in the series quinoline, $C_5H_5N$, $PhNH_2$, $PhCH_2OH$, PhOH, $Ph_2NH$, $C_6H_6$, $BzNH_2$ and $PhNH_2$ in any mixt. contg. 2 of them, the 1 higher in the series would receive the greater proportion of the H. $C_5H_5N$ and quinoline in mixts. with other compds. took all, or practically all, of the H. Apparently there is no relationship between the relative rates of hydrogenation of these compds. singly and in mixts. The relative rates of hydrogenation of the components of a mixt. are at least in part presumably dependent upon selective absorption by the catalyst through 2 possible acceptors of H. The hydrogenation of $Ph_2NH$ was accelerated by PhMe and $C_6H_6$ and the hydrogenation of $PhNH_2$ by the presence of PhOH in the reaction mixt. The ratio of cyclohexylcarbinol to PhMe produced in the hydrogenation of $PhCH_2OH$ was increased by the presence of PhOH or $Ph_2NH$ and especially of $C_6H_6$ or $BzNH_2$ in the reaction mixt. The original should be consulted for the table of data. C. J. West

Syntheses in the cyclobutanol series. L. Blanchard. *Bull. soc. chim.* [4], 49,

279–309(1931). cf *C A* 21, 3888.—The ethers of the dihalohydrins, $XCH_2CH(OR)CH_2X$, on condensation with $NaHC(CO_2Et)_2$ gave $XCH_2CH(OR)CH_2CH(CO_2Et)_2$ which was sapond. to $XCH_2CH(OR)CH_2CH(CO_2H)_2$. Traube and Lehmann (*Ber* 34, 1977(1901)) have shown that the acidification of the condensation product of $ClCH_2\overline{CH\ CH_2\ O}$ with $NaHC(CO_2Et)_2$ gives a lactone, $ClCH_2\overline{CH\ CH_2\ CH(CO_2Et)\ CO\ O}$. Compds of the type $\overline{CH_2\ CH_2\ CH_2\ C(CO_2Et)_2}$ formed by malonic ester condensation with $Cl(CH_2)_3Br$ or $Br(CH_2)_3Br$ are well known. By the use of $XCH_2CH(OR)CH_2X$, it would be possible to evade lactonization and so to prep. $ROCH\ CH_2\ CH_2\ C(CO_2Et)_2$, from which $HOCH\ CH_2\ CH_2\ C(CO_2H)_2$ (I) might be prepd. The removal of the R group of the ether might destroy the cyclobutane ring, though this difficulty would be avoided by synthesis of the corresponding formal, $ROCH_2OCH\ CH_2\ CH_2\ C(CO_2Et)_2$, which could be hydrolyzed by hot $H_2O$ to I. Furthermore, the prepn. of the formals $ROCH_2OCH(CH_2X)_2$ *is more convenient than that of the dihalohydrin ethers. Formals* 1 *Mixed formals*.—The addn. of $XCH_2OR$ to $ROCH\ CH_2\ CH_2\ O$ always yields mixed formals of the type $ROCH_2CH(OCH_2OR)CH_2X$. By the addn. of $MeOCH_2Cl$, $EtOCH_2Cl$ and $AmOCH_2Cl$ to epichlorohydrin the following mixed *formals* were formed. *Me 1,3-dichloroisopropyl*, $MeOCH_2OCH(CH_2Cl)_2$, $b_{11}$ 80–1°, $d_{18}$ 1.237, $n$ 1.45412, M. R. 37.88, calcd. 38.31. *Et 1,3-dichloroisopropyl*, $b_{12}$ 90–1°, $d_{17}$ 1.182, $n$ 1.44912, M. R. 42.44, calcd. 42.93. *Am 1,3-dichloroisopropyl*, $AmOCH_2OCH(CH_2Cl)_2$, $b_{11}$ 133–5°, $d_{18}$ 1.09, $n$ 1.4506, M. R. 56.55, calcd. 56.36. On addn. of $EtOCH_2Br$, $AmOCH_2Br$ and $EtOCH_2I$, to epichlorohydrin, chlorobromo and chloroiodo formals were produced, *Et 1,3-chlorobromoisopropyl*, $b_{16}$ 110–2°, $d_{20}$ 1.409, $n$ 1.46954, M. R. 45.81, calcd. 45.82, *Am 1,3 chlorobromoisopropyl*, $b_{16}$ 142–4°, $d_{15}$ 1.277, $n$ 1.46856, M. R. 59.52, calcd. 59.68. *Et 1,3-chloroiodoisopropyl*, $EtOCH_2OCH(CH_2Cl)CH_2I$, $b_{11}$ 124–5°, $d_{18}$ 1.6528, $n$ 1.50882, M. R. 50.28, calcd. 50.86. $MeOCH_2Cl$ added to $AmOCH_2\overline{CH.CH_2\ O}$ yielded *Me 1,3-chloroamyloxyisopropyl formal*, $MeOCH_2OCH(CH_2Cl)CH_2OAm$, $b_{12}$ 118°, $d_{18}$ 1.01, $n$ 1.43587, M. R. 58.10, calcd. 58.17. 2 *Symmetrical formals*.—A mixt. of dichlorohydrin and its $ClCH_2$ ether reacts slowly at room temp., evolving HCl with formation of a sym. formal. The elimination of HCl is favored by the presence of $Mg(OH)_2$. *Dichlorohydrin formal*, $CH_2[OCH(CH_2Cl)_2]_2$, m. 51°, *chlorobromohydrin formal*, m. 54–5°; *chloroiodohydrin formal* m. 60°, *dibromohydrin formal*, m. 68–9°. The condensation of $ClCH_2CH(OMe)CH_2Br$ with $NaHC(CO_2Et)_2$ formed *di-Et 1-chloro-2-methoxybutane-4,4-dicarboxylate*, $b_{11}$ 157°, $d_{25}$ 1.135, $n$ 1.44682, M. R. 63.11, calcd. 62.75. The sapon. of this ester gave an acid that was very difficult to isolate in a pure state. The condensation of $BrCH_2CH(OAm)CH_2Br$ with $Na_2C(CO_2Et)_2$ was carried out in 2 stages and gave *di-Et amyloxycyclobutanedicarboxylate* (II), $b_{12}$ 175°, $d_{18}$ 1.011, $n$ 1.4436, M. R. 75, calcd. 74.22. By digesting with 30% KOH for 5 hrs., the free *acid* (III) was prepd., which in turn was converted into its Cu salt, *diacid chloride*, $b_{15}$ 143–5°, *diamide*, m. 177.5°, *amyloxycyclobutanebarbituric acid*, m. 222–3°, *dianilide*, m. 175°. By heating to 120°, III gave off $CO_2$ and formed *amyloxycyclobutanecarboxylic acid*, $AmOCH\ CH_2\ CH_2\ CHCO_2H$, $b_{10}$ 164–6°, $d$ 1.003, $n$ 1.45412, M. R. 50.21, calcd. 49.36; *amide*, m. 131–2°. $AmOCH_2OCH\ CH_2\ CH_2\ C(CO_2Et)_2$, prepd. similarly to II, was sapond. to the diacid by the use of gaseous HCl at low temps. to prevent the hydrolysis of the formal group. By boiling the diacid with water for 5 hrs., cleavage into the *diacid alc.*, $HOCH\ CH_2\ CH_2\ C(CO_2H)_2$, m. 125°, and the formal, $CH_2(OAm)_2$, $d_{18}$ 0.843, took place. I and a similar MeO compd. showed an exaltation of the M. R. and the paper is concluded by a discussion of the M. R. of cyclobutane compds. C. R. ADDINALL.

**Cyclohexylmagnesium chloride and bromide.** HENRY GILMAN AND E. A. ZOELLNER. *J. Am. Chem. Soc.* 53, 1945–8(1931).—$C_6H_{11}MgCl$ and $C_6H_{11}MgBr$ have been prepd. in 80–96% yields. In its reaction with Mg $C_6H_{11}Br$ differs significantly from other sec. bromides. General recommendations are given for the use of RCl in preference to RBr and RI compds. for the prepn. of Grignard reagents. C. J. WEST.

**Dehydrogenation catalysis of bicyclic hydrocarbons.** N. D. ZELINSKII AND I. N.

TITE *Ber* 64B, 183–8(1931).—Some time ago Z obtained by dehydrogenation of *cyclohexylcyclopentane* (I) a cryst. compd (II), m 69.4°, which apparently had the compn $C_{11}H_{12}$ and was supposed to have the structure  , it being assumed that in such a system the loss of H atoms from the 6-membered ring stimulated a similar loss from the 5-membered ring although the dehydrogenation of a cyclopentamethylene ring was so unexpected that the synthesis of compds. of the type I was undertaken to check these results (*C. A.* 21, 900). The supposed I had been synthesized from $C_6H_{11}MgBr$ (III) and cyclopentanone (IV) and as the reaction seemed to proceed normally there seemed to be no doubt that the product was I. More thorough study showed, however, that II is really $Ph_2$ and that the action of Mg on $C_6H_{11}Br$ in $Et_2O$ yields chiefly $(C_6H_{11})_2$, the normal III which with IV gives the expected tertiary alc. being formed in only small quantity. Heating the reaction product with aq. $(CO_2H)_2$ yielded, together with the $(C_6H_{11})_2$, only a small quantity of an unsatd. hydrocarbon. Likewise, $C_6H_{11}MgBr$ and cyclohexanone yielded no appreciable amt. of the expected tertiary alc., and III with 3-methylcyclopentanone gave chiefly $(C_6H_{11})_2$. The true I was accordingly prepd. by hydrogenation of phenylcyclopentane (V), b. 217°, $d_4^{22}$ 0.9474, $n_D^{22}$ 1.5280, which was obtained in 54% yield from $C_6H_5Cl$, $C_5H_8$ and $AlCl_3$. Passed at the rate of 4 drops per min. in $H_2$ over Pt-charcoal at 220.5°, V gave I, b. 214°, $d_4^{21}$ 0.8780, $n_D^{21}$ 1.4728, which, when passed 3 times at the rate of 2 drops per min. over Pt-charcoal at 300°, yielded V°, b. 215–7°, $n$ 1.5192, with no higher boiling product and not a trace of crystals of $Ph_2$. This passivity of the pentamethylene nucleus in bicyclic systems toward dehydrogenation catalysis is further confirmed by the following expts. *Phenylcyclopentylmethane* (VI), b. 233–5°, $d_4^{19}$ 0.9345, $n_D^{19}$ 1.5206 (obtained together with $(PhCH_2)_2$ and a little $(C_5H_9)_2$ from $PhCH_2Cl$, $C_5H_9Cl$ and Na), remained unchanged when passed over Pt-charcoal at 300°. At 200° in $H_2$ it yielded *cyclohexylcyclopentylmethane*, b. 225–7°, $d_4^{19}$ 0.8789, $n_D^{19}$ 1.4775, which, when passed over Pt-charcoal at 300°, regenerated the VI. C. A. R.

Influence of substitution on the oxidation of side chains in the benzene nucleus. P. S. VARMA AND P. B. PANICKER. *Proc. 15th Indian Sci. Cong.* 1928, 150–1.—Using a neutral soln. of $KMnO_4$, V. and P. oxidized *o*-, *m*- and *p*-$O_2NC_6H_4Me$, *o*-, *m*- and *p*-$MeC_6H_4CO_2H$, *o*- and *p*-$ClC_6H_4Me$, *o*- and *p*-$BrC_6H_4Me$, *o*- and *p*-$IC_6H_4Me$, *o*-, *m*- and *p*-$AcHNC_6H_4Me$ and *m*- and *p*-$MeC_6H_4OMe$ under identical expti. conditions. Conclusion: In the *p*-series the order (the degree of oxidation decreasing) in which the side chain is oxidized is $-CO_2H$, $-NO_2$, -Br, -Cl, -OMe, -I, -NHAc and in the *o*-series the order is $-NO_2$, $-CO_2H$, -Br, Cl, -NHAc and -I. With regard to position isomers, there does not seem to be any regularity. *p*-$NO_2C_6H_4Me$ is oxidized most, the *m*-compd. the least, whereas in the acetyltoluidines, the *o*-deriv. comes first and the *p*-deriv. last. No details are given. E. J. C.

Obtaining an intermediate form in an acetylenic transposition. M. BOURGUEL. *Compt. rend.* 192, 686–8(1931); cf. *C. A.* 22, 2748.—Treatment of $PhC{\equiv}CMe$ (I) with $NaNH_2$ at 60–70° for 3 hrs. followed by cold very dil. acid yielded true phenylpropine, $PhCH_2C{\equiv}CH$ (II), and a new hydrocarbon, $b_{17}$ 72°, $d_{18}$ 0.9385, $n_D^{20}$ 1.582, believed to be $PhCH{=}C{=}CH_2$ (III). This does not react with CuCl, is not hydrated by $H_2SO_4$ and its Raman effect is different from I or II. Further treatment of III with $NaNH_2$ yields II. II treated with dry KOH at room temp. yields first III, then I. III polymerizes at 60° quickly to a soft resin. It forms a diketone, PhCOCOMe, either by taking up $O_2$ from the air, or by the action of $Hg(OAc)_2$. L. E. GILSON

Physical properties of various nitro derivatives. LOUIS DESVERGNES. *Rev. chim. ind.* 40, 34–7(1931); cf. *C. A.* 21, 3607, 23, 4207, 24, 350.—The solidification point of 2,4,6-$(O_2N)_3C_6H_2Me$ on 3 detns. was 80.83°. Its soly. at 19° in 100 g. of AcOEt is 30.921, abs. EtOH 1.426, MeOH 2.944. The soly. of tetryl at 18° for 100 g. of solvent is AcOEt 13.916, $Me_2CO$ 64.111, abs. EtOH 0.537, MeOH 1.320, $C_6H_6$ 5.070, $C_5H_5N$ at 19.5° 43.997, $C_7H_8$ at 19.5° 3.137. **Nitration of benzene.** P S VARMA AND K A JOSHI *Proc 15th Indian Sci Cong* 1928, 151 —$C_6H_6$ was nitrated by means of $HNO_3$ alone in the presence of Zn, Cu, Sn and Sb as catalysts It was possible to get some increase in the yield of $PhNO_2$ in the presence of metallic Sn but the yield so obtained can in no way be compared with the yield obtained by using a mixt of $HNO_3$ and $H_2SO_4$ as is done in the ordinary nitration No details are given E J C

**Nitration of *m*-dichlorobenzene.** H S JOIS AND B L MANJUNATH *Half-Yearly J. Mysore Univ* 4, 239-40(1930) —*m*-$C_6H_4Cl_2$ (100 g) was nitrated according to the method of Nietzki and Schedler (*Ber* 30, 1666(1897)) using $HNO_3$ of d 1 52. The mixt was kept at 80° for 30 min, then cooled and added to $H_2O$ + ice The ppt, crystd from EtOH, gave pure 4,6 dinitro-1,3 dichlorobenzene (I), rectangular plates, extinction about 40°, m 102 3° The mother liquor was evapd to dryness, and the residue dissolved in $Et_2O$, washed with $H_2O$ and dried, (Cl 30 3%, calcd for $C_6H_2(NO_2)_2Cl_2$, 29 9%) Dissolved in EtOH at 50°, it gave on cooling a crop of crystals of I. On boiling down and then cooling, this last mother liquor sometimes gave crystals of 2,4 dinitro-1,3 dichlorobenzene (II) (acicular crystals, extinction angle 10–12°, m. 70–1°), but it was not possible to det the exact exptl conditions for obtaining II. Recrystn from concd $H_2SO_4$ (cf. Dann, *C. A.* 24, 1356) gave II, m. 68–9°. The total yield was 120 g of I and 30 g of a mixture of I and II. GEORGE CALINGAERT

**New and improved methods in the formation of pharmacologically important amines. II. Synthesis of β-arylethylamines from aromatic aldehydes and carboxylic acids.** KARL KINDLER *Arch Pharm.* 269, 70-8(1931), cf *C A* 21, 260-8-9 —The following scheme indicates the methods followed in the present study in the prepn of β-arylethylamines·

(I) $ArCHO \longrightarrow ArCH(OAc)CN \longrightarrow$

(II) $ArCHO \longrightarrow ArCH_2CH_2CONH_2 \longrightarrow ArCH_2CH_2NH_2$

(III) $ArCOCl \longrightarrow ArCOCN \longrightarrow$

Under I the synthesis of anisaldehyde, methylvanillin, piperonal and myristicinaldehyde was carried out, under II, the amides of *p* methoxy-, 3,4-dimethoxy- and 3,4-methylenedioxyhydrocinnamic acid, under III, anisoyl chloride. The lowest yields obtained under I and II amounted to 70% of the theoretical The amines obtained are convertible into tyramine, hordenine, epinine, laudanosine, papaverine, hydrastinine, berberine and cotarnine WITH W. PESCHKE Reduction expts with II under pressure in a specially constructed app are described in the prepn of homopiperonylamine from 3,4 methylenedioxyacetylmandelic nitrile, homoveratrylamine from 3,4-dimethoxyacetylmandelic nitrile, *tyramine Me ether* from *p-methoxyacetylmandelic nitrile*, $C_{11}H_{11}O_3N$, m 38–9°, $b_6$ 165°, and homomyristicylamine from 3,4 methylenedioxy-5 methoxyacetylmandelic nitrile, tyramine Me ether from *p*-methoxybenzoylcyanide WITH D SCHMIDT Tyramine Me ether from *p*-methoxyhydrocinnamic amide, homoveratrylamine from 3,4-dimethoxyhydrocinnamic amide; homopiperonylamine from 3 4-methylenedioxyhydrocinnamic amide W. O E.

**Preparation of *p*-chloroaniline.** K. HABIB HASAN *Proc 15th Indian Sci Cong* 1928, 158 —Chattaway and Orton (1901) described a method of chlorinating AcNHPh with bleaching powder in glacial AcOH A good yield of *o*- and *p*-compds is obtained On hydrolysis of the anilides, however, the yields claimed for both anilines are not obtained, nor is the method of sepg *p*-chloroaniline suitable E. J. C.

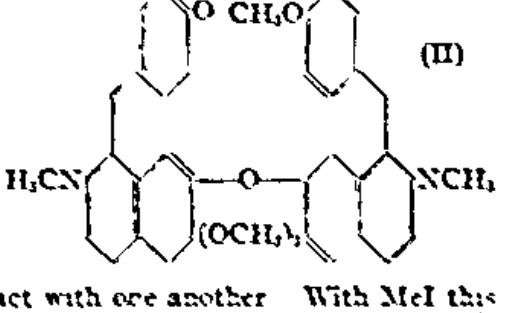
**Diazotization of difficultly diazotizable amines.** S KRISHNA AND RATAN LAL BHATIA *Proc 15th Indian Sci. Cong* 1928, 152 —The usual methods of diazotization do not work with certain substituted amines, nor are such treatments as pressure, high

temp., concn., solvents, etc., applicable in all cases. Hence a method was worked out in which use was made of a basic solvent like pyridine. Make a soln. of the desired amine in the min. quantity of pyridine and add to it a strong soln. of $NaNO_2$ (calcd. quantity) in water. Add this mixt. to a dil. soln. of HCl very slowly in small quantities. Diazotization proceeds satisfactorily. In this way tribromoaniline, 2,6-dichloro-*p*-nitroaniline, dibromo-*p*-aminobenzoic acid and dibromo-*p*-aminobenzaldehyde were successfully diazotized. F. J. C.

**Substituted quaternary azonium iodides. V. The molecular state of phenyldimethylazonium, phenylmethylethylazonium, phenyldiethylazonium, phenylmethylbenzylazonium, phenylpropylbenzylazonium iodides in solution.** Bawa Kartar Singh and Mola Ram Stud. *Proc. 15th Indian Sci. Cong.* 1928, 148; cf. *C. A.* 15, 1506.—The mol. wts. of these 5 compds. are detd. by using the Lumsden-Walker b. p. method, in water and EtOH. The solns. employed are very dil., the concn., in most cases, ranging from 0.6 to 1.5%. Conclusions: (1) The mol. wts. of all but phenylethylazonium iodide (I) are lower in EtOH than in water, in the case of I this relation is reversed. The degree of dissocn. is, therefore, greater in EtOH, a solvent of low dielec. const., than in water, a solvent which has a very high value. It is, therefore, clear that the Nernst-Thomson rule is not followed in these cases. (2) In $H_2O$, the degree of dissocn. of these compds. increases with increasing formula wt. of the base, but this regularity does not appear in EtOH. (3) The degree of dissocn. of the salts increases with dilu. in both solvents. (4) The mol. wts. furnished by the 2 methods, viz., the vol. and the wt. methods, are nearly identical for very dil. solns. No details or values are given. E. J. C.

**Aryl chlorosulfinates and aryl sulfites.** M. Battegay and L. Denivelle. *Compt. rend.* 192, 492–3(1931).—Besides confirming the method for the synthesis of $(PhO)_2SO$, $b_{15}$ 172–6°, by the action of $SOCl_2$ on NaOPh in toluene at 0° (cf. Voss and Blank, *C. A.* 25, 1797), B. and D. obtained a compd. $PhOSOCl$, *Ph chlorosulfinate*, $b_{15}$ 94–6°. This is a new type of compd. It fumes in air, is decompd. by $H_2O$ to PhOH, $SO_2$ and HCl, and by Zn to $SO_2$ and PhCl, and is the intermediate product in the formation of $(PhO)_2SO$. Janet E. Austin.

**Identification of phenols as the esters of 3,5-dinitrobenzoic acid.** Max Phillips and George L. Keenan. *J. Am. Chem. Soc.* 53, 1924–8(1931).—The 3,5-dinitrobenzoyl esters of phenols were prepd. by refluxing 0.01 mol. of the phenol and 0.01 mol. of $3,5\text{-}(O_2N)_2C_6H_3COCl$ in 20 cc. $C_5H_5N$ for 1 hr. and pouring the cooled reaction product into 400 cc. cold 5% $H_2SO_4$, then washing with $H_2O$ and 2% NaOH. The m. ps. are cor. The following data include the m. p. and values for $\alpha$, $\beta$ and $\gamma$; other crystallographic data are given in the original. 3,5-Dinitrobenzoyl deriv. of PhOH, rods, 145.8°, 1.505, 1.690, >1.740; *o*-$MeC_6H_4OH$, plates, 138.4°, 1.490, —, >1.720; *m*-$MeC_6H_4OH$, plates, 165.4°, 1.475, 1.700, 1.740; *p*-$MeC_6H_4OH$, plates, 188.6°, 1.500, —, 1.740; 3,4-$Me_2C_6H_3OH$, rods, needles, 181.6°, 1.508, 1.670, >1.740; 2,6-$Me_2C_6H_3OH$, rods, plates, 158.8°, 1.512, 1.670, >1.740; 2,4-$Me_2C_6H_3OH$, rods, plates, 164.6°, 1.517, 1.645, >1.690; 3,5-$Me_2C_6H_3OH$, rods, 195.4°, 1.485, 1.650, >1.740; 3,6-$Me_2C_6H_3OH$, needles, 137.2°, 1.487, 1.665, 1.740; thymol, needles, 103.2°, 1.480, 1.625, 1.705; *p*-cyclohexylphenol, needles, 168.0°, 1.515, 1.625, 1.702; guaiacol, yellow needles, 141.2°, 1.530, —, >1.740; creosol, rods, needles, 170.6°, 1.550, 1.570, 1.640; 4,2-Pr(MeO)$C_6H_3OH$, needles, 116.2°, 1.520, —, 1.650; eugenol, 130.8°; isoeugenol, 158.4°; $\alpha$-$C_{10}H_7OH$, yellow needles, 217.4°, 1.490, 1.615, >1.740; $\beta$-$C_{10}H_7OH$, needles, 210.2°, 1.475, 1.740, >1.740. Details are given of the prepn. of creosol and 4,2-Pr(MeO)$C_6H_3OH$. C. J. West.

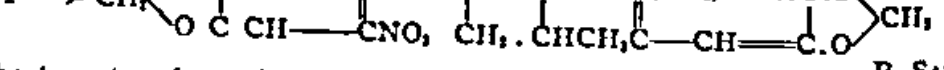


**The pyrolysis of phenols. III. Influence of the time of heating and of gases present.** August Hagemann. *Z. angew. Chem.* 44, 221–4(1931).—PhOH and pyrocatechol are passed through a hot tube in a current of $N_2$, $H_2$, $CO_2$ or steam. The % decompn. decreases as one passes from $N_2$ to steam, the yield of butadiene increasing in the same order from 33 to 56%. George Calingaert.

**Crotyl ethers of phenol.** Charles D. Hurd and Frank L. Cohen. *J. Am. Chem. Soc.* 53, 1917–22(1931).—4-Chloro-2-hexene (10 g.), 7.6 g. PhOH, 40 cc. $Me_2CO$ and 10 g. $K_2CO_3$ refluxed 11 hrs., give 30% of *α-ethylcrotyl Ph ether* (I), $b_{15}$ 116–8°, and 1.8 g. *o-α,δ-dimethylcrotylphenol* (II), $b_{15}$ 140–3°. Similarly, 4-chloro-2-heptene gives 65% of *α-propylcrotyl Ph ether* (III), $b_{12}$ 153–4°, turns a dark red on cooling. 2,4-Dimethyl 2-chloro-3-pentene gives *α α,γ-trimethylcrotyl Ph ether* (IV), very viscous, does not distil at 150° and 15 mm., $n_D^{22}$ 1.2047. Heating I at 200–5° for 30 min. gives 75% of II. III, heated at 228–30° for 30 min., gives 54% of *α-methyl-δ-ethylcrotylphenol*, $b_{15}$ 154–5°. Heating IV at 160–70° for 30 min. gives a mixt. of PhOH and

2,4 dimethyl 1,3 pentadiene (33% yield). It is pointed out that the substituted alkyl aryl ethers with the grouping $ArOCH_2C{:}C$ or $ArOCHRC{:}C$ may be expected to rearrange on heating, whereas with a grouping such as $ArOCR_2C{:}C$ pyrolysis leads to ArOH and a hydrocarbon. C. J. West

**Rearrangement of saturated alkyl phenyl ethers. Synthesis of isopropyl-phenol and -cresols.** Joseph B. Niederl and Samuel Natelson. *J. Am. Chem. Soc.* 53, 1928-34(1931); cf. *C. A.* 25, 931.—For the conclusive proof of the reaction mechanism offered for the condensation of olefins with phenols under the influence of cond. $H_2SO_4$ in the cold presented in the earlier paper, it was necessary to show that satd. alkyl Ph ethers would rearrange under the conditions used by Koenig (*Ber.* 24, 3889(1891)) for this purpose the various iso-Pr Ph and tolyl ethers were studied. The ethers were prepd. by heating 1 mol. wt. of the phenol, excess KOH (58 g.) and excess (125 g.) iso-PrBr (details given); the ethers were rearranged by adding 80 cc. of the ether to 150 cc. cond. $H_2SO_4$ made up to 1 l. with AcOH and refluxing 5 hrs. $PhOCHMe_2$, b. 178°, $d^{20}$ 0.875, $n^{D}_{D}$ 1.4092; rearrangement gives *o*-$MeCHC_6H_4OH$, b. 213-4°, $d^{20}$ 1.012, $n^{D}_{D}$ 1.5315. *iso-Pr o-tolyl ether*, b. 192°, $d^{20}$ 0.933, $n^{D}_{D}$ 1.5040; 2,4 $Me(MeCH)C_6H_3OH$, b. 232-4°, $d^{20}$ 0.980, $n^{D}_{D}$ 1.5178; 2,4,5-tri Br deriv., m. 223°. *iso-Pr m-tolyl ether*, b. 195°, $d^{20}$ 0.931, $n^{D}_{D}$ 1.4939; 3,5 $Me(Me_2CH)C_6H_3OH$, b. 230-5°, $d^{20}$ 0.904, $n^{D}_{D}$ 1.5280. *iso-Pr p-tolyl ether*, b. 184°; b. 195°, $d^{20}$ 0.927, $n^{D}_{D}$ 1.4952; *4 methyl 2 isopropylphenol*, b. 234-7°, $d^{20}$ 0.980, $n^{D}_{D}$ 1.5277. *o*-$MeCHC_6H_4OCH_2CO_2H$, m. 130°; *2 Methyl 4 isopropylphenoxyacetic acid*, from the K salt of the phenol and $BrCH_2CO_2H$, m. 87.5°; *3 methyl 1 isopropyl deriv.*, m. 141°; a 2nd *deriv.*, m. 125-6°, was prepd. from a condensation product, b$_4$ 95-100°; *4 methyl 2 isopropyl deriv.*, m. 126°. Proofs for the probable structure of these products are discussed and a general rule as to the way of migration of the alkyl groups is given. As the possibility of rearranging even short chain, satd. Ph ethers has now been demonstrated, a series of related problems, such as the rearrangement of the more important Ph ethers of mono- and polyfunctional alkanes is being investigated. C. J. West



**Constitution of oxyacanthine. II.** F. v. Bruchhausen and P. H. Gericke. *Arch. Pharm.* 269, 115-23(1931); cf. *C. A.* 24, 854.—New exptl. results are reported which appear to substantiate formula II for oxyacanthine and satisfactorily explain the formation of the decarboxyl acid, 4,5 $MeO(p\text{-}HO_2CC_6H_4O)C_6H_2CO_2H$ (I) therefrom. The methine base of oxyacanthine Me ether previously subjected to oxidation by $KMnO_4$ was treated with $O_3$, and smoothly split according to the equation $C_{21}H_{25}O_4N_2 + 2\,O_3 + 2\,H_2O = C_{11}H_{12}O_4 + C_9H_{11}O_4N_2$ (IV) $+ 2\,H_2O_2$ into 2 cryst. components, each in 95% yield. The N free portion is a dialdehyde, m. 72° and yields a disemicarbazone and diphenyl hydrazone, it condenses readily with malonic acid to diphenyl etherdiacrylic acid. Its constitution, 4,5-$MeO(p\text{-}OHCC_6H_4O)C_6H_2CHO$ (III), is easily shown through oxidation to I. The other component (IV) m. 76°, is unusually sol. in $H_2O$, possibly explained by the fact that aldehyde and carboxyl groups do not readily react with one another. With MeI this product yields a cryst. dimethiodide, $C_{23}H_{31}O_4N_2I_2$, characterized by the ease with which it is split by caustic alkali into $Me_3N$ and a cryst. dialdehyde (V), 2,3,4,6-$RO(MeO)_2(CH_2{:}CH)C_6HCHO$ ($R$ = 5,2,4 $OHC(MeO)(CH_2{:}CH)C_6H_3$–), m. 140°. With mineral acids this difficultly sol. product yields characteristic colors in AcOH. It forms a di semicarbazone, and in $CHCl_3$ soln. adds Br without evolution of HBr. Hydrogenation with Pd $BaSO_4$ leads to the formation of the satd. dialdehyde VI, which in turn yields a disemicarbazone and with hippuric acid a monoazlactone, thus showing that 1 aldehyde group is more reactive than the other. In the present study the following compds. were prepd. and characterized: *2′ methoxy-1,1′-diphenyl ether-4,5′-dialdehyde* (III), m. 72° (*disemicarbazone*, $C_{19}H_{19}O_4N_6(H_2O)$, m. 228°, *diphenylhydrazone*, yellowish white, m. 218°, *oxime*). *2′-Methoxy-1,1′-diphenyl ether-4,5′-diacrylic acid*, $C_{19}H_{16}O_6$, m. 258°, is converted into *2′ methoxy-1,1′-diphenyl ether-4,5′-dipropionic acid*, $C_{19}H_{20}O_6$, m. 144°. *Di-o-di (β-dimethylamino)ethyl-trimethoxydiphenyl ether-dialdehyde* (IV) (crystallizes with $H_2O$), m. 76° (*dimethiodide*, m. 239°). *Di-o-ethyl-trimethoxydiphenyl etherdialdehyde* (V), m. 140°, gives with cond. $H_2SO_4$ in AcOH soln. a deep blue color (*semicarbazone*, $C_{25}H_{34}O_6N_6$, m. 230° (decompn.)). *Di-o-ethyl compd.* (VI), (by reduction

of V), m. 88–9° (*disemicarbazone*, m 218°; *azlactone*, $C_{18}H_{17}O_3N$, yellow, m 252°)
W. O. E.

Catalytic reduction of mixtures of *p*-nitro- and nitrosophenols with aldehydes and ketones. Randolph T. Major *J. Am Chem Soc* 53, 1901–8(1931).—Catalytic reduction of 2,4 $(O_2N)_2C_6H_3OH$ in $Me_2CO$, followed by benzoylation of the reduction product, gives *2 benzamido-4 benzoylisopropylaminophenyl benzoate*, m 171°, while in 1,4-dioxane, MeOH, AcOH or iso-PrOH the expected product, $(BzNH)_2C_6H_3OBz$, m 233°, is formed, 2,4-$(O_2N)_2C_6H_3OEt$ in $Me_2CO$ gives *2,4-dibenzamidophenetole*, m 189°. Reduction of a mixt. of *p*-$O_2NC_6H_4OH$ and $Me_2CO$ gives some *p*-$H_2NC_6H_4OH$, m 184° (decompn.), and 4-$Me_2CHNHC_6H_4OH$, m 155–6° (45% yield), this was also obtained by reduction of $Me_2C{:}NC_6H_4OH$, the *NO deriv*, yellow, m 112–3°, the *phenylcarbamyl deriv* m 214–5° (decompn.), *HCl salt*, m 189°. Reduction of *o* $O_2NC_6H_4OH$ in $Me_2CO$ followed by treatment with $HNO_2$ gives a negligible amt. of NO deriv., the product being 2 $H_2NC_6H_4OH$; *p*-$O_2NC_6H_4OH$ and $Et_2CO$ give 60% of the *NO deriv* of *4 sec-amylaminophenol*, m 89–90°; *HCl salt*, decomps without melting, similarly MeEtCO gives the 4 *sec* butylamino deriv., analyzed as the *HCl salt* When *p*-$O_2NC_6H_4OH$ is reduced in BzMe or menthone, only *p*-$H_2NC_6H_4OH$ is formed Catalytic reduction of *p*-$O_2NC_6H_4OH$ in HCHO or AcH gave no definite condensation product, but with BzH in MeOH a considerable yield of 4-dibenzyl amino deriv is obtained, this also results from *p*-$H_2NC_6H_4OH$ and BzH *4 Benzoylisopropylaminophenyl benzoate*, m. 174–5°. *4-Dibenzylaminophenyl benzoate*, m 143–4°.
C. J. West

Derivatives of safrole. I. Kinzo Kafuku and Chiuta Hata *J Chem Soc Japan* 52, 20–5(1931).—A study of some derivs of 6-nitrosafrole. By oxidizing the 6-nitrosafrole (I) with $KMnO_4$, K. and H obtained a cryst. compd m 114° which, from the reaction with the Schiff and Tollens reagents and from analysis, was considered to be 6 nitrohomopiperonal, although it formed no semicarbazone, oxime or phenylhydrazone The other derivs studied were as follows: I ⟶ aminosafrole ⟶ acetylaminosafrole ⟶ acetylaminobromopiperonylic acid ⟶ aminohomopiperonylic acid I ⟶ nitrohomopiperonylic acid (II) ⟶ methylenedioxyoxindole II ⟶ azoxyhomopiperonylic acid, $[HO_2CCH_2(CH_2O_2)C_6H_2]_2N_2O$ I ⟶ 5-Ac deriv. I ⟶ 2,6-dinitrosafrole.

R. Saito

The two stereoisomeric isoeugenols. Fr. Borbecker and H. Volk. *Ber* 64B, 61–6(1931).—Theoretically, aromatic propenyl compds (anethole, isosafrole, isoeugenol (I), isochavibetol) can exist in 2 stereoisomeric forms, but no representative of this type of compds had as yet been isolated in both forms in pure state. If com I, f 0–5°, is dissolved in hot 15% NaOH, there seps on cooling a salt which yields the I m 33° (II) and the mother liquors on further purification through a benzoate give a homogeneous liquid phenol which is not eugenol and is doubtless the *stereoisomer* (III) of II. II and III can be converted into each other through their dibromides. Bromination of either form gives a mixt. of the dibromides of each, although one dibromide, probably the more stable one, predominates Thus the known acetisoeugenol, m 79°, a deriv of II, gives chiefly a dibromide (IV) m 132°, with a smaller amt. of an *isomer* (V) m 79°. The Ac deriv of III gives the same dibromides but the yield of V is somewhat larger. Similarly, both IV and V on debromination give mixts. of the 2 acetates III is best converted into II by brominating its acetate, debrominating the resulting mixt., removing most of the acetate of II, again brominating the residue, etc For the conversion of II into III the V resulting in small amt in the bromination of the acetate of II is debrominated and sapond., the II is sepd as the Na salt and the III isolated as the benzoate. By analogy, II is probably the *trans*- and III the *cis* form II, $b_{13}$ 141–2°, m 30–3°, $d_4^{20}$ 1 0852, $n_D^{20}$ 1 5782 (supercooled liquid) III, faintly yellow, $b_{13}$ 134–5°, $b_{4-5}$ 98°, $d_4^{20}$ 1 0851, $n_D^{20}$ 1 5726, benzoate, m 59–61°, depresses the m. p. of its isomer (m 102–3°) to 57–98° and that of eugenol benzoate (68–9°) to 45–50°. *Me ether* of II, m 16–7°, $b_{11}$ 143–4°, $d_4^{20}$ 1 0528, $n_D^{20}$ 1 5692, of III, $b_{13}$ 138–40°, $d_4^{20}$ 1 0521, $n_D^{20}$ 1 5616 The Me ether of cryst isochavibetol (m 96–7°), m 15 5–6 5°, $b_{13}$ 147°, $d_4^{20}$ 1 0527, $n_D^{20}$ 1 5692, does not depress the m. p. of the Me ether of II, it may therefore be concluded that II and cryst isochavibetol have the same spatial configuration *Acetate* of III, $b_8$ 132°, $b_{13}$ 160–2°, $n_D^{20}$

1.5418 Bromination of 20 6 g. of the acetate of II gives 31 g IV and 1.1 g. V; 22 8 g of the acetate of III yields 20 g. IV and 5 6 g. V. C A. R

**Absorption spectra of *o*-chlorophenol-indophenol and of *o*-cresol-indophenol.** Matilda Moldenhauer Brooks. *J. Am Chem Soc* 53, 1826–30(1931).—The absorption max of *o*-chlorophenol-indophenol (I) at $p_H$ 8 0 9 6 is at 625 mμ At these $p_H$ values the blue ion predominates The absorption max of the dissocd form of *o*-cresol indophenol (II) is at 610 mμ and that of the red acid form is at 500 mμ *The height of the max varies with the $p_H$ and concn of the dye In the case of I* the com sample examd was of equal purity to that of a very pure sample, while with II the com sample was only 51 54% as pure as the sample of known purity Four curves are given C J West

**Some relationships of the ratio of reactants to the extent of conversions of benzaldehyde and furfuraldehyde to their acetals.** Homer Adkins, Joseph Shmh and Lester M. Bolander. *J Am Chem Soc* 53, 1853–8(1931).—The effect of the ratio of reactants upon the extent of the reaction of BzH with EtOH, BuOH and iso-PrOH and of furfural with EtOH has been detd when the ratio of aldehyde to alc is varied from 1.2 to 1.10 The equil const. for the first 2 of these reactions was found to be identical for the 2 alcs but to decrease slightly with increase in ratio of alc to aldehyde The equil const for the reaction of BzH with iso-PrOH and of furfuraldehyde (I) with EtOH appeared to be independent of the concn of reactant The equil const. for the reaction of I and MeOH has been redetd The following values give (1) the mols of alc per mol of aldehyde, (2) % conversion of aldehyde to acetal and (3) $K$: EtOH and BzH, 2 08, 25 1, 0 091, 3 90, 31 1, 0 079, 5 87, 41 9, 0 089, 7 80, 48 6, 0 082; 9 96, 53 0, 0 081 BuOH and BzH, 2 02, 24 8, 0 091, 4 17, 36 0, 0 082, 6 13, 44 0, 0 084; 8 01, 48 9, 0 080, 9 90, 52 7, 0 080 iso-PrOH and BzH, 1 85, 6 7, 0 0045, 5 86, 11 1, 0 0030, 10 41, 18 7, 0 0047 EtOH and I, 2 20, 17 1, 0 036, 6 06, 32 6, 0 036, 6 21, 32 9, 0 035, 9 80, 39 8, 0 034, 11 08, 43 7, 0 039 MeOH and I, 4 40, 39 5, 0 098 I (96 g), 276 g. dry EtOH and 0 0012 g HCl, allowed to stand 1 day, give 21% of furfural acetal, $b_{18}$ 77–9°, $b_{760}$ 184 5°. C J West

**Substitution in resorcinol derivatives. Bromo derivatives from β-resorcylaldehyde and their orientation.** M S Iyengar and H S Jois. *Half-Yearly J. Mysore Univ.* 4, 199–201(1930).—*4 Nitro 6 bromoresorcinol di-Me ether*.—5,2,4-$O_2N(MeO)_2C_6H_2CHO$ (1 g) in a slight excess of cold glacial AcOH was treated with the calcd quantity of Br in AcOH in presence of a small quantity of I as catalyst, and after standing overnight, was dild with plenty of water and filtered On recrystn from EtOH, yellowish white crystals were obtained m 138–9° (Br 29 05%, calcd for $C_9H_9O_4NBr$, 30 5%) No oxime was obtained with the above deriv 5,2,4 $O_2N(MeO)_2C_6H_2CO_2H$ brominated in AcOH as above gave a product m 140–1°, identical with that obtained from the aldehyde (mixed m p) *4 Nitro-6 bromoresorcinol 1-Et 3-Me ether*.—5,2,4 $O_2N(EtO)$-$(MeO)C_6H_2CHO$ brominated as above yielded yellowish white needles m. 119–21° (Br 28 35%, calcd for $C_9H_{10}O_4NBr$ 28 62%), identical with the brominated product of the acid The Br deriv did not give rise to any oxime George Calingaert

**Wandering of groups during brominations.** M G Srinivas Rao, C. Srikantia and M. Sesha Iyengar *Proc 15th Indian Sci Cong* 1928, 158–9.—5-Nitro-4 methoxy-β resorcylaldehyde (I) on monobromination yields a normal bromonitroaldehyde, but this on further bromination apparently rearranges to give a dibromonitro deriv, in which the aldehyde group is absent The 2nd phenolic group in the last was ethylated and the product thus obtained was found to be identical with (1) the nitro deriv of tribromoresorcinol in which both the phenolic groups had alternatively been alkylated with MeI and EtI, resp., and (2) the dibromo (ethylated) deriv of 4 nitroresorcinol 3 Me ether, in which the nitro group is in the same position as in I. From these and a few other expts. the authors conclude that the nitro group has wandered during bromination E J C.

**Replacement of sulfonic groups by nitro groups in aromatic halogen compounds.** P. S. Varma and K. A Joshi *Proc 15th Indian Sci Cong* 1928, 150, cf *C A.* 14, 182. E J. C.

**Dihalocyanoacetyl derivatives of mesitylene.** Reynold C Fuson and Reid G Beveridge. *J. Am Chem. Soc.* 53, 1985–8(1931); cf. F and Walker, *C. A.* 24, 4772.—2,4,6-$Me_3C_6H_2COCH_2Cl$ (10 g) and 4 5 g KCN in 300 cc EtOH, boiled 4 hrs., give 50–60% of *cyanoacetylmesitylene* (I), m 108–9°; NaOBr gives 50–60% of the *di Br deriv.* (II), $Me_3C_6H_2COCBr_2CN$, m 81–2°, *di-Cl deriv*, m 38–9° (45–50% yield). I and fuming $HNO_3$ give 35% of the *di-$NO_2$ deriv*, m 170 3–1 3° (cor.), which yields 45% of a *di-Br deriv*, m 94–5°, also obtained by nitration of II. *Di(cyanoacetyl)-mesitylene*, m 156–7° (cor.) (70–80% yield); *tetra-Cl deriv*, m 52–3° (50–60% yield);

*tetra Br deriv*, m 121.2–2.2° (cor.) (30–5% yield). All of these dihalocyanoacetyl compds. have been found to be stable to cold solns. of alkalies. C. J. West

**New modification of the Reformatsky reaction.** J. A. Nieuwland and S. Florentine Daly. *J. Am. Chem. Soc.* 53, 1842–6(1931).—A β HO synthesis is obtained from α Cl esters and aldehydes or ketones and Zn, through the action of Cu metal or CuO. The catalytic action of Cu is accounted for by the formation of an intermediate between Cu and the aldehyde or ketone present, which then reacts with the Zn Cl ester compd. of the Cl esters and accelerates the synthesis. $C_6H_6$ is the best solvent, since it brings the temp. into the necessary range. It also keeps free metal surface available since the products are sol. in it. Limited reaction time increases the yield. Yields are given for 10 acids in $C_6H_6$, in PhMe and without solvent. *α Phenyl β hydroxy-β-p-methoxyphenylbutyric acid*, m. 75°, Me ester, $b_{4.5}$ 113–5°. C. J. West

*Preparation of 1,2,3-triaryl-2-hydroxybutyric acids.* D. Ivanov and A. Spassov. *Bull. soc. chim.* [4], 49, 371–5(1931). cf. *C. A.* 25, 2134.—$PhMgBr$, *m*- and *p*-$MeC_6H_4MgBr$ and *p*-$BrC_6H_4MgBr$, when added to $PhCH_2CO_2MgCl$ and to *p*-$ClC_6H_4CH_2CO_2MgCl$ condense with the formation of complexes which hydrolyze to give good yields of the corresponding triaryl substituted hydroxybutyric acids. In the course of the reaction of $PhMgBr$ with $PhCH\cdot CO_2MgCl$, the formation of $PhCH_2Bz$ and $PhCH(COMgCl)MgBr$ (I) is assumed and these, in turn, react to give $PhCH_2C(OMgBr)PhCHPhCO\cdot MgCl$ which on hydrolysis would be transformed into $PhCH_2C(OH)PhCHPhCO\cdot H$. The condensation of $PhMgBr$, *m*- and *p*-$MeC_6H_4MgBr$ with $PhCH_2CO_2MgCl$ gave 61% of *1,2,3 triphenyl 2 hydroxybutyric acid*, m. 176–7°, 61% of *1,3-diphenyl 2 m tolyl 2 hydroxybutyric acid*, m. 158–9°, and 62.5% of *1,3 diphenyl 2 p-tolyl 2 hydroxybutyric acid*, m. 169–70°. With *p*-$ClC_6H_4CH_2CO_2MgCl$ the same Grignard reagents gave 50% of *p*-$ClC_6H_4CH_2C(OH)PhCH(C_6H_4Cl)CO_2H$, m. 183°, 64.5% of *p*-$ClC_6H_4CH_2C(OH)(m\text{-}MeC_6H_4)CH(C_6H_4Cl)CO_2H$, m. 157–8°, and 63.5% of *p*-$ClC_6H_4CH_2C(OH)(p\text{-}MeC_6H_4)CH(C_6H_4Cl)CO_2H$, m. 175–6°. Condensation with *p*-$BrC_6H_4MgBr$ yielded *p*-$ClC_6H_4CH_2C(OH)(p\text{-}BrC_6H_4)CH(p\text{-}ClC_6H_4)CO_2H$, m. 181–2°. On the addn. of 14.8 g. of $PhCH_2Bz$ in $Et_2O$ to I prepd. from 9.65 g. of $PhCH_2Cl$ and heating for 3 hrs., 14.2 g. of $PhCH_2C(OH)PhCHPhCO_2H$, m. 176–7°, was formed. C. R. Addinall

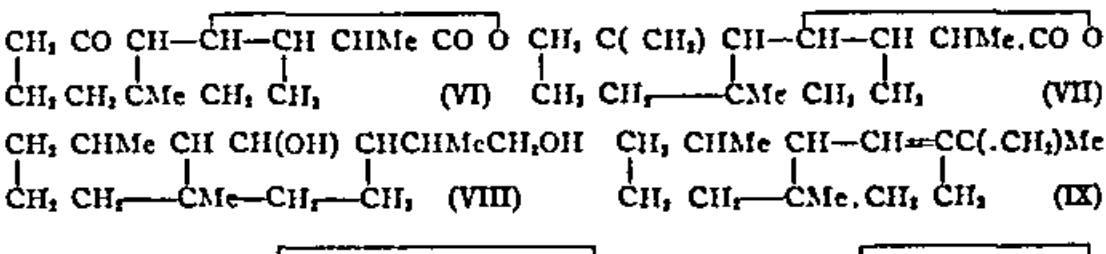
**Phenylacetaldehyde and its polymerization.** James R. Pound. *J. Phys. Chem.* 35, 1174–9(1931), cf. *C. A.* 20, 1986.—$PhCH_2CHO$ (I) on standing undergoes polymerization. The d. and *n* increase, in general, linearly with the time, but the viscosity increases much more rapidly. Crystals of the polymer, m. 104°, finally sep. The rate of formation of the polymer is approx. 3 to 4 times faster at 30° than at 15°, but seems to be const. under const. conditions. The solid polymer dissolves in most solvents as $(C_8H_8O)_x$, but in $CHBr_3$ as $(C_8H_8O)_4$. Its crystal unit is, therefore, $(C_8H_8O)_{16}$. I is not oxidized appreciably in air at ordinary temp. Louise Kelley

**Synthesis of 2,4,5-trimethoxyphenylalanine.** T. Széki and E. Lakos. *Acta Sci. Univ. Francisco Iosephinae, Acta Chem., Mineral. Physica* 1, 157–66(1929).—2,4,5-Trimethoxybenzalhydantoin was made from asarylaldehyde, and on treatment with $Ba(OH)_2$ and $H_2O$ gave *dl* 2,4,5-trimethoxyphenylalanine, m. 217°. Its Et ester HCl, m. 181°, was also produced. S. S. de Finály

**Condensation of monochloromethyl ether with phenylmalonic ester.** M. Gopala Rao and J. L. Simonsen. *Proc. 15th Indian Sci. Cong.* 1928, 149, cf. *C. A.* 14, 2483.—A simple method of synthesizing atropic acid is by treating $PhC(CO_2Et)_2CH_2OMe$ (I) (from $PhCH(CO_2Et)_2$ and $ClCH_2OMe$) with 50% KOH. I with 10% alc. KOH gives methyltropic acid, $PhCH(CO_2H)CH_2OMe$, $b_4$ 164.8° (?). No further information is given. E. J. C.

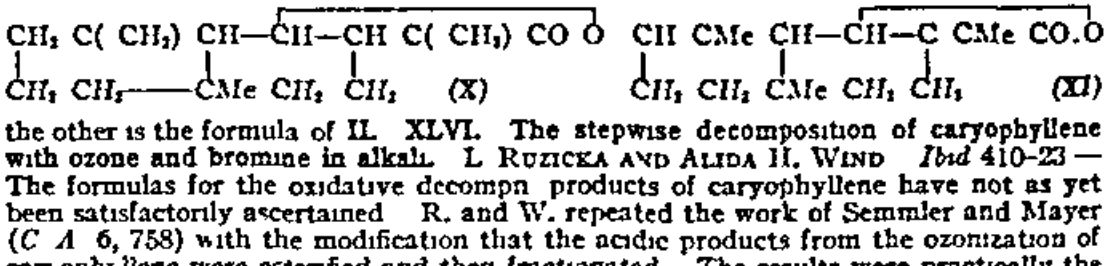
**Anacardic acid.** A. J. Haagen Smit. *Proc. Acad. Sci. Amsterdam* 34, 165–8 (1931).—Et$_2$O extn. of the *fruits of Anacardium occidentale* gave *anacardic acid* (I) which was purified through its Pb salt. The purified free acid crystd. when seeded with *pelandjauic acid* (II) but the mixed m. p. of I and II showed some depression so it appeared that, though the two were similar, they were not identical. Hydrogenation of I in EtOAc with Pt black gave *tetrahydroanacardic acid* (III), m. 92°. Tetrahydro-II m. 98° and gave a m.-p. depression of 7° with III. III with $FeCl_3$ in EtOH gave a violet color, indicating a OH ortho to $CO_2H$. I lost $CO_2$ at 220°, the same as II, and the product (IV) $b_{4.5}$ 205°. The Me ether (V) of IV $b_{4.5}$ 202°, $d_4^{15}$ 0.9240, $n_D^{15}$ 1.5076, $M_D$ 101.3 (calcd. for $C_{22}H_{34}O$, $M_D$ 100.9) and HI did not split off the Me group. V gave a tetrahydro deriv., m. 30°. The Me ether Me ester of I $b_{4.5}$ 220–2° and yielded the corresponding tetrahydro deriv. (VI), m. 38°. Oxidation of VI with $CrO_3$ gave an acid m. 59° which showed no m. p. depression with palmitic acid but did give de

pressions with stearic and myristic acids so a normal 16 C chain acid was indicated Hydrogenation of IV gave a decahydro deriv (VII), m 31°. VII was dehydrated with $ZnCl_2$ to give a deriv $b_{0.4}$ 180–5° The existence of a double bond was shown by a yellow color with $C(NO_2)_4$ This double bond was reduced catalytically and the resulting hydrocarbon, $b_{0.7}$ 178°, m 25°, $n_D^{20}$ 1 4612, $d_4^{19.5}$ 0 8323, $M_D$ 97 (calcd for $C_{21}H_{42}$ $M_D$ 97), was identical with pentadecylcyclohexane The corresponding hydrocarbon from II $b_{0.4}$ 194°, $n_D^{24}$ 1 4506, $n_D^{37.5}$ 1 4542, $d_4^{18}$ 0 8332, $d_4^{37.5}$ 0 8821, $M_D$ 106 1 (calcd for $C_{23}H_{46}$ $M_D$ 106 2) I is a homolog of II contg 2 less $CH_2$ groups and the following formula is suggested for it $C_4H_3(OH)(CO_2H)(C_{15}H_{27})$ C H Peet



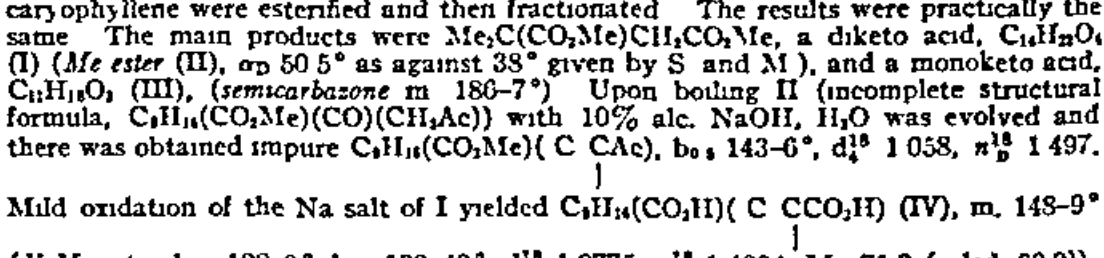
**2,4,5-Trimethoxybenzoic acid, a derivative of dehydrodeguelin.** E P Clark *J Am Chem Soc* 53, 2007–8(1931)—$KMnO_4$ oxidation of dehydrodeguelin in $Me_2CO$ gives a $HO(MeO)_3C_6H_2CO_2H$, m 210° (decompn), gives a blue color with $FeCl_3$ and gives asaronic acid (2 4,5-$(MeO)_3C_6H_2CO_2H$) on methylation Synthesis of the acid is under way C J West

**Condensation of ethyl phenylacetate and ethyl *p*-chlorophenylacetate by means of isopropylmagnesium halides.** D Ivanov and A Spassov *Bull soc chim* [4], 49, 375–7(1931) cf *C A* 23, 2420—Into a flask fitted with a reflux condenser and contg 0 15 mol of iso-PrMgX, 0 1 mol of $PhCH_2CO_2Et$ in $Et_2O$ was added dropwise and the mixt was heated for 2–3 hrs After hydrolysis and extn with $Et_2O$, 25 g of *Et 1,3 diphenylacetylacetate*, $PhCH_2COCHPhCO_2Et$ m 78 0–8 5°, was formed From *p*-$ClC_6H_4CH_2CO_2Et$ was similarly produced *p*-$ClC_6H_4CH_2COCH(p\text{-}ClC_6H_4)CO_2Et$, m 119 20°, in 93% yield The prepn of this compd by the condensation of *p*-$ClC_6H_4CH_2CO_2Et$ with the aid of NaOEt is not possible (*J Prakt Chem* 62, 554(1900)) C R Addinall



**Preparation of 1-phenyl-2,2-(dialkyl, diaryl or alkylaryl)-2-hydroxypropionic acids.** D Ivanov and A Spassov *Bull soc chim* [4], 49, 377–9(1931)—Ketones react with the complex $PhCH(CO_2MgCl)MgX$ (I) to give, in good yields, substituted hydroxypropionic acids I, prepd from 0 1 mol of $PhCH_2Cl$, was treated with 0 1 mol of the following ketones $Pr_2CO$, MeBz, $(PhCH_2)_2CO$, PhBz and $CH_2(CH_2)_4CO$, giving an 88% yield of $Pr_2C(OH)CHPhCO_2H$, m 171°, $PhMeC(OH)CHPhCO_2H$, m 182–3°, $(PhCH_2)_2C(OH)CHPhCO_2H$, m 183–4° $Ph_2C(OH)CHPhCO_2H$ (II), m 186–7°, and $CH_2(CH_2)_3CH_2C(OH)CHPhCO_2H$, m 135° II was also prepd from PhBz and $PhCH(CO_2Na)MgBr$, this latter being readily obtained from $PhCH_2CO_2Na$ and iso-PrMgBr (Cl) or EtMgBr C R Addinall

**Higher terpene compounds. XLV. Alantolactone and isoalantolactone.** L Ruzicka and J A van Melsen *Helv Chim Acta* 14, 397–410(1930), cf *C A*. 25, 2136—The study of alantolactone (helenin) (I) and isoalantolactone (isohelenin) (II) was undertaken because of the possible derivation of these compds from sesquiterpenes and especially to prove their relationship with santonin I was sepd from elecampane oil together with a *monocyclic sesquiterpene*, $b_{13}$ 135–8°, $d_4^{15}$ 0 8864, $n_D^{15}$ 1 5000, $M_D$ 67 76 (calcd 67 79), which yields eudalin (III) upon dehydrogenation with Se A *liquid* with a formula $C_{15}H_{20}O_2$ identical with that of I and II was also isolated Upon refluxing I or II (which may not be single compds) with Se, 1,7 $C_{10}H_6MeEt$ (IV) (*styphnate* m 125–6°) was obtained IV was oxidized to *1,7 naphthalenedicarboxylic acid* (0 6 g from 3 g of IV), m 294–6° (*di-Me ester* m 86–7°) by means of $K_3Fe(CN)_6$ and *KOH* Treatment of *I* or *II* with $H_2$ in the presence of *PtO* leads to the formation of *tetrahydroalantolactone* (V), m 143–4°, $\alpha_D$ 15 2°, which is either identical or stereoisomeric with deoxytetrahydrosantonin (Clemo and Haworth, *C A* 25, 708) The *dihydro deriv* of I, m 134°, $\alpha_D$ —24 6°, obtained by catalytic hydrogenation, and that of II, m 159–60, $\alpha_D$ 26 2°, could not be isolated in the pure state but are definitely not identical From the products of successive oxidation of impure I by $O_2$ and $KMnO_4$, the keto acid, $CH_2CH_2CH_2COCH_2CMe(CH_2)_2CO_2H$, $b_{0.4}$ 140–1°, m 92–3° (*semicarbazone*, m 183–5°) was isolated as the *Me ester*, the *semicarbazone* of which m 207–8°, in addn, VI, m 203–5°, was also obtained, presumably originating in a *dihydrolactone* (VII), different from either of the dihydro derivs already described Upon reduction of V with Na and alc the *glycol* VIII, $b_{0.4}$ 167–70°, was obtained (16 3 g from 31 g of V) This was transformed into the *dibromide* which upon treatment with quinoline at 250°, yielded the sesquiterpene IX (still contg 1% of O), $b_{12}$ 130–3°, $d_4^{19}$ 0 918, $n_D^{19}$ 1 5104 Dehydrogenation of IX with Se gave *1 methyl 7 isopropenylnaphthalene*,



isolated as the *picrate* m 87–8° I and II upon reduction yielded the *unsatd glycol* $C_{15}H_{26}O_2$, $b_{0.4}$ 168–70°, from which no pure dibromide could be obtained As a result of this work R and van M believe that one of the formulas X or XI, is that of I, while

(VI) (VII)

(VIII) (IX)

(X) (XI)

the other is the formula of II. XLVI. The stepwise decomposition of caryophyllene with ozone and bromine in alkali. L Ruzicka and Alida H. Wind *Ibid* 410–23 — The formulas for the oxidative decompn products of caryophyllene have not as yet been satisfactorily ascertained R. and W. repeated the work of Semmler and Mayer (*C A* 6, 758) with the modification that the acidic products from the ozonization of caryophyllene were esterified and then fractionated The results were practically the same The main products were $Me_2C(CO_2Me)CH_2CO_2Me$, a diketo acid, $C_{14}H_{22}O_6$ (I) (*Me ester* (II), $\alpha_D$ 50 5° as against 38° given by S and M ), and a monoketo acid, $C_{11}H_{18}O_3$ (III), (*semicarbazone* m 186–7°) Upon boiling II (incomplete structural formula, $C_8H_{14}(CO_2Me)(CO)(CH_2Ac)$) with 10% alc. NaOH, $H_2O$ was evolved and there was obtained impure $C_8H_{14}(CO_2Me)(C\ CAc)$, $b_{0.5}$ 143–6°, $d_4^{18}$ 1 058, $n_D^{18}$ 1 497.

Mild oxidation of the Na salt of I yielded $C_8H_{14}(CO_2H)(C\ CCO_2H)$ (IV), m. 148–9° (*di-Me ester*, $b_{0.5}$ 128–9°, $b_{0.6}$ 139–40°, $d_4^{18}$ 1 0775, $n_D^{18}$ 1 4894, $M_D$ 71.3 (calcd 69 9)) Oxidation of I obtained directly from the ozonization products also yielded IV besides a *substance*, $b_{0.5}$ 155–60°, $d_4^{20}$ 1 1390, $n_D^{20}$ 1 4873, which may be $C_8H_{14}(CO_2Me)(CO)(CH_2CO_2Me)$ IV does not absorb $Br_2$ (the ester does slowly) but by catalytic hydrogenation, $C_{12}H_{20}O_6$, m 149°, was obtained By ozonizing 1 7 g of IV, and esterifying the acid products (1 6 g ) $C_8H_{14}(CO)(CO_2Me)_2$ (tentative formula), $b_{0.5}$ 135–6°, $d_4^{18}$ 1 0856, $n_D^{18}$ 1 4625, $M_D$ 68 4 (calcd 68 0), was obtained The corresponding acid, m 70°, resists crystn , it loses 1 mol of $H_2O$ at 200°. From the products of the oxidation of III with $Br_2$ in NaOH, followed by esterification, the di Me ester, $C_{12}H_{20}O_6$, $b_{12}$ 140–2°, $d_4^{21}$ 1 048, $n_D^{21}$ 1 4516, $M_D$ 58 7 (calcd 58 7), was isolated The production of this compd by oxidation indicated the presence of the Ac group in III as well as in I. XLVII. Caryophyllenic acid. L Ruzicka, J C Bardhan and Alida H Wind *Ibid* 423–35 — S and M obtained caryophyllenic acid (V), $C_7H_{12}(CO_2H)_2$ by oxidizing some of the products from the ozonization of caryophyllene (VI) R , B and W consider that it was not a single substance They therefore repeated the work of S and M , with the modification that the oxidation products from the treatment of VI with $O_2$ and then with $HNO_3$ were esterified and then fractionated The analyses of 4 fractions b 110–25° agreed with the formula $C_7H_{12}(CO_2Me)_2$ (VII) From VII, b 110–20°, a cryst. product, m 145–50°, was isolated which consisted of a mixt. of V and a homolog $C_8H_{12}O_4$, the fraction b 124–5° yielded a product $b_{0.5}$ 165–70°, m. 66–75°, the analysis of which approached that of V very closely By treatment of VII with PhMgBr and MeMgI, the glycols $C_7H_{12}(CPh_2OH)_2$ (VIII), m 198–9° (15 g from 10 g of VII), and $C_7H_{12}(CMe_2OH)_2$ (IX), m 99–100° (4 5 g from 11 5 g of VII), were obtained *Oxidation of VIII and IX with $CrO_3$* seemed to proceed in different directions, from VIII, 1 7 (and 1 8) mols. of PhAc, 0 5 (and 0 6) mol of $Me_2C(CO_2H)CH_2CO_2H$ and a small quantity of BzOH were obtained IX underwent rearrangement during the oxidation, for it yielded $CH_2(CMe_2CO_2H)_2$ By boiling VIII with HOAc and with a mixt of HOAc and $HCO_2H$, the compd $C_{28}H_{20}$, $b_{0.2}$ 235°, and the unsatd alc , $C_{28}H_{22}O$, $b_{0.5}$ 240°, resp , were obtained Upon ozonization of the last compd PhAc resulted VII was carefully sapond with 1 mol of KOH, yielding *mono Me caryophyllenate* (X), $b_{0.4}$ 130–4°, this was converted with $SOCl_2$ into $C_7H_{12}(CO_2Me)(COCl)$ (XI), $b_{13}$ 115–8°, and this further into the amide, $C_7H_{12}(CO_2Me)(CONH_2)$, $b_{0.5}$

135°, which crystallizes very slowly. A compd., $b_{0.3}$ 240°, between 1 mol of $NH_2NH_2$ and 2 mols of XI was also obtained by mixing the constituents with the hope of obtaining the hydrazide of X. This series of compds is to be subjected to oxidative decompn. I. M. LEVINE

**Sesquiterpene alcohol of Cryptomeria japonica, D. Don.** Y. SUGII AND T. SENGOKU *J. Pharm. Soc. Japan* 51, 196–9(1931), German abstr. 21.—S. and S. isolated from *Cryptomeria japonica*, D. Don, a compd., $C_{15}H_{26}O$ (I), m. 84°, $[\alpha]_D^{19}$ 19.78° (in alc.). I corresponds to the *cryptomeradol* of Wienhaus and Schölz (*C. A.* 24, 1932) and did not depress the m. p. of the *machilol* of Takagi. Oxidation of I gave a compd. which did not depress the m. p. of *dihydroxymachilol* (m. 110°), the *monobenzoate* (m. 144–5°) did not depress the m. p. of *dihydroxymachilol monobenzoate* (*loc. cit.*). F. I. N.

**Bitter principles from alant root (preliminary communication).** KARL FR. W. HANSEN. *Ber.* 64B, 67–71(1931).—Alant root contains, in addn. to the known alantolactone, $C_{15}H_{20}O_2$ (I), m. 76°, and isoalantolactone (II), m. 115°, a 3rd bitter principle, $C_{15}H_{22}O_2$ (III), m. 174°, which is also a lactone. The starting material was Merck "Helenin (alant camphor)," but as the prepn. of the 3 compds. in pure form by crystn. was very tedious and time consuming a process was devised which, although it involved considerable losses, gave pure, readily crystd. products, identical with those obtained by crystn. The amides of the corresponding alantolic acids, obtained with alc. $NH_3$, are especially well adapted to the characterization of I and II but III gives no amide. The stability of the lactone ring in III is also shown in the behavior toward alkali. I and II yield the HO acid with boiling aq. alkalies while III requires alc. KOH. Contrary to the analyses reported by Bredt and Posth and by Sprinz for the amides obtained from I and II, which agree with the values calcd. for $C_{15}H_{20}O_2 + NH_3$, the compds. obtained in this work, although having the same m. ps. as those given by the earlier workers, have a quite different compn. Presumably these amides have a considerably more complicated structure than was assumed by Bredt and by Sprinz, the numerous analyses made would indicate that they contain 2 mols. lactone per mol. of $NH_3$. III is apparently a dihydro deriv. of II, which gives I with Na Hg. On dehydrogenation with Se, I, II and III give 1,7 $C_{10}H_6MeEt$ (IV), whose picrate (m. 101°) and styphnate (m. 126°) did not depress the m. ps. of prepns. furnished by Ruzicka who obtained the hydrocarbon by dehydrogenation of hexahydrosantenin (R. and Eichenberger, *C. A.* 25, 961) and of helenin and isohelenin (van Melsen, *Diss. Utrecht*, 1929). Of the two C atoms split off in the dehydrogenation, one presumably belongs to the C:O of the lactone ring and the other, as in eudesmol, is probably attached to a quaternary ring C atom, complete hydrogenation of the lactones and subsequent dehydrogenation with Se again gave IV and in somewhat better yield than did the non hydrogenated lactones. The 3 bitter principles are apparently sesquiterpene lactones of the eudesmol type. They were obtained by distg. the com. "Helenin (alant camphor)" in a high vacuum, treating the crystd. distillate in cold alc. with $NH_3$, filtering off the alantol- and isoalantolamides and recrystg. the residue from the mother liquors from AcOH. The III has a mol. wt. of 240 in camphor. The 2 amides are sepd. by crystn. from AcOEt and $Me_2CO$ and converted back into the lactones by dry distn. *in vacuo*. Amide from I, m. 205–6° (Bredt and Posth, 197°), Ac deriv., m. 180°. Amide from II, m. 247° (Sprinz, 237–9°), C 74.87, H 9.00, N 3.00%, Ac deriv., m. 216–7° (S., 212°), N 2.85%. IV with $K_3Fe(CN)_6$ gave 1,7-$C_{10}H_6(CO_2H)_2$, m. 265–6° (van Melsen gives 295–6° for the pure acid). C. A. R.

**Amyrins and attempts to clarify their constitution.** H. DIETERLE, A. SALOMON AND E. HERZBERG. *Arch. Pharm.* 269, 78–87(1931).—The amyrins required in the present study were prepd. *in accordance with a procedure duplicating in part the* methods of both Horrmann and Vesterberg. By oxidation with $CrO_3$ Vesterberg obtained α amyrone, $C_{30}H_{48}O$, a result corroborated by the present authors. Entirely different results were obtained, however, when oxidation was carried out in the presence of $H_2O$ vapor, a method previously employed by Windaus with cholesterol, and by D. with lupeol. In addn. to the volatile products AcMe and $CO_2$, as also minute quantities of a pleasant smelling substance, a non volatile *compd.*, $C_{21}H_{34}O$ (*hydrazone*, $C_{21}H_{36}N_2$, m. 224°), m. 89–90°, $[\alpha]_D^{20}$ 123.2°, and amyrone (*hydrazone*, $C_{30}H_{50}N_2$, m. 252°), were isolated. While amyrin is apparently unaffected by $KMnO_4$ in either alk. or acid soln., it is converted by $HNO_3$ into the 2 *products*, $C_{23}H_{30}N_2O_{10}$ and $C_{23}H_{32}N_2O_{10}$, the former m. 171°, the latter, yellow, m. 185–6°, both representing tribasic acids of the probable compn. $C_{20}H_{27}(NO_2)_2(CO_2H)_3$ and $C_{20}H_{29}(NO_2)_2(CO_2H)_3$. $O_3$ converts amyrin into a *dibasic* and a *tribasic acid*, $C_{23}H_{32}O_4$ and $C_{23}H_{36}O_6$. Since these acids are unaffected by Br, they contain no double bonds. On dehydration *via* Diels, amyrin

yields 3 different *hydrocarbons*, $C_{21}H_{36}$, $C_{21}H_{38}$ and $C_{21}H_{34}$, the constitutions of which are at present unknown. Attempts to convert α amyrin into the β form, and *vice versa*, were unsuccessful. On conversion of β amyrin into the formate, with subsequent sapon., an isomeric *substance*, γ amyrin, m. 168.9°, $[\alpha]_D^{20}$ 42°, resulted, which yields the hydrocarbon *γ-amyrilene*, $C_{30}H_{48}$, m. 175°, $[\alpha]_D^{22}$ 54.1°, reducible by HI to the *hydrocarbon*, $C_{30}H_{50}$ (amyrene), thick yellow oil, $b_{14}$ 120°, $[\alpha]_D^{22}$ 44.9°. W. O. F.

**The Plöchl reaction. Aminocamphor and formaldehyde.** H. Rupe, Fr. Buxtorf and W. Lutz. *Helv. Chim. Acta* 13, 1026-30(1930).—Attempts to prep. dimethylaminocamphor (I) through Plöchl's reaction (heating the amine HCl with HCHO) gave camphorquinone (II) and $(Me_2NCH_2)_2$ (III) instead of I. Aminocamphor HCl (IV) heated with $H_2O$ gave no II and I HCl treated similarly gave only a small amt. of II. I HCl treated with HCHO gave a fair amt. of II but no III. Since the conversion of I or IV into II involves an oxidation the following mechanism, which accounts also for the formation of III, is suggested. $Me_2NH$ is split off from I and 2 mols. of this react with 2 mols. of $CH_2(OH)_2$ to give III, O and $H_2O$. C. H. Peet.

**α-Carboxycamphocean-β-acrylic and -β-propionic acids. Synthesis of β-homocamphor.** F. Salmon Legagneur. *Compt. rend.* 192, 748-50(1931), cf. Bredt, *et al.*, *C. A.* 12, 1774.—Camphoric acid semialdehyde, $HO_2CC_8H_{14}CHO$, treated with $SOCl_2$ then MeOH, gave the Me ester, $b_{12}$ 136°. This was condensed with Zn and $BrCH_2CO_2Et$, forming the mixed ester of α-carboxycamphocean β acrylic acid, $MeO_2CC_8H_{13}CH{:}CHCOOEt$, m. 53°, $[\alpha]_D^{21}$ −92.2° in MeOH. The free acid (I) obtained by sapon. m. 174-6°, $[\alpha]_D^{23}$ 58.8° in MeOH. I does not decolorize cold Br but can be oxidized by alk. $KMnO_4$ to camphoric acid. Reduced in presence of PtO by Adam's method it yielded α-carboxycamphocean β propionic acid, $HO_2CC_8H_{14}(CH_2)_2CO_2H$, shiny plates, m. 151°, $[\alpha]_D^{19}$ 38.1° in MeOH, the Pb salt of which, heated in a current of $CO_2$, gave 45% of β homocamphor, $C_8H_{14}\underline{CH_2 CH_2 CO}$, m. 202-4°, $[\alpha]_D^{12}$ 111.2° in MeOH.

β Homocamphor is very sol. in org. solvents and is readily sublimed or steam-distd. Oxime, m. 105°, semicarbazone, m. 245°. L. E. Gilson.

**Oxidation of 5-hydroxycamphor from camphorol.** Yasuhiko Asahina and Morizo Ishidate. *Ber.* 64B, 188-92(1931).—The camphorol of Schmiedeberg and Meyer was recently shown to be a mixt. of 3- and 5-hydroxycamphor yielding on oxidation camphorquinone (or camphoric acid) and *p*-diketocamphane (I) (*C. A.* 22, 2161) and I later isolated the 5-HO compd. (II) from the camphorol (*C. A.* 22, 3406). By purification through the Ac deriv. or by boiling with KOH the m. p. of II has been raised to 222° and it was found that it gives I on oxidation only at high temps. and with an excess of acid, at lower temps. and in as dil. acid as possible there is formed a lower melting mixt. (around 200°) of I and a stereoisomer which decolorizes $KMnO_4$ in $H_2O$ or $Me_2CO$ and Br in $CHCl_3$, but on repeated crystn. is stabilized to I. The new product is autoxidizable in solid form as well as in soln. An aq. or alc. soln. which has stood a long time or a prepn. which has been exposed to the air reacts decidedly acid in $H_2O$ or alc. The unsatd. nature of the product is undoubtedly due to enolization and it is the enol which takes up O and changes into an acid. From a prepn. a month old was isolated an *acid*, $C_{10}H_{16}O_4$ (III), m. 250-1°, also obtained, with considerable unchanged I, with $KMnO_4$. As III gives a *disemicarbazone* (m. 251°), is stable toward cold $KMnO_4$, and does not reduce $NH_3$-$AgNO_3$, it is probably *1,5,5-trimethylcyclopentane 2,4-dione 1-acetic acid*. *5 Acetoxycamphor semicarbazone*, m. 180-5°. The enol content of various prepns. of the oxidation product II, as detd. by the Meyer Br titration method, ranged from 0.50% for a product m. 210° to 5.70% for a product m. 200° which had stood 1 month. C. A. R.

**Catalytic reduction of benzidine.** F. Balas and P. Ševčenko. *Collection Czechoslov. Chem. Comm.* 3, 171-6(1931).—$(p\text{-}NH_2C_6H_4)_2$ (I) (10 g.) in 150 cc. of glacial AcOH, shaken with 120 cc. of colloidal Pt (Skita), contg. 2 g. of Pt, at 0.1 atm. and 50°, absorbed the theoretical amt. of $H_2$ for complete reduction in 18 hrs. The solvents were distd. off *in vacuo*, the residue was dissolved in abs. EtOH, the Pt was filtered off, most of the EtOH was removed *in vacuo*, the bases were pptd. with dil. NaOH, mixed with much $H_2O$, extd. with $Et_2O$ and distd. at 0.8 mm. Most of the distillate was $(p\text{-}NH_2C_6H_{10})_2$ (II), $b_{0.8}$ 120°, m. 59°, colorless, turning yellow brown in the air, smelling like $C_6H_{11}N$, strongly basic, easily sol. in MeOH, EtOH and in dil. org. and inorg. acids, less sol. in $Et_2O$, $CHCl_3$ and PhH and very slightly sol. in $H_2O$. II does not give the characteristic reactions of I. No cryst. salts of II could be obtained but a *di HCl salt*, darkening at 260° and decompg. at 290°, was obtained by passing dry HCl gas

into II in anhyd $Et_2O$, and a *dipicrate*, dark red needles darkening at 235° and decompg *explosively* at 247°, was obtained in abs EtOH $NH_3$ corresponding to over 60% of the I was obtained from the acid reduction medium and unidentified amorphous by products of high mol wt which decompd on attempted distn were left after extn of the II. *Bicyclohexane* was not found C H Peet

**Addition of free radicals to unsaturated compounds (preliminary paper).** J B Conant and H W Schiefp *J Am Chem Soc* 53, 1941–4(1931) —$Ph_3C$ and $CH_2$ - $CMeCH$ $CH_2$ in N or $Ph_3CCl$, $CH_2$ $CMeCH$ $CH_2$ and Hg in $C_6H_6$ give *1,4 bis(triphenylmethyl) 2 methyl 2 butene*, m 163–4°, the structure was established by the action of $O_2$, giving $Ph_3CCH_2CO_2H$ and *1,1,1 triphenylbutan 3 one*, m 140.5–1°, also obtained from $Ph_3CCH_2COCl$ and MeZnCl $CH_2$ $CMeCMe$ $CH_2$ and $Ph_3C$ give the *compd* $C_{41}H_{40}$, m 240° (decompn.), $O_2$ gives $Ph_3CCH_2Ac$ C J West

**Action of cyanoacetic acid on triphenylcarbinol. Synthesis of triphenylmethylcyanoacetic and *N*-triphenylmethylmalonamic acids.** R Fosse *Bull soc chim* [4], 49, 159–73(1931) cf *C A* 1, 2797 —$Ph_3COH$ reacts with $NCCH_2CO_2H$ to give $Ph_3CCH(CN)CO_2H$ (I) by elimination of $H_2O$ and also by addn., forming a new type of acid, *N* triphenylmethylmalonamic acid, $Ph_3CNHCOCH_2CO_2H$ (II), the *N* $Ph_3C$ deriv of the yet unknown malonamic acid The sirup like liquid formed by heating 10 g of $Ph_3COH$ in 25 g of $NCCH_2CO_2H$ for 4 min on the steam bath was freed from excess $NCCH_2CO_2H$ by treatment with $H_2O$, and was agitated with 100 cc anhyd $Et_2O$ in a stoppered flask On addn of petroleum ether to the ether soln dried over $Na_2SO_4$, and on standing for 24 hrs crystals were formed which gave off $H_2O$ at 60° *in vacuo* to form I, m 155° Heated to 160–70°, $CO_2$ was evolved with formation of $Ph_3CCH_2CN$ (III), m 140° after recrystn from EtOH (*C A* 23, 4025) III was also prepd by the action of $Ph_3COH$ on $NCCH_2CO_2H$ at 110–5°, and by evapn to dryness of a soln of $Ph_3CCH(CN)CO_2Na$ To establish the constitution of I and III, the latter was hydrolyzed by heating with alc KOH to 280° for 20 min to $Ph_3CCH_2CO_2H$, which in turn was prepd by the fusion of $Ph_3COH$ with $CH_2(CO_2H)_2$. $Ph_3C$-$CH_2CONH_2$ was formed by refluxing 10 g of $Ph_3CCH_2CO_2H$ with 3.5 g of $PCl_3$ in 60 cc *dry PhH for 20 hrs., and passing dry $NH_3$ into the cooled soln* (*C A* 21, 2670) The amide was then transformed into III by refluxing with $PCl_3$ in PhH for 4 hrs The ether insol residue (II) from the prepn of I, when recrystd from $CHCl_3$, m 175°, giving off $CO_2$ and forming $Ph_3CNHAc$ (IV), m 211°, identical with the product of the action of $Ac_2O$ on $Ph_3CNH_2$ (*Ber* 17, 744(1884)) or by the fusion of $Ph_3COH$ with $AcNH_2$ at 210–40° for 45 min in the presence of a trace of $H_2SO_4$. It was hydrolyzed by 90% $H_2SO_4$ to $Ph_3COH$, $NH_3$ and AcOH II is therefore $Ph_3CNHCOCH_2CO_2H$, m 175° C R Addinall

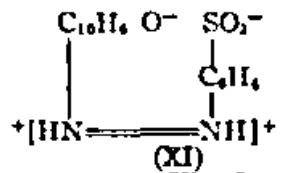
**Combinations among certain dyestuff radicals.** M Rebek. *Collection Czechoslov Chem Comm* 3, 155–70(1931) —$(p\text{-}Me_2NC_6H_4)_3COH$ (I) condensed with $[2,4\text{-}(O_2N)_2C_6H_3]_3CH$ in boiling $Me_2CO$, in $PhNO_2$ at 120–5° or by melting the components together, to give a compd (II) which was pptd by addn of $Et_2O$ On recrystn from $Me_2CO$, II yielded large green crystals with a golden glance which analyzed as $C_{41}H_{35}O_{12}N_9 \cdot 3Me_2CO$ Mol.-wt detns (f p) in $PhNO_2$ indicated 2 mols of $Me_2CO$ of crystn Similarly, I condensed with *[2,4,6-(O₂N)₃C₆H₂]₂NH (III)* to give long green crystals which analyzed as $C_{37}H_{31}O_{12}N_{10}Me_2CO$ (IV) and this formula was confirmed by a mol.-wt. detn IV reacted with $I_2$ in $CHCl_3$ to give a triiodide 3,4 $Me(H_2N)C_6H_3C(OH)(C_6H_4NH_2(p))_2$ condensed with III to give $C_{71}H_{52}O_{12}N_{10}$ (V) The rate of reaction for each of these condensations was followed *via* the cond changes of their $Me_2CO$ or $PhNO_2$ solns and these data are tabulated The reactions which give IV and V were instantaneous but, probably because both the pseudo base and pseudo acid involved must change to the true base and true acid form preliminary to the formation of the dye salt, II was formed slowly Color changes occurred at definite dilns II and IV exhibited identical absorption in the yellow and green regions and spectral examn indicated that the optical effect is additive An approximation to Lambert and Beer's law was observed C H Peet

**Triphenylmethane dyes derived from quinoline, tetrahydroquinoline, diphenylamine and carbazole.** Rajendra Nath Sen and Bhola Nath Sen *J Indian Chem Soc* 7, 965–72(1930) —Two mols of quinoline (I) condense with 1 mol of an aromatic aldehyde in the presence of concd HCl to form a leuco base oxidizable by $PbO_2$ to a carbinol, the linkage taking place at the 6-position of I since the 6-nitro deriv. of I did not condense The reaction is greatly retarded by the presence of a *m*-acidic substituent in the aldehyde. Aliphatic aldehydes did not condense Tetrahydroquinoline (II) and its *N*-Me deriv condensed more easily than I, the greater activity of the 6-H and stronger basicity of the products being due to the ring N atom which is doubly linked

in I, but singly in II to form a secondary (alkylated) amine. Phenylation of the amino group as in $Ph_2NH$ greatly retards the reactivity of the *p*-H, but methylation of the imino H in this compd markedly increases the reactivity of the *p*-H. Carbazole condensed less readily and methylation had less effect, showing that the influence of the NH group is affected when the N forms part of a ring. The II complex exerts a stronger auxochromic influence than the I complex. The following diquinolylmethanes were prepd. *phenyl*, by heating 14 cc. I, 6 cc. BzH, and 15 cc. concd. HCl 20 hrs. on the *water bath, extg. with 100 cc. $H_2O$, making alk. with NaOH, removing excess* BzH by steam distn., repptg. the product from AcOH with $NH_4OH$, and crystg. from equal parts of EtOH and AcOH (yield 30%), dyes wool and silk light green (*chloroplatinate*, m. 230°, *picrate*, m. 199°). *p-methoxyphenyl*, from I and anisaldehyde, orange-yellow; *o-hydroxyphenyl*, m. 157–60°, light yellow, *p-hydroxyphenyl*, m. above 263°, brownish red, *p-nitrophenyl*, m. 108°, light green (the *o*- and *m*-compds. were not obtained pure), *dimethyl-p-aminophenyl*, m. 168–70°, brown, *2,4-dihydroxyphenyl*, m. above 240°, orange (*Ac deriv.*, decomps. without melting; *di Ac deriv.*, m. above 267°, *di-Ag salt*, red flakes). *Ditetrahydroquinolylmethanes: m-hydroxyphenyl*, by heating 6 g. II and 2.8 g. *m* $HOC_6H_4CHO$, with 25 cc. 20% HCl 5 hrs. on the water bath, and working up as before, m. above 256°, light brown, *m-nitrophenyl*, m. 212° (decompn.), bright green, *furfuryl*, *p-methoxyphenyl*, light bluish green, *o-hydroxyphenyl*, m. 163–4°, bluish green *p-hydroxyphenyl*, m. 225°, bluish ash; *dimethyl-p-aminophenyl*, softens about 10°, yellowish brown, *2,4-dihydroxyphenyl*, m. above 235°, reddish brown. *p',p"-Diphenyldiaminotriphenylmethane*, by refluxing for 13 hrs. 10 g. $Ph_2NH$, 3 cc. BzH, and 30 cc. EtOH, and recrystg. the insol. product from EtOH and AcOH (1:2), green powder (*disulfonic acid*, by heating 5 g. with 15 cc. concd. $H_2SO_4$ 10 hrs. on the water bath, green plates from EtOH), *o HO deriv.*, from $Ph_2NH$ and salicylaldehyde, green powder, *3,4-methylenedioxy deriv.*, from $Ph_2NH$ and piperonal, green powder. *Diphenyldiaminodiphenylmethane*, from $Ph_2NH$ and HCHO, bluish green powder. *Dimethyldiphenyldiaminotriphenylmethane*, by heating $Ph_2NMe$ and BzH 0.5 hr. on the water bath without a condensing agent, m. 144–6°, greenish. *Dimethyldiphenyldiaminodiphenylmethane*, from $Ph_2NMe$ and HCHO, dark green powder. *Phenyldicarbazolemethane*, from carbazole and BzH, m. above 260°, faint green, *di N-Me deriv.*, from *N* methylcarbazole and BzH, m. 149°, bluish green. R. C. Elderfield

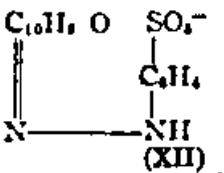
**Mixed benzoins. IV. Determination of the structure of mixed benzoins by the Beckmann reaction.** Johannes S. Buck and Walter S. Ide. *J. Am. Chem. Soc.* 53, 1912–7(1931); cf. *C. A.* 25, 2713.—The structures of 7 mixed benzoins, obtained by the usual KCN condensation have been detd. by means of a 2nd type Beckmann reaction. The results, interpreted according to Werner's views of the Beckmann rearrangement, give structures in agreement with those detd. by independent methods. The compds. studied were $ClC_6H_4CH(OH)COC_6H_3(OMe)_2$, $ClC_6H_4CH(OH)COC_6H_4OMe$, $ClC_6H_4CH(OH)COC_6H_4NMe_2$, $ClC_6H_4CH(OH)COC_6H_3O_2CH_2$, $PhCH(OH)COC_6H_4OMe$, $PhCH(OH)COC_6H_3O_2CH_2$, $PhCH(OH)COC_6H_4NMe_2$. The *oximes* of these m. as follows: 149°, 144°, 156–8°, 149°, 140°, 158°, 140°. The yields of aldehyde and nitrile obtained in the Beckmann reactions are listed. C. J. West

**Cyclohexanone-benzil.** Charles F. H. Allen. *Can. J. Research* 4, 264–74 (1931).—Cyclohexanone and benzil in the presence of a small amt. of NaOMe formed an addn. product which is a "semicyclic" 1,4-diketone. No derivs. of a bicyclic cycloheptane were found. Its most conspicuous chem. property is its sensitivity to mineral acids. Among the reaction products was found a diphenyltetrahydrocoumarone. Although the addn. product exhibits the phenomenon of halochromism the existence of a perchlorate is doubtful and it did not form a free radical. Analysis of cyclohexanone-benzil gave C 77.5, H 6.5%, mol. wt. 300–6 (calcd. for $C_{21}H_{20}O_3$: C 77.9, H 6.5%, mol. wt. 308). Reactions of cyclohexanone-benzil with the OH and C:O groups and with acidic and dehydrating reagents were studied. J. W. Shipley



**Naphthalene series. III. Action of bisulfite on *p*-nitrobenzeneazo-β-naphthol.** N. N. Vorozhtzov and P. A. Bielov. *Ber.* 64B, 77–83(1931); cf. *C. A.* 23, 2434, Turski, Pulawski, Hildebrand and Bortnowoska, *C. A.* 23, 2037.—Acid sulfites with azo dyes generally give bisulfite compds. from which the original dye can be regenerated by hydrolysis or by adding alk. reagents to their aq. soln. Of these dyes *p*-nitrobenzeneazo-β-naphthol (parared) (I) was of special interest because of its practical importance and also of the presence of a $NO_2$ group, which is not indifferent toward $SO_2$ and sulfites. V. had found 15 yrs. ago that I, probably because of its slight soly., reacts with $NaHSO_3$ considerably more slowly than the other azonaphthol dyes studied, yielding in every case as an end product the yellow crystals of a bisulfite compd. (or a mixt. of several), if the reaction is carried out under sufficiently rigorous conditions

the bisulfite compd on decompn yields a dye quite different from the original I; it contains S (apparently as $SO_3H$), dissolves in aq alkalies (even carbonates) and contains a primary diazotizable $NH_2$ group. The new dye gives with excess of $NaHSO_3$ the bisulfite compd. to be expected of naphthol dyes. These expts are described in a sealed report filed in 1916 with the *Gesellschaft zur Mitwirkung an der Verbesserung und Entwickelung der Textilindustrie in Moskau*, and the work has been taken up again because of the appearance of the paper by Turski, *et al.*, who found $H_2NC_6H_4N{:}NC_{10}H_6OH$ and $HO_3S(H_2N)C_6H_3N{:}NC_{10}H_6OH$ among the products. As far as can be judged from the *Chem. Zentr.* abstr. of their paper, they give no complete explanation of the course of the reaction, and V. and B. have endeavored especially to det. whether the reaction begins with the reduction of the $NO_2$ group or whether the formation of the bisulfite compd. is the 1st step. They found that under mild conditions I and $NaHSO_3$ give a compd. (*II*) of the compn. $I.NaHSO_3$ which readily regenerates the original I and has all the properties (as regards hydrolytic cleavage by dil., by acids or by alkalies) characteristic of the azonaphthol dye derivs. of this type. In agreement with the views previously developed, II must have the structure $C_6H_4{:}CH{:}CH{:}C(OH)(OSO_2Na){:}C{:}NNHC_6H_4NO_2$. The II is obtained in 2.5 g. yield



by refluxing 14.65 g. I with 75 cc. $CHCl_3$, 150 cc. alc., 125 cc. $NaHSO_3$ soln. (33.8% $NaHSO_3$) and 70 cc. $H_2O$ 20–5 hrs., filtering hot from the unchanged I and cooling to 25°. It is sol. in about 150 parts $H_2O$, forming orange-red concd. and yellow dil. solns., in concd. aq. soln. it begins to decomp. at 60–5°. With concd. solns. of $CaCl_2$, $BaCl_2$, $NiCl_2$, $CuSO_4$, $Pb(NO_3)_2$, $AgNO_3$ it at once forms ppts. which are yellow in the presence of $H_2O$ but assume a deeper color when dried in the air or in desiccators, the *Ba compd.* has the compn. $C_{22}H_{12}O_{12}N_4S_2Ba \cdot H_2O$, and the *Cu salt* contains $8H_2O$. The dissocn. of II in aq. solns. of various concns. at 25° was followed by iodometric titration, the amt. of titratable $SO_2$ in % of total $SO_2$ after 24 hrs. increased from 6.68 in $^1/_{100}$ to 11.08 in $^1/_{1000}$ *N* soln. In 50 cc. 0.01 *N* soln. of II, 25 cc. $H_2O$ and varying amts. of $NaHCO_3$, the titratable $SO_2$ increased from 5.58% with 0 equiv. $NaHCO_3$ to 73% with 10 equivs. $NaHCO_3$. In 25 cc. 0.01 *N* II and 25 cc. $H_2O$ with varying amts. of HCl, the titratable $SO_2$ decreased from 9.2% with 0 equiv. HCl to 3.84% with 0.05 equiv. HCl and 1.56% with 10 equivs. HCl. C. A. R.

Constitution of the azo indicators. I. α-Naphthol orange. K. H. Slotta and W. Franke. *Ber.* 64B, 86–94(1931).—α-Naphthol orange (I), compared with other compds. of similar mol. wt. contg. a $SO_3H$ group, is strikingly little sol. in $H_2O$, indicating that there is some point in its mol. which can extremely readily bind the H nucleus of the $SO_3H$ acid to form an inner salt. This was confirmed in attempts to det. the acid const. of I by cond. methods, the cond. of I in $H_2O$ is so small (of the order of magnitude of the cond. water used) that it could not be detd. The question now again arose whether the dissocn. of one H atom suffices for the indicator color change or whether the H of the phenolic OH must also dissoc. Conductometric titration of I showed that the color change to red occurred simultaneously with the 1st break in the titration curve on addn. of exactly 1 equiv. of alkali, the dissocn. of the 2nd H on further addn. of alkali, manifested by a 2nd break in the curve when the 2nd equiv. of alkali has been added, is without optical effect. This 2nd H atom can smoothly be replaced by alkyls in alk. soln. and the alkylated products do not lose their indicator properties. Alk. $Me_2SO_4$ gives only the mono-Me deriv. (III), almost identical with I itself as regards the color change interval and the half-value stage (*i. e.*, the $p_H$ at which 50% of the red and yellow forms are present). The same is true of the other monoalkyl derivs. obtained with $Et_2SO_4$, *p*-$MeC_6H_4SO_2Pr$, *p*-$MeC_6H_4SO_2Bu$ and heryl bromide, the introduction of the alkyls merely deepening the limiting colors. The covering power is also materially increased. Below are given the properties of I and its *Me* (II), *Et* (III), *Pr* (IV), *Bu* (V) and *heryl deriv.* (VI), resp.: Color change interval, 7.4–8.9, 7.4–9.0, 7.3–8.9, 7.4–8.9, 7.3–9.0, 7.4–8.9; half-value stage, 8.27, 8.25, 8.23, 8.26, 8.33, 8.27; alk. color, gray pink, blue-pink, rose-crimson, crimson, crimson, crimson; acid color, pale yellow green, yellow green, yellow, golden yellow, golden yellow, golden yellow, amt. of indicator for equal covering power, 100, 90, 75, 70, 75, 60. In view of this similarity in properties, all these indicators must have the same structure. The Me group in II is not split off by const.-boiling HI, indicating that it is not on the phenolic HO or the $SO_3H$ group. Only with $NH_4I$ above 200° is MeI split off, and even then only 0.5 of the calcd. amt. is given off. *p*-$H_2NNMeC_6H_4SO_3H$ (VII) behaves in exactly the same way, showing that in II the Me is on one of the azo N atoms. With alk. $Na_2S_2O_4$ II gives as one of the cleavage products 1,4-$C_6H_3(OH)$-$NH_2$ (VIII) which was detected by covering the reaction mixt. with $Et_2O$; the VIII

dissolved in the Et$_2$O with blue violet color as fast as formed and, after evapn of the ether, was isolated as the yellow *N p-nitrobenzoyl deriv*, decomps 276°, by treatment in C$_5$H$_5$N with O$_2$NC$_6$H$_4$COCl This shows that the Me in II is on the N attached to the C$_6$H$_4$ ring and hence that it is not the H on this N which is responsible for the indicator properties of these compds The other N atom could not be alkylated with any of the above agents but solid II in Et$_2$O suspension gave on long standing with CH$_2$N$_2$ a red orange *di Me deriv* (IX) which is insol in H$_2$O and in aq Me$_2$CO and shows no color change with alkalies, with Na$_2$S$_2$O$_4$ in hot MeOH it yields 1,4 C$_{10}$H$_4$(OH)NHMe (X) which splits off no MeI with HI-P and is distinctly sol in alkalies, showing that the Me is on the N and not on the HO group These facts indicate that the yellow acid ' form of I has the double zwitterion structure XI; as the $p_H$ of the soln is raised a H nucleus is withdrawn from the azo N atom whose attached ring is best adapted to a neutralization of the unions set free by becoming quinoid (the C$_{10}$H$_6$ nucleus), giving the deeply colored *p*-naphthoquinonephenylhydrazonesulfonic anion (XII), whose hydrazone H can be substituted by the usual alkylating agents If these views are correct, it should be possible to obtain the di Me deriv directly from the "acid ' form of I, and as a matter of fact the solid I allowed to stand some hrs with CH$_2$N$_2$ in Et$_2$O changes into the red di Me deriv I (90% from diazobenzenesulfonic acid and α naphthol in HCl I tOH), decomps 200° II (yield, almost quant ), needles with green luster, decomps 260° *p Methoxyazobenzene p-sulfonic acid*, which is the product obtained under the same conditions from HOC$_6$H$_4$N NC$_6$H$_4$SO$_3$H, is light brown and gives no color change with alkali III (3 6 g from 3 3 g I), green brown, decomps 263-5° IV (75% yield), green black, decomps 268°. V (64%), decomps 269-70°. VI (22%), green, decomps 267° IX, m 178° *N p-nitrobenzoyl deriv* of X, yellow, m 216°.

**Anthracene series. Halogenation and nitration.** P S Varma and A Subramanyam *Proc 15th Indian Sci Cong* 1928, 151 —Monoiodo- and *diiodo-anthraquinone* were obtained by the action of NaNO$_3$ and fuming H$_2$SO$_4$ on anthracene and I A number of Br compds were obtained by the action of Br and fuming H$_2$SO$_4$. Some of these halogenated compds were also nitrated In some cases nitro derivs were obtained, while in others the halogen compds were decompd and the halogens liberated No details are given

E J C

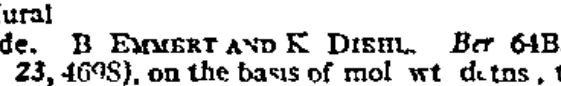
**Anthracene derivatives III.** Edward de Barry Barnett and John A Low *Ber* 64B, 49-56(1931), cf *C A* 24, 1638 —The work of the last 10 yrs has agreed with the hypothesis that the influence of α Cl atoms in the reactions of certain anthracene derivs is due to a coördination with a H atom in the *peri meso* position but it was desirable to show that the properties produced by a coördinated group would not be produced by a non-coördinated group in the same position An investigation of the α methylanthracenes was accordingly undertaken and, contrary to expectations, it was found with 1,4 dimethylanthracene (I) that an α Me group has very much the same influence as an α Cl atom *1,4 Dimethyl 10 bromoanthrone* (II) readily yields the corresponding *10 MeO deriv* (III) and reacts with bases, NHRR', to form the 10 NRR' derivs (IV) II also readily undergoes the Friedel Crafts reaction with C$_6$H$_6$, the resulting *10-Ph deriv* (V) giving with Grignard reagents carbinols (not isolated) which, under the catalytic influence of H ions, undergo no transanellar de-

hydration but change into alkylidene compds (VI), whose structure was proved by their complete lack of color and the absence of fluorescence, and also by the oxidation of the methylene deriv (R = H) back to V. That the intermediate carbinols, however, can readily undergo transanellar dehydration when alkylidene formation is impossible is shown by the very smooth formation of *1,4 dimethyl 9 10 diphenylanthracene* (VII) from V with PhMgBr and by the formation of I (see below). Furthermore, the benzylidene deriv VI (R = Ph) boiled with AcOH contg HCl gives a yellow, strongly fluorescent substance, probably VIII. 1 4 Dimethylanthrone with Grignard reagents and subsequent treatment with HCl gives the faintly yellow, strongly fluorescent compds IX; the benzyl compd (R = Ph) gives a Br deriv (X) which forms non *fluorescent NR'R" and R'O derivs with bases NHR'R" and alcs., R'OH, resp.* The latter on boiling with alcs. contg a little HCl change into easily sol., yellow, fluorescent substances, probably of the structure XI. Although v. Braun and Bayer were unable to acetylate 1 4 dimethylanthrone with hot $Ac_2O$ NaOAc the *1,4 dimethylanthranyl acetate* (XII) was easily obtained with $C_5H_5N$ $Ac_2O$. V, however, is recovered unchanged after heating 2 hrs. with $C_5H_5N$ $Ac_2O$ on the water bath. With Zn dust and $NH_4OH$ on the water bath, 1,4 dimethylanthrone gives the *9 10 dihydroanthranol* which on catalytic dehydrogenation in the presence of H ions readily yields I. I at once adds Br but the resulting dibromide slowly loses HBr at room temp. and both HBr and Br in boiling $C_6H_6$. It is clear therefore, that in spite of the impossibility of a *peri* co ordination the derivs of I are much more similar to the corresponding derivs of 1,4-, 1,5- and 4,5-dichloro and 1,5 diphenoxyanthracene than to those of anthracene itself, and it must be concluded that the hypothesis of *peri* coordination is untenable. It remains to be seen how many of the explanations on an electronic basis which have in recent yrs. been advanced by some investigators will stand the test of a more thorough and critical examn. than they have yet received. An extensive study of the influence of *bz*-substituents on the *meso* position of the anthracene complex has been begun and in the meantime no further theoretical discussion will be indulged in. *o*-(2,5 $Me_2C_6H_3CO)C_6H_4CO_2H$, from $AlCl_3$ slowly added to $C_6H_4(CO)$ O in *p* xylene, m. 149°, reduced by Zn dust (activated with $CuSO_4$), $NH_4OH$ and NaOH to *2,5-dimethyldiphenylmethane 2' carboxylic acid*, m. 136°, which with 80% $H_2SO_4$ on the water bath gives almost quantitatively 1,4 dimethylanthrone, m. 116°. XII, m. 162°, forms yellow, fluorescent solns. *1,4,9 Trimethylanthracene* (IX, R = H) m. 81°. *9 benzyl compd* (R = Ph), m. 135°. *1,4-Dimethyl 10 bromo 9 benzylidene 9,10 dihydroanthracene* (X), very light yellow, m. 180°, *10 piperidino compd.*, m. 150°, *10 MeO compd.*, m. 118-9°, *10 EtO compd.*, m. 130°. II, from the anthrone with Br in $CS_2$, yellow, decomps. about 160°, *10 piperidino compd* (IV), m. 133°, *10-PhNH deriv.*, bright yellow, m. 192°, *10 PhNMe deriv.*, yellow, m. 179°, *10 p-dimethylaminophenyl compd.*, m. 184°. III, m. 76°. V, m. 141°. *1,4-Dimethyl 9 methylene 10 phenyl 9,10 dihydroanthracene* (VI, R = H), *from V and MeMgI*, m. 129°. *9 benzylidene compd* (VI, R = Ph), from V and $PhCH_2MgCl$, m. 170°. VII, light yellow, m. 189°, shows vivid blue fluorescence in soln. in the light of an arc lamp.

C. A. R.

***ms*-Dichloroanthracene and its β-sulfonic acid as starting materials for production of alizarin.** V. I. Minaev and B. P. Fedorov. *Rev. gén. mat. color.* **34**, 330-2, 376-82 (1930).—See *C. A.* **25**, 1252. E. J. C.

**3-Nitrophthalic acid series.** H. W. Underwood, Jr., and R. L. Wakeman. *J. Am. Chem. Soc.* **53**, 1839-42(1931).—Condensation of 15 g. 3 nitrophthalic anhydride (I) and 16.1 g. PhOH with 3 g. concd. $H_2SO_4$ by heating 2.5 hrs. at 170° and 3 hrs. at 215-20° gives 2.1% of *phenol-3-nitrophthalein*, yellow, m. 204-5°, the NaOH soln. has a violet color, a very dil. soln. of the Na salt becomes practically colorless on addn. of a large excess of concd. NaOH. I (5 g.) and 6.3 g. *m* $C_6H_4(OH)_2$, heated 1.25 hrs. at 195-200°, give 17.4% of *resorcinol 3 nitrophthalein*, red, m. 260°, the NaOH soln. is brownish yellow; a dil. alk. soln. exhibits a green fluorescence but not nearly to the same extent as a soln. of fluorescein. The 1-mono-Me 3 nitrophthalate is un-



changed on heating with Ac$_2$O, while the 2 mono Me ester gives the anhydride, the di Me ester is unchanged. The isomeric 3 nitrophthalamic acids and 3 nitrophthalamide are converted into 3 nitrophthalimide by treatment with Ac$_2$O. C. J. W.

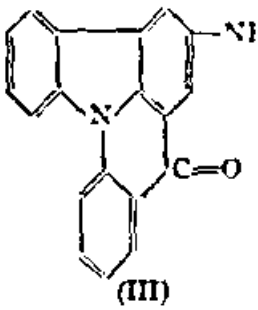
**A reaction of aromatic 1,4-diketone monoximes occurring instead of the Hofmann rearrangement.** I. Roland Scholl, Hans Semp and Edmund Stix. *Ber* 64B, 71–7 (1931).—The monoxime of α (2,4 Me$_2$C$_6$H$_3$CO)C$_6$H$_4$(CO)$_2$C$_6$H$_4$ with alc. HCl at 150° gives the xylidide Me$_2$C$_6$H$_3$NHCOC$_6$H$_4$(CO)$_2$C$_6$H$_4$ (I) and was therefore assigned the structure Me$_2$C$_6$H$_3$C(NOH)C$_6$H$_3$(CO)$_2$C$_6$H$_4$ (II) (*C. A.* 21, 2084). The yield of I was very small, however, and attempts were made to increase it by using other rearranging agents than alc. HCl. AcOH-H$_2$SO$_4$ gave in good yield a yellow, weakly basic compd. C$_{21}$H$_{11}$O$_2$N (III), contg. 1 H$_2$O less than I. Of the 2 theoretically possible Beckmann rearrangement products of II, viz., I and α (2,4 Me$_2$C$_6$H$_3$CONH)C$_6$H$_3$(CO)$_2$C$_6$H$_4$ (IV), neither gives III with AcOH-H$_2$SO$_4$; I splits off C$_6$H$_4$(CO$_2$)C$_6$H$_3$CO$_2$H and IV gives C$_6$H$_4$(CO)$_2$C$_6$H$_3$NH$_2$. The formation of III, therefore, is not dependent on a Beckmann rearrangement. The most plausible assumption, then, was that anhydridization occurred between the oxime OH and a H of the 2 Me group in the Me$_2$C$_6$H$_3$ residue, with formation of the isoindole, $\underline{CH_2}$ C$_6$H$_3$Me CR N (R = C$_6$H$_3$(CO)$_2$C$_6$H$_4$), especially as the oxime of *p xylyl α-anthraquinonyl ketone* (V) gave with AcOH H$_2$SO$_4$ an "anhydride" (VI) with the same ease as does II. But the oxime of the *p* tolyl (VII) and Ph homologs (VIII) also give "anhydrides" with great ease, while 2,4 Me$_2$C$_6$H$_3$C(NOH)Ph forms no anhydride with either AcOH-H$_2$SO$_4$ or any other dehydrating agent but merely undergoes the Beckmann rearrangement. The H$_2$O split off in the formation of III can therefore be formed only from the oxime OH and aromatic H. To det. at what point the anhydride ring was closed the oximes of 2,1-C$_6$H$_4$(CO)$_2$C$_6$H$_2$MeCOR (R = Ph and 2,4- and 2,5-Me$_2$C$_6$H$_3$) and of α (2,4,6 Me$_3$C$_6$H$_2$CO)C$_6$H$_3$(CO)$_2$C$_6$H$_4$ were treated with AcOH-H$_2$SO$_4$. None formed an anhydride, the first 3 were unchanged by short treatment and under more drastic conditions gave black, indefinite products together with a little 2,1 C$_6$H$_4$(CO)$_2$C$_6$H$_2$MeCO$_2$H, while the last reacted in some other way which remains to be elucidated. These results led to testing whether the anhydrides are phthalylacridines, C$_6$H$_4$(CO)$_2$C$_6$H$_2$  C$_6$H$_4$ formed directly from the oximes or from their tautomeric nitroso forms C$_6$H$_4$(CO)$_2$C$_6$H$_3$CH(NO)Ph. Phthalylacridines of this type are not known, but the corresponding acridones are. Both Ullmann's anthraquinone 1,2 acridone and the "anhydride" obtained from VIII were distd. over Zn dust, the former yielded *β-anilinoanthracene* (IX), also obtained by distn. of β C$_6$H$_4$(CO)$_2$C$_6$H$_3$NHPh over Zn dust, whereas the latter yielded a different product. The acridine structure can therefore not be considered for these anhydro oximes. Ph$_2$C:NOH also did not give acridine with dehydrating agents. *Anhydrophenyl α-anthraquinonyl ketone oxime* (1.15 g. from 2.5 g. VIII oxime heated in AcOH H$_2$SO$_4$ from 160° to 240° in the course of 10 min.), yellow, m. 291°, shows no fluorescence in org. solvents even under a quartz lamp, easily sol. in concd. H$_2$SO$_4$ with vivid yellow color, likewise in hot concd. HCl by which it is not changed at 180°, forms a dark orange complex salt when rubbed with anhyd. AlCl$_3$, gives a blue vat (sensitive to air) with alk. Na$_2$S$_2$O$_4$, yields on distn. in H over Zn dust an orange-red sublimate sol. in org. solvents with blue, in H$_2$SO$_4$ with green fluorescence and forming an orange red to brown picrate. The sublimate is therefore not IX, yellow leaves with green fluorescence, m. 197–8°, which forms an almost black picrate. *Anhydro-p-tolyl α-anthraquinonyl ketone oxime*, from the oxime of VII boiled 3 min. in AcOH H$_2$SO$_4$, m. 236–7°. *m-Xylyl homolog* (III) (yield, 50–60%), yellow, m. 240°, insol. in NaOH but readily forms a blue-green vat with NaOH-Na$_2$S$_2$O$_4$ at 70°. V (with Wilhelm Messe), from 1 C$_6$H$_4$(CO)$_2$C$_6$H$_3$COCl, *p*-xylene and AlCl$_3$ in PhNO$_2$ or CS$_2$, light yellow, m. 205°, sol. in concd. H$_2$SO$_4$ with yellow color, changed to green by Al powder, H$_2$O ppts. a blue substance, *oxime*, m. 223°, *anhydro oxime* (VI) (50% yield), yellow, darkens 255°, m. 265–6°. *Anthraquinone 1-carboxanilide*, light yellow, m. 288–9°, gives anthracene on distn. with Zn dust. *m-Xyloyl-α-aminoanthraquinone* (IV), from C$_6$H$_4$(CO)$_2$C$_6$H$_3$NH$_2$ and Me$_2$C$_6$H$_3$COCl in PhNO$_2$, m. 261–2°. *2 Methyl anthraquinone 1 carboxanilide*, light yellow, m. 287–8°, forms no anhydro oxime with AcOH H$_2$SO$_4$. C. A. R.

**Some experiments with fluoranthene.** O. Kruber. *Ber* 64B, 84–5(1931); cf. v. Braun and Manz, *C. A.* 25, 1244.—Treatment of 2.4 kg. of a neutral tar-oil fraction (b. about 370–90°) in an equal amt. of purified "solvent benzene" (b. about 140–80°) at 160° with 300 g. Na gave after 3 hrs. stirring a crumbly brown mass which, after thorough

washing with toluene, stirring with ice water, extn with $C_6H_6$ and distn *in vacuo*, yielded *180 g residue and 800 g distillate, most of which solidified on cooling and on* crystn from alc yielded 120 g tetrahydrofluoranthene (I), m 75°, shown by direct comparison to be identical with v Braun's synthetic product. The part of the original material which had not been attacked by the Na yielded *on fractionation 150 g* pure pyrene The I with $Na_2Cr_2O_7$ in AcOH gave an acid, $C_{16}H_{12}O_3$ (probably *fluorenone-8-propionic acid*), red-yellow, m 137–8° (2 6 g from 5 g I) The I with Na at 140–60° readily yields substances which with dry $CO_2$ give a mixt of $CO_2H$ acids from which was isolated a *mono-$CO_2H$ acid*, $C_{17}H_{14}O_2$, m 188°, on long heating above its m p or distn with lime the acid regenerates I. The I $b_{745}$ 363 5° and it is hardly likely that it was already present in the original tar-oil fraction C A R

**Nitrofurfuryl alcohol.** Henry Gilman and Geo F Wright *J Am Chem Soc* 53, 1923–4(1931), cf *C A* 24, 5751 —Furfuryl acetate and fuming $HNO_3$ in $Ac_2O$ at —20° give 59 5% of *5(?)-$NO_2$ deriv*, m 47°, hydrolysis gives 49–55% of *5(?)-nitrofurfuryl alc*, $b_4$ 157°, m 32°, oxidation of the latter with $MnO_2$ and 50% $H_2SO_4$ gives nitrofurfural C J West

**α-Pyrrolealdehyde.** B Emmert and K Diehl. *Ber* 64B, 130–2(1931) —It was shown recently (*C A* 23, 4698), on the basis of mol wt detns, that α-pyrrolealdehyde (I) exists in soln in an equil (depending on the solvent) with a form of higher mol wt. for which was suggested the Jacobson formula  (II)



It has now been possible, by benzoylation in petr ether, to stabilize the 2 forms and sep. them by means of MeOH as their Bz derivs. *N-Bz deriv* of I, sol in MeOH at room temp., m 90°, mol wt. in $Et_2O$ 171–8, in camphor 198, also obtained exclusively from the Na deriv of I and BzCl in ligroin, *phenylhydrazone*, green yellow, m 154° *Dibenzoate* of II, only slightly sol in cold MeOH, m 178°, mol wt in camphor 418–25 *N-p-Methylbenzoyl deriv* of I, m 79–80°, mol wt. in camphor 220, *phenylhydrazone*, yellow, m 146°. *Bis(p-methylbenzoate)* of II, m 167–8°, mol wt in camphor 432 C. A R.

**General method of synthesis for α-substituted pyrrolines and pyrrolidines.** Lyman C. Craig, Helen Bulbrook and R M Hixon *J. Am Chem Soc* 53, 1831–5(1931), cf. *C. A* 24, 1374 —A study has been made of the synthesis reported by Cloke (*C A.* 23, 2438) for the prepn of α substituted pyrrolines from $ClCH_2CH_2CH_2CN$ (I) The yields have been increased and the procedure shortened by elimination of MgClBr from the addn product of the Grignard reagent with I, closing the ring without passing through the intermediate ketimine α-Ethylpyrroline, b. 140°, results in 46% yield, *picrate*, m 87°, *chloroaurate*, m 122° The work of Gabriel and Coleman (*C. A.* 2, 1425) on the reduction of α-phenylpyrroline (55% yield by the new method) with Sn and HCl has been confirmed, catalytic reduction of this compd yields an indefinite mixt. γ-Chloropropyl phenyl ketimine acetate is reduced catalytically to 1-phenyl-1-amino-4-chlorobutane, although the latter compd was not isolated due to the ease with which it splits off HCl to form α phenylpyrrolidine. *α-Benzylpyrroline*, $b_{15}$ 126–8°, results in 13% yields, *picrate*, m 89°, *chloroaurate*, m 125° (decompn.). The yields of these 3 compds is in the reverse order to the order of reactivity of the Grignard compds. *from which they are derived* C. J West

**Behavior of pyrrolidine on dehydrogenation catalysis.** N D Zelinskii and I. K. Yur'ev. *Ber.* 64B, 101–3(1931) —It was shown recently (*C A.* 24, 1110) how easily *N*-methylpyrrole is hydrogenated with Pd under the usual conditions and the resulting *N*-methylpyrrolidine can be dehydrogenated back It was of interest to det. how pyrrolidine (I) would behave A com synthetic pyrrole, b 129–30°, when purified through the K compd which was washed several times in H with petroleum ether, dried in H and decompd with ice, $b_{760}$ 128 5°, $n_D^{21}$ 1 5093, with H and Pd asbestos at 160° it gave 30% I, b 85–6° (in H), $n_D^{19}$ 1 4390, $d_4^{20}$ 0 8618, with Rh as catalyst (which *permits of effecting the reduction at 100°*), *the resulting* I b 86–8°, $n_D^{24}$ 1 3498, I obtained from pyrrolidine (II) with Pd asbestos at 135° and carefully fractionated from BaO $b_{741}$ 85 5–6 5°, $n_D^{22.5}$ 1.4423, $d_4^{22.5}$ 0 8533 The II, obtained in 35% yield from pyrrole in alc with Zn-Pd and concd. HCl, $b_{740}$ 90–0 5°, $n_D^{22.5}$ 1 4650, $d_4^{22.5}$ 0 9017. The I, led at the rate of 4 drops per min through Pd-asbestos at 300°, yielded pyrrole, b 129–31°, $n_D^{19}$ 1.4955 C. A R.

**Tervalent nitrogen. II. Carbazoleacridone and its several monosubstitution prod-**

ucts. TARO HAYASHI *Bull Inst Phys-Chem Research* (Tokyo) 9, 970–90 (Abstracts 92–3 (in English) published with Sci *Papers Inst Phys-Chem Research* (Tokyo) 15, Nos 278–81 (1930)), cf *C A* 25, 1824.—The following compds were prepd to ascertain the existence of optical isomers of org compds contg a tervalent asym N atom entirely in the ring structure, and having neither an asym C atom nor any other cause for the optical activity *Carbazoleacridone* (I), obtained by treating $(C_6H_4)_2NH$ with $ClC_6H_4CO_2H$, yellow, m 178.9° (181.9°, cor.), whose CO group does not react with $PhNHNH_2$, showing no ketonic character *2 Nitrocarbazoleacridone* (II), obtained in 35 g (83%) yield by the addn of 160 cc conc $HNO_3$ (d 1.38) to 36 g of I in satd. glacial AcOH soln., yellow crystals from $PhNO_2$, m 304.5° *2 Aminocarbazoleacridone* (III), obtained by making alk. with NaOH the hot $H_2O$ ext of the double salt resulting from II, $SnCl_2$ and conc HCl, then treating its helicin compd with alk. KOH (the direct recrystn gives poor results), reddish orange crystals from $C_6H_6$, m 279.8° *HCl salt*, orange yellow, m 270.8°, *picrate*, yellow, m 163.4.5°, *2-acetylamino compd.*, yellow, m 225–6°, *2 benzoylamino compd.*, yellow, m 286.8°, *benzenesulfonamide* of I, yellow, m 224.5.6°, *methylamine* of I, a secondary amine, reddish orange, m 193.5.5°, *d α bromocamphorsulfonate*, yellow, m 252.4° *l tartrate*, yellow, m 171.2° (decomp.), *reaction product of* III *and salicylaldehyde*, yellow, m 251–2° (decompn.) *Helicin compd.*, obtained from III and helicin in hot EtOH, an orange ppt decomping at 218.22.5°, gives, on recrystn from EtOH, 2 geometrical isomers, one comparatively insol in EtOH, yellowish orange crystals from EtOH, decomping 223.5–5°, $\alpha_D^{22}$ 0.03° (in 0.098% EtOH sol., $l$ = 1 dm.), another easily sol in EtOH, yellow crystals from EtOH, m 238.9°, $\alpha_D^{22}$ 0.02° (in 0.100% EtOH sol., $l$ = 1 dm.) *d Hydroxymethylenecamphor deriv* of III, obtained in 14.5 g yield by treating 10 g of III in 100 cc glacial AcOH and 200 cc $H_2O$ with 6.5 g *d* hydroxymethylenecamphor in MeOH, yellowish orange crystals from the mixt of MeOH and $H_2O$, m 176.5–8°. Heating 3 hrs with alc potash and addn of alkali or HCl bring about no change, but cold conc $H_2SO_4$ dissolves it, with pink color, and treatment with $H_2O$ and dil NaOH gives III There is no indication of the existence of any optical isomer in III. *Carbazoleacridonediazonium chloride* (V), yellow powder, decomps about 230°. V in 10% cold NaOH, treated with SnCl in 50% NaOH and 5% NaOH, gives I. *Carbazoleacridone 2 nitrile* obtained in 8.0 g yield by treating 10.0 g of V with a hot soln of CuCN, yellow crystals from $C_6H_6$, m 248–9°, on sapong it with $H_2SO_4$ or NaOH, there results *carbazoleacridone 2 carboxylic acid*, yellow crystals from MeOH, m. 288–90°. *Strychnine salt*, yellow, decomps 180–4°, *brucine salt*, yellow, m 269–70°, *cinchonine salt*, yellow, m 220–2°. The latter 2 salts were optically inactive III. Configuration of the tervalent nitrogen compound *Ibid* 10, 1–4 (1931); *Ibid* 15, Nos 283–5, Abstracts (English) 1 (1931).—The structural formula ordinarily given for *indazolecarboxylic acid* (cf *C A* 25, 1824) selected as an org N compd contg a tervalent asym N atom which is entirely in the ring structure, and an amino or carboxyl radical capable of being combined with active substances, was doubtful and therefore *monosubstitution products of carbazoleacridone* (cf preceding abstr.) were prepd The exptl evidence that the tervalent N atom in *2-aminocarbazoleacridone α methylenecamphor* and the *brucine* and *quinine salt of carbazoleacridone 2-carboxylic acid* does not give rise to the existence of optical isomers and that *carbazoleacridone*, its *2 nitro* and *2-amino derivs.*, and its *2-carboxylic acid* form very weak combinations with MeI and HCl seems to permit of concluding that all 3 bonds of such a tervalent N atom exist in one plane K. KONDA

Color of complex diazoles III. Double quinonoid structure—the real chromophore GOPAL C CHAKRAVARTI *Proc 15th Indian Sci Cong* 1928, 158, cf *C A* 19, 2493.—All attempts to correlate color with the constitution of compds contg fused pyrrole imidazole or pyridine imidazole ring systems have so far been unsuccessful. Hewitt's rule and its modification by Watson and his co-workers are not sufficiently elastic to explain the color of these nitrogenous bodies. But when the theory of quinonoid structure is extended to heterocyclic compds like pyrrole and pyridine, a ready explanation of the cause of color in these condensed systems is at once available It is found that all the known colored condensed pyrrole imidazole and pyridine imidazole derivs may be represented as having a double quinonoid pyrrole or pyridine nucleus, whereas the colorless compds either do not possess this structure, or if they do possess it their chromophoric effect is neutralized by the presence of other hypsochromic groups Hence it is suggested that the presence of a double quinonoid pyrrole or pyridine ring

is necessary so that systems contg fused pyrrole- or pyridine-imidazole skeletons may develop visible color E J C

Action of hydroxylamine upon mustard oils: formation of dianilino-1,2,5-oxdiazole. P. C Guha and M N Chakladar *Proc 15th Indian Sci Cong* 1928, 157 —$NH_2OH$ reacts with mustard oils to yield unstable intermediate hydroxythioureas, RNHCS-NHOH, 2 mols. of which are easily decompd even at ordinary temp to yield 1,2,5-oxdiazoles with the sepn of S and water $2\ RNHC(NOH)SH \longrightarrow (RNHC(NOH)-S-)_2 \longrightarrow RHNC\ N\ O\ N\ CNHR + H_2O + 2S$ No details are given E J C

Possible existence of 2-thioimidazole group in insulin. C Ruiz, L Silva and L Libenson *Compt rend soc biol* 104, 1101 2(1930), *Physiol Abstracts* 15, 530 — The 4- or 5-methyl 2 thioimidazole produces hypoglucemia in the rabbit There is no proof that imidazole is the active group in insulin, though histidine has been isolated from it 2-Thioimidazole, the nucleus of ergothioneine, exists in red blood cells It has a hypoglucemic action on the rabbit *per os* 2 Thioimidazoline has a similar action Other derivs have no such effect. The pos effect is slight and does not suggest that the insulin mol contains the 2 thioimidazole group G G

Dyes derived from oxalyldibenzyl ketone. S A Saletore and Gopal Chandra Chakravarti *Proc 15th Indian Sci Cong* 1928, 152 —Hydroxyimidazoles obtained by condensing phenanthraquinone and acenaphthaquinone with salicylaldehyde in the presence of $NH_3$ are all colorless cryst compds (Japp and Streatfield, *J Chem Soc.* 41, 146(1882) and others), while those derived from substituted salicylaldehydes are colored (Sircar and Sircar, *C A* 17, 2880) It was therefore anticipated that the imidazole from oxalyldibenzyl ketone and salicylaldehyde would likewise be colorless, whereas this compd was obtained as a deep brown cryst. product with marked chromophoric properties. This is evidence in support of the observation made recently (C., *C. A.* 20, 207) that oxalyldibenzyl ketone is a much better chromophore than phenanthraquinone or acenaphthaquinone, although the latter bodies contain condensed benzene nuclei Several other imidazoles derived from oxalyldibenzyl ketone *on the one hand* and vanillin, nitrosalicylaldehyde, *p-* and *m* $HOC_6H_4CHO$, resorcyl aldehyde, bromosalicylaldehyde, etc., on the other, are also found to be deeply colored No details are given E J C

Some heterocyclic derivatives of biphenyl. J M F Leaper *J Am Chem Soc* 53, 1891–6(1931) —4-ClH $H_2NC_6H_3Ph$ (100 g.), slowly added to 700 g of $S_2Cl_2$ at 20° and stirred overnight, then treated with 400 cc $C_6H_6$ and heated 4 5 hrs at 75–80°, gives 140 g *phenylphenylenethiazthionium chloride*, brownish red powder, chars about 130°, stirring with $H_2O$ overnight gives the *hydrate* (I), m 135° (decompn.) I and NaOH give the Na salt of *4-amino-3 mercaptobiphenyl*, analyzed as the *Zn salt* The Na salt and $CS_2$ in NaOH, refluxed 5 min., give 87% (on the basis of the $PhC_6H_4NH_2$) *of 2 mercapto-6-phenylbenzothiazole* (II), m 220 *Zn salt*, *Pb salt*, yellow. I in NaOH gives *bis-6-phenyl 2-benzothiazole disulfide*, m 163° II was also obtained from $PhC_6H_4NH_2$, NaSCN and Br in AcOH, which gives *2-amino-6 phenylbenzothiazole*, m 227–8°, heating with concd KOH splits the heterocyclic ring, giving the aminothiophenol which reacts with $CS_2$ to give II. The above Na salt and ClCH·CO·H give 94% of *2-amino-5-phenylthioglycolic acid*, m 212–2.5° The diazo compd gives a *dye* with β $C_{10}H_7OH$, $C_{24}H_{15}O_2N_2S$, reddish needles with metallic luster, *o*-$PhC_6H_4OH$ gives a dye which gives an orange AcOH soln., while that from β $C_{10}H_7OH$ gives a bluish red soln. C. J West

The two isomers of hydroxymethyl phenylcyanopyridine. N Troccoli *Ann chim applicata 21, 41–45(1931)* —J *Guareschi has shown (Atti accad Torino 34)* that β-diketones condense with $NCCH_2CO_2Et$ in the presence of $NH_4OH$ to form cyanopyridones. If an asym. diketone is used 2 isomers are obtained. Thus with $AcCH_2Bz$, the α- as well as α'-phenyl-γ-methyl β-cyano-α-ketodihydropyridine, m 263–4° and 310° resp., are obtained, and are sepd. by their difference in soly in EtOH, the latter being much less sol. Alkali salts form readily by treating the EtOH suspension with 10% alkali. The salts of the heavy metals can then be prepd. from the alkali salts by adding sol. metal salts, by metathesis. In this way the K, Na, Ba, Cu, Ni and Co salts of each isomer was prepd. A. W Contieri

The condensation of pyridine- and quinolinecarboxylic acids with amino acids. Hans Meyer and Roderich Graf *Biochem. Z.* 229, 154–63(1930) —$CH_2(NH_2)-CO_2Et$ and 2 $C_5H_4NCOCl$ give *Et 2-pyridoylaminoacetate* (I), m. 71°. Sapon. gives the *free acid*, m. 165–6° (cf Sendju, *C A* 22, 602), its *amide*, m. 184–5°, is obtained from I and $NH_4OH$ The following compds. were prepd. similarly. *3 pyridoylaminoacetic acid*, m 237–8° (decompn.) (*amide*, m 193–5°, *Et* and *Me esters*, m 54–5° and 67–8°,

resp.). *4-pyridoylaminoacetic acid*, m. 221–2° (decompn.) (*Et ester*, m. 89–90°; *amide*, m. 227–8° (decompn.)). *2-quinoloylaminoacetic acid*, m. 183–4° (decompn.) (*Me ester*, m. 100°, *amide*, m. 231–2° (decompn.)). *4-quinoloylaminoacetic* acid, m. 244–6° (decompn.) (*monohydrate*, decomps. 110°, *amide*, m. 226–7°; *Et ester monohydrate*, sinters 110°, m. clear 120°). *2-phenyl-4-quinoloylaminoacetic acid*, m. 216° (*Et ester*, m. 140–1°, *amide*, m. 213°). *3-pyridoylglycylglycine*, m. 232° (decompn.) (*Et ester*, m. 144.5°). *N (3-pyridoyl)anthranilic acid*, m. 258.9° (*Me ester*, m. 127°). *N (2-pyridoyl)anthranilic acid*, m. 171–2° (*Me ester*, m. 84–5°). *N-(3-pyridoyl)-anthranoylanthranilic acid*, m. 222° (*Me ester*, m. 181° (decompn.)). A. P. Shepard

Anhydrides of pyridine- and quinoline-carboxylic acids. Roderich Graf. *Biochem. Z.* 229, 164–8(1930); cf. *C. A.* 23, 837.—Nicotinyl chloride and Na nicotinate refluxed 1 hr. in $C_6H_6$ give *nicotinic anhydride* (I), m. 122–4°. *Isonicotinic anhydride* (II), prepd. similarly, m. 103–4° and carbonizes 180°. I and II are only slowly hydrolyzed. Na cinchoninate and cinchoninyl chloride heated 0.5 hr. at 170° give *cinchoninic anhydride*, b. about 240–50°, m. 215° (decompn.). Anhydrides could not be obtained from quinaldinic acid or 2-pyridinecarboxylic acid. A. P. Shepard

α-Piperidinobenzalacetophenone. I. P. Kohler and W. F. Bruce. *J. Am. Chem. Soc.* 53, 1994–8(1931).—K. and Addinall (*C. A.* 24, 1030) expressed the opinion that a peculiar red piperidine deriv. (Watson, *J. Chem. Soc.* 85, 1322(1904)) is an unsatd. ethylene oxide, $PhCH\overset{O}{\frown}C(NC_5H_{10})Ph$ (I); however, it is an unsatd. ketone, $PhCH{:}CBzNC_5H_{10}$ (II), as by Dufraisse Moureu (*C. A.* 21, 3051). Hydrogenation gives *α-piperidinobenzylacetophenone* (III), pale yellow, m. 81°, also obtained from $PhCH_2CHBrBz$ and piperidine; the *oxime* m. 141–2°; it was not possible to regenerate the ketone from the oxime. III and PhMgBr give *α α,γ-triphenyl-β piperidinopropanol*, m. 148–9°; pyrolysis of the carbinol gives $PhCH_2CH_2NC_5H_{10}$ and $Ph_2CO$. I and PhMgBr give *α piperidino β,β-diphenylpropiophenone*, yellow, m. 163°; further action of PhMgBr gives *α α-diphenyl β piperidino γ,γ-diphenylpropanol*, m. 136–7°; the *chloride* m. 162–4°. C. J. West

The bromination of methylarsepidine. The existence of a radical with quadrivalent arsenic. Enrique V. Zappi and Helvecio Degiorgi. *Bull. soc. chim.* [4], 49, 366–71 (1931); cf. *C. A.* 10, 2874.—The bromination of methylarsepidine, $CH_2.(CH_2)_3.CH_2.AsMe$ (I) is exothermic and forms the *dibromide*, $\overbrace{CH_2\ (CH_2)_3\ CH_2}\ AsBr_2Me$ (II). On adding about 50 cc. of 2 *N* Br in $CCl_4$ (contg. 0.1 atom Br) to a cold soln. of 16.1 g. of I (0.1 mol.), the reaction ceases with the production of *dibromomethylbiarsepidine*, $[\overbrace{CH_2\ (CH_2)_3\ CH_2}\ AsBrMe]_2$ (III). By allowing this soln. to attain room temp. and on adding 50 cc. of 2 *N* Br, II was pptd. The white cryst. material (III), m. 60° (decompn.), is very hygroscopic, sol. in warm $CCl_4$ to a yellow soln. which is decolorized on exposure to the air, pptg. the *peroxide*, $[\overbrace{CH_2\ (CH_2)_3\ CH_2}\ As(MeBr)O]_2$. It would seem that III is capable of dissocg. into the free radical *bromomethylarsepidyl* $\overbrace{CH_2\ (CH_2)_3\ CH_2}\ As(MeBr)$, contg. As in the quadrivalent state. Though there are no previous reports on quadrivalent As, Blicke and Smith (*C. A.* 23, 3908), have reported bivalent As in the tetraaryldiarsyls. When II is heated to 80–90° at 6–8 mm., or when a soln. of II in $CCl_4$ is distd. to a small vol., MeBr is evolved, with formation of *bromoarsepidine*, $\overbrace{CH_2\ (CH_2)_3\ CH_2}\ AsBr$, a red oil which is converted on bromination into *arsepidine tribromide*, $\overbrace{CH_2\ (CH_2)_3\ CH_2}\ AsBr_3$ (IV), m. 102°. IV is decompd. by $H_2O$ into HBr and $\overbrace{CH_2\ (CH_2)_3\ CH_2}\ As(OH)O$, and on heating gave gaseous hydrocarbons and $AsBr_3$ but not $\overbrace{CH_2\ CH_2\ CH\ CH\ CH_2}\ As$ as was hoped. Attempts to form the pentabromide, $\overbrace{CH_2\ (CH_2)_3\ CH_2}\ AsBr_4$, were unsuccessful. C. R. A.

Pyrimidines. CXXII. Improved methods for the synthesis of orotic acid. Treat B. Johnson and Elmer F. Schroeder. *J. Am. Chem. Soc.* 53, 1989–94(1931); cf. *C. A.* 25, 1830.—Uracil-4-carboxylic acid (orotic acid) (I), known to occur in milk, is most easily prepd. in quantity by oxidation of 2-thiouracil-4-aldehyde (II) or uracil-4-aldehyde (III) with $CrO_3$. Details are given for the prepn. of $(EtO)_2CHCO_2Et$, $(EtO)_2$

$CHCOCH_2CO_2I$ t, the di I't acetal (IV) of II, II, and the di-I't acetal (V) of 2 ethylmercaptouracil-4 aldehyde (VI) Oxidation of II gives 76% of I, identical with the natural product; VI gives 55% of I; IV gives 68% of I, V gives 53% of I. IV, oxidized with 3% $H_2O_2$ in 20% NaOH, gives a nearly quant yield of the di I t acetal of III; oxidation of the latter gives a good yield of I. A quant yield of III is obtained by the careful hydrolysis of corresponding di I't acetal; III contains 1 mol $H_2O$, lost on heating 1 hr at 120°, it is easily oxidized to I. C J West

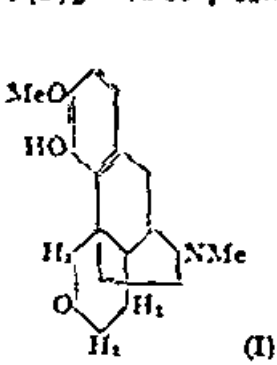
**Cyclic ammono ketones and acid chlorides of the quinoxaline series.** R A. Ogg, Jr., and T W. Bergstrom *J Am Chem Soc* 53, 1840–53(1931), cf *C A* 25, 957.—*2,3-Dichloroquinoxaline (I) is a deriv of an ammono oxalyl chloride, the method of prepn*, from $PCl_5$ and 2 3 dihydroxyquinoxaline (previously shown to be an ester of a mixed aquoammono oxalic acid), is in accord with this view I also reacts with $(CH_2NH_2)_2$ *to give o-phenylenethylenoxamidine, leaves, m above 250° alc solns show a* faint fluorescence I also reacts with 2 1 equivs of MeMgI to give 60% of 2,3 dimethylquinoxaline (II) and with PrMgI to give 30% *of 2,3 dipropylquinoxaline* (III) *m. 42.9°* (cor.) *I did not react with PhMgBr even after prolonged heating II is a* deriv. of an ammono diacetyl this is seen in its synthesis from I and MeMgI and from *o* $C_6H_4(NH_2)_2$ and di Ac and in its behavior on reduction further, BzH gives a *dibenzal deriv II does not react with Grignard reagents or with HCN* With 2 equivs of $KNH_2$ II gives a di K salt, greenish yellow, which yields with I t-I III (70% yield) 2,3-Diphenylquinoxaline (IV) is a deriv of an ammono benzil as shown by its synthesis and behavior on reduction and oxidation IV does not react with Grignard reagents or with HCN, with $KNH_2$ it appears to undergo a benzilic acid rearrangement giving 30% of what is assumed to be *1,2 dihydro 2 2 diphenyl 3 aminoquinoxaline*, m 287° (cor.), it does not react with $HNO_2$ or with I tOH HCl at 150° These reactions constitute 2 new methods for the synthesis of 2,3 dialkylquinoxalines C J W

**Synthesis of substituted thiazines.** S Krishna and Mitter S Jain *Proc 15th Indian Sci Cong.* 1928, 153–4.—The methods of prepn of substituted thiazines hitherto described give only the symmetrically disubstituted derivs and are applicable only in a very limited no of cases An attempt has therefore been made to synthesize mono-, di- or polysubstituted thiazines by a method that should be applicable to $C_6H_4$ derivs contg acid or basic substituents Thiazine was synthesized by a method utilizing the reactivity of the *halogen atom in negatively substituted chlorobenzene* 6,3 $Cl(O_2N)C_6H_3SO_2H$ condenses with aniline to form 4,2 $O_2N(HO_2S)C_6H_3NHPh$. This is readily sol. in $H_2SO_4$ If the blue soln obtained is immediately dild with water, *3-nitrophenothiazine S oxide is pptd., but if the soln is kept for half an hr before dilu.*, 3-nitrophenothiazine (I) is obtained and $SO_2$ evolved. I is readily reduced to 3-amino phenothiazine from which, through the diazo compd., phenothiazine is obtained. A *blue color is produced when a soln of I in AcOH is treated with HCl gas* The production of this blue color has been regarded as evidence of the existence of quinonoid dithionium salts. Attempts have been made to isolate such salts but these have not *been successful, probably on account of the influence of a nitro group* E J C

**The hydrogenation of methylene blue in the absence of enzymes.** Fritz Lieben and Erich Molnar *Biochem Z* 232, 209–17(1931).—Glycocoll as well as alanine inhibit *the effect of dil NaOH in deepening the color of methylene blue and lead thus to the* formation of stable light blue solns Since this effect can also be produced by means of inorg buffers, it is concluded that the amino acids probably produce this effect through their buffer action The hydrogenation of methylene blue by urea or guanidine derivs manifests certain regularities The addn of CO groups to the —NHCONH or —NHC(:NH)NH— promotes the reduction, whereas $CH_2$ groups inhibit it Urea and guanidine themselves are inactive, nor do the groups —CONH— or —CONHCO— occasion reduction Opening the ring diminishes or even abolishes the reducing action The reducing effect diminishes along the series: alloxan > parabanic acid > allantoin > hydantoin also hydantoin > hydantoic acid, creatinine > creatine This shows the stimulating effect of CO groups or of the cyclic structure S. M

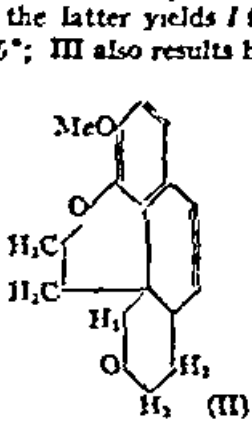
**Isomerism. Ring closure of *o*-thiocarbamidobenzoic acids.** Trjendra Nath Ghosh *J Indian Chem Soc* 7, 981–4(1930).—When anthranilic acid and PhNCS are allowed to react in the cold, *o-phenylthiocarbamidobenzoic acid*, *o*-$RNHCSNHC_6H_4CO_2H$ (I), (R = Ph), and *4 keto-2 thio-3-phenyl-1,2,3,4 tetrahydroquinazoline*, $C_6H_4$ NH CS NR.CO (II), are obtained Anthranilic acid has now been condensed with various mustard oils in hot alc and in each case only the corresponding quinazoline has been obtained, showing that the arylthiocarbamidobenzoic acid very easily passes into the quinazoline with loss of water When II is heated with concd $H_2SO_4$

for 3–4 hrs at 125–30° it is isomerized to a compd of the type $C_6H_4$ N·C(NHR) S CO,



*2-anilino 3 keto-4,5 benzo 1,3 thiazine* (III), insol in alkali but sol in acids. III is also obtained from I by the same treatment. The allyl analog gave, however, a S-free compd with $H_2SO_4$, but a compd similar to III when HCl was used. II m above 300°, *disulfide* (by addn of $I_2$ in KI to II in AcOH and gentle warming followed by diln.), m 250–2°, *p-tolyl analog* m 310°, *o tolyl analog*, m 258–70°, *disulfide*, m 215°, *1,3,4 xylyl analog*, m 259–60°, *allyl analog*, m 206–7°. III, m 184–5°, *p-tolyl analog*, m 235°, *allyl analog*, m 115°. R C. Elderfield

Thiodiazines. VII. Condensation of ethyl chloroacetate with thiosemicarbazides. Prafulla Kumar Bose and Birendra Kumar Nandi *J. Indian Chem Soc* 7, 961–4(1930), cf *C A* 25, 1532.—Thiosemicarbazide and its 4 substituted derivs condense with $ClCH_2CO_2Et$ to give in good yields thiodiazines, RNH C N N C(OH) $CH_2$ S (I), sol in warm aq alkalies and acids. The indifference of



these compds to aldehydes and ketones indicates a thiodiazine rather than a thiazole formula. Mol proportions of the thiosemicarbazide and $ClCH_2CO_2Et$ were refluxed in EtOH for 1 hr. The cryst condensation product sepd during the reaction. *2-Amino 5 hydroxy 1,3,4 thiodiazine* (R = H in I), m 254° (decompn.) (*Ac deriv.*, m 205°, *Bz deriv.*, m 200°, *addn compd with phenylthiocarbamide*, m 195°), *2 Me homolog* m 282° (decompn.) (*Ac deriv.*, m 198°), *2 Et homolog*, m 225° (*Ac deriv.*, m 189°), *2 iso Bu homolog*, m 210° (*Ac deriv.*, m 190°, *mono-Me deriv.*, by refluxing with slightly more than 1 mol MeI and 1% KOH in MeOH, m 135°), *2 phenylamino analog* m 184° (*Ac deriv.*, m 172°, *mono-Me deriv.*, m 205°), *2-o-tolylamino analog*, m 183° (*Ac deriv.*, m 210°), *2 p-tolylamino analog*, m 195° (*Ac deriv.*, m 218°). R C Elderfield

Calycanthine. II. The degradation of calycanthine to *N*-methyltryptamine. Richard H F. Manske *Can J Research* 4, 275–82(1931).—Degradation of calycanthine by benzoylation with subsequent treatment with alkali gave a well-defined cryst. substance, benzoyl *N* methyltryptamine. The identity of this substance was established by both analysis (C 77.14, 76.87, H 6.58, 6.40, N 9.90, 9.95, mol wt 293, 305) and synthesis. *m* Chlorobenzoyl and *p*-nitrobenzoyl *N* methyltryptamine were prepd., the former consists of short stout prisms, m 153°, the latter of golden yellow rectangular plates, m 134°. Benzoyl 1-methyltryptamine formed synthetically from BzCl and 1 methyltryptamine was recovered as colorless acicular needles, m 117°. J W. Shipley

Sinomenine. XXIV. Degradation of sinomenine to *l*-thebenone. Kakuji Goto with Reikichi Inaba and Hideo Shishido *Ann* 485, 247–57(1931), cf *C A* 25, 2132 and following abstr.—Demethoxyd hydrosinomenine MeI, heated with 25% KOH 10 min., gives 80% of *des N methyldesmethoxydihydrosinomenine*, $C_{15}H_{19}O_3N$ (I), m. 182°, $[\alpha]_D^{22}$ −54.94° ($CHCl_3$), coned $H_2SO_4$ gives a deep red soln., while this has the same m. p. as the *N* Me I ase from dihydrothebainone, the rotation is different. I MeI gives with KOH 44% of *dehydrothebenone*, $C_{17}H_{19}O_3$ (II), m. 104°, $[\alpha]_D^{18}$ −206.87° ($CHCl_3$). Catalytic reduction of I gives nearly quant. the *dihydro deriv.*, m 156.5°, $[\alpha]_D^{19}$ 67.82°, *methiodide*, m 226–9°, with KOH the latter yields *l* thebenone (III), $C_{17}H_{21}O_4$ m 134°, $[\alpha]_D^{18}$ −78.60°, *oxime*, m 204.5°; III also results by the reduction of II.

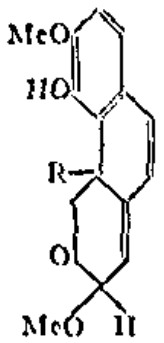
Sinomenine and disinomenine. XXV. Three different sinomenmemethines. Kakuji Goto and Hideo Shishido *Bull Chem Soc Japan* 6, 79–87(1931), cf



preceding abstr.—Sinomenine MeI and 2 mols. 2% NaOH, boiled 1 min., give *sinomenine achro-methine* (I, R = $Me_2NCH_2CH_2$-) (previously termed *N*-methylanhydrosinomenine, *C. A.* **21**, 1050; the name arises from the very faintly yellow halochromy in concd. $H_2SO_4$ and to avoid confusion with the methylmorphimethines), best purified through the Na salt, *m.* 170°, $[\alpha]_D^{18}$ 72.58° ($CHCl_3$), *easily sol. in Et₂O*, *HI salt*, *m.* 115–8°; the HCl and HBr salts are very hygroscopic; *methiodide* (II), m. 212°, $[\alpha]_D^{17}$ −33.00° ($H_2O$); *oxime*, decomps. 204.5°, decompn. of I with 60% KOH or $Bz_2O$ gives the same sinomenol or Bz deriv. as with sinomenine itself. I on standing for years gives 10% of *sinomenine roseo methine* (III) (previously termed *β* sinomenine methine), also obtained by decompn. *of sinomenine-MeI with 5 mols. 5% NaOH*, yellow, m. 183°, gives an intense red halochromy in concd. $H_2SO_4$ and a yellow red in concd. HCl; $[\alpha]_D^{18}$ 135.70° ($CHCl_3$), difficultly sol. in $Et_2O$; *methiodide*, m. 277° (decompn.), $[\alpha]_D^{17}$ −18.26° ($H_2O$). I with 10% NaOH gives 20% of *sinomenine isoleo methine* (IV) (previously termed the *α* deriv.), m. 172.3°, almost insol. in $Et_2O$, $[\alpha]_D^{17}$ 434.78°; the *methiodide*, m. 200°, $[\alpha]_D^{17}$ 373.30° ($H_2O$), results in almost quant. yield by the action of cold 10% NaOH upon II; both compds. give an intense blue halochromy *in concd. $H_2SO_4$ or fuming HCl*, *boiling the MeI deriv. with 3.3% NaOH* for 1 hr. gives sinomenol. The proposed structures for these 3 compds. are discussed.

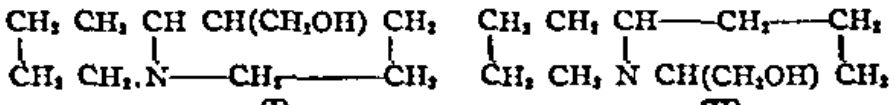
**The structure of yohimbine.** F. Mendlik. *Pharm. Weekblad* **68**, 257–71(1931).—The alkaloid yohimbine $C_{21}H_{26}O_3N_2$, which is the Me ester of yohimbic acid and contains a OH, was *mixed with Se and heated in a bath at 300°. Dehydrogenation occurred* with evolution of $H_2Se$. Extn. of the reaction mass with $C_6H_6$ yielded a cryst. base *yobyrine* (I), $C_{18}H_{12}N_2$, m. 217°, the salts of which have a violet blue fluorescence. From the $C_6H_6$ mother liquor a more sol. base *dihydroyobyrine* (II), $C_{18}H_{10}N_2$, m. 170°, was obtained. The residue insol. in $C_6H_6$ was extd. with EtOH and yielded *ketoyobyrine* (III), $C_{20}H_{10}ON_2$, m. 328°. Fusion of III with KOH at 350° gave a *cryst. base* $C_{11}H_{10}O_2N_2$, m. 258°, and an acid, m. 144°, which was identified as *hemimellitic acid*. Yohimbine probably contains a cyclohexane ring. The first thermal reaction product of the acid is apoyohimbic acid in which the *OH* and an adjacent *H* have split out as $H_2O$. Dehydrogenation by Se then splits off $CO_2$ from the $CO_2H$ and removes 4 H, leaving I and the intermediate II. The products are the same whether yohimbic acid or its Me ester (yohimbine) is used. In the formation of III the dehydrogenation of apoyohimbine is attended by loss of $H_2O$ instead of loss of $CO_2$. The base $C_{18}H_{12}N_2$ *obtained by dry distn. of yohimbine differs from I by 0 C and 6 H. It is possible that a hydrogenated o-xylene ring is present which is broken up in the distn. leaving* 2 H at the places of attachment, while the same ring is rendered stable by the Se dehydrogenation. Dimethylindole, another decompn. product of yohimbine, may possibly represent the structural portion from which the hemimellitic acid was obtained *by oxidation*. A. W. Dox

**Diastereoisomerism. VI. Configuration of the morphine alkaloids.** Hermann Fuhr. *Helv. Chim. Acta* **13**, 1035–58(1930); cf. *C. A.* **24**, 2115.—It is deduced from observations recorded in the literature and from the detn. of the rotation of derivs. that the rotation of the 5 asym. C atoms in morphine is $C_9(-)$, $C_{13}(-)$, $C_{14}(-)$, $C_{15}(+)$, $C_{16}(+)$, numbered according to Gulland and Robinson (*C. A.* **17**, 2584). Based on these conclusions regarding morphine, it was correctly predicted that thebaine would be *l*- and dihydrothebaine *d* rotatory. The isomers of morphine and of codeine prove to be exceptions to this, *e. g.*, *a*-isomorphine rotates *more strongly levo than* morphine although it would be expected to rotate less strongly levo if these compds. were true epimerides. The explanation that all 5 rings may not be in the same plane

may answer here. If a model for morphine is constructed using planar rings, the quaternary asym C atom ($C_{13}$) prevents all 5 rings from being in the same plane, ring III or V is inclined against the plane of the other 4 rings. In apomorphine or morphothebaine, when $C_{13}$ is not asym., all 5 rings may be arranged in the same plane. $[M]_D$ (in water unless stated otherwise) are recorded as follows: morphine·HCl ($3H_2O$) —370°, codeine·HCl ($2H_2O$) —402°, thebaine·HCl ($H_2O$) —574°, apomorphine·HCl —149°, morphothebaine·HCl —146°, codeine MeI —302°, α-6-acetylmorphine·HCl —593°, diacetylmorphine·HCl —619°, dipropionylmorphine, m. 107°, —655° in alc., dipropionylmorphine —671° in dil. HCl (HCl salt, m. 210° (not sharp)), —613°), dihydrocodeine —459° (H tartrate —588°), dihydrothebaine —623° in dil. HCl.

A. Wieben

Cinchona alkaloids. VII. Sulfonation of quinine and hydroquinine. G. Grassa and M. Oesterlin *Ber.* 64B, 57–61(1931); cf. *C. A.* 19, 1425, Kitasato and Goto *C. A.* 25, 1532.—The striking ease with which the hydroquinine-sulfonic acids are formed and saponified led to the suspicion that sulfonation does not occur in the nucleus and that the supposed $SO_3H$ acids result from esterification of the alc. group and are really acid sulfates. Sulfonation occurs only when the alc. group is present, if it is acylated, either the acyl group is saponified off and the sulfonic acid is formed or, under the proper conditions, neither sapon. nor sulfonation occurs. Accordingly, hydroquinine chloride and desoxyhydroquinine form no sulfonic acid, while acetyl and benzoylhydroquinine undergo a quant. exchange of acyl radicals (*Umesterung*). On the other hand, it is not possible to obtain from hydroquininesulfonic acids the corresponding acylsulfonic acids, even with such reactive agents as AcCl or ClCO·Et. It had been shown that treatment of freshly diazotized 5'-aminohydroquinine with freshly prepd. Cu paste reduces the alc. group simultaneously with the elimination of N, giving methylhydrocuprein. Diazotized 5'-aminohydroquininesulfonic acid behaves in the same way, splitting off the sulfonic group (at room temp.) and likewise giving the cuprein. Because of the possibility of rearrangement into the iso base, quinine with concd. $H_2SO_4$ gives no homogeneous product. The rearrangement can be completely prevented, however, by using $Ac_2O$, the resulting *quininesulfonic acid* (I) is difficultly sol. in $H_2O$, can be converted back into quinine, adds 1 mol $Br_2$ to form *quininesulfonic acid dibromide* (II) (which can be saponified to quinine dibromide) and is oxidized by $KMnO_4$ to *quiteninesulfonic acid* (III), which forms quitenine with HCl. The quant. formation of I in $Ac_2O$ from quinine bisulfate would suggest an intermediate formation of acetylquinine, which then reacts with the $H_2SO_4$, in expts. with acetylquinine under analogous conditions, however, almost 90% was recovered unchanged. With concd. $H_2SO_4$ quinine in the cold gives chiefly *hydroxyhydroquininesulfonic acid* (IV) (mixt. of the α- and β isomers), along with isoquinine- and niquininesulfonic acids. I, from quinine bisulfate in $Ac_2O$ at room temp. or, more simply, from neutral quinine sulfate in $Ac_2O$ with the amt. of $H_2SO_4$ necessary for the formation of the bisulfate, darkens around 230°, decomps. 237°, gives a positive thalleioquine reaction, rapidly decolorizes $KMnO_4$, $[\alpha]_D^{20}$ 88.86° (NaOH), *mono-HCl salt*, needles with 5 $H_2O$, m. 205°, is quantitatively converted back into quinine by boiling 25% HCl. II, m. 232°. III, very hygroscopic, m. 221–5°. IV has not as yet been crystd.; the $H_2SO_4$ soln. shows blue fluorescence and only slowly decolorizes $KMnO_4$; the thalleioquine reaction is positive; it forms no NO deriv. but yields with Ac·O a di-Ac deriv. C. A. R.



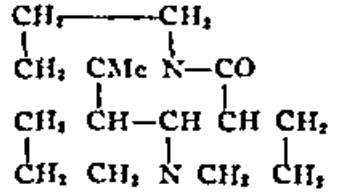
The molecular structure of strychnine and brucine. Robert Robinson. *Proc. Roy. Soc.* (London) A130, 431–52(1931).—Bakerian Lecture, May 1930. A summary of the chemistry of *strychnine* and *brucine* (dimethoxystrychnine). Evidence is given to prove the occurrence of 5 groups of atoms in strychnine. These 5 groups are combined, giving a structure contg. 5 fused rings. The disposition of the atoms of the group $C_3H_7$ cannot be predicted but they must be added so as to introduce 2 new rings. The structure of strychnine is represented by the accompanying formula, brucine contains MeO groups instead of H at the 2 positions marked with an asterisk. Janet E. Austin

Synthesis and pharmacodynamic action of a homoisopapaverine (and laudanosine). I. Synthesis of β-2,3-dimethoxyquinaldine. Frigyes (Fritz) Kohek. *Matematik és Természettud. Értesítő* 47, 779–86(in German 787)(1930).—Veratrole in glacial AcOH is nitrated with 1.5 $HNO_3$, the resulting nitroveratrole is reduced with Sn to aminoveratrole, then

treated with fuming HCl and paraldehyde, 0.25 vol alc and 0.25 vol ether is added and the mixt cooled to —10–15°. The HCl salt of the base which ppts is water-sol. and has an anesthetic action when put on the tongue. S S DE FINÁLY

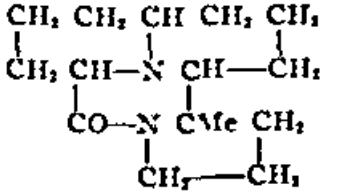
**Problems of the technical manufacture of papaverine (and laudanosine).** FRIGYES (FRITZ) KONEK. *Matematik és Természettud Értesitö* 47, 788-93(in German 794) (1930).—For the time being neither the method of Pictet, that of Rosenmund nor that of Pictet-Spāth seems to be economical for papaverine manuf S S DE FINÁLY

**Constitution of lupinine. I.** K WINTERFELD AND F W. HOLSCHNEIDER. *Ber.* 64B, 137–50(1931).—In the course of their investigations on the lupine alkaloids (*C. A.* 24, 4787), W. and H have confirmed one of Karrer's suggested formulas for lupinine (I) but have also found that I is not homogeneous, being accompanied by a structural isomer (II), for which the name *allo-lupinine* is suggested. These conclusions are based on the following series of reactions: $C_{10}H_{19}ON$ (I) ($-H_2O$) ⟶ anhydrolupinine (III) ($+ H_2$, Pd) ⟶ lupinane, $C_{10}H_{19}N$ (IV) ($+$ BrCN) ⟶ bromo-*lupinanecyanoamide* (*V*) ($H_2$, Pd) ⟶ *lupinanecyanoamide* (*VI*) ($+ HCl$) ⟶ $C_{10}H_{21}N$ (VII) ($-6 H_2$) ⟶ $C_{10}H_{15}N$ (VIII). In spite of the most careful purification, these intermediate products did not seem to be homogeneous, as indicated by the not quite sharp m. or decompn. ps. of individual salts and of *N*-derivs. of VII. VII has a secondary cyclic N atom and all the properties of a piperidine deriv., VIII a tertiary cyclic N atom and the properties of a $C_5H_5N$ homolog. Oxidation of the VIII in $H_2O$ with varying amts. of $KMnO_4$ gave $\alpha,\alpha'$- (IX) and $\beta,\alpha$-$C_5H_3NMeCO_2H$ (X), $\alpha,\beta$ $C_5H_3N$-$(CO_2H)_2$ (XI) and a mono-$CO_2H$ acid $C_{11}H_{13}O_2N$ (XII) giving the Fe salt reaction characteristic of α-pyridinecarboxylic acids. The extraordinarily slow oxidation of the side chain $C_4H_9$ in XII and the failure of I and IV to give a pyrrole reaction indicate that this $C_4H_9$ group contains a straight C chain and that XII is *α-butylpyridine-α'-carboxylic acid*. It follows that VIII is a mixt. of *α-butyl-β-* and *-β'-methylpyridines*, and VII a mixt. of the corresponding *piperidines*, that I and II have the structures shown in the accompanying formulas and IV is a mixt. of the corresponding compds. with Me instead of $CH_2OH$. Yields of the oxidation products of VIII indicate that in the product isolated by W. and H. from the seeds of the yellow lupine I predominates. Since no trace of α-picolinic acid could be detected in the oxidation products, cleavage by the action of BrCN on IV must take place almost exclusively in the non-substituted ring. In the light of the structure thus established for I, there can hardly be any doubt that the quant. rearrangement of the *l* rotatory I by Na in boiling $C_6H_6$ into the *d*-rotatory isolupinine (Krieg, *Diss. Marburg*, 1928) is a case of *cis-trans* isomerism, I being the energy richer *cis* form. V (yield, 90%), yellow to light red oil, is very slightly sol. *in 15% HCl*. *In the prepn. of VI is formed as by product a base* $C_{11}H_{24}N_2$ *(XIII)*, isolated as the *chloroplatinate*, orange, m. 217–8° (decompn.). The VI (yield, 85%) is a light yellow mobile oil of garlic-like odor. VII, $b_{11}$ 101–2° (decompn.), b. 169–71° (decompn.), gives the characteristic piperidine reaction (blue-violet color) with the Levin reagent, *HCl salt*, m. 151–3°, easily sol. in $H_2O$ with weak acid reaction, is optically inactive (0.0505 g. in 10 cc. 96% alc. in a 10-cm. tube), *HI salt*, readily becomes discolored in the light, *HBr salt*, m. 168–70°, *N-Bz* and *N p-nitrobenzoyl derivs.*, yellow oils practically insol. in dil. acids and $H_2O$ (the Bz deriv. requires 4–5 hrs. heating with concd. HCl at 150° for quant. hydrolysis), *Ac deriv.*, liquid, *β naphthalenesulfonyl derivative*, leaflets from aq. MeOH, m. 86–7°, granular and of higher



(I) (II)

m. p. from petroleum ether, of lower m. p. (57–9°) from $Me_2CO$. The HCl salt heated with concd. aq. KOCN and then treated with BzCl gives a *Bz deriv.*, $C_{18}H_{18}NCONBz_2$, m. 169–70°, of the *half-sapond.* VI, also obtained by moderate sapon. of VI with alc. HCl at 85°. XIII is also obtained from VI with $H_2$ in 96% alc. with Pd $CaCO_3$. VIII, $b_{11-10}$ 110–2°, b. 153–4° (decompn.), *chloroplatinate*, orange- to yellow red, m. 190–1°, decomps. 192–4°; *chloroaurate*, m. 46–7°. XII was isolated as the dark violet *Cu salt; chloroplatinate*, yellow, m. 154–5°. *Cu salt* of IX, light blue crystals with 1 $H_2O$, m. 253–5° (decompn.); *HCl salt*, m. 202.5–3.5° (decompn.); free *acid*, m. 95–6°, identical with a product synthesized from 2,6-$C_5H_3NMe_2$. X was isolated as the chloroplatinate, orange-red crystals with 2 $H_2O$, m. 189–90° (decompn.). *Cu salt* of XI, dark blue prisms with 2 $H_2O$ or prismatic needles with 1 $H_2O$, darkens and evolves gas 190–5°, m. 229° (decompn.), identical with synthetic quinolinic acid; synthetic $\alpha,\alpha'$-



*pyridinedicarboxylic acid*, from 2 6 $C_5H_3NMe_2$, m 235–6° (decompn ) and depresses the m p of XI 10–2°

C A R

**Lupanine.** K Winterfeld and A Kneuer *Ber* 64B, 1979–87(1931) —Lupanine (I), the main alkaloid of the blue lupine, differs from sparteine (II), an alkaloid of the yellow lupine, only by having an O instead of 2 H atoms As this O atom is present neither as HO nor as an ether, it was concluded that it is present as a C O group, and since I, although it is bitertiary, is a mono-acid base, the C O group must form a lactam ring with a N atom, a view confirmed by Clemo and Leitch who with fuming HI and red P were able to replace the O in I with H and obtain in good yield a desoxylupanine isomeric with II. W and K by the same reaction under somewhat different conditions (heating 50 instead of 36 hrs and raising the temp to 240°) have been able to break down the I mol and obtain 2 cleavage products $C_{14}H_{15}N$ (III), yellow oil of a hay like odor, $b_{15}$ 85 6°, identified through its *chloroaurate*, m 143–4°, and picrate, m 164 5°, with β lupinane, and a product (IV) $b_{12-3}$ 145–7°, which yielded no cryst salts but distinctly gave the pine splinter pyrrole reaction Ten of the C atoms in I must therefore have the same structure as in β lupinane and the other five are probably in the form of a pyrrolidine nucleus Oxidative degradation of II gives α methyl pyrrolidine, assuming a similar ring system in I, the (still purely hypothetical) structure V may be assigned to I. Direct comparison of III with a sample of the decompn product of matrine (Kondo, *C A* 22, 1212) proved that the 2 compds are identical Kneuer (*Diss Freiburg i Br* 1929) obtained from the mother liquors of lupinine a new alkaloid, *lupanidine*, isomeric with I, which, in view of the facts presented in the preceding abstr , is probably the structural isomer VI. Contrary to Thoms and Bergerhoff, W and K were able to effect a quant cleavage of I with BrCN by using boiling $C_6H_6$ and excluding moisture The well-crystd *bromocyanoamide* (VII) after removal of the Br and sapon of the CN group gave an oily *base* (VIII) whose secondary cyclic N atom was readily benzoylated but the ring in the Bz deriv could not be broken open with $PBr_5$ or $PCl_5$, at the high temp required, considerable halogen substitution took place, exhaustive methylation also resulted in only 15% cleavage, boiling the quaternary $NH_4$ base chiefly split off MeOH *Chloroplatinate* of III, red, decomps 217° IV, $b_{0.01}$ 72–3°, mol wt in $C_6H_6$ 220–5, chloroplatinate, sinters 55–70°. IV is apparently a mixt VII, reacts neutral to litmus in $H_2O$, gives in acid soln with $AgNO_3$ a slight opalescence only after some time, forms no salts, quantitatively reduced by Zn dust in boiling AcOH to the *lupaninecyanoamide*, faintly yellow oil of distinct alk reaction *Chloroaurate* of VIII, m 153°, *picrate*, m 93–4°, *chloroplatinate*, red, decomps 225°. *Bz deriv*, m 195°, only slightly sol in $H_2O$, with neutral reaction *chloroaurate*, m 206° *Quaternary methiodide*, m 277–8°, gave on extn from alk soln with $Et_2O$ *N methyllupanine*, viscous, strongly alk oil (*chloroaurate*, m 140° (decompn )), which on methylation with MeI in abs alc and distn of the quaternary $NH_4$ base gave a thick oil $b_{0.05}$ 120–40° and immediately decolorizing $KMnO_4$ in $H_2SO_4$. Similar treatment of the des *N* methyllupanine gave 15% of the calcd amt of $NMe_3$ (as the chloroaurate), methylation of the product and extn of the neutral soln with $Et_2O$ gave a strongly unsatd yellowish sirup of neutral reaction in $H_2O$

C A R.

**Lupine alkaloids. III.** George R Clemo, Richard Raper and Charles R S Tennyswood *J Chem Soc* 1931, 429–37, *cf C A* 24, 123 —Clemo and Leitch (*C A* 22, 3665) showed that *dl* lupanine (I) is reduced to an inactive base, probably *dl*-sparteine, the work is now repeated with the active bases Attempts to resolve I through the thiocyanates (Davies, *Arch Pharm* 235, 211(1897)) failed, however, the active forms are readily obtained by the use of the camphorsulfonates (II) *d* I-*d* II, in 24 2 g yield from 50 g I and 46 g II after 3 crystns from $Me_2CO$ m 108–10°, $[\alpha]_D$ 45 5°, a satd soln of KI gives the *HI salt*, m 189°, $[\alpha]_D$ 45 5° ($H_2O$), of *d* I, m 40°, the thiocyanate m 184°, $[\alpha]_D$ 55 6° (1 062% $H_2O$ soln ) The mother liquor from the *d* I-*d* II was concd , treated with KI and then with *l*-II, giving 16 1 g of *l* I-*l*-II, m 110–3°, $[\alpha]_D$ —45 3°, the *HI salt* m 190°, $[\alpha]_D$ —43 6°, of *l* I, $b_{11}$ 186–8°, $[\alpha]_D$ —61 0° (3 146% $Me_2CO$ soln ), the thiocyanate m 183–5°, $[\alpha]_D$ —55 3° (1 25%

aq soln.) Equal wts. of the 2 bases, crystd from $Me_2CO$, give I, m 98°. *d* I, HI and red P, heated 36 hrs at 220–30°, give *l* sparteine, $b_{11}$ 130·5°, $[\alpha]_D$ −11·3° (2·732% abs EtOH soln.), while this is about 6° less than the recorded value for sparteine, the picrate, m 205–6°, and the HI salt, m 231°, do not depress the m. p. of authentic products. Similarly, *l* I gives *d-sparteine*, $b_{11}$ 133·5°, $[\alpha]_D$ 15·9°; *picrate*, m 205–6°, *HI salt*, m 229°. Lupinine and $PBr_3$ in $C_6H_6$ give ω-bromolupinane (III), whose *methiodide* m 228·8° (decompn.). III and 20% MeOH KOH, refluxed on the $H_2O$ bath for 16 hrs., give a mixt. of ψ-anhydrolupinine (IV) and lupinine Me ether, whose *methiodide* m 177·8° and *picrate*, bright yellow, m 81·2°. The action of heat on ω-lupinyltrimethylammonium chloride gives a mixt. of IV and *ω-dimethylaminolupinane*, $b_{23}$ 95°, $[\alpha]_D$ −37·7°, whose *dimethiodide* m 308°. Karrer and Vogt (*C.* 1·25, 900) state that they obtained in this way 30% of the *l* anhydro base. Chlorolupinane and K phthalimide heated with a trace of Cu 72 hrs. at 210–20° give *N(II)-lupinylphthalimide*, m 105°, unchanged in concd. $H_2SO_4$ after 24 hrs.; electrolytic reduction in 20% $H_2SO_4$ gives *N-lupinylhydroxamide* m 88°; hydrolysis gives *II-aminolupinane* (V) $b_{11}$ 98°, rapidly absorbs $CO_2$ from the air and yields a *Bz deriv.* m 131·2°. V and $(CH_2CO_2Me)_2$, heated to 100° for 5 min. and then slowly to 190° during 1 hr., give a mixt. of *dilupinylsuccinamide*, m 225·6°, and *lupinylsuccinimide*, m 137° (*methiodide*, m 290°). Electrolytic reduction of the imide gives *N(II)-lupinylpyrrolidine*, $b_{11}$ 155°, whose *methiodide* m 302° (decompn.). The amide is not reduced under these conditions. $CH_2(CH{\cdot}CO_2Me)_2$ and V give *Me N(II)-lupinylglutaramate*, m 75–6°, and *dilupinylglutaramide*, m 193–5°. It has not been possible to convert the Me ester into the glutarimide and obtain compds. isomeric or identical with lupanine or α-Methyloxysparteine and Br in $C_6H_6$ give a *Br deriv.*, m 142°. HBr salt, m 214°, the Br is very firmly held as the compd. is not attacked by EtOH KOH, HBr, KOH at 180° or boiling $C_5H_5N$. IV. Synthesis of octahydropyridocoline. G. R. Clemo and George Rowntree Ramage. *Ibid* 437–42.—Because of the work of Winterfeld and Holschneider (preceding abstrs.), the following report is now offered. Distn. of lupininic acid with soda lime gives a base mixt. from which, after catalytic reduction, an inactive *base* (I), $C_9H_{17}N$, can be readily isolated; this $b_{23}$ 43·5°, and has a strong non terpene-like basic odor; the *picrate*, bright yellow, m 195·4°; *methiodide*, m 333–5° (decompn.); *chloroaurate*, light yellow, m 106–7°. I + piperidine-2-carboxylate and $Br(CH_2)_3CN$ with $K_2CO_3$ give 90% of *γ-2 carbethoxypiperidinobutyronitrile*, $b_{13}$ 170° (an excess of nitrile gives a *quaternary salt*, m 184°); hydrolysis with EtOH-HCl gives 75% of *Et γ-2-carbethoxypiperidinobutyrate*, $b_{14}$ 180°. Na in PhMe gives 50% of *Et 1 keto-octahydropyridocoline-2-carboxylate*, orange oil, $b_3$ 155°; heating with 20% $H_2SO_4$ on the $H_2O$ bath for 3 hrs. gives 70% of *1 keto-octahydropyridocoline*, yellow oil, $b_{14}$ 107° (*semicarbazone*, m 215°; *methiodide* m 210°). Zn and concd. HCl reduce this to *octahydropyridocoline* (II), $b_{23}$ 43°, $b_{14}$ 75°; *picrate*, yellow, m 213° (decompn.), *methiodide*, m 283°, *chloroaurate*, old gold m 170°. Reduction of the keto deriv. with Na Hg and abs. EtOH gives the *1 HO deriv.* of II, $b_3$ 120°, m 65–8°. Since I is not II or 3-ethylquinuclidine, it follows that either lupinine is not represented by *III* or structural changes have occurred in the production of *I*. Such possible changes were mentioned in part II and by W. and H.

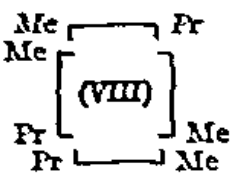
Recent investigations on the constitution of pectins. Marc Bridel. *J. pharm. chim.* [8], 13, 99–131(1931).—A detailed review with structural formulas, a summary and 39 references are given of the investigations of Ehrlich and Schubert, *et al.*, on the pectins of the sugar beet, fruits and of flaxseed (cf. *C. A.* 20, 2519, 3310; 22, 996, 23, 1623, 5465; 24, 65).

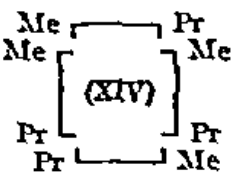
S. Waldsott.

Ring synthesis of 3-methyl-4-acetylpyrrole-5-carboxylic acid. Hans Fischer,

Heinrich Beyer and Ewald Zaucker *Ann* 486, 55-70(1931); *cf C. A.* 22, 2569 — In the previous synthesis of opsopyrrole from $H_2NCH_2COMe$ and $MeCOCH_2COCO_2H$ there was obtained a by product, m 251°, removal of $CO_2$ gave a pyrrole, m. 80°, which is shown by synthesis to be *2 methyl 5-acetylpyrrole* (I) 2-Methyl-5-acetylpyrrole-4-carboxylic acid (II), m 305° (decompn.), gives an *Et ester* (III), m. 125°. II gives a *hydrazone*, needles, which do not m. 300°; *phenylhydrazone*, golden yellow, m 238°, in AcOH $PhNHNH_2$ gives a *pyridazine deriv*, decomps 324°, *oxime*, decomps. 244° boiling in NaOH gives the *oxime anhydride*, m. 233° (decompn.), heating the latter with $N_2H_4$ and EtONa in a bomb tube gives the ketazine of II. The oxime gives a *Br deriv* in AcOH at 40° III is reduced by Al Hg in $Et_2O$, giving the *carbinol*, $C_{10}H_{15}NO_3$, m 142° III gives a *p-dimethylaminobenzal deriv*, cinnabar red, m. 231°; the acid soln has a strong blue green fluorescence. Decarboxylation of II or the action of EtMgBr upon 2 methylpyrrole gives I, m 89°, *phenylhydrazone*, *oxime*, m 150° (*Ac deriv*, m 147°), *ketazine*, $C_{14}H_{18}N_4$, yellow, m. 183°, *semicarbazone*, m 200°, *benzylidine deriv*, yellow, m 197°. I with 2 mols. Br yields a *tri Br deriv*, decompn. not sharp. 3 mols Br give a *di Br deriv*, m 161°. 2 Methyl-5-ethylpyrrole and $MeC_6H_4N_2Cl$ give an *azo dye*, $C_{15}H_{16}N_3Cl$, orange red, decomps 178°. $PhN_2Cl$ gives a yellow *dye*, $C_{13}H_{14}N_3Cl$, decomps. 174°, the *dye* with $HO_3SC_6H_4N_2Cl$ m. 240–50°. III and 2 mols Br give a *di Br deriv*, m 185°, the *tri-Br deriv* m. 165°. The isoopsopyrrole obtained by reduction of I, heated with 2 mols. $NH_2OH$ HCl and 1 mol $Na_2CO_3$ 7 hrs., gives *2,5-heptanedione dioxime*, m 150°. The reaction product of 2 methyl-3-carbethoxypyrrole (IV) and EtMgBr, treated with AcBr, gives *2-methyl-3-carbethoxy-5-acetylpyrrole* (V), m 152°, *phenylhydrazone*, m. 144°, *oxime*, m 191°, *hydrazone*, m 116°, *di Br deriv*, m. 214°. 2 Ethylpyrrole (VI) and EtMgBr, heated 4 hrs. and then treated with $HCO_2Et$, give *triethyltripyrrylmethane*, m 162° (cor.), heating with EtOH for 2 hrs. gives *2-ethyl-5 formylpyrrole*, m 52°. *2 Methyl 5 formylpyrrole*, m 70°, *oxime*, m 153°. VI, MeMgI and $ClC(OEt)_3$ give *2-ethyl-5-carbethoxypyrrole*, $b_{15}$ 134°, m 48°, heating with satd. $NH_4OH$ 12 hrs at 150–65° gives *α-ethylpyrrole-α'-carboxylic amide*, m 112°. IV and AcCl with $AlCl_3$ and $CS_2$ give V and a deep red *compd*, decomps 194°. α-Acetylpyrrole and *p*-$Me_2NC_6H_4CHO$ give the *chalcone deriv*, $C_{15}H_{16}ON_2$, orange, m. 200° (cor.)



C. J. West



Synthesis of some pyrroles and dipyrrylethanones. H. Fischer and Pierre Viaud *Ber* 64B, 193–200(1931) —The position of one or more $CO_2H$ groups in the chlorophyll and uroporphyrin mols is still in question. These $CO_2H$ groups are readily split off and therefore cannot be present as $EtCO_2H$ residues. One possibility is that they are attached to the methine groups joining the pyrrole nuclei and it was therefore undertaken to synthesize pyrromethenes carboxylated on the methine group by condensing pyrroles having an α-$CCl_3CO$ side chain with trisubstituted pyrroles and then sapong the $CCl_3$ group 2,4 Dimethylpyrrole (I) with $CCl_3CN$ yielded the *5-trichloroacetyl deriv* (II), readily obtained by hydrolysis of the imine and reduced by Zn dust AcOH to the 5-Ac deriv., thus establishing its structure. Similarly, I with $NCCO_2Et$ gave *Et 2,4-dimethylpyrrole-5 glyoxylate* (III), the free *acid* (IV) is stable toward Br. Cryptopyrrole likewise yields the *5-trichloroacetyl deriv* (V), reduced to the *5-Ac deriv* (VI) which is readily obtained from cryptopyrrole with glacial AcOH With alc. KOH, the imine-HCl of V splits off $CHCl_3$ to give α-cyanocryptopyrrole 2,3 4-Trimethyl and 2,4-dimethyl-3 acetylpyrroles also yielded 5-$CCl_3CO$ derivs. Unfortunately, the condensation of these $CCl_3CO$ derivs. with di- and trisubstituted pyrroles has as yet given no well-defined products, there result dyes with no characteristic absorption and having no tendency to crystallize In phylloporphyrin it is not yet definitely established whether the 2 pyrrole nuclei are united through a group —CH CH— or —CMe= To throw light on this point *bis(2,4-dimethyl-3-acetyl)pyrrothylmethane* (VII) and the *Pr homolog* (VIII) were prepd by condensation of 2,4-dimethyl-3 acetylpyrrole with the appropriate aldehydes, but dehydrogenation to the methenes has thus far yielded no cryst. products As the pyrrole nuclei in chlorophyll may possibly be united through a $—CH_2CO—$ group, a $ClCH_2CO$ group was introduced into I, 2,3 4 trimethylpyrrole and cryptopyrrolecarboxylic acid and the products were treated with the Grignard compds of di- and trisubstituted pyrroles. The resulting dipyrrylethanones with α α'-brominated pyrromethenes give dyes which have not yet been obtained in cryst. form II (22 g from 10 cc. I), m. 108–9°, is stable toward boiling alc. *2,4 Dimethyl-5-carbethoxy-3-trichloroacetylpyrrole* (60–70% yield) m. 173–4° *3 Br deriv* of II (11 5 g from 10 g II with Br in AcOH), m 145–6°. V (4 g from 2 cc. cryptopyrrole), m 101–2°. VI (70% from V), m. 111–2°. *2,3,4-Trimethyl-5-trichloroacetylpyrrole* (90%), m. 114–5°. *2,4-Dimethyl-3-acetyl-5-trichloro-*

*acetylpyrrole*, m. 145–6°. *2,4-Dimethyl-3-bromo-5-chloroacetylpyrrole*, m 184–6°. III, m. 60–1°. IV, m. 164–5° (decompn). VII (87%), m 208–9°. VIII, m 213–4°. MeCH CHCHO gives a product m 236–8° whose compn, however, does not agree entirely with that calcd for the propenyl analog. of VIII. *(3,4,5-Trimethylpyrryl)-(3,'5'-dimethylpyrryl)-2,2'-ethanone*, m 168°. *3,5-Dimethyl-3,'5'-dimethyl-4'-ethyl analog*, m 162–3° (in 1 prepn there was obtained as by-product an isomeric (probably dimeric) *product*, m 229° (cor.)) *3,5-Dimethyl-4-ethyl-3',5'-dimethyl compd*, m. 156°. *3,4,5-Trimethyl-3',5'-dimethyl-4'-ethyl compd*, m 157° *Bis(3,5-dimethyl) compd*, m. 179° (cor.) 2,4-Dimethyl-3-ethyl-5-chloroacetylpyrrole with 1 mol $SO_2Cl_2$ in $Et_2O$ gives a *mono-Cl deriv*, m 123–5°, whereas with 2 mols $SO_2Cl_2$ is obtained a product which, after washing with ice $H_2O$, is *3-ethyl-4-methyl-5-chloroacetylpyrrole-2-aldehyde*, m 113–4° *(Chloroacetyl)cryptopyrrolecarboxylic acid*, obtained with $ClCH_2CN$, m 212–3° *2,3,4 Trimethyl-5-anilinoacetylpyrrole*, from the 5-$ClCH_2CO$ *deriv* and $PhNH_2$, m 194–6° *2,4 Dimethyl compd*, m 207° *2,4-Dimethyl-3-bromo compd*, m 205–10° (decompn) *2,4-Dimethyl-3-ethyl compd*, m 181–3° C. A. R.

Porphyrin syntheses. XXXVII. Synthesis of tetramethyltetrapropylporphins I–IV and of octapropylporphin. H Fischer, Martin Goldschmidt and Wilhelm Nüssler. *Ann.* 486, 1–54(1931), cf *C A* 25, 1256.—Although the 4 possible isomers of etioporphyrin (tetramethyltetraethylporphin) have been synthesized, their high m ps. make a detn of their differences difficult, for this reason the corresponding tetramethyl tetrapropylporphins have been prepd 2,4-*Dimethyl-5-carbethoxypyrrole* and EtCOCl with $AlCl_3$ give 83% of the *3-propionyl deriv* (I), m 140°, in AcOH Br and I give the *2-bromomethyl deriv*, m 145° (cor.) Heating 100 g I, 55.5 g Na, 667 cc. abs. EtOH and 50 cc. 77% $N_2H_4.H_2O$ 12 hrs. at 160–5° (25–35 atm.) gives 25–6 g *2,4-dimethyl-3-propylpyrrole* (II), $b_{15}$ 98–100°, m 13.5°, $d^{19}$ 0.8988, $n_D$ 1.49243, *picrate*, yellow, m 132° (cor.). $HO_3SC_6H_4N_2Cl$ gives an *azo dye*, $C_{15}H_{15}N_3O_3S$, brown red, m. 248°. II, (18 g) HCN and HCl in $CHCl_3$-$Et_2O$ give 14 g *2,4-dimethyl-3-propyl-5-formylpyrrole*, m 105°, $NCCO_2Et$ gives the *5-Et glyoxylate deriv*, m 192°. II in 30% $H_2SO_4$ with $CrO_3$ gives *methylpropylmaleinimide* (III), m 57°. II gives an *oxime*, m 198° The residue from II is the *pyrazoline* of I, $b_{15-16}$ 141–5° (yield, 45 g), *di-HCl salt*, m. 145° (cor.); *dipicrate*, deep yellow, m. 137° (cor.) 2,4-Dimethyl-3 propionylpyrrole and 77% $N_2H_4.H_2O$ in abs. EtOH, boiled 5 hrs., give the *ketazine*, canary-yellow, m. 159° (cor.). II and Br in AcOH-$CCl_4$ give the *HBr salt*, blue-violet leaflets, m. 130° (*HCl salt*, brown red, m 178°, *picrate*, yellow-brown, m. 182°), of *5-bromo-5'-bromomethyl-4,3'-dimethyl-3,4'-dipropylpyrromethene*, brown red, decomps. 207°. The methene with HBr-AcOH, heated 4 hrs. at 170° or better with $(CH_2CO_2H)_2$ 10 min. at 180° gives 10–15% of the *tetramethyltetrapropylporphin* (IV), m. 290°; *Cu complex*, needles, m 295°; *Mg complex*, red leaflets, m 249°; *Fe complex*, dark leaflets, m. 338° (cor.), the *bromohemin* m 333°, the *iodohemin* m. 310°; the *nitroporphyrin*, brown red, m. 272°. Shaking IV in $CHCl_3$-AcOH with $PbO_2$ until the porphyrin spectrum has disappeared, gives *xanthoporphyrinogen*, yellow, crystals with 2 mols $H_2O$, m. 262°; reduction with Na-Hg again gives IV; photooxidation gives III. The reaction product of II and EtMgBr, treated with $ClCO_2Et$, gives 70% of *2,4-dimethyl-3-propyl-5-carbethoxypyrrole*, m. 98° (cor.); the *2-bromomethyl deriv*. m. 148°; the crude Br deriv., heated with *(HCHO)*$_x$ in MeOH 3–4 hrs., gives *4,4'-dimethyl-3,3'-dipropyl-5,5'-dicarbethoxypyrromethane* (V), m 166°; the free acid is not stable and could not be recrystd; the crude product decomps. about 140°, boiling in AcOH for 4 hrs. gives some 2-methyl-4-propylpyrrole and a small amt. of crystals, m. 121–2°. The dry acid

and Br in $HCO_2H$-AcOH give *5,5'-dibromo-4,4'-dimethyl-3,3'-dipropylpyrromethene* (VI), orange-brown, m. 146°, as the *HBr salt*, dark violet, does not decomp. at 270°;

*picrate*, orange, m 181° (decompn.). 2,3-Dimethyl-4-*propylpyrrole* and 48% HBr in $HCO_2H$, boiled 5 min., give *5,5',4,4'-tetramethyl-3,3'-dipropylpyrromethene HBr*, red, m 184°, *picrate*, bluish green decomps 179-80°, the *HBr* salt and Br in AcOH give the *5,5'-dibromomethyl deriv* (VII), red, m.p. not sharp. V (6.5 g.) in 20 cc. $HCO_2H$, oxidized with a stream of air at 30-40° for 5-10 days, gives 600 mg. *tetramethyltetrapropylporphin* (VIII), dark violet, m. 330° (decompn.), this also results in 41% yield from VI and VII with succinic and tartaric acids at 190°. the *Fe complex* decomps. 336-9° (cor.). *Cu complex*, Cu red does not m. 310°. *Zn complex*, wine red, does not m. 340°. *3,5,3',5'-Tetramethyl-4,4'-dipropylpyrromethene*, yellow, m. 95°. *HBr salt*, red, m. 218°. *5,5'-bromomethyl HBr salt* (IX), red, decomps. above 200°. VII and IX with succinic and tartaric acids, heated at 190°, give 47% while HBr-AcOH at 170-5° for 4 hrs. give 17.5% of *tetramethyltetrapropylporphin* (X), m. 218°. *Fe complex*, dark violet, m. 276°; *Cu complex*, red, m. 255°. *Ag complex*, red brown, m. 267° (cor.). $PrCOCH_2CO_2Et$, for which details of prepn. are given, $b_{16}$ 84-8°, $b_{12}$ 94-6°, $b_{10}$ 101°, $b_{9}$ 104°, $d^{15.4}_{4}$ 0.9862, $n^{15}_{D}$ 1.4700. titration with Br indicates 12.95% enol form; the values are also given for various solvents at 17.9°. $PrCOCH_2CO_2Et$ (180 g.) in 850 cc. AcOH, treated with 80.4 g. $NaNO_2$ in $H_2O$ at 5-10°, allowed to stand overnight, then treated with 147.6 g. $AcCH_2CO_2H$ and finally with 150 g. Zn at 70-80°, gives 160-80 g. *2-methyl-4-propyl-3,5-dicarbethoxypyrrole*, m. 102°, with conc'd $H_2SO_4$ at 40° there is partial sapon., giving the *3-carboxylic acid*, m. 217° (cor.), $CO_2$ being split off giving *2-methyl-4-propyl-5-carbethoxypyrrole*, m. 80°, with HCN and HCl this yields the *3-formyl deriv.* (XI), m. 117°, reduction with EtONa and $N_2H_4 \cdot H_2O$ by heating 12 hrs. at 160-70° gives about 70% of *2,3-dimethyl-4-propylpyrrole* (XII), $b_{14}$ 96-8°, *picrate*, yellow, m. 127°. XI and XII with HBr give *5,5',4,3'-tetramethyl-3,4'-dipropylpyrromethene HBr* (XIII), yellow brown, decomps. 182°, *picrate*, orange-yellow, decomps. 162°, *perbromide*, dark wine red, m. 100° and easily loses HBr. The HBr salt and Br in AcOH give the *5,5'-dibromomethyl HBr salt*, red brown, has no m.p. XII (30 g.) with EtMgBr and $ClCO_2Et$ give 33 g. of *2,3-dimethyl-4-propyl-5-carbethoxypyrrole*, m. 102°, *2-bromomethyl deriv.*, m. 156°, heating with $(HCHO)_x$ in MeOH-HBr gives *5,5'-dicarbethoxy-4,4'-dipropyl-2,3'-dimethylpyrromethane*, m. 132°, the *free acid* m. 168°, with Br in AcOH the acid gives *5,5'-dibromo-4,4'-dipropyl-3,3'-dimethylpyrromethene* yellow brown, m. 141°, as the *HBr salt*, red, does not melt. VII and XIII with HBr-AcOH at 130-5° for 8 hrs. give 29.6%, with HBr-AcOH at 170-5° for 4 hrs., 14.5% of tetramethyltetrapropylporphin (XIV), lilac-brown, m. 206°, *Fe complex*, black violet, m. 287°, *Cu complex*, red, m. 235°, *Zn complex*, red, m. 250°, *picrate*, violet brown, decomps. 190-204°. The HCl nos. of the 4 isomers are IV, 6.6, VIII, 6.4, X, 6.2, XIV, 6.3. Spectroscopic data are also given. *2-Methyl-4-propyl-3-propionyl-5-carbethoxypyrrole*, m. 119°, reduction gives *2-methyl-3,4-dipropylpyrrole*, $b_{16}$ 116-24°, *picrate*, yellow, m. 98°, HBr in AcOH gives *5,5'-dimethyl-4,4',3,3'-tetrapropylpyrromethene HBr*, m. 152°, the *perbromide*, violet, m. 113°. With succinic and tartaric acids the perbromide gives 27% of *octapropylporphin*, violet red, m. 276°, HCl no. 21, *Fe complex*, black, begins to sinter at 225°, *Cu complex*, red, m. 327°. *2-Methyl-4-propyl-3,5-dicarboxypyrrole*, from the 5-$CO_2Et$ deriv. with EtOH-NaOH or the 3,5-$(CO_2Et)_2$ deriv. (XV) with 10% NaOH, m. 251° (cor.), decarboxylation gives *2-methyl-4-propylpyrrole* (XVI), $b_{14}$ 86-8°. *2,2'-dimethyl-4,4'-dipropylpyrromethene HBr*, yellow brown, m. 190° (quant. yield), *picrate*, has no m.p., *Cu complex*, green, sinters at 160°. XV (20 g.) and $SO_2Cl_2$ in abs. $Et_2O$ give 10-15 g. *2-formyl-4-propyl-3,5-dicarbethoxypyrrole*, m. 88°, *hydrazone*, m. 118°, *semicarbazone*, m. 199°, *phenylhydrazone*, m. 85° (decompn.), the free *acid* carbonizes above 210°. XVI and the acid with HBr give quant. *4,3'-dipropyl-5'-methyl-3-carboxypyrromethene HBr*, decomps. about 100°. *2,4-Dimethyl-3-propionyl-5-carboxypyrrole* (XVII) m. 214° (decompn.), on distn. gives *2,4-dimethyl-3-propionylpyrrole* (XVIII), m. 122°. XVII and Br in AcOH give *3,5-dibromo-4-5'-dimethyl-4'-propionylpyrromethene HBr*, red, which does not melt, the free base, orange red, decomps. 175°. XVIII, HCN and HCl give *2,4-dimethyl-3-propionyl-5-formylpyrrole* pale yellow, m. 169°, with XVIII and HBr in EtOH there results *3,5,3',5'-tetramethyl-4,4'-dipropionylpyrromethene*, yellow red, m. 197°. *HBr salt*, red yellow, m. 222°, heating with Br in AcOH gives *4,4'-dibromo-3,5,3',5'-tetramethylpyrromethene HBr*, m. 217°. Short heating of XVIII in HCHO gives *3,5,3',5'-tetramethyl-4,4'-dipropionylmethane*, m. 225°, the Br deriv. decomps. 175°. *2-Ethyl-4-propyl-3,5-dicarbethoxypyrrole*, m. 91°, *2,4-di-Pr deriv.*, m. 87°, *2-methyl-3-acetyl-4-propyl-5-carbethoxypyrrole*, m. 112°, *2,3-dimethyl-4-propyl-5-formylpyrrole*, m. 75°, *2,5-dimethyl-3,6-diacetylpyrazine*, m. 101° (cor.).

C. J. West

**Coloring matter of awobana.** CHIKA KURODA *Proc Imp Acad Tokyo* 7, 61–3 (1931).—The flower of "Tsuyukusa" (*Commelina communis*), which is azure blue, is used in the prepn of awobana paper, which was used in these expts The dye is insol in MeOH but is sol in $H_2O$, from which the dye is pptd by MeOH as an ultramarine-colored powder The ash contains (14.5–15%) principally K and Mg, with traces of Fe, Al, Ca, $PO_4$ and $SO_4$ are the important acid radicals Heating with MgO gives about 1% $NH_3$ The coloring matter, acidified, turns purple to red without losing its solv in $H_2O$ Hydrolysis gives about 31% of sugar, which appears to be 1 mol of a monosaccharose (glucose) the red aglycon is sol in EtOH but insol in other org solvents Decompn with alkali gives *p*-coumaric acid and *p*-$HOC_6H_4Ac$, the acid is obtained even with cold 1% aq alkali while the ketone is formed only after heating C J WEST

**Organic oxygen compounds.** HENRY DREYFUS. Fr 697,726, June 20, 1930 O compds of C are hydrogenated in the presence of catalysts composed of or contg Fe or Co in the form of compds having the metals in the acid radical, *e. g.*, ferrites, ferrates, cobaltites or cobaltates of alkali or alk. earth metals Examples are given of the prepn of EtOH and higher alcs along with aliphatic acids and aldehydes from CO and H and from a mixt of MeOH, CO, $CO_2$ and H Fr 697,727 describes the prepn of similar compds. in which catalysts composed of or contg compds of metals of groups 1 and 2 are used with oxy acids of elements of groups 2, 3, 4 and 5, *e. g.*, borates, aluminates, zincates, silicates or phosphates of alkali, or alk. earth metals or Cu Cf. *C. A.* 25, 963 and following abstrs

**Organic oxygen compounds.** HENRY DREYFUS Fr 697,896, June 25, 1930 EtOH and higher aliphatic alcs are obtained from mixts of H and O compds of C in the presence of a catalyst composed of or contg Fe, Ni or Co in the form of oxy acids of groups 2, 3, 4 or 5, or as free metals (or their compds.) in intimate assocn with other compds of oxy acids. The metals may be used in the form of borates, aluminates, zincates, silicates, phosphates or other salts of oxy acids of P

**Organic oxygen compounds.** HENRY DREYFUS. Fr 698,094, June 26, 1930 Org. O compds are prepd by the reaction of steam with aliphatic hydrocarbons such as $CH_4$, $C_2H_6$, $C_3H_4$ or $C_2H_2$. Alk. earth metals or metals of groups 4, 5, 6, 7 and 8, Al, Mg or Zn or their compds may be used as catalysts The reaction is carried out under pressure and preferably at 250–500°. Examples are given of the prepn of MeOH and higher alcs along with aldehydes, acids and ketones

**Oxidizing paraffins, etc.** I. G FARBENIND. A.-G. (Manfred Dunkel, inventor). Ger 522,361, Mar. 19, 1927 Paraffin hydrocarbons, waxes, etc., are oxidized with

gases contg O in the presence of both a metalliferous catalyst and a small quantity of an org base. Thus, paraffin may be oxidized at 170° with air in the presence of Mn soap 0.5 and $(CH_3)_2NH$ 0.3%

Higher olefins and diolefins from lower olefins. PAUL FEILER (to I G Farbenind. A.-G.) U. S. 1,799,787, April 7. In the production of compds such as diolefins from lower olefins such as $C_2H_4$, the initial gases are exposed, at a higher rate of flow than that required for the production of $C_2H_2$, to the action of high temp. elec. discharges and the process is carried out in a closed cycle with continuous removal of the higher olefins and diolefins by cooling. Cf. *C. A.* 25, 2435.

Diolefins. I. G. FARBENIND. A.-G. Fr. 698,426, July 5, 1930. 1,3 Butylene glycol or other compds. hydroxylated in the 1 and 3 positions are dehydrated in the presence of catalysts and under pressure. Suitable catalysts are $H_3PO_4$, red P, $NaH_2PO_4$, or alum. Examples are given.

Cyclic aldehydes. I. G. FARBENIND. A.-G. (Georg Kalischer and Karl Keller, inventors). Ger. 519,806, Mar. 22, 1928. Addn. to 514,415 (*C. A.* 25, 1536). The aldehyde group is introduced into oxygenated cyclic compds. by treating these with formamide in the presence of $AlCl_3$ or a chloride or oxychloride of P or S. A large excess of formamide should be used. Thus, a mixt. of β naphthol and formamide may be heated to 95°, mixed with $AlCl_3$, the mixt. heated to 130–40°, and the cooled product stirred with water, then heated with AcOH and filtered. 2 naphthol 1 aldehyde is obtained from the filtrate. Other examples are given also.

Ketones. SCHERING-KAHLBAUM A.-G. Fr. 698,230, June 30, 1930. Vapors of aromatic dicarboxylic acids or their anhydrides and vapors of aliphatic carboxylic acids are passed together over suitable catalysts. Thus, a mixt. of acetone and acetophenone is obtained by passing a mixt. of phthalic anhydride and AcOH over $MnO_2$ at 350–400°.

Catalytic synthesis of amines from alcohols and ammonia. HERRICK R. ARNOLD (to E. I. du Pont de Nemours & Co.) U. S. 1,799,722, April 7. In processes such as effecting reactions between MeOH and $NH_3$ in the presence of a catalyst such as alumina gel, the mol. ratio of alc. to $NH_3$ is the most important factor influencing yield and proportion of primary, secondary and tertiary amines in the product. As this ratio is increased the total conversion increases. At low ratios, *e. g.*, 1 to 4, primary amine is the major product, while at a ratio of about 3 to 1 primary amine disappears, the product consisting of secondary and tertiary amines, tertiary being formed in the larger amts. Examples with details of procedure are given.

Aromatic amines. I. G. FARBENIND. A.-G. (Julius Laux, inventor). Ger. 516,999, Feb. 16, 1927. Addn. to 515,758 (*C. A.* 25, 2437). The method of 515,758, for producing aromatic amines by the reduction of nitro compds. by Fe in the presence of aq. Al salt soln. is modified by replacing the Al salts by salts of other ter- or quadrivalent metals. Thus, $PhNO_2$ is reduced by Fe filings in the presence of $CeCl_4$ to produce $PhNH_2$.

Monocyclic lactones. LEOPOLD RUZICKA (to Soc. anon. M. Naef & Co.). U. S. 1,799,536, April 7. See Fr. 657,971 (*C. A.* 23, 4483). For prepg. monocyclic lactones having 14 to 18 ring members, monocyclic ketones having 13 to 17 ring members are heated with persulfuric acid. Examples with details of procedure are given.

Keto acid esters. PAUL HALBIG, FELIX KAUFLER and H. PETER SCHMITZ (to A. Wacker Ges. für Elektrochemische Industrie G. m. b. H.) U. S. 1,798,937, March 31. See Fr. 654,413 (*C. A.* 23, 3714).

Diazo solutions. KARL SCHNITZPAHN (to General Aniline Works). U. S. 1,799,068, March 31. A solid aryl diazonium fluoborate of the benzene series such as *p*-nitrophenyldiazonium fluoborate is dissolved in an aq. soln. of salts of metals such as KCl or $AlCl_3$, the metal of which has a greater affinity for the hydrofluoboric acid than for the acid residue of the salt, so that difficultly sol. fluoboric metal salts may be sepd. and concd. diazo solns. obtained.

Stable diazo compounds. SOC. ANON. POUR L'IND. CHIM. A BÂLE. Fr. 697,425, June 14, 1930. Solns. of diazo compds. are treated with aromatic sulfonic acids contg. more than one $SO_3H$ group in the presence of salts of metals of the 2nd group of the periodic system, the hydroxides of which are strong bases, *e. g.*, $CaCl_2$, $MgCl_2$ or $MgSO_4$. Cf. *C. A.* 24, 1391.

Hydroxycarbazoles. I. G. FARBENIND. A.-G. Fr. 698,148, June 27, 1930. The prepn. of 2- or 3-hydroxycarbazole is described by treating 2- or 3-alkoxytetrahydrocarbazole with PbO at a temp. of 400–600°.

Phenols. F. RASCHIG G. M. B. H. Fr. 698,341, July 3, 1930. PhOH and its homologs are prepd. by treating PhCl and its homologs with steam at a high temp. in the presence of $Al_2O_3$ or $Al(OH)_3$ free from Fe. The catalyst may be prepd. by

neutralizing a soln of $Al(OH)_3$ in an alk lye with an acid soln of a Cu salt. Instead of Al other metals of the 1st to the 4th group may be used

Stabilizing phenols. I G Farbenind A -G Ger. 522,391, Feb 24, 1929 The darkening and ultimate resinification of phenols or their solns under the influence of light and air is hindered by addn of 0 5–3% of oxalic acid or its acid or neutral salts or esters

Alkyl substituted phenols. Soc. Reichhold, Flugger & Boecking Fr 697,711, June 20, 1930 Unsatd hydrocarbons are caused to react on phenols in the presence of metallic chlorides such as $AlCl_3$, $ZnCl_2$ and $FeCl_3$ The reaction is started by small quantities of alkyl halides or halogen acids Thus, gaseous isobutylene is bubbled *through a soln of PhOH in $CCl_4$ contg $AlCl_3$, a small quantity of tert-BuCl being* added at the start. Other examples are given

Isoalkylene phenols. Walter Schoeller, Hans Jordan and Reinhard Clerc (to Schering-Kahlbaum A -G ) U S 1,798,813, March 31 3 Methyl-6-isopropylenephenol is prepd by heating 4,4′-dimethyl 2,2′ dihydroxydiphenyldimethylmethane above the m p and sepg the decompn products by fractional distn.

*Polymerization products. I G Farbenind A -G. Fr 697,437, June 14, 1930* Acid polymers or their derivs are prepd by polymerizing, in known manner, the halides or nitriles of monomeric acids capable of being polymerized and afterward substituting the halogen or CN by other radicals by appropriate treatment By treatment with water, steam, aq solns of alkalies or moist air the acids themselves are obtained, and with less than the equiv amt of water the anhydrides are obtained Examples are given of the treatment of polymerized acrylic acid chloride

Condensation products. Oscar Adler and Rudolf Adler. Fr 697,881, June 25, 1930 Salts of phenylquinolinecarboxylic acid and pyrazolones or alkylated aminopyrazolones are heated in the presence of water to a temp necessary to obtain a clear fusion. Thus, Ca 2-phenyl-4-quinolinecarboxylate is ground with 1 phenyl 2,3-dimethyl-4-dimethylamino-5-pyrazolone and a little water and heated The mass obtained is cooled and ground

Alkylene derivatives. I G Farbenind A -G Fr. 697,786, June 23, 1930 Alkylene oxides with org compds contg OH or COOH groups or water are passed through heated pressure towers and afterward distd Thus, ethylene glycol is prepd. from a mixt. of ethylene oxide and water, and glycol monoacetate from ethylene oxide and AcOH Other examples are given

Derivatives of anthraquinone. I. G. Farbenind A -G. (Wilhelm Müller, inventor) Ger 516,997, June 30, 1928 Derivs of anthrapyrimidine character are obtained by the action of $NH_3$ on anthraquinone 2,1-oxazole Thus, *C*-phenylanthraquinone-2,1-oxazole is heated to 150° with aq $NH_3$ for 12 hrs in an autoclave to give 2-amino-*C*-phenyl 1,9 anthrapyrimidine, m. 343–5° Further examples are given

*Benzimidazole derivatives. I G Farbenind A -G (Wilhelm Eckert and Otto* Braunsdorf, inventors) Ger 522,173, June 19, 1928 4 Dialkylacetylnaphthoylenebenzimidazole-5-carboxylic acids are prepd by heating naphthoylenebenzimidazole-*peri*-dialkylindandiones with KOH The initial materials are prepd by oxidizing acenaphthenedialkyl-*peri* indandiones (cf *C A* 4, 2144), and condensing the resulting naphthalene-4,5-dialkylindandione-1,8-dicarboxylic acids or their anhydrides with *o*-diamines Examples are given

Benzothiazole derivatives. I. G Farbenind A -G. (Heinrich Jensch, inventor) Ger. 522,059, Sept 18, 1928 See Fr 680,384 (*C A* 24, 3801).

Guanidine derivatives. R. Freiherr von Godin Ger. 522,057, July 10, 1929. Salts of alkylenediguanidines are prepd by fusing higher alkylenediamines with guanidine salts The reaction proceeds with evolution of $NH_3$ Examples are given Cf *C A* 23, 1649

Hydroxydiphenylamine derivatives. I G Farbenind A -G Fr 697,764, June 21, 1930 Derivs of 3-hydroxydiphenylamine are prepd by heating 1-methyl 2-amino-4-hydroxybenzene with aromatic amines contg no sulfonic, carboxylic or nitric groups in the presence of HCl or agents liberating HCl Examples are given of the prepn of the 6-methyl-4,6-dimethyl and 4-chloro derivs

Piperazine derivatives. Soc. des usines chim Rhône-Poulenc. Fr. 698,687, Oct 7, 1929 Mono- and di substituted derivs of piperazine are prepd by the reaction of ethylene oxides on piperazine hydrate, in excess to obtain the monosubstituted, and not in excess to obtain the disubstituted derivs Examples are given of the prepn. of piperazinedimethylethylcarbinol, m 77–78°, piperazinebis(dimethylethylcarbinol), m 230° (with decompn ), *N*-benzoylpiperazinedimethylethylcarbinol, m. 33°, piperazinebutyloxymethylmethylcarbinol (picrate, m. 204°), piperazinemethylbenzylcarbinol,

m 63–64°, piperazinebis(methylbenzylcarbinol), m 135°, piperazinemethylphenoxymethylcarbinol, m 58–59°, piperazinebis(methylphenoxymethylcarbinol), piperazine-α quinoline (picrate, m 244°), and quinolinepiperazinedimethylethylcarbinol

**Pyridine derivatives.** Schering-Kahlbaum A.-G. (Curt Räth, inventor) Ger. 522,060, April 15, 1927. Derivs. of 2-chloropyridine substituted in the 5-position or the 3,5-positions with $NO_2$, COOH, or halogen, are prepd. by halogenating the correspondingly substituted *N* alkyl- or *N* aryl 2 ketopyridines. Thus, *N* methyl 2 keto-5-nitropyridine, treated at 150–160° with $PCl_5$ contg. a little $POCl_3$, yields 2 chloro-5-nitropyridine. Other examples are given.

**Xylenol derivatives.** I. G. Farbenind A. G. Fr. 697,821, June 23, 1930. Aryl ides of asym-o-xylenolcarboxylic acid are prepd. by heating the carboxylic acid (obtained by heating alkali salts of *o* xylenol of the constitution $CH_3$, $CH_3$, OH = 1,2,4) in the presence of condensing agents with arylamines contg. no COOH or $SO_3H$ groups. Examples are given of the prepn. of the anilide (m. 178°), the *p* chloroanilide (m. 209–210°), the *o* toluide (m. 296–297°) and a list of constituents with the m. ps. of the compds. is given.

**Stable leuco indigo preparations.** Imperial Chemical Industries, Ltd. Fr. 698,491, April 2, 1930. Dispersed indigo, the particles of which are much smaller than those of ordinary finely divided indigo (i. e., below 10μ) is reduced, by means of alkali and reducing sugar, one mol. proportion or less of reducing sugar and 7 mol. proportions or less of alkali being used for one mol. proportion of indigo. Cf. *C. A.* 25, 1539.

**Trialkyl phosphates.** Wm. J. Bannister (to Commercial Solvents Corp.). U. S. 1,799,349, April 7. Tributyl phosphates are obtained by the reaction of Al butoxide with P oxychloride in $C_6H_6$ at a temp. below 15°, adding water to hydrolyze $AlCl_3$ and fractionally distg.

**Calcium tartrate.** Société industrielle du Languedoc (S. A.). Ger. 516,673, April 24, 1929. Crystd. Ca tartrate is freed from its water of crystn. by heating with water to above 120° in an autoclave. Thus, the salt contg. 72.3% Ca tartrate and 27.7% water, is mixed with water and heated to about 160° and steam under pressure led in. The resulting salt has a water content of 0.4%.

**Aryl isothiocyanates.** I. D. Riedel-E. de Haën A.-G. (Karl H. Slotta and Helmut Dressler, inventors). Ger. 522,058, Oct. 18, 1928. Aryl isothiocyanates are prepd. by the reaction $RNHCSSNH_4 + COCl_2 = RN{:}C{:}S + HCl + NH_4Cl + COS$. The reaction is effected in an anhyd. solvent, e. g., $C_6H_6$, while cooling. The aryldithiocarbamate required as initial material is preferably prepd. with exclusion of water, e. g., by treating an aromatic amine in $C_6H_6$ soln. with dry $NH_3$ and then with $CS_2$ while still passing in $NH_3$. Examples are given.

**Halogen derivatives of α-chloronaphthalene.** I. G. Farbenind A.-G. (Georg Rosch and Wilhelm Bauer, inventors). Ger. 516,671, Oct. 25, 1928. 1 Chloronaphthalene-8-sulfonic acid is halogenated. If the $SO_3H$ group is retained in the mol. after halogenation, it can be removed or replaced by halogen if desired. Several examples are given. In one, Na 1,4-dichloronaphthalene 8-sulfonate is prepd. by chlorinating Na 1-chloronaphthalene 8-sulfonate. In another, 1,4,8-trichloronaphthalene, m. 130°, is obtained by further chlorinating the same sulfonate as in the preceding example.

**Tetramethylthiuram polysulfides.** Adrien Cambron (to Roessler & Hasslacher Chem. Co.). U. S. 1,798,588, March 31. After reaction of an aq. soln. of $NH_4Cl$ with formaldehyde, the soln. is treated to remove the major portion of unreacted $NH_4Cl$ and by products formed, and the resulting soln. is treated with $CS_2$ followed by an aq. soln. of an alkali metal hydroxide while cool to produce an alkali metal salt of dimethyl dithiocarbamic acid, and the soln. is treated with $S_2Cl_2$ to form tetramethylthiuram tetrasulfide.

**Acrylic acid chloride.** I. G. Farbenind A. G. Fr. 697,311, June 30, 1930. See Brit. 333,079 (*C. A.* 25, 524).

**Salts of sulfuric acid esters of nitroanthrahydroquinone.** I. G. Farbenind A.-G. (Arthur Luttringhaus, Heinrich Neresheimer and Wilhelm Schneider, inventors). Ger. 516,845, Nov. 6, 1927. Nitroanthraquinone is treated with metals in the presence of tertiary bases and halides or anhydride of $H_2SO_4$. Thus, 1 nitroanthraquinone and Cu powder is added to pyridine and Me sulfuric acid chloride. Further examples are given.

**Sulfuric esters.** Richard M. Deanesly (to Shell Development Co.). Can. 310,439, April 14, 1931. Alkyl sulfuric esters are prepd. by contacting liquid olefins with $H_2SO_4$ at a const. temp. obtained by permitting the vaporization of some part of

the hydrocarbons and condensing the vapors in a condensing device apart from the reaction vessel, and returning the condensed hydrocarbons to the reaction vessel

**Silicic acid ester.** Tuhitaro Sakami and Kansai Paint Kabushiki Kaisha Japan 90,227, Feb 10, 1931 Silicic acid ester is prepd from $SiCl_4$ and MeOH, PrOH, BuOH, AmOH or benzyl alcohol The product is heated above 100° to expel HCl Then a small amt of remaining HCl is removed by mixing with slight excess of oxides or hydroxides of Pb Hg or Ag at about 60 The product contains no trace of HCl The metallic chlorides formed are insol in $H_2O$ or alc and sepd by decantation

**Acylated esters of hydroxy acids.** Howard J Powers (to Commercial Solvents Corp) Can 310,874 Apr 28, 1931 A mixt of a hydroxy aliphatic acid and an ester is refluxed in the presence of a catalyst Suitable catalysts are aq concd HCl, dry HCl, anhyd $NaHSO_4$, concd $H_3PO_4$, benzene, sulfonic acids, etc

**Compounds of dialkylbarbituric acids and 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone.** Ernst Preiswerk (to Hoffmann La Roche Inc) U S 1,798,576 March 31 Mol proportions of 1 phenyl 2 3 dimethyl 4 dimethylamino 5 pyrazolone and a compd such as isopropylallylbarbituric acid are dissolved in a common solvent such as acetone or $C_6H_6$ and a compd of the 2 substances sepa as crystals which are removed from the solvent before any excess of the starting materials crystallizes out The products form yellow crystals sol in org solvents

**Products from 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone and 5,5-substituted barbituric acids** Georg Preiswerk (to Schering Kahlbaum A G) U S 1,798,771, March 31 A substantially colorless solid product is obtained by solidification of a molten mixt of 1 phenyl 2,3 dimethyl 4 methylamino 5 pyrazolone and a 5,5 substituted barbituric acid such as 5,5 diethylbarbituric acid

**Recovery of dilute acids in esterification processes.** Ignaci J Krchma (to Commercial Solvents Corp) Can 309,802, Mar 31 1931 In the production of esters, *e g*, butyl acetate, by the reaction of acid and alc, the unchanged acid is recovered from the aq distillate fraction by extn with the alc and then the water is removed from the alc soln by distn

**Fatty acids.** I G Farbenind A G Fr 697,505, June 18, 1930 Hydrocarbons are oxidized to fatty acids by means of oxides of N or $HNO_3$ and the product of the oxidation is submitted to a temp below 300° or to a reduction, preferably in the presence of catalysts or under high pressure or both, before the final distn

**Sulfonic acids.** N V de Bataafsche Petroleum Maatschappij Fr 698,536, June 13, 1930 Sulfonic acids, the Ca salts of which are sol in water, are prepd from sulfonic acids the Ca salts of which are insol by treating the latter with concd or fuming $H_2SO_4$ or an agent acting in the same way Examples are given

***o*-Xylenolcarboxylic acid.** I G Farbenind A G (Leopold Laska and Oskar Haller, inventors) Ger 522,064, May 20, 1929 An acid believed to be 1,2 dimethyl 4 hydroxybenzene 5 carboxylic acid is prepd by heating an alkali salt of 1,2 dimethyl 4 hydroxybenzene with $CO_2$ under pressure An example is given

**Acetic acid.** Hermann Suida Austrian 121,909, Nov 15, 1930 Concd AcOH is recovered from dil AcOH by extg the superheated vapor of the dil acid with a high-boiling solvent for AcOH to which 5 10% of pure or crude MeOH has been added Cf. *C A* 25, 2440

**Acetic acid.** Verein für chemische und metallurgische Produktion Fr 698,098, June 26, 1930 AcOH and AcOMe are made by catalytic synthesis from $Me_2O$ and CO or gases contg them at temps of 250 450° and pressure of 300 500 atm Neutral or acid phosphates of Cr and of a metal of the 3rd group, *e g*, Al are used as catalysts

**Polyvinyl alcohol.** Consortium für Elektrochemische Industrie G m b H (Wolfram Haehnel and Willy O Herrmann inventors) Ger 510,096, Sept 24, 1928 Addn to 450,286 Polyvinyl halides are saponified by alk reagents in the presence of catalyzers In the example, polyvinyl chloride is saponified with NaOH in the presence of light and uranyl nitrate A 90% yield is obtained

**Methylamine.** I G Farbenind A G Fr 698,640, July 8, 1930 The imides of dicarboxylic or sulfonic acids or their *N* methylol derivs are treated with $CH_2O$ under heat and pressure Examples are given of the treatment of phthalimide, *o* sulfobenzoic acid, *N* methylolphthalimide and succinimide

**Naphthalene purification.** Georg Schroeter (to Newport Mfg Co) U S 1,800,160, April 7 Naphthalene contg impurities capable of producing a red coloration on treatment with concd $H_2SO_4$ is treated, at a temp above its m p, with a porous material such as absorbent earth contg small quantities of metal oxides such as lime

*(d)* $CH_2O_2$ *and Fe, and from defibrinated blood by (e) putrefaction or satn. with illuminating gas,* was converted into the Na or K salt and purified by crystn. from pyridine or MeOH-KOH-AcOH. Various cryst. forms were obtained depending on the procedure, and these forms were mutually convertible. A. W. Dox

Absorption spectra of the fractions of serum albumins. E. Faltin. *Magyar Chem. Folyóirat* 37, 74–87(1934).—The ultra-violet absorption spectra of serum albumin of horse and oxen blood were exaind. No distinction can be made in the different bloods because of the very varying action of different animals of the same species. The difference is probably caused by the fact that albumin and globulin are not homogeneous albumins but mixts. of several proteins with different absorption spectra. The ratio of the mixt. varies probably in each individual. Gradual satn. of sera with $(NH_4)_2SO_4$ sepd. 6 protein fractions, the absorption power of which was less the more $(NH_4)_2SO_4$ was needed for their sepn. Of the various fractions the contents of tyrosine and tryptophan diminished in proportion to their absorption power. S. S. de Finály

The nature of the chromaffin reaction. P. Gerard, R. Cordier and L. Lison. *Bull. hist. appl. physiol. et path.* 7, 133–9(1930). *Physiol. Abstracts* 15, 331.—The red color obtained by the action of oxidizers on adrenaline is due, not to a simple oxidation product, but *to an addn. compd. formed between the quinone deriv. produced in* the oxidation and the unchanged adrenaline. The chromaffin reaction, then, is to be interpreted as a dehydrogenation and transformation of adrenaline into a quinone deriv., which then combines with as yet unchanged adrenaline to give a strongly colored substance. G. G.

Histochemical study of the chromo-argentaffine substance in Kultschitzky's cells. R. Cordier and L. Lison. *Bull. hist. appl. physiol. et path.* 7, 140–8(1930). *Physiol. Abstracts* 15, 331.—*These are special cells in the intestinal epithelium.* Guinea-pig duodenum was fixed in 10% neutral formol and imbedded in paraffin, and the diazo reaction for the phenol group applied to the sections. The presence of 2 OH groups was then proved by the usual oxidation tests. Thus the phenolic constitution of the argentaffine granules, previously postulated, was definitely confirmed. G. G.

The red fluorescence which certain bilirubin derivatives show in ultra-violet light. Ch. Dhéré. *Compt. rend. soc. biol.* 103, 371–4(1930). *Physiol. Abstracts* 15, 303.—Very dil. solns. of bilirubin with $NH_3$, $(AcO)_2Zn$ and a drop of I show a striking red fluorescence with ultra-violet light. The fluorescence is intense, like that of the porphyrins. Bilirubin in $CHCl_3$ soln. plus Br gives a blue pigment which shows a red fluorescence. The blue color of cholecyanin comes out with soda and $NaNO_2$. All these fluorescent solns. show several absorption bands. A distinctive band in the red is present even with extreme dilns. It is impossible to say if all the fluorescent pigments consist of bilicyanin, or whether several complex combinations exist with I, Br and Zn. Also in *Arch. intern. pharmacodynamie* 38, 134–9(1930). G. G.

Models for the capillary electrical theory of irritability. J. Klinke. *Arch. ges. Physiol.* (*Pflügers*) 227, 110–31(1931).—Mech. models (gelatin membranes in solns. of electrolytes) were prepd. to illustrate the transmission of elec. impulses in the body. Arthur Grollman

Effect of heat upon the activating efficiency of enterokinase. James Pace. *Biochem. J.* 25, 1–7(1931).—The course of the heat inactivation may be described by the unimol. expression. The optimum $p_H$ for enterokinase lies between 6 and 7. Benjamin Harrow

Optimum hydrogen-ion concentration and temperature of the style enzyme of Pecten maximus. Alastair Graham. *Proc. Roy. Soc.* (London) B108, 84–95(1931).—The diastase of the cryst. style of the mollusc, *Pecten maximus*, exhibited no variation in its optimum $p_H$ with variation in the time of the expt. A decrease in the optimum temp. accompanied a decrease in the $p_H$ of the medium. When time and temp. were made equal to those in natural conditions, then the optimum $p_H$ was found to be the actual value in the living animal. Joseph S. Hepburn

Proteolytic enzymes. VII. Peptidases of green malt. Masakazu Sato. *Compt. rend. trav. lab. Carlsberg* 19, No. 1, 1–26(1931). *cf. C. A.* 23, 5477.—The velocity of hydrolysis of the peptides alanylglycine (AG) and leucylglycine (LG) by the peptidases of malt indicate the presence of 2 different enzymes, and not one, as might be inferred from the data of Grassman and Klenk (*C. A.* 24, 868). LG, for which an enzyme prepn. has slight affinity, inhibits markedly the splitting of AG, for which the prepn. has great affinity. Calcn. according to the data of G. and K. would indicate that the LG affinity is about 32 times greater than the AG affinity, a conclusion which cannot be correct. W. D. Langley

Asymmetric ester hydrolysis by enzymes. VI. The influence of cleavage products

upon the optical selectivity of an esterase. EUGEN BAMANN AND PAUL LAEVERENZ. *Ber* 64B, 897-909(1931), cf *C A*. 25, 527-8.—Recent objections (Rona, *et al*., *C. A*. 25, 976) to the theory of esterase hydrolysis, based on the mass action law, have led to a review of the work. With liver esterase in *dl* mandelic acid ester mixts., the *d*-component was the more rapidly hydrolyzed, while in mixts., with the optically active components used separately as substrates, the *l*-component was favored. This action was explained as a result of the ratio of the velocities of the destruction of the intermediate products and the ratio of the enzyme affinities. B. and L. also investigated the effect of alc. upon the optical selectivity of the esterase. They found, as expected, that the action of the *d*-ester was favored. 0.0575 g. 1 tOH in 200 cc. reaction liquid decreased by 19° the negative rotation, of the mandelic acid produced. MARY E. LEAR

Possible relationship between hemoglobin and chlorophyll as shown by the use of liver ext. ORAN RABER. *Science* 73, 457-8(1931).—Liver ext. was added to solns. of corn plants which were then kept in the dark 10 days. These were greener than the control plants. Some factor seemed to check the destruction of the chlorophyll. Whether this is the same effect as that observed in the use of liver ext. in cases of hemoglobin deficiency is the question. MARY E. LEAR

The ultra-violet rays of artificial light. H. BUTZ AND TH. BOTTGER. *Z. Tierzucht. Zuchtungsbiol. Tierernahr.* 21, 48-72(1931).—The question of the usefulness of the rays in the prevention and cure of rickets is reviewed with special reference to animal husbandry practice. Data are presented showing that light treatment is without effect upon the hemoglobin content of the blood of rabbits. L. A. MAYNARD

Enzymic synthesis of higher dextrins. S. NISHIMURA. *Biochem. Z.* 225, 264-6 (1930).—It is shown that yeast autolyzate contains an enzyme which synthesizes amylum. If 20 cc. of such a purified enzyme soln. is added to 100 cc. of 1% achroodextrin soln. and the $p_H$ adjusted to 6.2 with 0.1 *N* HCl the mixt. gives a red to reddish violet color with $I_2$ after several days. At that time more enzyme prepn. is added and a few days later the soln. gives a violet to violet blue color with $I_2$. Dextrin was also prepd. from the mixt., thus proving its synthesis from the lower mols. S. MORGULIS

Influence of citrates on enzyme hydrolysis of starch. E. OHLSSON. *Arch. intern. pharmacodynamie* 37, 98-107(1930). *Physiol. Abstracts* 15, 276-7.—Citrates have no influence on diastases in optimum H ion concn., but they retard their action in high or low concn. of H ions. In the presence of chlorides citrates do not affect the action of pancreatic diastase, but in the absence of chlorides they increase this action when the H ion concn. is optimum. Citric acid does not hinder pancreatic digestion in the normal intestine. J. D. S.

Action of the alkaloids of cinchona on amylolytic enzymes. E. OHLSSON. *Arch. intern. pharmacodynamie* 37, 108-14(1930); *Physiol. Abstracts* 15, 276.—Quinidine has no effect on pancreatic amylase. Quinine, cinchonine, cinchonidine and optochine retard the hydrolysis of starch by enzymes, quinine being the most strongly inhibitory. For taka-diastase the order is quinine, cinchonine, cinchonidine, optochine, while for pancreatic enzyme it is quinine, cinchonidine, optochine and cinchonine. J. D. S.

Oxidation mechanisms in animal tissues. M. DIXON. *Biol. Rev.* 4, 352(1929). *Physiol. Abstracts* 15, 501.—This review is divided into the following sections: (*a*) the dehydrases, (*b*) peroxide formation, peroxidases and coupled oxidations, (*c*) Warburg's theory and the "respiratory enzyme", (*d*) cytochrome; (*e*) glutathione. A full discussion of the present position of our knowledge of these systems is given, together with extensive bibliography. J. D. S.

Viscosity of protoplasm as determining the rate of biological reactions. W. STILES. *Biol. Rev.* 5, 171(1930). *Physiol. Abstracts* 15, 495-6.—This contribution to the problem of temp. coeffs. brings support to the views of Crozier and attacks those of Belehradek. The general applicability of the Sutherland Einstein-Smoluchovski formula is contested by Stiles, who adduces several investigations on rate of diffusion in colloidal solns. of varying viscosity which show that increasing viscosity reduces the coeff. of diffusion relatively little. It is concluded that the viscosity of protoplasm, far from detg. the rate of biol. reactions, generally plays a very small, perhaps a negligible, part. J. D. S.

The distribution of urea in trichloroacetic acid filtrates as a function of the urea concentration of the medium. E. DELCOURT BERNARD. *Compt. rend. soc. biol.* 104, 784-5 (1930). *Physiol. Abstracts* 15, 590. cf. *C. A*. 25, 321.—The distribution of urea in different portions of a $CCl_3CO_2H$ filtrate from an albuminous fluid, blood, soln. of egg white, etc., is irregular. The differences are greater for blood than for albuminous fluids. The 1st parts of the filtrate from sheep blood contain the mean amt., then the curve rises, again falls and finally reaches the mean again. That is for a small concn. of urea

When the concn is greater, the 1st portions have a low titer and the 2nd high.
J D S

Molecular weight of casein. III. D C CARPENTER *J Am Chem Soc* 53, 1812–26(1931), cf *C A*. 24, 1400.—The protein contained in crude casein, which has been shown to have a mol wt between 75,000 and 100,000 by the ultracentrifuge, has been subjected to analysis. The S, P, cystine, tryptophan, tyrosine and histidine contents have been found to be 0.785, 0.856, 0.488, 1.237, 5.55 and 1.776%, resp. The most probable value for the mol wt of this protein, consistent with the above analyses and the results obtained with the ultracentrifuge, is 98,000. Details are given of the analytical methods used in detg the above components. C. J. WEST

Polarimetric reducing-sugar relationships of starch hydrolytic products resulting from diastatic action. D. T. ENGLIS, G. T. PFEIFER AND J. L. GABBY *J Am Chem Soc* 53, 1883–9(1931).—Theoretical consideration of the properties of the final products of hydrolysis of starch resulting from diastatic conversion seemed to indicate that the assumed const. relationship between the polarimetric and reducing sugar values would not hold if glucose as well as maltose resulted from the action of the amylase system. It was further believed that the ratios found might furnish information on the mechanism of the hydrolysis of starch. Detns. of the ratio have been carried out with taka-diastase as a glucose-forming amylase system. The ratios found were different from those anticipated and indicate that the changes in the early stages of hydrolysis are probably unlike those of malt diastase. While the ratios found were not const., detns. of diastatic activity based upon the assumption of a const. value will probably not involve an error more serious than those from other sources in such procedures. Improvements in the procedure will be necessary to give definite information as to the course of hydrolysis of starch. C. J. WEST

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

A new method for staining mycelium. A. FERRARI *Boll. soc. intern. microbiol. Sez. ital.* 3, 26–7(1931)(in French).—The microscopic sections contg. mycelium are kept for 20 min. in the ruthenium red reagent (0.01 g. of $RuNH_4$ oxychloride in 15 cc. $H_2O$). The mycelium color is red and the cell color is pale red, but if the sections are then transferred to a 10–20% KOH, the cell color disappears, while the mycelium color becomes red-yellow. G. A. BRAVO

A simple procedure for the determination of the hydrogen-ion concentration of normal human skin surface. B. LUSTIG AND A. PERUTZ *Arch. Dermatol. u. Syphilis* 162, 129–34(1930).—A thin sheet of absorbent paper, moistened with distd. water, is pressed for 5 min. against the skin surface to be measured. The liquid is then expressed and its $p_H$ is measured. To avoid error due to constituents of sweat, the $p_H$ of the skin surface is detd. after washing with water, then after washing with soap and finally after washing with $C_6H_6$. The detns. of the $p_H$ of the soln. expressed from the absorbent paper were made with Wulff's indicator papers. (These consist of a colloidal membrane, on which the indicator is adsorbed, $^1/_5$–$^1/_4$ of the paper is dipped in the soln. to be measured, then wiped dry with filter paper, and compared with a scale.) The chief cause for a marked acid reaction of the skin is sweat. After treatment with water, soap

and $C_4H_6$, the $p_H$ values found for various regions of the skin ranged from 5.1 to 5.8.
B. C. BRUNSTETTER

Modifications in technic for the determination of cholesterol, phosphorus and calcium on the same sample of blood serum. G. H. BARIL AND J. LABARRE *Trans. Roy. Soc. Can.* 24, Sect. V, 185–7(1930).—Add to 1 cc. serum 1 cc. water and 1 cc. 2% $K_2C_2O_4$ mix, and after 20 min. centrifuge. Wash the ppt. with 2 cc. water, again centrifuge, dissolve the ppt. in dil. $H_2SO_4$ and titrate against 0.005 *N* $KMnO_4$ for Ca. Pour the first filtrate into a tall, somewhat conical 30-cc. beaker and add 5 cc. of 0.05% KOH in 60% alc., and 10 cc. $Et_2O$, shake vigorously and then allow to rest some minutes. Transfer the aq. layer to a test tube calibrated at 25 cc. Pour the wash water from the oxalate slowly into the ethereal layer, and after sepn. the ethereal layer is added to the calibrated tube. Est. cholesterol in the ethereal soln. by Grigaut's method (*C. A.* 4, 2513, 2514), and the P in the aq. soln. by that of Benedict and Theis (*C. A.* 18, 3398). Comparison with the usual procedures showed accurate results. A. T. CAMERON

Determination of glycogen in liver tissue. ALBERT CARRUTHERS. *Chinese J. Physiol.* 5, 85–92(1931).—A method is described for the estn. of glycogen in liver tissue which does not require the use of strong KOH, as does Pflüger's method. About 5 g. of chopped liver tissue is boiled for 1 min. in 10 cc. $H_2O$ and then ground in a mortar. The mixt. is again boiled for 1 min. and made up to 50 cc. After centrifugation 20 cc. of supernatant fluid is pptd. with 5 cc. of 10% $CCl_3CO_2H$ and filtered. To an aliquot portion of filtrate EtOH is added to make a concn. of 70%. On the next day the ppt. is washed by centrifuging with 70, 95% and absolute EtOH and finally with ether. The ppt. is dissolved in boiling $H_2O$, HCl is added to make 2% and the mixt. hydrolyzed for 3 hrs. on the boiling water bath. After neutralization with NaOH sugar is detd. by a suitable micromethod. The values obtained by this method are somewhat higher than those by Pflüger's method, because of the presence of a carbohydrate which is insol. in 70% EtOH, but which is destroyed in 30% KOH. C. F. CORI

Determination of total sugar in liver tissue. ALBERT CARRUTHERS. *Chinese J. Physiol.* 5, 93–102(1931).—The $CCl_3CO_2H$ filtrates described in the preceding abstract were used for the detn. of total sugar. An aliquot part was hydrolyzed for 3 hrs. in 2% HCl. Non-sugar reducing substances were removed from the neutralized soln. by pptn. with $HgSO_4$ according to West, Scharles and Peterson. No evidence was found for the presence of hydrolyzable carbohydrates other than glycogen. C. F. CORI

Folin's method for determining amino acids in the blood. P. M. RE AND D. POTICK. *Compt. rend. soc. biol.* 103, 1283–5(1930).—See *C. A.* 25, 1856. E. J. C.

A simple method for the determination of assimilable pentosans. R. D. REGE. *Proc. 15th Indian Sci. Cong.* 1928, 51.—Treat a definite quantity of finely powd. material in the cold with 5% pure NaOH for 24 hrs. with occasional shaking. After neutralization distil the ext. with HCl by the usual Krober and Tollens' method. This method gives quite satisfactory results agreeing within 5% with those from the lengthy method (*C. A.* 21, 4062) previously described. E. J. C.

A micromethod for the analysis of proteins. N. NARAYANA AND M. SREENIVASAYYA. *Proc. 15th Indian Sci. Cong.* 1928, 163.—Van Slyke's well known method of protein analysis has been extended and modified for dealing with 100–200 mg. of substance, 0.05 of the quantity usually employed for a microanalysis. The pptn. of the hexone bases by phosphotungstic acid, which is affected by the presence of salts, is controlled by the effective removal of the HCl from the protein hydrolyzate *in vacuo* over freshly burnt lime. Arginine is estd. by flavianic acid, and histidine by bromination. Total monoamino and diamino is estd. by the Van Slyke micro app. Cystine is estd. by a microestn. of S according to Pregl. Tyrosine is detd. colorimetrically. E. J. C.

A simple method of protein determination in spinal fluid (and other body fluids). IVÁN BERGER. *Klin. Wochschr.* 9, 888–90(1930).—The turbidity produced by sulfosalicylic acid added to the fluid is compared with that produced in known standards (casein solns.) in a specially designed comparator. The av. protein content of spinal fluid is 0.200%; the minimal value, 0.05–0.08%. H. EAGLE

Studies on blood volume. I. A micromethod for the indirect determination of absolute blood volume. ISTVÁN WENT. *Magyar Orvosi Arch.* 31, 39–53(1930); cf. *C. A.* 23, 3942.—A colorimetric micromethod is described. A procedure is given for the elimination of errors caused by unequal distribution of dye. S. S. DE FINÁLY

Solution for the simultaneous staining of fat and nuclei. LAJOS KAROLINY. *Magyar Orvosi Arch.* 31, 440–1(1930).—One-hundred cc. of hematoxylin of Ehrlich is added to 20 cc. of acetone alc., then 2.3 g. of Sudan III is dissolved. The mixt. is shaken, let stand for 24 hrs., decanted and kept hermetically closed. Staining with this soln. is effected in 5 min. S. S. DE FINÁLY

Determination of calcium in blood serum. A. Grigaut and I Ornstein *Compt rend. soc. biol.* 104, 747–9(1930); *Physiol. Abstracts* 15, 573.—The serum is first evapd. to dryness in a Pt crucible and then incinerated to a white ash This is washed with HCl and centrifuged, treated with NaOAc and $(NH_4)_2C_2O_4$, and again washed and centrifuged. After addn. of $H_2SO_4$, titration with $KMnO_4$ is carried out to the point of persistence of a pink color The no of cc. of 0 1 *N* $KMnO_4$ used multiplied by 100 gives Ca in mg per l The amt. in normal serum is 95 to 110 mg by this method. G G.

Microestimation of calcium L Velluz and R. Deschiaseaux *Compt rend. soc biol* 104, 976–7(1930); *Physiol Abstracts* 15, 562.—*In estg Ca, it is* recommended to use org solvents (alc., ether) to wash the Ca oxalate, which is sol in distd water. These solvents permit the removal of $NH_4$ oxalate and prevent mech removal of part of the ppt It is well also to oxidize the Ca oxalate in the cold by means of 150 *N* permanganate, of which the excess is estd iodometrically G G.

Glass electrodes. Hyakuichi Yagata and Noboru Furutani *Japan J. Gastroenterology* 3, 71–5(1931) —The glass electrode can be employed in the detn. of the $p_H$ of biological fluids C. M. McCay

The chemistry of uroselectan. Arthur Binz *Brit J Urol* 2, 348–51(1930), *J. Urol.* 25, 297–309(1931), *cf C A* 25, 2192.—*Uroselectan, the Na salt of 5-iodo-2-*pyridoneacetic acid, appears to be a satisfactory substance for use in visualization of the urinary tract E R. Main

Methodical contributions. XI. A method for the determination of silver, ionized or bound to protein and of silver in organic substance. Ludwig Pincussen and Wadim Roman. *Biochem Z* 225, 447–51(1930), *cf C. A.* 24, 3524, 4801.—The method consists in sepg the Ag salts, Ag protein compd and the metallic Ag and detg the Ag in each fraction Tissues are frozen with $CO_2$ and weighed. The frozen tissue is rubbed up fine at first dry, then with 5 cc. 0 1 *N* $Na_2S_2O_3$ The material is washed into a large centrifuge tube with 5 times 5 cc. 0 1 *N* $Na_2S_2O_3$ With blood, 5 cc. is treated directly with 30 cc. 0 1 *N* $Na_2S_2O_3$ in the centrifuge tube. This is now kept overnight in a cool, dark place, and sharply centrifuged The turbid soln. is decanted into a second centrifuge tube, placed in a water bath at 70° to coagulate the proteins and again centrifuged. The clear soln. is now transferred to an Erlenmeyer flask, and the residue once more treated with 5 cc. 0 1 *N* $Na_2S_2O_3$. The combined $Na_2S_2O_3$ exts. contg. the inorg. Ag compds. constitute fraction A. The residue is mixed with 5 cc. 5% $NH_4OH$ and after standing overnight is also centrifuged for about 20 min and treated 4 times more with 5 cc of the $NH_4OH$ soln. The combined centrifuged $NH_4OH$ exts. constitute the B fraction contg. the Ag bound to the protein. The last residue, fraction C, contains the metallic Ag. It is evapd to dryness on the water bath, it is then charred on the sand bath. This is also done with the fractions A and B. When cool the charred material is taken up with halogen-free $HNO_3$ and perhydrol and evapd. to dryness; this process is repeated until a colorless soln. is obtained. All org. material is thereby oxidized and Ag converted to $AgNO_3$, while the halogens are driven off. The white residue is now dissolved in $H_2O$ and evapd., this treatment continued until the $HNO_3$ is completely removed The residue is then acidified with a few drops $HNO_3$ (1:3), and titrated with 0 001 *N* $NH_4SCN$ in the presence of a crystal of iron alum, each cc. corresponding to 107.9 g Ag S. Morgulis

Manometric determination of catalase. Akiji Fujita and Takeshi Kodama *Biochem Z.* 232, 20–34(1931) —The Warburg manometric app. is used to det. the catalase activity of bacteria. The catalase coeff. = $Q_{cat.}$ = (cc. $O_2$ produced in 30 min. at 38°) ÷ (mg dry wt). If the rise in level of manometer is $h$ mm. and the vessel const. $k_{ox}$ sq mm., the $O_2$ formed $x_{ox}$ is calcd. from the formula $x_{ox} = h\,k_{ox}$. The $Q_{cat}$ for *Staphylococcus pyogenes albus* was found to be 5120–5200; for gonococci 8700–8720; for *Saccharomyces saké* 44 5–45.2, for rabbit retina 65–53; for Jensen's rat sarcoma 119–113, for rat lung emulsion 475–459; and for a purified catalase prepn. 900,000–895,000 The optimum activity was found to be between $p_H$ 6.4 and 8 0. NaCl did not produce an inhibitory action nor was any depressing effect observed with a phosphate concn below 0 005 mol. No difference in the catalase activity has been found in enterococci cultured aerobically or anaerobically. On the contrary in the case of bacteria no catalase was found in the anaerobes, although some aerobes like the Shiga dysenteria bacillus are also free from catalase, and facultative anaerobes contain a moderate amt. of catalase Two long lists are reported of the $Q_{cat.}$ values for various bacteria and tissues from several organisms S Morgulis

Application of the Folin method for determining amino nitrogen in 0 2 cc. of blood. S A. Povorinskaya. *Biochem. Z* 232, 69–71(1931).—The reagents and procedure are the same as in the original Folin method except that the blood (0.2 cc.) is obtained from

the finger by means of a micropipet, and only 0.2 of the amts of the reagents are employed throughout the detn S MORGULIS

A simple colorimetric $p_H$ determination. E HERZFELD *Biochem Z* 232, 72-7 (1931).—Buffer mixts of $Na_2HPO_4 2H_2O$ and citric acid with a range from $p_H$ 2.2 to 8.0, and mixts of $H_3BO_3$, KCl and NaOH with a range from $p_H$ 7.8 to 10 are employed together with 7 sep indicator solns The detns are carried out in the 1931 model of the Leitz Universal colorimeter in the following way After adding the specified quantity of indicator to 100 cc of buffer mixt this is divided into 3 parts One is placed in the lower left cup The second portion is acidified with a few drops of concd HCl and is used in the right upper compensating cup The third portion made alk with a few drops of NaOH is placed in the lower right cup, while the left compensating cup is filled with distd $H_2O$ The depth of the buffer mixt is set at 10 mm and the depths of the cups with the acidified and alkalinized mixts are so adjusted that a perfect color match is obtained The relative depths of the last two cups corresponding to each $p_H$ between 2.2 and 10.0 are tabulated The $p_H$ values of urine, serum, etc., are detd in a similar way by adding the proportional quantity of indicator and proceeding as before With the microcolorimeter the detns can be made with only 10 cc of the original sample, and from the depths of the acidified and alkalinized portions which together match the color of the untreated sample the $p_H$ is read off from the table The color of the material studied does not interfere in the detns by this method S MORGULIS

Titrimetric determination of fat and lipoid substances by the Bang chromic acid oxidation method. H STRAUB *Biochem Z* 232, 128-45(1931).—The reduction quotient of Bang i. e., the cc. 0.1 *N* $K_2Cr_2O_7$ necessary for the oxidation of 1 mg fat or lipoid material has been redetd on a series of substances, and has been found to be generally lower than that given by Bang This quotient was found to be larger the greater the excess of $K_2Cr_2O_7$ employed On the other hand if the quantity of fat exceeds about 0.4 g the value of the quotient tends to decrease The quotient is also affected by the temp of the reaction mixt. after the addn of $H_2SO_4$, by the length of time during which the $K_2Cr_2O_7$-$H_2SO_4$ mixt has been kept, etc For triolein, tripalmitin, tristearin, the quotient is 1.82, for oleic and palmitic acids 1.87, for stearic acid, 2.03, for cholesterol, 2.37, for cholesterol palmitate, 2.16, for cholesterol stearate, 2.27; and for lecithin, 1.44 The method has been applied to quantities ranging from 0.5 to 10 mg The lipide in a 100 cc Erlenmeyer flask is treated with 3.0 cc. *N* $K_2Cr_2O_7$, then with 15 cc concd $H_2SO_4$, and the mixt is left standing until it cools to room temp This is now transferred with 300 cc $H_2O$ to a 500 cc flask and after the addn of 10 cc 10% KI is titrated with 0.1 *N* $Na_2S_2O_3$ The results of such analyses with the different pure substances are tabulated The results are also plotted and the amt of substance corresponding to the cc 0.1 *N* $Na_2S_2O_3$ used up can be read off directly from the curves with an av error of 2.92% S MORGULIS

Dialysis procedure for the determination of serum proteins. A A SCHMIDT AND KLARA TULICHIVSKA *Biochem Z* 232, 323-34(1931).—One cc. of serum is dild with 2 cc. $H_2O$ and 3 cc satd $(NH_4)_2SO_4$, thoroughly mixed and left standing $^1/_2$-1 hr The pptd globulins are collected on a small filter paper and washed 3 times with 2 cc. of $^1/_2$ satd $(NH_4)_2SO_4$ soln, the wash water being added to the original filtrate The globulins are transferred to a small dialyzing shell by dissolving them in small quantities of $H_2O$ and allowing the soln to drip through the funnel, and the filter paper is washed with 5 cc of 250 *N* NaOH, 1 cc. is used at a time The NaOH is then neutralized by adding from a buret an equiv quantity of 0.1 *N* HCl, the shell is then closed with a stopper and the dialysis carried out The filtrate contg the albumins is also put into a dialyzing shell The dialysis is carried out for about 8 hrs at a temp of 45-60°, against water circulating at the rate of 10 l per hr until the reaction with Nessler's reagent is neg when distd water is passed at the rate of $^1/_2$ l per hr In the shell with the globulin soln at the end of dialysis the euglobulin is present as a firm ppt while the pseudoglobulin is in soln and the 2 fractions are quantitatively sepd by centrifuging The euglobulin is washed with 3-5 cc $H_2O$ which is placed together with the original pseudoglobulin soln in a 25 cc flask The ppt is dissolved in 5 cc. *N*/250 NaOH and also transferred to a 25 cc flask The dialyzed albumin soln is entirely clear and is put into a 50 cc flask, to which is added also the *N*/250 NaOH used for rinsing the shell The N is detd on these 3 portions and expressed in terms of mg per cc serum S M

A method for determining lactose in the urine. E FREUND AND B LUSTIG *Biochem Z* 232, 449-51(1931).—To 100 cc urine add 25 cc $HNO_3$ and evap to 20 cc Dil and cool the mixt and wash the pptd mucic acid with alc. and ether, dry and weigh Considerable amts of mucic acid are found after feeding 40-100 g lactose or galactose, but none is obtained when 1-2 g lactose is added directly to the urine, which suggests

that the mucic acid is derived from the galactose However, a 1% aq soln of lactose also yields much mucic acid The reason for the neg results with urine is found in the fact that urea and $NH_4$ salts prevent the formation of mucic acid under the same exptl conditions A modified method was, therefore, developed for the lactose detn in urine Add 1-g lactose to 100 cc urine, acidified with 0 1% AcOH, and treat with 10 cc of 10% Pb acetate soln Wash the ppt with 0 1% AcOH, and remove the excess Pb in the filtrate by adding, drop by drop, dil $H_2SO_4$ Neutralize the filtered soln with NaOH, make slightly acid with AcOH and carefully evap to a small vol Boil the residue 2–3 times with 100 cc alc, cool and filter This procedure removes urea, $NH_4$ salts and sugar except the lactose *which is practically insol in cold alc* *Dissolve the alc -extd* residue in $H_2O$ and filter Lactose detns made by this procedure, the lactose being detd polarimetrically or by reduction methods, give recoveries with 10% of the added amt S MORGULIS

**Determination of iron in organs and in body fluids.** HANS HORSTERS *Biochem Z* 232, 460 78(1931) —Organs are oxidized by the Neumann wet method, urea being added to destroy nitroso compds The ash soln is dild with Fe-free water to 50 cc in case 2–5 g of tissue was oxidized To this is added for every 2 mg Fe 10 cc of Neumann's Zn reagent, which is made by dissolving separately 25 g $ZnSO_4$ and 100 g $Na_2PO_4$, mixing the two in a 1 l flask, redissolving the ppt with purest dil $H_2SO_4$ and diluting the soln to 1 l The pptd double salt of Fe and Zn phosphate is carefully dissolved *in pure NH₄OH (d 0 90) added drop by drop, and the clear soln is heated 30–60 min* The ppt is filtered off hot and washed several times with hot water The ppt is now dissolved on the filter paper in exactly 5 cc purest HCl (d 1 124), and the paper is washed several times with hot water, but the total vol should not exceed 20 cc The soln of the double salt, which under certain conditions may be purified by a second pptn with the Zn reagent, is transferred to a 50-cc volumetric flask and filled to the mark with 30 cc of 40% $NH_4SCN$ The colorimetric detn is then carried out after 3 min, as standard, a suitable soln of $FeCl_3$ (0 10 to 0 01 mg % Fe) acidified with HCl is used The standard soln should not be used longer than 20 min, when it should be replaced by a freshly prepd soln S MORGULIS

**Determination of methylglyoxal, pyruvic acid and acetaldehyde separately or in *mixture as well as a determination of lactic acid in the presence of these substances* and in a single sample of material.** ERNST SIMON AND CARL NEUBERG *Biochem Z* 232, 479–84(1931).—Biol fluids contg methylglyoxal, AcH and pyruvic acid are deproteinized in an acid medium, *i e*, $CCl_3CO_2H$ These are pptd with 2,4 dinitrophenylhydrazine, the hydrazones being either filtered off or centrifuged off For lactic acid detns the excess 2,4-dinitrophenylhydrazine can be removed first by making the soln alk and filtering off the ppt The traces of reagent still remaining in soln can be extd with EtOAc However, where carbohydrates must be removed by the Cu-Ca pptn method the extn is unnecessary because the traces of the 2,4-dinitrophenylhydrazine are carried down in the ppt In this filtrate lactate is detd by the usual procedures The pptn of methylglyoxal, pyruvic acid and AcH is practically quant *for solns contg 0 1 to 1 0%, and this is also true when all 3 substances are present* together, but in the presence of AcH the pptn must be made in the cold The suspended ppt is then left for 10 hrs at 37° in a glass-stoppered Erlenmeyer flask After cooling this is filtered through a Gerate glass filter No 1G4ab, washed 3 times with cold 2 *N* HCl and then with cold water For the sepn of the dinitrophenylhydrazones advantage is taken of the fact that only the pyruvic acid hydrazone is sol in $Na_2CO_3$ and can be dissolved out from the ppt in the glass filter Since this soln is colored brown it is possible to tell when the extn is completed because the soln begins to come through colorless. The hydrazone is again pptd in the filtrate by carefully acidifying with HCl, filtered off, washed, dried at 110° and weighed The sepn of the other 2 hydrazones is effected by means of hot 0 1% alc in which the AcH deriv alone is sol The extn. is, *therefore, again carried out in the original glass filter by passing hot alc until the soln* which is at first yellow becomes colorless The alc soln of the AcH hydrazone is evapd in a weighed beaker, the residue is dried in a vacuum desiccator to const wt and weighed The methylglyoxal hydrazone is washed on the filter with ether, dried at 140° and weighed The method is also applicable to the detn of trioses since these yield methylglyoxal on distn with 20% $H_2SO_4$ By treating the methylglyoxal deriv with alc. or $Na_2CO_3$ even levulinic acid and furfurol coming from hexoses and pentoses, resp, do not interfere S MORGULIS

Calcium and constitution. New method for the estimation of calcium in the blood. LUIGI F. LUNARDONI AND GIUSEPPE MIRAGLIA *Rass clin terap sci affini* 30, 1–7 (1931) —Two cc. of serum is mixed in a centrifuge tube with 2 cc of water and 1 cc. of

satd $(NH_4)_2C_2O_4$ soln The mixt is allowed to stand for 4 hrs., centrifugalized for 1 min, decanted and the ppt is washed with 4 cc of 1% $(NH_4)_2C_2O_4$ soln The mixt. is centrifugalized, decanted and the ppt is dissolved in the smallest possible quantity of 4% HCl One drop of alc. phenolphthalein soln is then added, enough of 2% $NH_4$ to produce a red color, and 1 cc. of satd $(NH_4)_2C_2O_4$ soln After 2 hrs. the ppt. is conveyed to an ashless filter, 2-3 washings of 3 cc. of 1% $(NH_4)_2C_2O_4$ soln. are employed to bring the last traces of the ppt on the filter The filter is placed in an oven at 100°, until the ppt. is almost dry Then the filter with the ppt. is conveyed to a Pt crucible and incinerated The residue of CaO is dissolved in 5 cc. of 0.01 *N* HCl, the soln. with washings is conveyed to a beaker and the excess of HCl is titrated with 0.01 *N* NaOH with methyl red as an indicator A blank test should be run to det. the alky. of the ashes of the filter paper used Calcn.: $Q = 50(5-n-y) \times 0.0002$, where $Q$ = Ca in mg., $y$ = no. of cc. of 0.01 *N* HCl used for the neutralization of the ashes originated from the ignition of the filter and $n$ = no. of cc. of 0.01 *N* NaOH used for the neutralization of HCl. G. Scriwoch

Determinaton of uric acid in blood. F. Montequi *Anales soc. espaĥ. fis. quim.* 29, 204–6(1931).—The method depends on the reduction of $K_3Fe(CN)_6$ by uric acid in the presence of $Na_2CO_3$, the $K_4Fe(CN)_6$ formed giving a blue color with $FeCl_3$. Blood is dealbuminized by the Folin method, by adding Na tungstate and 0.66 *N* $H_2SO_4$. Uric acid is isolated as Ag urate, uric acid is set free and oxidized in an alk. $K_3Fe(CN)_6$ soln., the soln. is acidified with HCl and $FeCl_3$ is added to give a blue color. Detn. is by color comparison. E. M. Symmes

## C—BACTERIOLOGY

CHARLES B MORREY

Necessity of the control and standardization of methods of investigation of vitamin products. Edmund Lelesz and A Przedziecka Jedrzejowska. *Med. Doswiadczalna i Spoleczna* 12, 357–87(1930).—The popularization of the science of vitamins is discussed Control tests as performed by the Biochem. Department of the State Hygienic Institute of Poland are described J. Kučera

The kinetics of the bacterium-bacteriophage reaction. Albert P. Krueger and John H Northrop *J Gen Physiol* 14, 223–54(1930).—Expts. were made on 16-hr cultures of *Staphylococcus aureus* and antistaphylococcus bacteriophage in nutrient broth of $p_H$ 7.6 at 36°, the cultures being mechanically shaken The following symbols are used in explaining the results $B$ = bacterium, $P$ = bacteriophage, $[B]$ = bacteria/ml., $[P]$ = phage/ml., $Bo$ = initial value of $[B]$, $Be$ = $[B]$ at max. stationary phase of $B$ growth, $Po$ = initial value of $[P]$ $B$ growth in $P$-$B$ mixts. resembles growth in controls without $P$ except where the initial $P/B$ ratio is very high. The destruction of $B$ does not begin soon after mixing $P$ and $B$. $B$ growth is not stimulated by $P$ but it is an essential conditioning factor for $P$ formation $B$ growth and $P$ production exhibit short lags during which time $P$ diffuses so rapidly into $B$ that by the end of the lag period 70–90% of the total $P$ is assocd with $B$, the rest being extracellular During the logarithmic $B$ growth phase, the formation of $P$ is also logarithmic but at a higher rate. Therefore it is not true that each time a $B$ divides a certain amt. of $P$ is formed When $B$ growth shows pos. acceleration equil between extracellular and intracellular $P$ fractions becomes established and is maintained until the onset of lysis Extracellular $[P]$ constitutes a small const. % of total $[P]$ The distribution of $P$ suggests that of a simple chem. compd. rather than that of a complex organized parasite Lysis begins when log $P/B$ = 2.1. If this value is reached or exceeded when $P$ and $B$ are mixed $B$ does not grow and lysis soon occurs. Lysis is probably brought about by a particular $[P]$ per $B$ and not by a certain $[P]$ per ml., but the major conditioning factor is in doubt. The max. $[P]$'s of lysates made by mixing a const. initial $[B]$ with widely varying $Po$'s fall within a narrow range The lytic destruction of $B$ is logarithmic with time, being similar in this respect to most death processes Cells need not be growing to undergo lysis. During $B$ lysis a considerable percentage of total max. $P$ formed is destroyed, the loss is chiefly in intracellular $P$. From 70 to 90% of the final $P$ present at the completion of bacteriophagy is set free during bacterial soln. Although $B$ growth is essential for $P$ formation, the different temps. of $B$ and $P$ formation suggest that the 2 processes are basically different. A

similar interpretation is given for $B$ soln and $P$ inactivation The $[B]$ at which lysis occurs for given values of $Bo$ and $Po$ may be calcd from the equation $\log B = \frac{2\ 1 + n \log Bo - \log Po}{n - 1}$ If this value of $\log B$ is substituted in the equation $t = \frac{1}{g\ Be}\left[\log \frac{B(Be - Bo)}{Bo(Be - B)}\right]$ gives satisfactory agreement with exptl values for lysis time Kinetic analysis of the $P - B$ reaction predicts a straight line relation when $\log Po$ is plotted against $t$ lysis for a const $Bo$ The plot has been used in a method for the estn of $P$ (cf *C A* 24, 3810) on the basis of exptl observation Its use is made more rational by the facts given in this paper

C H RICHARDSON

**Natural and chemically defined media.** A BERTHELOT *Bull soc chim biol* 12, 1025–8(1930) —Various media suitable for the growth of *M tuberculosis* are discussed A high content of arginine is favorable, and use may be made of products derived by *proteolysis from naturally occurring substances* B C A

**Occurrence of cellulose-decomposing bacteria of the group Cytophaga in the rumen of the ox.** CH ARMANDI *Boll soc intern microbiol Sez ital* 3, 35–40(1931) (in French) —In the ox rumen, 2nd and 3rd stomach and in the cecum (examd by the Winogradsky method (*C A* 24, 3309)) several species of cellulose-decomposing bacteria were found, and *Cytophaga hutchinsonis* was isolated The oxidation products of cellulose give the reaction of oxycellulose, but do not reduce Fehling's soln G A BRAVO

**The relation between the acidity of milk serum and its bacterial content.** M. BONDIOLI *Boll soc intern microbiol Sez. ital* 3, 77–8(1931)(in French) —The coccus groups of microorganisms, which are weak acid producers and very slightly resistant to acid, are predominant at first in milk serum, but afterward they are gradually replaced by organisms of the bacillus group, which produce more acid and are more acid resistant.

G. A BRAVO

**Favoring influence of local disturbances caused by adrenaline on the development of bacterial infections.** M RENAUD AND A MIGET *Compt rend soc biol* 103, 1052–4 (1930), *Physiol Abstracts* 15, 412 —Adrenaline favors the growth of microbes in living tissues Subcutaneously injected before inoculation, it induces rapid development of pathogenic organisms, and saprophytic bacteria which are ordinarily quickly destroyed continue to live in the prepd. regions Added to the culture medium, adrenaline also renders bacteria more active than those cultivated without it G. G

**Egg-yolk agar medium for the growth of tubercle bacilli.** RUSSELL D HERROLD *J Infectious Diseases* 48, 236–41(1931) —Approx 15% raw and sterile egg yolk added to melted ordinary beef ext agar at $p_H$ 7.5 forms an excellent medium for the isolation of tubercle bacilli from body fluids and tissues. JULIAN H. LEWIS

**Further studies on bacterial lipoids.** M GUNDEL AND W WAGNER *Z Immunitäts* 69, 63–76(1930) —The acetone-sol fraction of the alc. ext. of *Pseudomonas aeruginosa* was bactericidal for all of a series of bacteria except the typhoid colon group The same fraction from other bacteria was bactericidal for anthrax bacilli alone. The bacteria are killed by bacteriolysis The bactericidal properties of bacterial lipoids are thermostable in an aq medium, but are inactivated by heat when in a protein medium Bactericidal action is dependent on the concn and age of the lipoids After standing and after exposure to light, the lipoids are decreased in their bactericidal properties but not in their antigenic action *Immunization with lipoids from Ps aeruginosa* produces lipoid antibodies, while lipoids from staphylococci and typhoid and colon bacilli are not antigenic The bactericidal and antigenic properties of bacterial lipoids are not identical *Fatty acids and their esters and lipoids from plant but non-bacterial origins* are bactericidal JULIAN H. LEWIS

**The chemical differentiation of hemolytic and nonhemolytic streptococci.** LOUIS AVILES *Z. Immunitäts* 69, 433–7(1931) —By means of the Berlin blue reaction the changes in the hemoglobin of blood agar plate cultures of streptococci were studied. In the clear zone around hemolytic streptococci hemoglobin is absent and the bacterial colonies give the reaction for Fe. In nonhemolytic cultures the zone around the colonies gives a reaction for Fe while the colonies themselves do not JULIAN H LEWIS

**Are there gas-forming variants of typhoid bacilli?** CURT SONNENSCHEIN *Z. Immunitäts* 69, 449–63(1931) —A critical study of the claims of various workers to have observed variants of typhoid bacilli that form gas leads to the conclusion that these claims are unwarranted These organisms never acquire this property by any process of regression, transformation or dissocn Gas formation by an organism excludes its possibility of being *Eberthella typhi*. JULIAN H LEWIS

A quantitative study of the respiration of Staphylococcus aureus cultures lyzed by bacteriophage. Monroe D Eaton, Jr *J Bact* 21, 143–53(1931).—When a large amt of bacteriophage actively lyzes a culture of staphylococcus in the stage of max rate of growth the observed rate of O consumption is greater than can be accounted for by the number of intact cells present A lyzed culture contg negligible numbers of living bacteria continues to give off $CO_2$ and take up O for several hours Either the bacteriophage itself or some product of the action of bacteriophage on or in combination with bacteria respires Lysis by bacteriophage is not a simple autolysis J T M

Isolation and study of an apparently wide-spread cellulose-fermenting anaerobe, Cl. cellulosolvens (N. Sp?). Philip B Cowles and Leo I Rettger *J. Bact* 21, 167–82(1931).—This organism was isolated from horse feces and is morphologically similar to the organisms described by Omelianshy The rods are thin, often slightly curved, and form spherical terminal spores Colony formation can best be obtained on a peptone beef infusion agar contg dextrin and cysteine although it is not selective The best liquid medium is beef infusion peptone phosphate agar contg a strip of filter paper Cellulose, dextrin, arabinose and xylose alone of the materials tested are attacked Glucose is not utilized, a fact in contradiction to the so-called theory of carbohydrate gradients Dextrin or glucose has little effect on cellulose decompn The products of cellulose decompn by this organism are $CO_2$, H and org acids John T. Myers

Influence of osmotic pressure upon spore germination. Harold R. Curran *J Bact* 21, 197–209(1931).—There is a definite limiting concn of food below which no germination occurs, irrespective of the osmotic pressure There is no evidence of a purely osmotic limitation in low pressure solns, limitation being probably due to food deficiency Germination is more rapid and complete at relatively low pressures. When the min nutritional requirements are exceeded, the increased concn of food may retard germination because of an unfavorable increase in osmotic pressure A pressure of 36 to 40 atm becomes inhibitory John T. Myers

Peptone water with rhamnose as a differential culture medium for Pasteurella pestis and Corynebacterium rodentium Pfeiffer. A Bessonova *Zentr. Bakt Parasitenk*, I Abt., 119, 33–5(1930).—*C pseudotuberculosis* produces acid, *P pestis* does not John T Myers

Investigations on the power of the Brucella melitensis group of bacteria to produce hydrogen sulfide The production of hydrogen sulfide as a criterion for the differentiation of the members of the Brucella group. Giovanni Favilli *Zentr Bakt Parasitenk*, I Abt., 120, 24–34(1931).—See *C A* 24, 5329 John T Myers

The influence of bile on the agglutinability of a typical paratyphoid bacilli. N G Kluyeva *Zentr Bakt Parasitenk*, I Abt., 120, 34–40(1931).—Some magglutinable strains become agglutinable when grown in a bile-contg medium Spontaneously agglutinable strains are not changed by bile John T. Myers

The frequent occurrence of streptococci in human croup which produce excessive polysaccharides when grown on the surface of a substrate containing sucrose or raffinose. J Oerskov and K A Poulsen *Zentr Bakt Parasitenk*, I Abt., 120, 125–7(1931).—This is a const property of many strains John T. Myers

A substance which increases bacteriophage action. Friedrich Hoper *Zentr Bakt Parasitenk*, I Abt., 120, 162–5(1931).—There is a substance in human and animal blood which increases bacteriophage action It appears also to be present in certain bacteria Its nature is not understood It may be enzyme like or vitamin-like in character John T Myers

Bacteriological study of chronic infectious arthritis. John W Gray and Cecil H Gowen *J Med Soc New Jersey* 28, 38–41(1931).—G and G describe a modification of the medium used in Cecil's method (*Arch Internal Med* 43, 571) for the isolation of a streptococcus from the circulating blood of patients with chronic infectious arthritis The beef heart infusion is prepd as described by C At the end of the boiling and filtering, 0.5% NaCl, 1% gelatin, 1% glucose and 1.5% Witte peptone are added The mixt is kept in the Arnold app for 20 min., titrated to $p_H$ 8, placed again in the Arnold app for 60 min., and retitrated The $p_H$ should not be below 7.8 The soln is filtered through paper and sterilized in the Arnold app for 30 min. on 3 successive days in bottles contg a teaspoonful of powd $CaCO_3$ If the $p_H$ is 7.6–7.8 the medium is satisfactory With this improved medium it is possible to produce growth in the form of diffuse clouding of the medium in 1–4 days without opening the bottles G Schwoch

Investigations on the agglutination of various species of Leishmania. Alessandro Laurinsich *Pediatria Rivista* 39, 345–50(1931).—The expts were carried out on 4 strains of *L infantum*, 2 strains of *L donovani*, 1 strain of *L tropica* and 1 strain of *L*

*brasiliensis* Immune sera were prepd by injecting rabbits with cultures of these strains The immune sera from the rabbits injected with *L donovani* agglutinated the homologous strains and also the *L infantum* strains The immune sera from *L infantum* agglutinated the homologous strains and also the strains of *L donovani* The immune sera prepd with *L tropica* and *L brasiliensis* agglutinated only the resp homologous strains L assumes on the basis of his results that *L donovani* and *L infantum* are identical or at least very closely related G SCHWOCH

Specific and nonspecific polysaccharides of type IV pneumococcus. MICHAEL HEIDELBERGER AND FORREST E KENDALL *J Exptl Med* 53, 625-39(1931), cf *C A* 24, 653.—Three N contg polysaccharides have been isolated from autolyzed cultures of Type IV pneumococcus a type sp carbohydrate (I), differing markedly from those of Types I, II and III pneumococcus and representing a type of substance hitherto not observed among sp polysaccharides a chemically similar carbohydrate (II) without sp function, and the C" substance (III), or species-sp polysaccharide of Tillett, Goebel and Avery (*C A* 25, 541) Detailed directions are given for the sepn of these 3 compds That I was not obtained pure is evidenced in the variation of $[\alpha]_D$ from 17 0° to 35 0°, in the acid equiv from 1250 to 3330, in the total N from 4 7 to 5 9, in the reducing sugars on hydrolysis (as glucose) from 67 to 76 4, 2 samples contained in % 0 1 and 0 4 amino N, 5 6–5 9 acetamido N, less than 0 1 P and 1 sample showed 45 9 C and 6 7 H, the hydrolysis products are AcOH and an amino sugar deriv II showed $[\alpha]_D$ 10°, acid equiv 4540, total N 5 9 acetamido N 5 6, reducing sugars on hydrolysis (as glucose) 55 (av values), the hydrolysis products are glucosamine, amino sugar deriv and AcOH III gave as av values, $[\alpha]_D$ 42°, acid equiv 1050, total N 6 1, amino N, 0 9, acetamido N 3 7, reducing sugars 36, hydrolysis products, amino sugar deriv, $H_3PO_4$ and AcOH III contained 4% P, at 100° $H_3PO_4$ is only slowly split off by *N* HCl or NaOH The relationship of these compds to chitin is pointed out and its bearing indicated on the unsettled controversy as to whether or not chitin occurs in bacteria C J WEST

Metabolism of S and R forms of pneumococcus PHILIP FINKLE *J Exptl Med* 53, 661–76(1931).—Results are given of studies on the respiration and glucolytic metabolism of pneumococcus Types I (I), II (II) and III (III) and of the R forms derived from these The metabolism of the S and R forms is compared and the relationship between changes in virulence, changes in chem constitution and changes in metabolism is discussed. There is no respiration in Ringer soln unless sugar is added The $p_H$ (7 8) that is optimal for growth of pneumococcus is also the $p_H$ at which the max respiration occurs The intensity of respiration varies with the type in the strains used The respiratory capacity of I is 56% of that of III, which in turn is 71% of that of II. The anaerobic glucolysis is approx the same for all 3 groups I is capable of aerobic glucolysis, while II and III do not effect glucolysis aerobically The energy set free in respiration is considerably greater than that set free in glucolysis The oxidation quotient for lactic acid is of the same order as that found by Meyerhof in muscle and by Warburg for mammalian tissues The respiratory capacities of I and III are changed on conversion of the smooth to the rough form For I the respiration is increased 110%; for II it is diminished 45%, for III there is only a slight diminution in respiratory activity (16%) The anaerobic glucolysis is increased 25% on the av for all R forms irrespective of type derivation I on being converted to the R form loses its capacity for aerobic glucolysis, while III gains it The *O* consumption by pneumococcus compared with that of the human tubercle bacillus and of mammalian tissue, for the same time intervals, wt for wt, is I consumes 13 times as much O as does the tubercle bacillus (*H 37*), *II consumes 34 times as much O, and III consumes over 20 times as much O as* does isolated rat kidney tissue and almost 100 times as much O as does isolated dog muscle. C. J. WEST

THOMAS G PHILLIPS

The possible presence of norleucine in the proteins of castor-oil seeds. R NUCCORINI (WITH G BAGNIS) *Boll ist super agrario Pisa* 6, 227–37(1930).—Among the hydrolysis products (with concd boiling HCl) of the proteins of germinating castor-oil seeds, together with ricinine, a crystd compd was found, which had the compn.

$C_6H_{11}O_2N$, m 270–80° (with partial decompn.), $[\alpha]$ —10.52 in aq. soln. and +14.00 in 20% HCl soln. This compd was racemized and the Bz deriv (prepd by the Fischer method, cf. *Ber* 33, 2370(1900)) had m. p. 134–5° (with previous softening). The yield was too low to continue the identification expts., but very likely the compd is norleucine, which till now has not been found among the hydrolysis products of the vegetable proteins. G. A. Bravo

Fluorescent substances contained in plants. II. R. Nuccorini (with M. Monsaccini). *Boll. ist. super. agrario Pisa* 6, 252-62(1930).—The plants examd. (olive tree, black cabbage, rape, spinach, lettuce, celandine, rue, sweet clover) contain water-sol. substances fluorescing bluish to Wood's light (3950–4750 A. U.), which are probably pigments formed as secondary products of the biochem. activity of the plants. In several plants characteristic fluorescing compds. are present, *e. g.*, *oleuriols* (fluorescing green blue, 4500 A. U.) in the olive tree and *berberine* (fluorescing gold yellow, 5500 A. U.) in the celandine. The fluorescent substances are not injured by the action of the molds. G. A. Bravo

Studies in sap analysis. I. Carbohydrates in saps. M. Srinivasaya and H. N. Sastry. *Proc. 15th Indian Sci. Cong.* 1928, 163–4.—The estn. of sugars in saps is complicated by the presence of interfering impurities such as tannins, gallic acid, dextrins, proteins and similar substances. Pptg. agents like basic Pb acetate, dialyzed Fe, fibrous alumina, $HgCl_2$, etc., have proved unsatisfactory in one way or another. A very suitable method consists in the preliminary removal of dextrins and the greater part of the proteins by an addn. of 10 vols. of 95% alc. contg. a little $NH_3$. The alc. filtrate is concd. on a water bath; tannins, etc., are eliminated by dialyzed Fe; and the clear filtrate is used for the sugar estns. by Bertrand's method. The direct reducing sugars are estd. as dextrose. The citric acid hydrolysis gives sucrose and the HCl hydrolysis gives maltose. Invertase and maltase are also being tried for the estn. of sucrose and maltose. The saps can also be absorbed on fat free filter paper, extd. by 95% alc. contg. a little $NH_3$ and the alc. ext. treated as above. This modification gives excellent results. E. J. C.

Effects of hydrogen-ion concentrations on rice cultures. S. K. Mitra and Lokenath Phukan. *Proc. 15th Indian Sci. Cong.* 1928, 166–7.—Effects of H ion concns. on rice cultures were studied with Knop's soln. as the standard nutrient soln. and with HCl (0.001–0.01%) and NaOH (0.001–0.05%) as the adjusting media. The $p_H$ values of the solns. ranged from 3.0 to about 8.4. The expt. was continued with one-month old seedlings for a fortnight and the total length of roots in mm. was taken as the criterion of growth. *Results.*—(1) The seedlings showed strong acid toxicity at a concn. of 0.002% HCl, whereas higher concns. were distinctly inhibitory to root growth. With the addn. of alkali, the roots developed far better and the highest root development was shown at a concn. of 0.3% NaOH. (2) A definite relationship was found between the H ion concns. of the culture solns. and their corresponding root lengths, which showed a steady increase with the higher $p_H$ values. $p_H$ 3.9 was distinctly toxic whereas $p_H$ 3.3 was extremely toxic to root growth. At acidities less than $p_H$ 6.0, the development of roots was below normal but beyond this it was quite satisfactory. The highest root growth was attained at $p_H$ 7.9, but further on a drop was shown at $p_H$ 8.4, which was, however, not quite confirmatory and requires further experimentation. E. J. C.

Effects of Shive's three salt nutrients on rice seedlings. S. K. Mitra and Lokenath Phukan. *Proc. 15th Indian Sci. Cong.* 1928, 167.—Following Shive's procedure an expt. on the effects of the 3 salt nutrients of $KH_2PO_4$, $Ca(NO_3)_2$, and $MgSO_4$ was tried on the development of roots in rice seedlings. The nutrient solns. were arranged to give all possible combinations in variations of 0.1–0.8 of the total osmotic concn. of 1.75 atm., for each of the 3 salts used. The results of the expt. were as follows. (1) The culture showing the highest root development had 0.5 of its total osmotic concn. due to $KH_2PO_4$, 0.2 to $MgSO_4$ and 0.3 to $Ca(NO_3)_2$. Similarly, other high root developments were characterized by high concns. of $KH_2PO_4$ and low concns. of the other 2 salts. (2) The culture showing the lowest root development had 0.3 of its total concn. due to $KH_2PO_4$, 0.5 to $Ca(NO_3)_2$ and 0.2 to $MgSO_4$. The region of low root development was characterized by low concns. of $KH_2PO_4$ and high concns. of $Ca(NO_3)_2$ or $MgSO_4$ or both. (3) The best and the worst cultures contained the metallic ions of Mg, Ca and K in the proportions of 0.56 0.43 1.00 and 0.93 1.20 1.00, resp. E. J. C.

Injection experiments with special reference to the production of alkaloids, etc., and general metabolism in plants. S. Krishna and H. Chaudhuri. *Proc. 15th Indian Sci. Cong.* 1928, 224.—For expti. purposes 2 or more species (of the same genus) which differed in the production of alkaloids, etc., were taken at a time. The plants were all grown from seeds under observation. Successful and interesting results were

obtained when even min quantities of chemicals in colloidal solns. were injected Thus when colloidal Fe was injected in opium poppy, which normally contains berberine, it produced less of that alkaloid, whereas when colloidal Fe was injected in red poppy, which contains practically no morphine or berberine, berberine was actually found Injection of colloidal S caused vigorous growth and produced healthier flowers and seeds, though the flower production was a bit delayed. Injection of colloidal Fe in a no of plants inhibited the development of flower buds. E J C

Importance of iron for the growth of fungi (Fusarium vasinfectum Atkinson). B B Mundkur *Proc 15th Indian Sci Cong* 1928, 230—*Fusarium vasinfectum* Atkinson was grown in media with and without Fe in order to det. whether Fe exercised any influence on the growth of the fungus It was observed that in solns. with Fe there was more growth than in solns. without Fe. It is concluded that for some fungi, at any rate, Fe acts as a stimulant, even though they do not have chlorophyll and therefore do not need it. E J C.

Studies in photosynthesis in tropical sunlight. I. G Gopala Rao and N R Dhar *J Phys Chem* 35, 1418–23(1931)—HCHO has been obtained from $CO_2$ and $H_2O$ *in the presence of the following photosensitizers and sunlight chlorophyll, methyl* ene blue, malachite green, methyl orange, ferric hydroxide sol, uranyl nitrate, Cr sulfate and $CuSO_4$. Small quantities of CO were obtained from the photochemical reduction of $CO_2$ by chlorophyll II. Photosynthesis of formaldehyde and carbohydrates from alkali bicarbonates in the presence of colored insoluble substances. *Ibid* 1424–32.—Exposure of $NaHCO_3$ solns. contg inorg catalysts such as Ni carbonate, Co carbonate or colloidal $Fe(OH)_3$ to sunlight for a period of 45 to 60 hrs. effected the synthesis of definite quantities of HCHO and carbohydrates. HCHO solns. contg ZnO methyl orange, or $FeCl_3$ when exposed to sunlight formed small quantities of reducing sugar the soln alone, or contg $Fe(OH)_3$ sol, or MgO produced no sugar A suggested mechanism for the photosynthesis of HCHO consists of 2 steps, (1) the combination of chlorophyll and $H_2CO_3$ in the presence of light energy to form chlorophyll peroxide and CO and (2) the instantaneous interaction of this nascent CO with $H_2O$ to form HCHO and $O_2$ The proposed mechanism is shown to account for most of the facts of photosynthesis. P H Emmett

Sorbitol content of Norwegian mountain ash berries. Axel Jermstad *Arch Pharm* 269, 68–9(1931)—Both the acid (malic) and sorbitol contents of Norwegian mountain ash berries increase during the ripening period. In French berries the sorbitol increases while the acid content decreases. The Norwegian berries are lower in sorbitol than the French W O E

Chemical examination of the red pigments of some autumn fruits. László Zechmeister and László Cholnoky *Matematik és Természettud Értesitö* 47, 209–17 (German abstract 218)(1930). cf *C A* 24, 3020, 4303—Sixty kg of *Lycium halimifolium* gave 17 g *of a cryst. pigment, the compn of which was found to be* $C_{74}H_{116}O_8$, it is identical with the physalien of Kuhn and Wiegand. No secondary pigments were found Fruits of *Tamus communis* contained lycopine, also fruits of *Solanum dulcamara* Arillus of *Evonimus europeus* contained a xanthophyll like pigment of the compn $C_{40}H_{56}O_2$ Examn. of other fruits, *e g*, *Arum maculatum* and *Sorbus aucuparia* is in progress. S. S. de Finály

Investigations on the action of different ions on the saccharase of Penicillium glaucum. Ella Fehér. *Mezögazdasági Kutatások* 3, 292–315(1930)—The quantity of saccharase in well nourished *P glaucum* is almost proportional to the quantity of added sugar. Scarcity of Ca has no influence, but that of Mg or $PO_4$ ions decreases the saccharase quantity The optimum $p_H$ is 4.5. The no. obtained by multiplying dry-matter content and saccharase quantity of a mold culture is a const. value which is characteristic of the resp. cultures. Dialysis at first increases enzyme action The action is strengthened by the presence of Cl, $SO_4$ and $NO_3$ ions. The enzyme action is, however, diminished by long dialysis and cannot be reactivated with salts The $p_H$ optimum is 4.3 after dialysis. The presence of salts has no influence on this value. The action of saccharase cannot be increased by autolysis. S. S. de Finály

Cyanogenesis in plants. M. E Robinson *Biol Rev.* 5, 126(1930). *Physiol Abstracts* 15, 556—A review G. G

Vegetable proteins. I. The proteins of Dolichos lab lab. Duraiswami Narayanamurti and Coimbatore Venkataromana Ramaswami Aiyar *Biochem J.* 24, 1650–24(1930)—The chief protein of *Dolichos Lab lab* constitutes about 80% of the N in the meal and is obtained in the aq fraction. Benjamin Harrow

Irradiation of Dolichos tyrosinase. Duraiswami Narayanamurti and Coim-

RATORE VENKATAKOMANA RAMASWAMI AIYAR. *Biochem. J.* 24, 1855-8(1930).—The enzyme is most active when it is least charged. BENJAMIN HARROW

Solarization of leaves. RICHARD HOLMAN. *Univ. Calif. Pub. in Botany* 15, 139-51(1930).—In *Passiflora* and *Coleus*, solarization was delayed rather than hastened by an increased $CO_2$ supply, and occurred more slowly, if at all, when the leaves were starch filled. JOSEPH S. HEPBURN

Fermentation phenomena of the Nymphaea coeca and their relation to yeast. J. GRÜSS. *Hoehn. Forsch.* 47, 473-7(1930).—See *C. A.* 24, 5788. S. JÓSA

The enzyme content of dormant and germinating seeds. YUTAKA JONO. *Acta Sch. Med. Univ. Imp. Kioto* 13, 211-38(1931).—The carbohydrate- and protein-splitting enzymes, catalase and urease, are present in the dormant seeds and become augmented during germination. The lipases are present in wheat seeds, beans and peas and likewise increase during germination. In the hemp seed, watermelon seed and pumpkin seed the lipase is largely demonstrable in either the resting or germinating stages. Barley seeds are free from urease. Peas and hemp seeds manifest only a trace of urease which shows no increase during germination. In the soy bean, watermelon seeds and pumpkin seeds urease is found in considerable quantity which increases during germination. B. S. LEVINE

The rôle of silica in living organisms. The biology of the diatoms. EUGENE BACHRACH AND M. LEFÈVRE. *J. pharm. belg.* 27, 241-9(1931).—Under the influence of ill-defined factors certain marine and fresh water diatoms, grown in sterile culture but in the presence of silica, become incapable of forming a siliceous carapace. No loss of vitality results and the diatoms are able to develop and multiply through many generations. The loss of carapace is more or less rapid according to the species. When a diatom divides in spite of the absence of rigid valves, the resulting forms resemble the original but the determination of the species is impossible. The presence of valves is not essential for locomotion. L. A. MAYNARD

Studies on leguminous bacteria and plants. IX. Utilization of different nitrogen compounds as well as of the nitrogen accumulated in the root nodules by leguminous plants. ARTTURI I. VIRTANEN AND SYNNÖVE VON HAUSEN. *Biochem. Z.* 232, 1-14(1931), cf. *C. A.* 24, 3252.—Red clover grows best in media containing amino acids as the N source, and the best results were obtained with hydrolyzed casein. Growth is less with $(NH_4)_2SO_4$ and still poorer with $KNO_3$. The behavior of white clover toward N compds. is just the reverse, since it grows best with $(NH_4)_2SO_4$ and very poorly with amino acids. The amino acids are utilized directly and not as a source of $NH_3$, since the $p_H$ of the medium remains unchanged and $NH_3$ cannot be detected. S. MORGULIS

Biochemical studies in connection with the problem of early budding. ANNELIESE NIETHAMMER. *Biochem. Z.* 232, 1-55(1931).—Either frost or a dry spell, especially the latter, promotes budding. The effect of frost is to increase the amt. of reducing sugar. The sugar content of a twig in the course of a year is subject to great variations and its max. does not coincide with the max. budding. The lability of the parenchyma cells to plasmolysis seems to correspond to the tendency to budding. S. MORGULIS

Choline as the injurious substance in diseased barley. G. SCHROETER AND L. STRASSBERGER. *Biochem. Z.* 232, 412-8(1931).—It is shown that barley extd. with dil. HCl yields lecithin, which on boiling and evapn. of the acid ext. yields choline, so that from every barley and not only from the diseased barley choline can be obtained. Lubs's studies are further criticized because by his method of ppty. choline from the acid ext. with an alc. soln. of $HgCl_2$ lecithines and other substances besides choline are ppd. as complex Hg salts, which were thus erroneously calcd. as choline. S. MORGULIS

The death wave in *Nitella*. III. Transmission. W. J. V. OSTERHOUT AND S. E. HILL. *J. Gen. Physiol.* 14, 385-92(1931), cf. *C. A.* 23, 3004.—When a cell of *N. flexilis* is cut a series of rapid elec. responses are set up, which are transmitted very rapidly. They are followed by slower responses, the speed of which falls off as the distance from the cut increases. The mechanism appears like a mech. disturbance, the intensity of which falls as it travels. The faster responses are probably due to the motion of sap past surfaces which have not been altered. They are possibly similar to elec. changes following a blow on the end of a soft rubber tube contg. Ag-AgCl electrodes. The slower responses seem to be due to alterations in the protoplasm and are usually irreversible. C. H. R.

The sensitivity of Laminaria to external actions and the volatilization of iodine. PIERRE DANGEARD. *Compt. rend.* 192, 500-1(1931), cf. *C. A.* 24, 2160.—The liberation of free $I_2$ from *Laminaria flexicaulis* is provoked by a variety of external actions. T. H. RIDER

The constancy of vegetable composition according to Liebig and the sugar beet

*bred by selections.* ÉMILE SAILLARD *Compt rend* 192, 504-7(1931).—*Liebig* was led to believe that plants had fixed compns. S found that the quantities of basic minerals relative to a given amt. of sugar in the sugar beet decreased as the sweetness increased. The $H_3PO_4$ contained in the entire plant did not bear a const. ratio to the sugar. The relative quantity of base combined with org. acids decreased as the sugar increased. T. H. RIDER.

**The physiology of latex.** MARIA ROIBIN *Jahrb. wiss. Botan.* 69, 587-635, *Chem. Zentr.* 1930, I, 989-90. The methods employed permitted working with very small quantities of latex; thus the latex of the same plant could be examd. under various conditions. Expts. with dye solns. and Li solns. showed that the latex tubes are not particularly adapted for the transport of fluids. The solid matter of the latexes varied between 15 and 30% in the euphorbias examd. When plants cultivated in moist soil were kept in a dry atm. for 24 hrs. the solid matter of the latexes was reduced to one half, this was probably due to the inhibition of photosynthesis and to the transfer of osmotically active substances to adjacent tissues. Degradation of starch was observed in the latex of plants kept in dry air. Latex of plants treated with $CaCl_2$ soln. showed degradation of starch and increase in reducing substances. Inhibition of assimilation by darkening also caused a diminution in solid matter. Treatment of cut off shoots with salt solns. produced a distinct decrease in starch, a pronounced increase in sugar and an increase of solid matter. Glucose soln. (6%) caused a decrease in solid matter. The electrolyte content increases after administration of sugar, which may be due to the formation of acid. The electrolyte content is of the same order of magnitude in the representatives of the different genera and species of the Euphorbiaceae, Moraceae and Compositae, in a dilu. 1:1000 the sp. cond. ranged from $10 \times 10^{-4}$ to $30 \times 10^{-4}$. Cultivating a plant in a dry atm. causes a reduction in cond. which is compensated by transferring the plant to a moist atm. Treatment of cut off shoots with $CaCl_2$ soln. resulted in a strong increase in cond. The total press juice had a considerably smaller cond. than the latex of the same plant, with respect to the order of magnitude it is equiv. to the press juice of the latex free plants from ordinary habitats. The latex has a storing function, this fact does not imply that the substances stored are permanently eliminated from the metabolism. The latex tube system has no conducting function, but it seems to be of importance for the regulation of osmosis. G. SCHWOCH.

**The carbon dioxide assimilation of arctic plants and the dependence of the assimilation on the temperature.** D. MÜLLER *Planta* (Abt. F, *Z. wiss. Biol.*) 6, 22-39, *Chem. Zentr.* 1929, II, 2570.—In Godhavn, West Greenland, the assimilation of 2 arctic plants, *Salix glauca* L. and *Chamaenerium latifolium* (L.) Spach., was examd. in the month of July. From the curves on assimilation and illumination intensity it is found that at midnight in the long day period *Chamaenerium* has a weakly pos. apparent assimilation at temps. of below 10°. The assimilation curves of arctic plants show the same course as those of the hebophilous leaves of Danish plants. With completely open stomata and normal $CO_2$ content of the air the assimilation was examd. at different illumination intensities at 10° and at 20°. The compensation point and the respiratory intensity increase with the temp. With low illumination intensities the apparent assimilation is greater at 10° than at 20°; with illumination intensities larger than 4000 or 9000 lux, resp., it is greater at 20° than at 10°. The course of the curves makes Lundegardh's temp. assimilation curves appear improbable. The stomata of arctic plants are rather wide open during the whole night, in some cases up to 100%. The quantity of the lignified arctic plants per area is lower than that of the subarctic plants, the same is true for the leaf area per surface unit. G. SCHWOCH.

*Differential growth of phytophthoras under the action of malachite green.* LEON H. LEONIAN *Am. J. Botany* 17, 671-7(1930).—Malachite green, at the rate of 1 part dye to 1, 2, 4, 8 and 16 million parts of nutrient soln., was used to induce differential growth in *Phytophthora*. Three organisms failed to grow when malachite green was present at the rate of 1 part dye to 16 million parts of nutrient soln., and 8 others made only a sporadic growth. Twenty-one organisms failed to grow when the amt. of dye was doubled, and 20 others made only a sporadic growth. Only 1 organism was able to make a growth in nutrient soln. with 1 p. p. m. of malachite green. The critical concn. of the dye for the *P. cactorum* group is in the neighborhood of 1 part malachite green in 4 million parts nutrient soln., while that for *P. omnivora* is decidedly higher. J. J. SKINNER.

**Effect of mineral salts upon the transpiration and water requirement of the cotton plant.** BERNARD S. MEYER *Am. J. Botany* 18, 79-93(1931).—The salts employed for the transpiration expts. with cotton in soil were NaCl, $NaNO_3$, KCl, $KNO_3$, $CaCl_2$ and $Ca(NO_3)_2$. The first 4 were applied to the soil in concns. of 0.025, 0.05, 0.1, 0.2 and

0.4% of the soil, with the Ca salts an addnl concn of 0.8% was used. For 4-day periods addition of any of these salts in all the concns employed, with the exception of the 2 lowest concns of $KNO_3$, resulted in a decrease in transpiration as compared with plants growing in the soil to which no salt was added. Transpiration progressively decreased in amt with progressive increases in the concn of any of these salts in the soil. The results were essentially the same whether transpiration was calcd on the basis of leaf area, fresh wt. of the top or dry wt of the top. It is clear that the concns of salts employed with reference to the soil conditions used lie in the range where osmotic effects predominate over specific ionic effects. NaCl in concns of 0.0125, 0.025 and 0.05% of the dry wt. of the soil, and $CaCl_2$ in concns of 0.0125, 0.025, 0.05, 0.1 and 0.2% of the dry wt of the soil, were used in the water requirement study. Cotton plants were allowed to grow under these treatments for 50 days, the usual technic of water requirement studies being followed. The water requirement of the plants treated with NaCl decreased progressively with increased concn of this salt in the soil. The 2 lowest concns of $CaCl_2$ employed resulted in an increased water requirement; beyond that concn the water requirement decreased progressively with increase in the concn of $CaCl_2$ in the soil. A progressive increase in the concn of NaCl or $CaCl_2$ in the soil resulted in a progressive increase in the final water content of the tops of the cotton plants.

J. J. Skinner

Chemistry of the halophytes. II. J. Zellner and E. Zikmunda. *Monatsh.* 56, 197–9(1930). cf. *C. A.* 21, 2718.—The ash content of *Lepidium crassifolium* L. was 10.35%. It had the following compn.: K, 10.50, Na, 21.43, and Mg, 3.46%. The following substances were isolated from *Salicornia herbacea* L. by the use of selective solvents: an unidentified wax alc., m. 64°, a sterol of higher m. p.; resin and fatty acids which were not identified, choline, phlobaphenes, betaine, Au salt, m. 196–8°, a *l* rotatory invert sugar, phenylosazone, m. 203°, oxalic acid, and a considerable amt. of inorg. salts.

C. W. Sonders

Chemistry of the higher fungi. XXI. Polyporus sulfureus L. and Lentinus squamosus Schroet. Julius Zellner and Eugen Zikmunda. *Monatsh.* 56, 200–3(1930). cf. *C. A.* 23, 3005–6.—From the first named fungus were isolated: an unidentified cryst. substance m. 265°, a cerebrin like substance, m. 112–4°, ergosterol, m. 163–5°, fungisterol m. 146°, stearic and palmitic acids, choline, fumaric acid, m. 284°, mannitol, m. 165°, and K H oxalate. The last named fungus yielded mannitol; choline, a phlobaphene like substance, a sugar, phenylglucosazone, m. 206°; and a polysaccharide which when hydrolyzed yielded only glucose. No pentoses were obtained.

C. W. Sonders

Comparative plant chemistry. XXII. Chemistry of barks. 7. Norbert Froschl, J. Zellner and F. Zikmunda. *Monatsh.* 56, 204–11(1930). cf. *C. A.* 23, 3005.—From the bark of the branches of *Morus nigra* L. there was isolated a phytosterol m. 132°, ceryl alc., stearic, myristic, and linolenic acids, $H_3PO_4$, glycerol, tannins, phlobaphenes and a sugar, *phenylosazone*, m. 204°. The following substances were isolated from *Alnus incana* L.: protalnulin, m. 226°, alnulin, m. 260°; alnuresinol, m. 192–3°, an unidentified substance m. 194–5°, Ac deriv., m. 253°, resin acids and phlobaphenes and a sterol like substance, m. 260°, Ac deriv. m. 203°.

C. W. Sonders

The absorption of iodine by the roots of plants. J. Stoklasa. *Protoplasma* 8, 199–214(1929).—Larger amts of I both org. and inorg. accumulated in the organs of plants when the soil contained 1000γ of I per kg. than when the soil contained only 200–400γ per kg. When the I content of the soil was below 400γ per kg. the absorbed I was converted into an org. form. Plants with a low $p_H$ were more sensitive to the toxic effect of I.

M. H. Soule

Hydrogen-ion phenomena in plants. I. Hydrion concentrations and buffers in the fungi. J. I. Armstrong. *Protoplasma* 8, 222–60(1929).—The tissue and expressed sap reactions of 10 species of the larger Basidiomycetes were investigated. For *Hypholoma fasciculare* the inorg. phosphates of the sap accounted for 50% of its total buffering at $p_H$ 6.0–9.0. With *Coprinus micaceus* the inorg. phosphate in the sap accounted for all the buffering at $p_H$ 6.0–7.0, the oxalate at $p_H$ 4.0–5.0. With *Collybia velutipes*, phosphate, citrates and malates accounted for the buffer curve. II. An investigation of the buffer complex of sap from stems of Pelargonium sp. *Ibid* 313–43.—The aerial stems of *Pelargonium* from young and mature plants were cut into short lengths and the sap was expressed by pressure. The juices were passed through Gooch crucibles and the filtrates were used at once for titration or analysis. Phosphate and the characteristic odoriferous acid of the tissues, pelargonic acid, were shown to be unimportant constituents of the buffer complex. Org. acids constituted the major part of the buffer complex at the initial $p_H$ of the sap. The acids found and estd. included oxalic, malic,

citric and tartaric, and the contributions made by all these buffer systems to the buffering exhibited by the sap were considered in detail. **III. The acidity of certain cell walls considered in relation to the higher fatty acids.** *Ibid* 508–21(1930).—Higher fatty acids belonging to the acetic and oleic series together with certain derivs of oleic acid, notably ricinoleic or subernic acid, were tested with a series of 9 indicators that had been used in this series of studies. The virage obtained from any given acid with any given indicator was found to depend upon the avidity of the acid concerned for the indicator base. The base avidities of the acids varied in a peculiar manner with the no. of C atoms in the acid mol. M. H. SOULE

**The accumulation of ions in living cells—a non-equilibrium condition.** S. C. BROOKS. *Protoplasma* 8, 389–412(1929).—Living cells of *Valonia macrophyssa* Kutz were collected from their natural habitat and exposed for different lengths of time to sea water in which the proportion of K had been increased or decreased by the addn. of isotonic KCl or NaCl solns. The concn. of K in the sap ordinarily increased more than that of Na or Cl regardless of whether it was present in more or less than normal concn. in the surrounding soln. The Cl concn. in the sap ordinarily changed in much the same way as the K concn. but to a significantly smaller extent. The Na concn. appeared to have increased first and then decreased, depending upon the length of exposure and the extent to which the sea water was altered. This was explained by supposing (*a*) that the cell is normally in the non-equil. condition with respect to the surrounding soln., (*b*) that it is surrounded by a plasma membrane consisting of a mosaic of anion permeable and cation permeable areas which are of the nature of charged porous films, and as such exaggerate differences between the diffusion velocities of the ions to which they are permeable, (*c*) that the diams. of the pores are variable according to exptl. conditions, (*d*) that the penetrabilities of different ions are characteristic functions of their own effective diams. and of the diams. of the porous membranes. M. H. SOULE

**The influence of frequency of cutting on the productivity, botanical and chemical composition and the nutritive value of "natural" pastures in Southern Australia.** J. GRIFFITHS DAVIES AND A. H. SIM. *Council Sci. Ind. Research (Australia) Pamphlet* No. 18, 5–28(1931). cf. Shutt, Hamilton and Selwyn, *C. A.* 24, 5792.—Five series of pastures, approx. 40 years old, were compared, the 1st 4 being cut every 2, 4, 7 and 10 weeks, resp., and the last was cut only at the end of the season, *i. e.*, November. The yield of dry matter and of crude fiber from the whole pasture was greatest in No. 5, and least in No. 1, the yield of total N and of crude protein varying inversely. However, though this held for the erect species which comprises most of the plants, *Erodium botrys* gave a max. yield of dry matter in No. 1 and a min. in No. 5. The yields of CaO and of $P_2O_5$ from the whole pasture were not greatly affected by the defoliation, but $P_2O_5$ was distinctly least in No. 5. The CaO content of all the species was high, about 2.2% of the dry matter. The yield in series 1 was greatly affected by rainfall, particularly at the end of the season, the yield of any cut being influenced principally after a lag of 2 weeks. The effect of temp. was less marked, but may be a limiting factor near the beginning and end of the season. No significant changes in chem. compn. of the pasture of No. 1 were observed throughout the season. Analyses of the soil and botanical compn. of the various cuts over 2 seasons are given. K. V. THIMANN

**Movement of organic materials in plants.** ALDEN S. CRAFTS. *Plant Physiology* 6, 1–14(1931).—C. suggests that the movement of sugars, amino acids, etc., in plants takes place in the phloem as the channel for conduction with the majority of transport taking place in the cell walls. The functioning of the mechanism proposed is discussed in detail and expts. are described in support of C.'s views. WALTER THOMAS

**Food reserves in relation to other factors limiting the growth of grasses.** L. F. GRABER. *Plant Physiology* 6, 43–71(1931). cf. *C. A.* 22, 1177.—Certain cultural practices with grasses (blue grass, red top, fescue and timothy) are correlated with the utilization and accumulation of labile org. substances—the so-called org. food reserves of plants. The productivity, as measured by both root and top growth, varied inversely with the frequency of defoliation. Frequent and close cutting of the succulent top growth of grasses having abundant reserves resulted in heavy depletion of the available N of the soil. The agronomical aspects of the morphological and ecological relationships of the org. food reserves of the flora of grass lands are also discussed. WALTER THOMAS

**Relation of hydrogen-ion concentration of tissue fluids to the distribution of iron in plants.** R. A. INGALLS AND J. W. SHIVE. *Plant Physiology* 6, 103–25(1931). cf. *C. A.* 23, 865.—The $p_H$ of the tissue fluids of buckwheat, clover, sedum and bryophyllum varied directly with the change of light intensity from day to night (*C. A.* 19, 3293). The range of variation was proportional to the degree of succulence of the plants.

The $p_H$ of the tissue fluids of the stems of buckwheat and clover was always higher than that of the leaves, but in sedum and bryophyllum the differences were small In the above plants and also in tobacco, tomato, asparagus and soy bean the sol (filterable) Fe varied inversely and total Fe directly with the changes in $p_H$ produced by variation in the light intensity. The detn of $p_H$ has no significance unless made on material collected at the same time and grown under approx identical conditions The paper is illustrated with 10 figures WALTER THOMAS

The Corail pea or Adenanthera pavonina. J PIERAERTS, E. CASTAGNE AND L. ADRIAENS *Mat grasses* 22, 8785-7, 8810-12, 8838-41, 8866-8, 8894-6, 8922-4, 8977-8, 9003-4, 9032-4(1930).—The seed of this pea contains neither alkaloids nor tannin Most of the K is found in the spermoderm and in the albumen while most of the P is in the embryo as lecithin The albumen is composed mostly of galacto mannanes The sugars, mostly found in the embryo, are a mixt of saccharose and stachyose The fats of the seeds are the glycerides of oleic, linolic and lignoceric acids The last accounts for 75% of the total solid acids Other acids are found in very small quantities. From its characteristics the oil of the Corail pea must be classed as a vegetable grease However, only the butter of *Parkia africana* possesses similar consts The consts. of *Parkia* butter, Corail pea butter from India and Corail pea butter from Belgian Congo are, resp acidity index 2.5, 0.56, 1.25, sapon index 184.5, 181.4, 176.6, I index 91.6, 87.9, 94 Reichert Meissl index 0.6, 1.22, 0.77, Hehner index 95.5%, 95.5%, 95.3% $n_D^{25}$ 1.470, $n_D^{60}$ 1.4570, $n_D^{55}$ 1.4710 P. PHILIP B HAWK

Sun rays and vitamin D. A VAN WYK, F H REERINK AND W MÖRIKOFER *Strahlentherapie* 39, No 1, 80-92(1930).—The authors compared the action of rays from the sun and those from a Hg quartz lamp upon ergosterol soln in hexane and found 2 essential differences, the radiation of the ergosterol soln in the sun rays caused a quicker destruction of the formed vitamin D and also the formation of another decompn product of unknown compn The different distributions of the intensities of the radiation of the 2 sources of light are believed to be the explanation for the differences They found that the relation for vitamin destruction and vitamin formation is 3 times as large with the sun rays as with the Hg quartz lamp Therefore, with sun radiation much quicker decompn of vitamin D will take place so that only a small portion of ergosterol is transformed into vitamin D, while a considerable portion of the latter is decompd F R. GREENBAUM

Blood studies in hemorrhagic anemia. H S MAYERSON AND HENRY LAUFENS. *J Nutrition* 3, 453-63(1931).—Severe secondary anemia was produced and maintained in 27 dogs by the method of Whipple and Robscheit Robbins (*C. A.* 19, 2092) In dogs fed the standard bread S diet (W and R R., *loc cit.*), contg salmon, the av weekly production of hemoglobin was 4 g above the maintenance level With dried apricots the value was 15 dried peaches 7 and lettuce 10 After several weeks of bread S feeding there is a gradual rise in the no of red blood cells accompanied by a decrease in corpuscular vol and corpuscular hemoglobin The percentage of hemoglobin in these smaller cells remains relatively unchanged If lettuce, apricots or peaches are added to the diet, these changes do not occur and they are interpreted as being compensatory reactions to the $O_2$ deficiency occasioned by the low hemoglobin when the severe anemic level is maintained C R FELLERS

The incorporation of vitamins in bread. F F. TISDALL, T. G H DRAKE AND ALAN BROWN *Can Med Assoc J* 24, 210-3(1931); cf *C A.* 24, 2161.—Bread is a particularly suitable carrier for vitamins on account of its universal distribution and large general consumption The refined grain products are deficient Incorporation of wheat germ will supply $B_1$ and F, and of irradiated ergosterol, D. Such procedures can be utilized at no addnl cost to the consumer A T CAMERON

Microbiological studies as a basis for vitamin investigation. WERNER KOLLATH *Wiener klin Wochschr* 44, 277-80, 320-3(1931).—A review D B DILL

Influence of E-vitamin on hypertrophy of female genitalia. F. VERZÁR. *Debreceni Tisza I Tud Tars II Oszt Munkái* 3, 352(1930).—Lack of E vitamin caused sterility in rats Hypertrophy of the uterus was caused in young animals of 50 g wt. by in-

jecting at intervals of 1–2 days 0.5–1.0 cc. concd. ext. of D vitamin without sitosterol. S. S. DE FINÁLY

**Practical significance of alkaline earths in the ash of forages.** L. URBANEK. *Mezőgazdasági Kutatások* 2, 441–51(1929). cf. *C. A.* 24, 4325.—Too much $CaCO_3$ has a toxic action on sheep and pigs. Salt metabolism is disturbed if forage ash contains more than 30 mg. equiv. of alk. earths. S. S. DE FINÁLY

***Role of photoactivity in the detection of the antirachitic effect of substances.*** L. URBANEK. *Mezogazdasági Kutatások* 3, 491–6(1930).—No connection was found between the antirachitic effect and photochemical activity. Many org. solvents showed photoactivity after a previous treatment with ultra violet light, *e. g.*, benzene, toluene, xylene, nitrobenzene, nitrophenol, aniline, ethyl-, propyl- and amyl ales., $CHCl_3$, $CCl_4$, oleic acid, turpentine oil, paraffin oil and cod liver oil. S. S. DE FINÁLY

**The action of white phosphorus and of vitasterol D (Vigantol) on the respiratory metabolism of rachitic young rats.** H. SELL. *Arch. exptl. Path. Pharmakol.* 140,194–204 (1929). *Physiol. Abstracts* 15, 373.—A rachitogenic diet depressed the metabolism of rats. P. injected subcutaneously in oily soln. in doses of $10^{-2}$ to $10^{-3}$ mg. daily caused the metabolism to rise to normal, but did not greatly increase the wt. or cure the rickets. Irradiated ergosterol caused a rise of metabolism and cured the rickets. G. G.

**Protein diet and the number of leucocytes in the intestinal mucosa of the mouse.** H. DE WINIWARTER. *Compt. rend. soc. biol.* 102, 121–3(1930). *Physiol. Abstracts* 15, 368.—An exclusively albuminous diet causes a characteristic invasion of macrophages in the mucosa, which modifies the villous formations. This is accompanied by a considerable relative increase of eosinophiles and intense destruction of leucocytes, the debris of which is found in various coats of the intestine. No similar results are seen on a purely fatty or carbohydrate diet. G. G.

**Determination of vitamin A.** KATHARINE H. COWARD, KATHLEEN M. KEY, FREDERICK J. DYER AND BARBARA G. E. MORGAN. *Biochem. J.* 24, 1952–66(1930).—The vitamin A contents of 2 substances are compared, 2 groups of rats (5–10 in each group) being used, each group is fed on A free diet until growth ceases, and each rat within the group is then given the same daily dose of the substance to be tested. The mean increases in wt. of the 2 groups are calcd. These mean increases are then referred to a curve which relates mean increase to dose of a particular sample of cod-liver oil. BENJAMIN HARROW

**Salicylic acid fruit in the prevention and treatment of rheumatism in children.** J. EPSTEIN. *Arch. Pediatrics* 48, 73–81(1931).—Salicylic, benzoic citric and tartaric acids are antirheumatic. For this reason, certain fruits (strawberries, huckleberries, raspberries, plums, cherries, lemons, grape fruit and melons) should be included in the diet beginning with the second year of life, both as preventives and as a portion of the therapy of rheumatic fever. JOSEPH S. HEPBURN

**Low-fat, high-starch evaporated-milk feeding for the marasmic baby.** JOHN HOWLAND WEST. *Arch. Pediatrics* 48, 189–93(1931).—The marasmic baby usually does not tolerate fats and sugars. A readily digested, high-calorie diet, composed of unsweetened evapd. milk, Ca caseinate and cooked starch, usually is satisfactory. JOSEPH S. HEPBURN

**To better human life by milk. I. II.** W. A. PRICE. *Creamery and Milk Plant Monthly* 20, No. 3, 26–37, No. 4, 46–54(1931).—Data obtained indicate that the vitamin content of dairy products is largely dependent upon the utilization by the cow of a rapidly growing fresh grass that has developed on a soil amply provided with such mineral requirements of the plant as to provide the cow not only with these minerals but with activating substances which are not produced in adequate quantity in the absence of these minerals. Detns. of vitamins A and D were made on butters obtained from various parts of the world. Seasonal variations were found in the quantities of these vitamins present in the butter. Thus in North America vitamin D tends to be low from Nov. to April, rising in May and June, falling in midsummer, sometimes rising in the early autumn with a rapid decline in the fall and early winter. It was found that the vitamin content of butter did not decrease during storage. From the standpoint of public health, therefore, it was recommended that butter should be placed in storage at the season of its greatest vitamin content. A. H. JOHNSON

**Observation on the assay of the antineuritic vitamin. Some of the factors involved in the use of the rat method.** W. H. SEBRELL AND E. ELVOVE. *U. S. Pub. Health Repts.* 46, 917–25(1931).—Results are reported which are in agreement with the experience of others, to the effect that the symptoms of polyneuritis in rats appear to be assocd. with shortage rather than complete absence of antineuritic vitamin. The

curative method for testing antineuritic concentrates on rats may be applied by injecting a suitable soln. of the concentrate, subcutaneously or intraperitoneally. J. A. E.

Nutritive value of soy-bean cake for hens. II. Kozo Suzuki and Tamaki Hayashi. *J. Agr. Chem. Soc. Japan* 6, 901–9(1930).—Soy-bean oil cake was given as protein source of the feed. Twelve parts of bone powder, 4 parts of $CaCO_3$ and 4 parts of NaCl for 100 parts of the cake were supplied. The nutritive value was similar to that of fish meal. It gives results on egg production and wt. of egg similar to those of other animal feeds. III. *Ibid* 910–6.—The chicks hatched from the eggs as above mentioned were also fed with soy bean oil cake. No abnormal signs were noted. Y. Kihara

Vitamin D. III. Eiichi Takamita. *J. Agr. Chem. Soc. Japan* 6, 977–74 1930), cf. *C. A.* 25, 537.—Ergosterol was dissolved in olive oil and treated with ozone. The ergosterol soln. so treated was antirachitic for mice. Excess of ozonation diminished the antirachitic activity. If ozone acted on ergosterol for 3 min. rickets were cured by a dose of 0.05–0.1 mg. ergosterol per day. Vitamin D itself may be 5,6-mono-ozonide ergosterol. Y. Kihara

Soy-bean cake for the fattening of swine. Kozo Suzuki. *J. Agr. Chem. Soc. Japan* 6, 975–8 (1930).—Soy bean oil cake as 20 and 30% was added to a feed consisting of korean 47, maize 30, bone powder 2 and NaCl 1%. The nutritive value of the feed with soy bean oil cake was as good as that with fish meal. The results in fattening were rather superior. Vitamin A, Cl, Na and Ca should be supplied. Y. Kihara

Muramatsu's beriberi bacteria and antiamnosis. Tsuyoshi Akiyama. *J. Agr. Chem. Soc. Japan* 6, 1125–43(1930).—Pigeons fed with polished rice excrete Muramatsu's beriberi bacteria. If the pigeons are fed with a diet deficient in vitamin B, the bacteria are difficult to find in the excreta. Dogs fed with polished rice show the symptom of the sickness but do not excrete the bacteria. The bacteria could not be found in the excreta of mice fed with polished rice. There is no relation between exptl. beriberi and Muramatsu's bacteria. Y. Kihara

Effects of a large quantity of lactic acid in the diet. Ryuzo Sasaki. *J. Agr. Chem. Soc. Japan* 6, 1144–52(1930).—Mice were forced to eat lactic acid as 5.5% of the diet. Ca and especially P of the bone were decreased. Decrease of P in the muscle was also found but it was less than that of the Ca decrease. Y. Kihara

Vitamin C. IV. Vitamin C in seeds germinated under a Mazda lamp. Toichi Matsuoka. *J. Agr. Chem. Soc. Japan* 7, 19–28(1931). cf. *C. A.* 24, 5349.—The seed-rice was germinated under 1000 w. elec. lamp at 28–30°. Vitamin C was produced after 3 days of germination. The detection of vitamin C by Bezssonov's reaction does not coincide with the biological test. Y. Kihara

Effects of alkali disintegration upon the vitamin content of cereal straws. Hiratoshi Iwata. *J. Sci. Agr. Soc. (Japan)* No. 326, 37–45(1931).—The straws of barley, wheat and rice contain some vitamins A and B. The vitamins in the straws were more stable toward 1% lime, especially in the soaking process, than toward NaOH. Y. K.

The study of calcium metabolism. Citrate and urinary excretion of calcium. R. Proverman and L. Brull. *Bull. soc. chim. biol.* 12, 1151–7(1930).—Subcutaneous injection or feeding of tri-Na citrate caused a marked increase in urinary Ca and a decrease in blood Ca. The presence of citrate in body tissues and fluids is thought to have an important relation to Ca metabolism. C. G. King

Loss of vitamin A during the baking of thin butter cookies. Helen T. Parsons, Ina Stevenson, Iva Mullen and Carolyn Horn. *J. Home Econ.* 23, 366–72(1931).—Thin butter cookies, baked at 160° for 10 min., lose 20–25% of their original vitamin A content. Amy Leviscontt

Metallized food in the regeneration of hemoglobin in rat and man. J. L. McGhee. *Science* 73, 347–8(1931).—Milk was left in contact with an alloy of Fe, Cu, Mn and Cu in an ice box and small quantities of these metals were dissolved in it. This metallized milk and control milk were fed to young white rats whose hemoglobin had been reduced to about 75%. Those to which metallized milk was fed showed rapid regeneration. They also showed some storage of these metals. Cu alone was effective but the mixt. of metals was much better. There was a lower mortality among rats fed on metallized milk than on milk to which salts of the metals were added. Tests extended to man indicated similar results. G. H. W. Lucas

The comparative value of irradiated ergosterol and cod-liver oil as a prophylactic antirachitic agent when given in equivalent dosage according to rat units of vitamin D. D. J. Barnes, M. J. Brady and E. M. James. *Am. J. Diseases Children* 39, 45–58 (1930).—Cod-liver oil, administered to infants in doses of 1400 rat units of vitamin

a seasonal variation in litter size, being higher in summer. The omnivorous mothers were heavier at parturition than the vegetarian, but for mothers of the same body weight the young from the omnivorous animals were heavier. The birth weight of the young tended to increase with the age of the mother and the order of the litter up to the fourth for the vegetarian and to the third for the omnivorous rats L A M

*Growth of vegetarian rats on omnivorous diet.* Shiyo Wan and Tung-Tou Chen. *Chinese J Physiol* 5, 71-8(1931).—Young born of vegetarian mothers, but nursed by omnivorous mothers and reared upon an omnivorous diet after weaning, averaged 93% normal in wt at 4 months Young born of and nursed by vegetarian mothers, and placed on an omnivorous diet at 4 weeks, attained wts which were 82% normal Similar young reared upon a vegetarian diet to 4 months and then changed to the omnivorous diet reached wts which were 77% normal "These results show that nutrition during lactation is more important than later in life." L A Maynard

Excessive doses of vitamin D. M Pincherle and V. Nava *Rev clin pediatrica* 28, No 3(1930), *Rev sud americana endocrinol immunol quimioterap* 14, 27(1931).—High doses of vitamin D produce in rats alterations in the bones, the blood vessels, kidneys and spleen The distance of the toxic dose from the therapeutic is great enough to avoid danger A E Meyer

The toxic and calcifying action of irradiated ergosterol. L Michelazzi *Arch. ital biol* 84, 111-7(1931).—Injection of large doses of irradiated ergosterol into rabbits causes pronounced cachexia and deposition of Ca salts in such organs and tissues as normally exhibit no calcification There is also evidence of a hemolytic effect S Morgulis

*The action and the mechanism of the action of excessive doses of irradiated ergosterol in experimental parathyroid insufficiency.* M Cohel. *Arch ital biol.* 84, 119-20(1931).—Large doses of irradiated ergosterol administered previous to parathyroidectomy prevent the occurrence of tetany and of the symptoms of parathyroid insufficiency Irradiated ergosterol in the amts used causes considerable hypercalcemia and also a slight hyperphosphatemia, but the hypercalcemia does not last long following parathyroidectomy; after a variable interval it gives place to hypocalcemia characteristic of parathyroid insufficiency However, the blood P does not increase as much as it usually does in the parathyroidectomized animal so that the Ca/P ratio does not fall nearly as low In animals treated with the ergosterol after the operation the hypercalcemia is transitory, and is followed by hypocalcemia Also in *Arch fisiol* 29, 123-44(1930) S Morgulis

The bread problem. II. The physiological effects of whole-grain bread. I Abelin *Biochem Z* 232, 278-91(1931), cf C *A.* 24, 1144.—Unlike white bread or bread rich in bran, bread made from 100% whole grain flour (as 75% whole wheat and 25% whole rye) has good nutritive value The value of this bread is still further enhanced when the excess $H_3PO_4$ of the flour is largely neutralized by means of Ca salts of org acids Young rats nourished exclusively on pure whole grain bread or on one contg Ca attain their normal body wt and are in good health even after 6 months on such a regime Fed on white bread or on bran bread, the animals grow very slowly, show a disposition to skin and mucous-membrane infections and generally die in 3-4 months Neutralizing the excess $H_3PO_4$ of white bread with Ca had some favorable effect but not nearly so much as in the case of the whole grain bread Whole grain flour may, of course, be of good or poor quality, and the method of prepg the bread is also important in detg its nutritive value For instance, toasting made the bread less nourishing and even injurious Animals fed on toasted whole grain bread manifested bone injuries, became very sick and died S Morgulis

Ammonium bicarbonate together with acid sugar-beet cossettes as a protein substitute. (A feeding experiment on milk goats.) Franz-Hermann Ziemer. *Biochem Z* 232, 393-422(1931).—$NH_4HCO_3$ could replace about 50% of the protein in a ration designed to maintain an increased milk production in goats Sixty-five tables of detailed results are given S Morgulis

The nitrogen balance during dietary corrections of obesity. J M Strang, H B. McCluggage and Frank A Evans *Am J Med Sci* 181, 336-49(1931).—The level of N metabolism in obese patients does not differ from that of normals The rapid reduction of wt by a "maintenance protein diet" produces only a slight depression in the N level even after 28 weeks The total N loss in the period of neg balance is less than 4% of total body N R C Willson

Creatinine excretion in abnormal states of nutrition. H B McCluggage, George Booth and Frank A Evans *Am J Med Sci* 181, 349-55(1931).—The creatinine excretion of obese subjects is close to that of normal ones The excreted creatinine

does not change appreciably when reduced by dietary measures alone The excretion in persons of subnormal wt. is markedly reduced as compared to the normal
R C Willson

**The effect of irradiated ergosterol on the composition of gastric and pancreatic juices.** Walter Bauer, Alexander Marble, Stephen J. Maddock and Josephine C. Wood *Am J Med Sci* 181, 309–413(1931).—Free HCl was reduced in 3 of 4 patients, a questionable reduction occurring in the fourth case The pancreatic enzyme activity was depressed in 1 case The fixed base content of pancreatic juice was not affected Cl ion was decreased and $CO_3$ ion increased and thus a more alk. pancreatic juice resulted
R C Willson

**The influence of vitamin A on the action of viosterol in rickets.** P. Roimer and R Dubois *Rev franc pediatrie* 6, 604–8(1930), *J Am Med Assoc* 96, 305.—Six rachitic children were given either the min effective dose or an insufficient dose of viosterol (from 300 to 600 rat units per day) They were also given daily doses of 3000 rat units of vitamin A The addn of the larger doses of vitamin A did not modify the action of the viosterol in any way The clinical symptoms, results of x ray examn and blood analysis corresponded with those normally obtained by small doses of viosterol

**Antirachitic products.** Soc des usines chim Rhône Poulenc Fr. 698,040, June 11, 1930. Products having high antirachitic activity are prepd by irradiation of ergosterol with ultra violet rays The ergosterol is sepd from the crude product of irradiation by using the low soly of ergosterol in org solvents such as EtOH, acetone or AcOEt The sepn of the ergosterol is followed up until a dextrorotatory product is obtained, which has preferably a rotatory power in alc soln above 23° for the yellow Hg ray The irradiation of the ergosterol is stopped before the point of max. activity is passed and preferably before it is reached

## F—PHYSIOLOGY

E. K. Marshall, Jr

**Excitability of the reflexes as a function of the $p_H$ value.** M. Mitols *Atti accad. Lincei* 12, 191–4(1930), cf *C A* 23, 3482, 4253.—The effect of changing $p_H$ on the cerebrospinal axis of *Bufo vulgaris* was studied by immersing this for half hr periods in acid solns (HCl, lactic acid), as well as in alk. solns (NaOH, KOH) and noting the reaction Outside of the limits $p_H$ 6.7–7.2, either acids or alkalies promote more and more excitability increasing to clonic convulsions, tetany, and finally total paralysis at values below $p_H$ 6.1 or above 7.6
A W Contieri

**The regulating function of the central nervous system.** M. Mitolo. *Atti accad Lincei* 12, 246–51(1930).—The function of the central nervous system of *Bufo vulgaris* in regulating $p_H$ value has been studied by adding small amts (in mg.) of the substance to 10 cc of the acid mixt, Sorensen's solns being used (0.1 *M* HCl + 0.1 *M* glycocoll, *M*/15 $K_2HPO_4$ + *M*/15 $Na_2HPO_4$) as well as those of McIlvaine (0.1 *M* citric acid + 0.2 *M* $Na_2HPO_4$) Various parts of the nervous system, as brain and spinal fluid, have the same regulating function Time of contact or temp has little effect on the regulating function, there is no difference in the action of isotonic and *anisotonic solns*, *however, in isotonic solns of mixts of* KCl, LiCl, $KIO_3$, *slightly* greater regulation is obtained than in isotonic NaCl alone A neutral strychnine sulfate soln. (2.5 10,000, tetany-producing) raises the power slightly, whereas a soln of 9.5 cc physiol soln and 0.5 cc abs EtOH (narcotic) depresses the action. A. W. C.

**The hydremic curve (fasting) in various short exercises. III.** L. Bracaloni *Atti accad. Lincei* 12, 252–7(1930), cf *C A* 24, 4814.—Previous work suggested that the hydremic curve may vary with the intensity of exercise rather than duration, therefore, 6 subjects were subjected to various forms of exercise: 50 and 100 m race, climbing a 9 m rope, rowing 10, 20, 30 strokes, 10–30 chinnings, 10 leg flexings In all cases the water content of the blood diminished 0.7 to 1.23%, but was recovered in about 15 min., and differed more with the individual than with the form of exercise. A. W. C.

New viewpoints to the problem of the transformation of fat into carbohydrate in the organism. M. Hevze. *Z. physiol. Chem.* 195, 248–64(1931); cf. *C. A.* 25, 494.—In formulating the reactions involved in the transformation of fat into carbohydrate the chief difficulty is the fact that β-oxidation of fatty acids yields 4 C chains such as $AcCH_2CO_2H$ and $MeCHOHCH_2CO_2H$, whereas 3 C chains such as $AcCO_2H$ and AcCHO are required for glucose synthesis. The newly discovered reaction product of $AcCH_2CO_2H$ and AcCHO, viz., diacetylethanol, $AcH_2CAcCHOH$, contains 6 C atoms and by addn. of 2 $H_2O$ and 1 O could yield $C_6H_{10}O_6$. Again, this hydroxydiketone could oxidize to 2 AcCHO, thus effecting the transition from the 4 C to the 3-C chain. Feeding expts. with this ketol show that large amts. are tolerated and frequently disappear entirely. Likewise liver pulp removes the ketol. In such expts. the sugar is first destroyed by yeast fermentation which does not attack the ketol. Disappearance of the latter is then shown by the absence of reducing power. Oxidation by $KMnO_4$ converted the ketol into $AcCO_2H$, identified by prepn. of the *p*-nitrophenylhydrazone.
A. W. Dox

The fate of choline in the blood. Comment on the paper of Irvine H. Page and Erich Schmidt. Fritz Wrede and Ernst Brücl. *Z. physiol. Chem.* 195, 255–9 (1931).—The disappearance of added choline, observed by Page and Schmidt (*C. A.* 25, 322) could not be corroborated. Whether fresh blood, serum or blood heated to 56° was used and whether the analysis was performed immediately or 7 hrs. after adding the choline, the recovery as chloroaurate by the authors' method (*C. A.* 23, 5493) was quite uniformly approx. 80%. Pos. evidence by isolation and chem. identification of the substance should outweigh neg. results by a biol. assay.
A. W. Dox

The occurrence of ether-insoluble lecithins in the brain. Wilhelm Merz. *Z. physiol. Chem.* 196, 10–18(1931).—From the protagon fraction of the brain a white hygroscopic substance was isolated which resembled sphingomyelin in its insoly. in $Et_2O$, petr. ether and MeAc. It becomes vitreous at 65–72° and melts above 140° with decompn. Hydrolysis by $Ba(OH)_2$ in MeOH yielded choline which was identified as the chloroplatinate. Cholamine, the base constituent of cephalin, was not found. The fatty acids identified were palmitic, very little stearic, and about 21% oleic. Since less than 30% of unsatd. acid was found, the existence of natural lecithins contg. only satd. acids is demonstrated. Of the glycerophosphoric acid present 58% was the β-acid identified by its difficultly sol. double salt with $Ba(NO_3)_2$. This is the first instance of a naturally occurring lecithin insol. in $Et_2O$.
A. W. Dox

The follicular hormone. Preliminary paper. Bolesław Skarzyński. *Z. physiol. Chem.* 196, 19–22(1931).—By the method of Marrian, in which 5% KOH is used, a hormone was obtained from gravid urine which in 240–50° and showed the same ultraviolet absorption curve as Butenandt's hormone. Its activity was 9,500,000 mouse units as detd. by a 50% response after 5 injections during 30 hrs. The substance in KOH soln. showed a complete loss of selective absorption spectrum after 72 hrs., indicating a deep-seated change. Possibly the crystals represent an inert substance to which the hormone is assocd. as a difficultly separable impurity.
A. W. Dox

The ammonia content of frog muscle and the reversibility of ammonia formation in the isolated frog muscle. Gustav Embden. *Z. physiol. Chem.* 196, 23–46(1931).—A lengthy and tedious polemic against Parnas (*C. A.* 25, 995).
A. W. Dox

The development and phosphatase activity in vivo and in vitro of the mandibular skeletal tissue of the embryonic fowl. Honor Bridget Fell and Robert Robison. *Biochem. J.* 24, 1905(1930).—cf. *C. A.* 24, 1672.—By the sixth day of embryonic development the future histological structure of the non-ossifying part of Meckel's rod and of a future cartilage bone such as the palato-quadrate or femur is already detd., although at this stage no histological differences between the 2 types of cartilage have yet appeared. The membrane bone surrounding Meckel's cartilage possesses a high phosphatase activity.
Benjamin Harrow

What effect have the hormones of pregnancy on the growth of the fetus and the changes of pregnancy of the mother? F. Siegert. *Arch. Gynäkol.* 143, 72–9(1930).—Both the ovarial hormone and the hormone from the anterior lobe of the hypophysis are increased during pregnancy. The ovarial hormone is excreted in the urine in increasing amts. as pregnancy progresses while the hypophyseal hormone is excreted in large amts. from the very onset of pregnancy and in lesser amts. as pregnancy progresses. While in early pregnancy the blood always gives a pos. test for ovarial hormone, at the time of delivery the blood of the mother gave a pos. reaction in 57.7% of the 52 cases studied and the blood of the child a pos. reaction in 76.5%. The content of hypophyseal hormone is the same in the blood of both mother and child and shows no decrease at the time of delivery. It is probable that the ovarial hormone plays an

important role in the changes in the organism of the mother that accompany pregnancy and that it is excreted in larger amts in the second half of pregnancy because its biologic importance is now lessened The biologic activity of the hypophyseal hormone during pregnancy must remain the same or increase, as in spite of increased excretion in the urine at the end of pregnancy there is no change in its content in the blood The hypophyseal hormone is probably directly concerned with the growth of the fetus The regulation of the amts of hormones seems to be a function of the placenta, in fact it is most probable that the placenta takes on the function of producing a substance identical with *the ovarial hormones and through the fetal portion of the placenta stimulates* the anterior lobe of the hypophysis to increased activity HARRIET F HOLMES

**The calcium content of the blood serum during pregnancy.** M. ADLER *Arch Gynäkol* 143, 236–47(1930) —By use of the method of Kramer Tisdall the Ca content of the blood serum was detd for 14 healthy nonpregnant women, 26 healthy women *in different stages of pregnancy* 6 women *during labor* and 12 women during the puerperium During pregnancy the Ca content of the serum is lowered and the decrease begins as early as the 3rd month The decrease is uniform from the 5th to the 9th month The Ca content rises slightly in the 10th month without reaching the normal level During labor the Ca content increases to the lower limit of physiol variability and the degree of increase seems to be related to the duration of the labor pains Twenty four to 48 hrs postpartum the Ca content drops below the value before labor It remains below normal until the 8th day postpartum and then rapidly returns to the lower normal limit HARRIET F HOLMES

*Potassium and calcium in the menstrual cycle and during pregnancy.* R SPIEGLER *Arch Gynäkol* 143, 218–71(1930) —The K content of the blood undergoes a marked alteration during the menstrual cycle As a rule, the lowest K value is reached during menstruation and then increases progressively in the postmenstrual period to reach its max in the premenstrual period In contrast the Ca content of the blood is very stable and shows no noteworthy change during the menstrual period The opposite behavior of the K and Ca ions results in a marked change in the K Ca ratio In pregnancy the K content of the blood tends to rise in 60% of the cases The Ca content is not altered with the onset of pregnancy but during the course of pregnancy there seems to be a slight decrease in Ca content With increasing pregnancy the K Ca ratio is slightly shifted in favor of the K In comparing the blood of mother and child the ions of the blood of the child are not inconsiderably increased over those of the mother The increase affects both K and Ca but the K Ca ratio in general is increased in favor of K HARRIET F HOLMES

**The modification of the alkali reserve of the blood by pregnancy, labor and puerperium and its behavior in the newborn.** J MALPATTI AND J BURTSCHER *Arch Gynäkol* 143, 272–309(1930) —The alkali reserve of the blood decreases during pregnancy The decrease becomes more marked during labor and is greater in primiparas *than in multiparas* The alkali reserve of the blood increases postpartum but does not reach normal value during the first 3 or 4 days Lactation modifies the $CO_2$-combining power of the blood as is shown by a decrease in the alkali reserve of the blood if the blood is withdrawn at least more than 12 hrs after the beginning of lactation if the blood is withdrawn before this time, this decrease cannot be demonstrated After the decrease in alkali reserve of the blood produced by lactation, there occurs a further increase in $CO_2$-combining power, which does not return to normal even 12 21 days postpartum In a case of vomiting of pregnancy and in a case of *nephropathia gravidarum* the alkali reserve was decreased below that of healthy pregnant women Septic conditions cause a particularly low value for the alkali reserve The alkali reserve of the blood of the newborn child is in general lower than that of the mother The newborn child in the first 21 days of life shows a distinct acidosis that is in general greater than that of the mother during the puerperium HARRIET F HOLMES

**The iodine content of the blood in women under physiologic conditions.** W SCHERINGER *Arch Gynäkol* 143, 319–37(1930) —The total I content of the blood (inorg and org bound I) was detd in 18 healthy women A diet poor in I caused a decrease of about 25% in the I content of the blood After more than 2 days of a diet poor in I, the I content of the blood tends to remain const with an av value of 8γ% Seasonal variations from winter to summer were not observed That the menstrual cycle has an effect on the I content of the blood was confirmed At the onset of menstruation the I content of the blood is increased to 20–25% of the I content in the intermenstrual period Several normal women were studied more carefully with detn of basal metabolism and the Reid-Hunt reaction and the I content of the blood was

pora lutea in the ovaries had no stimulating effect on the development of mammalian tissue J. F. LYMAN

The relation between contraction frequency and lactate accumulation and its bearing upon the economy of tension production and maintenance in striated muscle. M. B. VISSCHER AND P. W. SMITH *Am J Physiol* 95, 121-9(1930).—Lactic acid production in the frog's gastrocnemius muscle is inversely proportional to the frequency of stimulation. The lactic acid coeff of developed tension is a more const factor than is the coeff of maintained tension The slow removal of lactic acid is of advantage in those muscles where maintenance of tension is an important function. Fatigue contracture seems to be due to a depletion to a low level of the store of base for neutralizing free lactic acid J. F. LYMAN

The source of energy for anaerobic contraction in glycogen-poor muscle. P. W. SMITH AND M. B. VISSCHER *Am J Physiol* 95, 130-8(1930).—Lactate accumulation in anerobic contractions to fatigue is entirely balanced by the loss of glycogen in glycogen-poor, as well as in glycogen rich muscle The constancy of the developed tension coeff of lactate at widely varying levels of glycogen content strongly supports the hypothesis that the reactions assocd with lactic acid production yield the energy for the contraction process. J. F. LYMAN

Maternal and fetal blood-sugar changes under various experimental conditions. S. W. BRITTON *Am J Physiol* 95, 178-85(1930).—In early pregnancy, blood sugar changes seem to be readily effected in the fetus in response to changes in the maternal blood In the later stages of gestation, fetal glucose variations are brought about (and then only slightly) only after severe maternal disturbance, such as insulin hypoglucemia, emotional excitement, adrenaline or glucose administration. J. F. L.

Physiological variations of the cardiac output in man. X. The effect of variations in the environmental temperature on the pulse rate, blood pressure, oxygen consumption, arteriovenous oxygen difference and cardiac output of normal individuals. A. GROLLMAN *Am J Physiol* 95, 263-73(1930); cf. *C. A.* 24, 5824.—From 0° to 45° the pulse rate rises progressively, blood pressure falls about 10%, metabolism declines to a min. at about 30°, after which it rises slowly, cardiac output is const. between 0° and 28°, above which the output gradually increases. XI. The pulse rate, blood pressure, oxygen consumption, arteriovenous oxygen difference and cardiac output of man during normal nocturnal sleep. *Ibid* 274-84.—Of the functions studied only the pulse rate rises as a result of awakening of the subject. XII. The effect of the menstrual cycle on the cardiac output, pulse rate, blood pressure and oxygen consumption of a normal woman. *Ibid* 96, 1-7(1931).—No variations in the functions studied were observed as a result of the menstrual cycle XIII. The effect of mild muscular exercise on the cardiac output. *Ibid* 8-15.—*The cardiac output in very mild exercise bears* no simple relation to the $O_2$ consumption. J. F. LYMAN

The mechanism of water exchange in the animal organism. I. The nature and effects of superficial burns. F. P. UNDERHILL, R. KAPSINOW AND M. E. FISK. *Am. J. Physiol* 95, 302-14(1930).—Skin burns, involving about 30% of the total area, were made on anesthetized rabbits by means of a hot iron The subsequent edema and absorption of the fluid are described In the production of such a burn heat was shown to penetrate the body sufficient to raise the temp. of the body cavities temporarily to about 111°F. This is regarded as sufficient to lead to local circulatory changes inducing the formation of ulcers, hemorrhages, etc., which have been ascribed to the effects of a burn toxin II. Changes in capillary permeability induced by a superficial burn. *Ibid* 315-24.—Under the conditions of a burn, capillary permeability is increased. Substances which normally do not pass the capillary wall (*e. g.*, dyes) are found in the edema fluid. Since absorption from the burned area is much slower than normal, increased capillary permeability in one and decreased permeability in the opposite direction may exist. III. The extent of edema fluid formation induced by a superficial burn. F. P. UNDERHILL, M. E. FISK AND R. KAPSINOW *Ibid* 325-9.—With a burn involving about 17% of the total body surface the max. water loss in the edema fluid was about 70% of the total blood vol. IV. The composition of the edema fluid resulting from a superficial burn. F. P. UNDERHILL AND M. E. FISK *Ibid* 330-3.—Edema fluid, produced by an extensive skin burn, is approx. the same in compn. as the serum of the blood of the burned animal, non-protein N, K, Mg and inorg. P are generally higher in the edema fluid than in normal serum, K may be several times higher. Both the serum of the burned animal and the edema fluid contain less globulin than does the serum of a normal non fasting animal V. The relationship of the blood chlorides to the chlorides of the fluid produced by a superficial burn. F. P. UNDERHILL, M. E. FISK AND R. KAPSINOW. *Ibid* 334-8.—Blood Cl shows no diminution as long as blood concn. is main-

tained within normal limits Cl losses may be replaced to a considerable extent. As much as 30% of the NaCl of the blood may be lost to the edema fluid without causing alteration in the Cl content of the blood VI. The composition of tissues under the influence of a superficial burn. *Ibid* 339–47.—Rabbits were burned under anesthesia, about 17% of the skin area being affected, and allowed to live without food or water for 2–3 days In comparing the water, ash and chloride content of the tissues of burned animals with those of unburned controls, no effect of the burn on the compn of the tissues was apparent Presumably the compn of the tissues is conserved in preference to that of the blood When a portion of the skin is burned the Cl content of the entire skin is markedly increased In muscle tissue injured by a burn the $H_2O$ content is increased, the ash content varies but little from normal, but the Cl content is increased even more than in burned skin. The resorption of material from a burned area is very slow VII. Dehydration produced by various means. F P Underhill and M E Fisk. *Ibid* 348–63.—When rabbits are deprived of food and water and in addn. given phlorhizin or hypertonic solns or bled, the skin may lose 20% of its water, the blood may become concd. and the muscles may lose some water, but a marked loss from all the tissues except the liver (and possibly the kidney), which never lose, results in death. VIII. Dehydration by pilocarpine under varied dietary conditions. *Ibid* 364–70.—The repeated injection of pilocarpine causes pulmonary edema and blood concn., a loss of water from the skin and an increase of water in most of the organs of animals receiving fresh vegetables as part of their diet J. F Lyman

The respiratory quotient of resting mammalian muscle as shown by the eviscerated decapitated cat. L Irving and H C. Foster *Am J. Physiol* 95, 429–45(1930).—When over ventilation was avoided and correction made for any change in $CO_2$ content of the muscles, the R Q of the eviscerated decapitated cat was about 0 80 Intravenous injection of glucose caused a slight rise in the R Q to 0.85 After large doses of insulin and glucose the corrected R. Q rose to 0 94, indicating the diversion of oxidation to the principal use of carbohydrate The action of insulin and glucose, in addn. to increasing carbohydrate oxidation and glycogen storage, affects the $CO_2$ equil in muscle, probably increasing muscle capacity for $CO_2$ J F. Lyman

Metabolism. VIII. The effect of estrin injections on the basal metabolism, uterine endometrium, lactation, mating and maternal instincts in the adult dog. M M. Kunde, F E D'Amour, A. J. Carlson and R. G Gustavson *Am J. Physiol* 95, 630–40(1930), cf *C A* 22, 113.—Basal metabolic rate in normal dogs is not changed by the subcutaneous injection of the female sex hormone, estrin In normal and castrated bitches injection of the hormone causes estrus and lactation. J. F. Lyman

The effect of simultaneous injections of the female and male hormones in capons. Mary Juhn, F. E D'Amour and C B Womack. *Am J Physiol* 95, 641–9(1930).—The continued daily administration of both hormones together, or of alternate injections, on successive days, resulted in birds with female plumage and male head furnishings. There was no evidence of antagonism between the sex hormones J. F. L.

The nature of the nerve impulse. I. The effect of carbon monoxide on medullated nerve. F O Schmitt *Am J. Physiol* 95, 650–61(1930); cf *C. A* 25, 732.—Conclusion The action potential of nerve, whether anaerobic or aerobic, requires an oxidation or oxygenation of substances in nerve, and activation of the $O_2$ by a respiratory enzyme similar to that of Warburg is essential J F Lyman

The hormone of the adrenal cortex. F A Hartman, Katharine A Brownell and W. A. Hartman. *Am J Physiol* 95, 670–80(1930), cf *C A*. 25, 1884.—Cortin can be prepd by extg the adrenal cortex with $Et_2O$, which dissolves little adrenaline The $Et_2O$ is distd., and the residue extd with warm 80% EtOH Much inert material is removed by chilling and filtering After removing the alc. the residue (*cortin*) is dissolved in water When it is given subcutaneously to adrenalectomized cats, animals, which otherwise would lose wt. and die, carry out all the life functions normally A case of Addison's disease with a systolic blood pressure of 50 mm. and a pulse of 120 with other characteristic symptoms was revived by the use of cortin. J. F. Lyman

Changes in sugar and lactic acid content of blood caused by burns. M. A. Slocum and H. D Lightbody *Am J Physiol* 96, 35–9(1931).—The concn. of sugar and lactic acid in the blood of rabbits that had been subjected to burns with the adrenal glands intact, and after removal of the glands, indicate that increased activity of the adrenals in a burned animal does not account for the observed increase in blood sugar. J F. Lyman

The oxygen consumption of isolated muscles for isotonic and isometric twitches. Ernst Fischer. *Am J Physiol.* 96, 78–88(1931).—Isotonic twitches with large loads, where only little shortening occurs, have a higher O consumption than isometric

twitches, while isotonic twitches with small loads, and consequently large shortenings, need less O than the isometric twitches The value of 0 380 for the O consumption per g tension and unit muscle length was obtained, with a max. efficiency of 13.8%. The energy liberated in a twitch depends on 2 factors, the length of the fibers during contraction and the work done J F LYMAN

The hemoglobin content of the blood of fowls. H H DUKES AND L H SCHWARTE. *Am J. Physiol.* 96, 89–93(1931) —By using the Newcomer acid hematin method with the Bausch and Lomb "Improved Newcomer Modal" hemoglobinometer, a correction for turbidity disturbance in fowl blood must be applied as follows $C = 0\,91\,U - 1\,49$, where $C$ is the corrected reading and $U$ the uncorrected reading A corrected value of 9 8 g hemoglobin per 100 cc. of hen blood was obtained, for pullets 8.9%, cocks 13 5, pheasants 13 7, wild ducks 14, wild geese 14 9, brants 14 7, swan 13 4, peafowls 12 0, turkeys 10 7 J F. LYMAN

The oxygen pulse in athletic girls during rest and exercise. ELLEN M RADLOFF *Am J Physiol* 96, 126–31(1931) —From 2 to 3 times as much $O_2$ is used per systolic discharge of the heart during exercise as during rest J F LYMAN

The adrenal cortex. I. The effect of a lipide fraction upon the life span of adrenalectomized cats. W W SWINGLE AND J J PFIFFNER *Am J Physiol* 96, 153–63 (1931) —A crude lipide fraction that is capable of prolonging life in an animal whose adrenals have been removed can be prepd as follows Fresh adrenal cortex material is extd 24–72 hrs at room temp with 2 5 vols of 95% EtOH The alc is removed through muslin and filtering The residue is re-extd with 2 vols of 80% EtOH The alc. is distd. *in vacuo* to about 7% of the original vol , each extn is handled separately Each concentrate is extd 3 or 4 times with an equal vol of benzene for each extn The benzene is distd *in vacuo*, the last traces being removed by the addn of 50–100 cc portions of abs EtOH and evapg to dryness The lipide residue is dissolved in corn oil or olive oil with the aid of abs EtOH, the alc being removed by distn *in vacuo* 1 cc represents 30 g fresh cortex Adrenaline is present in the prepn II An aqueous extract of the adrenal cortex which maintains the life of bilaterally adrenalectomized cats. *Ibid* 164–79 —The lipide fraction, as obtained by the method described above, weighing 81 g was treated with 500 cc. acetone in the refrigerator for 24 hrs The residue was extd once with 500 cc. acetone and once with 100 cc. acetone The acetone was distd *in vacuo*, leaving 14 7 g residue This residue was treated in a separatory funnel with 30 cc petr ether (b 30–60°), 74 cc of 95% EtOH and 26 cc of $H_2O$ The 70% alc. layer was washed 5 times with 30 cc. portions of petr ether The petr ether soln. and washings were distd. *in vacuo* and the distribution procedure was repeated The petr ether soln., resulting from the second distribution, was extd twice with 70% alc. The alc. solns were washed successively 5 times with 30 cc. portions of petr. ether in the order 2, 3 and 4 distributions, and finally the third and fourth distributions were washed twice with 30 cc. portions of petr ether The active material, sol in 70% alc., weighed 1 489 g The alc. was removed *in vacuo* to a vol of about 65 cc. and $H_2O$ was added to 100 cc , 1 cc. representing 30 g fresh cortex The ext was kept in the refrigerator overnight, centrifuged and decanted through a Seitz filter The clear reddish brown ext contained 0 5809 g of solids, $p_H = 5.2$, 1 cc. = 0 36 mg adrenaline, *i. e.*, 99 6% of the adrenaline in the original tissue was eliminated III. The revival of cats prostrate from adrenal insufficiency with an aqueous extract of cortex. J J PFIFFNER AND W W SWINGLE *Ibid* 180–90 —Adrenaline was removed from the ext. of adrenal cortex described above as follows The 70% alc.-sol. fraction contg 1 49 g solids and 36 mg of adrenaline was distd *in vacuo*, the residue dissolved in 100 cc. of 95% EtOH and the soln filtered through two 30 g portions of permutite, at the rate of 1 to 2 drops per sec The permutite was washed with one 100 cc and one 300 cc portion of 95% alc The alc. filtrate contained 0 41 g solids and less than 1 mg adrenaline It was coned to about 100 cc and filtered through two 15 cc portions of permutite The filtrate contained 0 40 g solids and about 0 05 mg adrenaline The alc. soln was coned to about 100 cc and 70 cc water added. The alc. was removed and the ext dild to 100 cc with water The resulting milky soln was clarified and sterilized by filtering through a Seitz filter The ext. was crystal clear and very pale yellow It contained 0.29 g solids, 0 05 mg adrenaline, $p_H = 5\,65$ One cc. = 30 g fresh beef adrenal cortex Large doses of this ext can be given without any deleterious effects Cats in collapse from adrenal insufficiency, following removal of the glands, were restored to a normal condition after injection of the ext. J F L.

Water diuresis. D McK. RIOCH *J Physiol* 70, 45–52(1930) —Large vols. of fluids were given through the stomach to normal dogs and the effects on blood and urine observed There was (1) a const lag of diuresis behind the changes in the blood

following the ingestion of isotonic salt solns; (2) a constancy of changes in the blood following the ingestion of isotonic salt solns and (3) an inconstancy of changes in the blood following the ingestion of water. Dilu of the electrolyte concn of the blood is *probably the responsible factor* in instigating a water diuresis. J. F. Lyman

**Water diuresis. IV. Changes in the concentration of electrolytes and colloids in the plasma of decerebrate dogs produced by the ingestion of water.** L. E. Bayliss and A. R. Ure. *J. Physiol* 70, 60–6(1930), cf. *C. A.* 24, 4821.—Conclusion: In dogs the absorption of water from the digestive system results in a fall in the concn. of plasma colloids, which is approx. that which would take place if the extra water were uniformly distributed throughout the tissues. There may be a fall in the electrolyte concn. of the plasma, but this is always less than that of the colloid concn. Intravenous injection of 0.6% NaCl soln. also results in a fall in the concn. of the plasma colloids of the expected magnitude. J. F. Lyman

**The respiratory quotient of the eviscerated spinal cat.** A. B. Corkhill, H. H. Dale and H. P. Marks. *J. Physiol* 70, 85–95(1930).—The R. Q. of the decapitated cat, whose viscera have been removed and whose blood sugar is maintained by artificial addn. of glucose, is usually found to be 1. Somewhat lower values are sometimes found. Excessive ventilation in these expts. was excluded. J. F. Lyman

**Delayed anaerobic heat production of stimulated muscle.** H. Blaschko. *J. Physiol* 70, 96–100(1930).—The occurrence of delayed anaerobic heat after a tetanic stimulus in muscle has been verified. It seems to be due to some real process going on in the muscle, but condensation of water vapor, caused by a temporary rise of osmotic pressure and also the *non uniform* heat production in contraction or control have been excluded as possible causes. J. F. Lyman

**Reactions of denervated voluntary muscle, and their bearing on the mode of action of parasympathetic and related nerves.** H. H. Dale and J. H. Gaddum. *J. Physiol* 70, 109–44(1930).—Evidence is obtained, from a study of the action of drugs on denervated muscle, that vasodilator effects of impulses in the parasympathetic and dorsal root nerve fibers depend upon peripheral liberation of acetylcholine. J. F. Lyman

***The nature of inhibition in the intestine.*** B. Finkelman. *J. Physiol* 70, 145–57 (1930).—When the movements of a certain piece of intestine were inhibited by nervous stimulation, a substance appeared in the liquid passing over the surface of the intestine which had the power of inhibiting a 2nd piece of intestine. Conclusion: The inhibitory nerves to plain muscle act by liberating an inhibitory substance. The effects of this substance are, in all ways, similar to those produced by adrenaline. J. F. Lyman

***The automatic regulation of gastric acidity.*** F. L. Apperly and Joan H. Norris. *J. Physiol* 70, 158–68(1930).—Changes in acidity of acid solns. placed in the stomach were studied. *Conclusion.*—The reduction in acidity observed with solns. above a certain concn. takes place mostly by dilu., the diluting fluid being partly secreted by the gastric mucosa and partly regurgitated from the duodenum, and, in the majority of cases, the reduction in acidity is partly effected by duodenal alkali in addn. J. F. L.

**Interrelations of respiratory and gastric secretion.** C. E. Brunton and M. C. G. Israels. *J. Physiol* 70, 184–94(1930).—*If gastric HCl is derived from the blood* chloride thus: $BCl + H_2CO_3 \longrightarrow BHCO_3 + HCl$, an increased $CO_2$ tension in the alveolar air might be expected during gastric secretion with a subsequent fall during the phase of pancreatic digestion. No such const. shifts were observed. It is argued that any possible excess of alkali resulting from the secretion of amts. of HCl normally produced might be dealt with without necessarily causing a measurable rise in alveolar $CO_2$. J. F. Lyman

***Lactic acid formation and removal with change of blood reaction.*** M. Grace Eggleton and C. L. Evans. *J. Physiol* 70, 261–8(1930).—The lactic acid content of the blood, used to perfuse isolated mammalian muscle, is increased by increasing the alky. of the perfusing fluid. When the acidity of the fluid is increased, the lactic acid falls again, if the blood is perfused through muscle, but not if perfused through lung alone. J. F. Lyman

**The lactic acid content of the blood after muscular contraction under experimental conditions.** M. Grace Eggleton and C. L. Evans. *J. Physiol* 70, 269–93(1930).—The following points were settled: (1) The av. lactic acid content of superficial venous blood is closely parallel to that of the arterial blood, yet individual samples show variations. (2) The lactic acid content of tissues is somewhat less than that of the blood plasma. This difference, up to about 10%, can be accounted for on the basis of the higher water content of the plasma. (3) Lactic acid in the blood and tissues does not come to equil. until at least 10 min. after the end of exercise. (4) The liver removes

lactic acid from the blood, but it is not solely responsible for lactic acid removal (5) In the eviscerated animal (*a*) lactic acid does not rise during rest during the 4 hrs following the operation, and (*b*) glycogen synthesis occurs to a considerable extent in muscles during recovery from exercise (6) In the resting condition the sugar and lactic acid content of the blood are normal under amytal anesthesia, but abnormally high in the decerebrate animal J F. LYMAN

**The diffusion of creatine and urea through muscle.** P. EGGLETON. *J. Physiol* 70, 294–300(1930) —In salt solns contg creatine, in which resting muscles are immersed, there is creatine equil without loss or gain of creatine to the muscle when the liquid contains 80 mg creatine per 100 cc of soln or 65 mg per 100 g of muscle (80 mg per 100 cc of $H_2O$ in the muscle) This indicates that about 20% of the total creatine of resting muscle is in the free state With fatigued muscle equil is obtained at concns of 200 to 300 mg creatine per 100 cc of soln Urea distributes itself between resting muscles and surrounding isotonic salt solns as if the whole of the water in the muscles is capable of dissolving urea J F LYMAN

**The effect of carbon dioxide on the circulation** I R J S MCDOWALL. *J Physiol* 70, 301–15(1930) —Over ventilation has 2 effects (1) a dilatation of blood vessels in certain regions of the circulation resulting from a loss of tone in the vasomotor center (2) a constriction in other regions produced by a different mechanism Accordingly blood pressure may fall, rise or remain unchanged as a result of overventilation J F LYMAN

**Excitable substances in the nerve-muscle complex.** W A H RUSHTON *J Physiol* 70, 317–37(1930) —Conclusion There are 2 different excitable substances in the nerve muscle complex The $\gamma$ substance, which is isochronous with nerve, so far from being the excitable substance of the normal muscle fiber lies in a direction which is usually quite different, and appears to be absent from the pelvic extremity of the sartorious the $\alpha$ substance, on the contrary, seems to have the properties of the excitable element of the muscle fiber J F LYMAN

**The carriage of carbon dioxide by blood.** M N J DIRKEN AND H W MOOK *J Physiol* 70, 373–84(1930), cf *C A* 24, 3157 —An app is described with which it is possible to measure either the $p_H$ or the $CO_2$ tension of a fluid after $CO_2$ has been added, at various moments up to about 4 sec There is evidence that hydration of $CO_2$ is slow dehydration of $H_2CO_3$, while slow, is much more rapid than its reverse If hemoglobin is present, anhydrous $CO_2$ disappears from the fluid just as rapidly as any acid There must be (1) some direct combination between hemoglobin and anhydrous $CO_2$ or (2) a catalytic acceleration of the hydration of $CO_2$ by hemoglobin J F LYMAN

**Selective absorption of carbohydrates.** J. J R MACLEOD, H E MAGEE AND C B PURVES *J Physiol* 70, 404–16(1930) —*The surviving intestine shows selective* absorption for sugars at body temps, but at 4° the intestinal wall behaves like a dead membrane Selective diffusion could not be demonstrated when mixts of sugars were used in place of sep solns of each sugar The selective absorption of glucose is most rapid when the concn of glucose is about 0 75 *M* J F LYMAN

**The vapor pressure of normal human blood.** R. MARGARIA *J. Physiol.* 70, 417–33(1930) —Measurements were made by the use of Hill's thermoelectrical method (*C A* 24, 3695) Expressed in terms of g of NaCl in 100 g of $H_2O$, the values were for men (19 observations) 0 9447 ± 0 00495, for women (16 observations) 0 9269 ± 0 0059 The reality of the difference between the sexes is statistically certain The difference is due mostly to bicarbonate and urea differences After drinking 1500 to 2000 cc of water, values as low as 0 88 were noted and after severe muscular exercise a value of 1 048 was observed J F LYMAN

**The absorption of calcium from the gall bladder.** L M G SACHS AND T. SCHRIRE. *J Physiol* 70, 434–40(1930) —Ca can be absorbed *from the gall bladder, probably* along with water and other substances It is suggested that there is a "Ca circle" in the liver, which provides a mechanism for a continuous supply of Ca to the general circulation J F LYMAN

**The nervous control of insulin secretion.** J HOET AND H ERNOULD Proc Physiol Soc, *J Physiol* 70, i–ii(1930) —A demonstration that vagus innervation of the pancreas is necessary for normal insulin secretion is described When 60 cg glucose per kg rabbit is injected into an animal under allylisopropyl barbiturate of diethylamine" whose kidneys have been removed the blood sugar level comes back to 0 130 or 0 140%, but when also the vagi are cut, the glucemia will stay for hrs. at a level of 0 300 or 0 400% J F LYMAN

**Glycogen recovery in mammalian muscle as an insulin function.** G DEBOIS. Proc Physiol Soc, *J Physiol* 70, ii–iv(1930), cf *C A* 25, 1884 —The glycogen content

*of muscles from cats, whose metabolism had been altered by operations,* was detd immediately after periods of work and after a recovery period of 1 5 hrs. Conclusion: In the absence of liver and pancreas and other visceral organs there is no recovery of muscle glycogen after loss by exercise There is no recovery in a cat under ether with the vagi cut With the vagi intact there is a normal recovery After removal of the pancreas there is no recovery whatever Insulin injection makes recovery possible in a very short time Glycogen recovery after contraction in muscle is an insulin function J F Lyman

*A possible nervous mechanism involved in the liberation of histamine.* R. G MacGregor and S. Peat *J Physiol* 71, 31 5(1931) —Cats were anesthetized, the left lung was removed for analysis, the animal then subjected to the exptl conditions, after which the right lung was removed and assayed The method used was capable of detecting a difference of 20% or more Neither stimulation of the nerves supplying the lungs, nor perfusion with adrenaline, pilocarpine or physostigmine gave rise to any detectable change in their histamine content. J F Lyman

Ovulation. IV. Induction of ovulation in the hypophysectomized rabbit by administration of anterior lobe extracts. Margaret Hill and A S. Parkes. *J. Physiol* 71, 36-9(1931), cf *C A* 24, 5819, 25, 2765 —A hormone, extd from the anterior lobe of ox pituitaries, replaces the function of the removed pituitary in the rabbit in causing ovulation in estrous, pseudo-pregnant or immature rabbits V. The action of the ovulation-producing substance of urine of pregnancy on the hypophysectomized rabbit. *Ibid* 40 6 —Exts of urine from pregnant women induced ovulation in 4 out of 19 trials in hypophysectomized rabbits. Exts of normal rabbits placentas were inactive, but highly active exts were obtained from the placentas of intact or hypophysectomized rabbits previously injected with exts of pregnant urine J F. L

Adaptations of the organism to changes in oxygen pressure. I. Physicochemical changes in human blood at low oxygen pressure. D B Dill, H T. Edwards, A. Föll-ing, S A Oberg, A M Pappenheimer, Jr and J H Talbott *J Physiol* 71, 47-63(1931) —Measurements were made at sea level, 10,000 ft. and 14,000 ft The O transport capacity may be decreased by 20% in normal men at 10,000 ft altitude This large effect may be due to an indirect effect of a small change in O satn of arterial blood upon the limiting value of cardiac output J F Lyman

*The initial and recovery heat production of vertebrate nerve.* D. W. Bronk. *J. Physiol* 71, 130-44(1931) —Heat production of frog nerve has been measured with improved app The recovery heat production is at a max rate immediately after a stimulus of 9-15 sec and continues for some min (11 min at 19° and 7 75 min at 24-5°) at a decreasing rate The initial heat production is 8 9% of the total J F L.

The creatine and phosphorus contents of muscle. Marion Brown and C. G Imbrie *J Physiol* 71, 214 21(1931) —When the concn of creatine in the muscles of cats was increased, following the absorption of creatine from the intestine, the concn of the total acid sol P was also increased J F. Lyman

Studies on the action of the $p_H$ in striated muscle and on their buffering power. S Goldberger *Arch sci biol* (Italy) 15, 505-24(1930) —Varying the H ion concn of the circulating liquid, whether it be toward the acid or toward the alk side, increases the threshold of the excitability and the intensity of the stimulus necessary to produce max contraction, lowers the height of the contraction and leaves unchanged the latent time and the duration of the contraction The muscle retains its buffering power for over 24 hrs when using solns between $p_H$ 3 2 and 10 8, while the more acid or alk fluids cause the loss of such capacity within 45 min The acid solns. also bring about an inexcitability of the muscle, while the alk solns do not The loss of excitability is related to the transformation of the protein anion into cation The size of the edema formed is independent of the H ion concn The variation of the H ion concn. produces a marked vasoconstriction Peter Masucci

Respiratory exchange in asphyxia. Giorgio Mennyey. *Arch sci. biol* (Italy) 15, 52a-54(1930) —The scope of these studies was to clarify certain points in the behavior of the respiratory exchange in man under conditions of asphyxia caused by an abnormal compn of the respired air Voluntary apnea, after normal respiration, may continue until the partial pressure of $CO_2$ and O in the alveolar air reaches a definite value 51 mm Hg for $CO_2$ and 78 mm Hg for O Respiration, for 90 sec , of a gaseous mixt. (7% $CO_2$ and 11% air) similar in compn to that of alveolar air, at the end of the voluntary apnea causes variations in the compn of the expired air, pulmonary ventilation, R Q , elimination of $CO_2$ and consumption of O, these changes, which are enumerated in detail, take place during and after the respiration of the gaseous mixt. The phenomena are observed in the same manner, but less conspicuously, when a gaseous mixt.

contg 7% $CO_2$ and 20% O is respired In this case, during the period of asphyxia there is also a diminution in the elimination of $CO_2$, with a successive increase in elimination in the post asphyxia period For respiration of a mixt contg 11% O without the addn of $CO_2$, the curve of O absorption is the same, but with fewer oscillations than in the preceeding case During the period of asphyxia, the mixt has no action on $CO_2$ elimination, but does cause a slight increase in the post asphyxia period In the respiration of a mixt poor in O as well as in the respiration of a mixt rich in $CO_2$ there is an increase in pulmonary ventilation, but it is less intense than in the respiration of the asphyxia mixt, the increase is greater during the post-asphyxia period than during the asphyxia period In both cases at the end of the 12th min, there is yet an "O debt" The decreased absorption of O in the presence of an excess of $CO_2$ is probably attributable to a displacement in the curve of the dissocn of oxyhemoglobin as a result of the increase of the $CO_2$ tension in the blood PETER MASUCCI

**Variations in certain fermentative properties of fatigued muscles.** EMILIO BECCARI *Boll soc ital biol sper* 5, 1180-4(1930).—The aim was to see whether any quant differences existed between the glucolytic and amylolytic properties of fatigued muscles and normal muscles Fatigue was induced by periodic elec current stimulation of white mice The animals were then bled to death, the dorsal muscles of the legs removed and triturated to a pulp This pulp was suspended in physiol saline at $p_H$ 7.6 and placed in the incubator at 37° The substances fermented were glucose and rice starch The glucolytic power of fatigued muscles in contrast to that of normal muscles was inhibited, but the amylolytic power remained unchanged Since these changes took place even when the lactic acid was removed and when the reaction of the fatigued muscles was the same as the normal, the fermentative action is attributed to the so-called fatigue poisons. PETER MASUCCI

**Studies on pressor changes and on certain blood constants under the influence of mud baths applied in various ways.** C CIPRIANI AND A ROBECCHI *Minerva med* 1931, I, 269–75.—The diffused vascular action of mud baths is accompanied after each application by marked changes in the general arterial pressure, consisting in a lowering of the pressure followed by a return to the original values. In hypertension cases, the lowering is more marked and may lead to an advantageous decrease of pressure at the end of the treatment The variations in arterial pressure are simultaneous to general changes in the blood, during the first phase there are transitory signs of blood serum dilution, and later this is followed by an increased density of the serum P M

**Determinations of blood volume in human beings. III. Preliminary investigations. IV. Results with the vital red method.** C. C. FLEISCHER-HANSEN *Skand. Arch. Physiol.* 59, 243-65(1930).—Injections of 0.5 mg vital red per kg of body wts are used under conditions which insure even distribution of the dye in the blood stream The mean blood wt in 18 men was found to be 5.1% of the body wt, while in 12 women the results varied from 4.8 to 16.5%, the high results being apparently due to elimination of the dye S. MORGULIS

**The fat of sow milk.** OTAKAR LAXA *Ann. fals* 24, 87-8(1931).—At ordinary temp. the fat consists of a granular mass similar to melted butter, light yellowish brown, with a pig like odor, and having the following consts. solidifying point 17–18.5°, m. p. 28°, $n_{40}$ 52 (presumably oleo-refractometer degrees), sapon. no 193.0, Hehner no. 93.7, I no. 58.2, Reichert Meissl no 2.1, Wauters Polenske no 1.2 The mol wts of the volatile acids indicate that caprylic and caprinic acids are present in least amts The insol acids solidify 36.5–37.5°, m 39–40°, have a mol wt of 276.9 and I no 61.9%. The satd acids m 60.5° and have a mol. wt. of 256 Detn of stearic acid via Hehner and Mitchell (*Analyst* 1896, 316) gave neg results Conclusion The compn of the fat is approx oleic acid 64.5, palmitic acid 26.6, myristic acid 2.6, volatile acids (caprylic and caprinic) 1.4, glycerol 4.9%. A PAPINEAU COUTURE

**The unsaponifiable portion of the bile lipoids.** E. P HAUSSLER AND E. BRAUCHLI *Helv. Chim. Acta* 13, 908–15(1930).—In an investigation of the estrus hormone, 3 compds. (I, II and III) were isolated from ox bile by repeated extns. and crystns. They were all colorless, insol in water and KOH, contained neither N nor S, were not pptd by digitonin, dissolved in $CHCl_3$, did not add $Br_2$ and were not decompd by $KMnO_4$ in acid They differed from cholesterol (IV) in their reaction to the Liebermann Burchard and the Salkowski tests and they gave neg results in the Rosenheim, Tortelli Jaffe, Carr and Price, and Pettenkofer tests. None of the 3 acted as an estrogen when injected into castrated rats. I ($C_{28}H_{46}O_4$ or $C_{27}H_{44}O_4$) occurs as an addn compd (V) m 172-3°, $[\alpha]_D^{23}$ (4.7% in $CHCl_3$) −32.5°, with IV. The IV was pptd with digitonin and I, m 185–7°, was obtained from the mother liquor Acetylation of V gave no

identifiable product but benzoylation in $C_5H_5N$ gave a resinous substance, sol with difficulty in 1 tOH; it yielded I, m 191 5°. This I gave an Ac deriv m 169–70°. II crystd out during the crystn of I. It m 217–8° and reacts with $Ac_2O$ but the reaction product could not be isolated III was obtained at the same time as an amorphous powder which yielded crystals m 255–7°. III appears to have 2OH groups and its Ac deriv m 231–2°, $[\alpha]_D^{22}$ (1% in PhH) —51°. C H Peet

**Factors influencing the respiration of erythrocytes. I. Primitive avian erythrocytes** G Payling Wright *J Gen Physiol* 14, 179–98(1930).—The O consumption of normal and "primitive red cells" of fowls' blood was detd during the course of anemia produced by injection of $PhNHNH_2$. "Primitive red cells" have an O consumption at least 20–25 times greater than normal red cells Suspension of the cells in NaCl solns of various concns has little effect on the O consumption of the cells The red cells from anemic blood are sensitive to changes in $p_H$ The max O consumption in NaCl soln occurred at $p_H$ 7 75 The red cells were more sensitive to variation of $p_H$ on the acid side than on the alk side The addn of glucose to the medium increased O consumption of the cells, 0 6% glucose caused a 15% increase above solns which did not contain glucose Low concns of amino acids were practically without effect on O consumption, higher concns of some of them diminished it II. **Mammalian reticulocytes.** *Ibid* 201–13.—The O consumption of rabbit reticulocytes was detd during anemia produced by $PhNHNH_2$ Respiration increased greatly during regeneration, but the O consumption per billion cells throughout the period remained approx the same Respiration of the reticulocytes was affected by changes in $p_H$ of the medium in which they were suspended, reaching a max at $p_H$ 8, the intracorpuscular $p_H$ probably being about 7 75 Variations in toxicity of the suspending medium had little effect on respiration Glycine, alanine and glucose in the suspending medium produced no acceleration in respiration of the cells. Higher concns of glucose tended to depress respiration The material oxidized is largely or entirely contained in the cells when they are liberated from the marrow The O consumption in cu mm per 100 cu mm cells for the fowl and rabbit is as follows primitive red cell, fowl, 140, normal red cell, fowl, 12, reticulocyte rabbit, 70 C H Richardson

## G—PATHOLOGY

H Gideon Wells

Speed of reaction of antitoxins and its significance on the curative value of sera. R Kraus *Anales quim farm* (Chile) 1, 13–8(1931).—Review of the controversy between Ehrlich and Krauss and co-workers on the correlation between the antitoxic value of sera as measured *in vitro* and their actual curative value The Ehrlich method has only a quant value but does not take into account the quality of the antitoxins The curative value is intimately connected with the so-called speed of reaction. C. Abeledo

Urea administration in water intoxication. V J Harding and L. J. Harris *Trans Roy Soc Can* 24, Sect V, 101–10(1930).—Retention of water to produce convulsive symptoms in dogs must exceed 60 cc per kg body wt All animals in such convulsions recover by administration of 10% NaCl, but only 2 of 14 recovered by administration of hypertonic urea solns It is doubtful if the convulsions of epilepsy or eclampsia are manifestations of water intoxication, even though they may be accompanied by a pos water balance A T. Cameron

Effect of certain oxidation-reduction potential indicators on diphtheria toxin. P. J Moloney and Edith M Taylor *Trans Roy Soc Can* 24, Sect. V, 127–32 (1930).—2-Chloroindophenol, phenolindophenol and similar indicators will render the toxin atoxic, oxidation seems to be a factor in the detoxication Its rate increases with increased concn of indicator, and, in the range $p_H$ 6 5–7 5 with increased alky of soln Toxoids may be produced by such indicators which are equal antigenically to those produced by the action of formalin on toxin A. T. Cameron

Studies on hay fever. R Binaghi and G Falconi *Ann chim applicata* 20, 547–58(1930).—The active principle in *Vicia faba* from Sardinia has been shown to be a glucoside having no cyanogen groupings A phytosterol (*vicisterol*) was also isolated, as well as sugar whose compn was not detd The necessity for studying the pharmacology of the above glucoside and its relation to the pathology of hay fever is indicated. A W. Contieri

The partition of amino acids in the blood in anemias. Alexander Simon *Arch exptl Path Pharmakol* 154, 239–46(1930).—The amino-acid contents of the whole blood and of the plasma in various types of anemias are within normal limits The amino

acid content of the cells is somewhat elevated, as is the ratio of amino N of the cell to that of the plasma In the regeneration phase, this ratio returns to its normal values.
H Eagle

**The relationship between creatinuria and muscle glycogen.** Carlo Brentano. *Arch exptl Path Pharmakol* 155, 21–45(1930) —In spontaneous creatinuria, as well as in creatinuria induced by acidosis or narcosis, there is a depletion of glycogen from the skeletal muscles Agents which cause such a glycogen depletion (adrenaline, phlorhizin, convulsions, CO) cause creatinuria H. Eagle

**Studies in edema. II. Diseases with change in the colloid-osmotic pressure.** Hans Horsters *Arch exptl Path Pharmakol* 155, 248–56(1930), cf *C A* 22, 1406 — The av value of the colloid-osmotic pressure is about 371 mm $H_2O$, 40–45 mm. per g. serum protein In essential hypertension it averages 288 mm., 22–30 mm per g protein, the serum protein being usually high In acute nephritis, the colloid-osmotic pressure averages 250 mm $H_2O$, with a low serum protein Lowest values per g protein are observed in uremia (23–29 mm $H_2O$ per g.) In chronic nephritis the serum protein averages 7.7%, the colloid-osmotic pressure, 311 mm $H_2O$ In both amyloidosis and cardiorenal insufficiency there is a lowered colloid-osmotic pressure Normal values are observed in diabetes mellitus except for cases in coma, in which it is very low
H Eagle

**Level of iodine metabolism, unsanitary conditions of life and goiter.** R McCarrison and Clive Newcomb *Indian J Med Research* 17, 1061–1100(1930) —Young rats on a diet of oatmeal, patent flour, linseed meal, $Ca_3(PO_4)_2$ and NaCl, contg 125–250γ $I_2$ per kg., did not develop hypertrophic goiter unless they were kept under unhygienic conditions This type of goiter could be prevented by adding sufficient $I_2$ to the diet to change the urine $I_2$ from 33γ to 85γ per l Another type of goiter (lymphadenoid) may develop even on a diet contg $I_2$ and under conditions of perfect sanitation A statistical analysis of the results obtained with the individual rats indicate that these conclusions were justified, also, that unhygienic conditions may cause splenic enlargement in the animals, not affected by $I_2$ Rats under unhygienic conditions without iodine have comparatively large livers H Eagle

**The iodine metabolism in Basedow's disease and the explanation of the post-operative reaction following thyroidectomy.** Artur Bier. *Klin Wochschr* 9, 819–21 (1930) —Following thyroidectomy, there is a 5–10% fall in blood I, *i. e.*, the post-operative reaction is not due to the mech expression of the thyroid. Instead, it is considered due to a sudden fall of the thyroid secretion, a "hypothyroxic" shock, in an organism on a high level of $I_2$ metabolism, it is best avoided by continued treatment with $I_2$ up to and following thyroidectomy B points to the fact that the post operative urine contains only traces of $I_2$, indicating $I_2$ insufficiency and retention rather than overdosage.
H Eagle

**The cause of icterus neonatorum.** Karl J Anselmino and Fredrich Hoffmann *Klin Wochschr* 10, 97–100(1931) —A review H. Eagle

**The blood cholesterol in arterial hypertension.** C. Alvarez and S M Neuschloss *Klin Wochschr* 10, 244–7(1931) —The blood serum of individuals with normal arterial blood pressure is not satd with respect to cholesterol (57–90% of the total possible soly.), but in 21 of 25 hypertensives the blood serum was supersatd (106–132%) The possible etiological connection between hypercholesterolemia and arteriosclerosis is discussed H Eagle

***A new form of diabetes mellitus in animal experimentation.*** M Majus and O Sternberg *Klin Wochschr* 10, 264–5(1931) —Removal of an adrenal gland from a dog, combined with the surgical implantation of more parathyroid glands, causes the animal to develop glucosuria, and a blood sugar tolerance curve characteristic of diabetes H Eagle

**Demonstration of specific antibodies in vitro in severe allergy to fish and yeast.** Kaete Jaffé *Klin Wochschr* 10, 304–6(1931) —The sera of subjects sensitive to fish and yeast give complement fixation with an appropriate fresh ext. The sera must be used in the active state, possibly because the antibody is thermolabile Only patients with a pos immediate skin test will give the reaction H Eagle

**The occurrence of heavy metals in human gallstones.** R Schönheimer and W. Herkel. *Klin Wochschr.* 10, 315–6(1931) —Cu, Zn, Mn and Fe are all present in gallstones H Eagle

**The clinical significance of the hyperglucemic principle in the pancreas (the so-called initial insulin-hyperglucemia).** Max Börger *Klin Wochschr* 10, 351–4 (1931) H Eagle

**The relationship between cancer and the lipoid metabolism. II.** F. Burgheim

AND W. JOEL. *Klin Wochschr* 10, 397-8(1931). cf *C. A.* 23, 3735.—The presence of large quantities of cholesterol in the immediate vicinity of malignant, as contrasted with benign, tumors may be an important factor in detg their further spread. Malignant tumors contain much more cholesterol than normal tissue or benign tumors.
H. EAGLE

Phenolsulfonephthalein test in surgical kidney disease, with particular reference to its use in ureteral catheterization. HAYAMI HIROSE. *Tohoku J. Exptl. Med.* 15, 369-97(1930).—The prognostic value of the phenolsulfonephthalein test is stressed as well as the value of ureteral catheterization for the test of a single kidney function.
H. EAGLE

The circumvention of the hemolytic and anticomplementary properties of the antigens used in the Wassermann reaction. F. OKOLOV AND L. GRIBANOV. *Z. Immunitäts* 68, 7-13(1930).—By filtering the aq. dil'n. of the antigen through a paper filter, its hemolytic and anticomplementary components can be largely removed without affecting its sensitivity for the Wassermann reaction.
H. EAGLE

The nature of "H" and "O" agglutinogens. M. N. FISCHER AND R. B. HOCHBERG. *Z. Immunitäts* 68, 43-55(1930).—Agar cultures of *B. typhosus* and *proteus X 19* were extd. with water. These exts. combined both "H" and "O" agglutinogens, effecting a coarse- and fine-flaked agglutination, resp. The "H" substance ppts. from the ext. at its isoelec. point as a single voluminous floccule, while the "O" substance ppts. as a fine granular sediment at a somewhat more acid reaction. Both are protein (globulin), contg. the same proportions of C, H, N, S and P, they are considered by F. and H. to be the same substance in a different state of aggregation. The sera of patients with typhoid vary in their pptg. action upon these 2 substances.
H. EAGLE

The purification of hemolytic antibodies. HANS V. EULER AND EDVARD BRUNIUS. *Z. Immunitäts* 68, 124-36(1930). cf. *C. A.* 24, 2179.—By absorbing amboceptor onto the stroma of red cells, and subsequently extg. the agglutinated stroma in weakly alk. reaction ($p_H$ 10-11), one obtains highly active solns. By dialyzing these exts. one obtains a 300-fold purification as compared with original serum.
H. EAGLE

Disturbances in the equilibrium of the serum proteins in the blood serum of lepers. K. SCHLOSSMANN. *Z. Immunitäts* 68, 154-68(1930).—The total protein content of leper serum increases in the early stages of the diseases after the appearance of skin manifestations and decreases in the late stages. The serum globulin is increased in fever and during active phases. The lowest albumin/globulin ratios are obtained in lepra tuberosa and mixta. Those sera giving a positive Wassermann reaction contain large quantities of globulin, but not all sera with increased globulin are Wassermann-pos. In contrast, all syphilitic sera with a low albumin/globulin ratio are Wassermann-pos. The globulin of leper serum is much more stable in the presence of beef heart lipoid than that of syphilitic serum.
H. EAGLE

The effect of phenol upon specific and non-specific complement-fixation phenomena. KARL DREYFUSS. *Z. Immunitäts* 68, 193-210(1930).—The addn. of phenol to the cholesterinized EtOH ext. of beef heart as used in the Wassermann reaction causes an increase in its sensitivity. Phenol also makes lecithin, bacterial exts. and bacterial suspensions give complement fixation in the Wassermann reaction, but non specific positive reactions are thereby obtained. Suspensions of macerated guinea pig heart or aq. exts. acquire Wassermann reactivity by the addn. of phenol, without attaining the sensitivity of the alc. exts. Here again, the phenol predisposes to non-specific reactions.
H. EAGLE

The effect of intracutaneous stimulation upon agglutinin formation. JENÖ SZÉP. *Z. Immunitäts* 68, 274-6(1930).—The intracutaneous injection of a suspension of paratyphoid *B. bacilli* into rabbits is twice as effective in the formation of agglutinins as the subcutaneous injection.
H. EAGLE

The blood-group titer in tuberculosis. HERMANN ZANTROP. *Z. Immunitäts* 68, 277-85(1930).—There is no significant difference in the isoagglutinin titer of tuberculosis, as compared with normal sera. No significant change in titer is observed during a 3 month rest-cure, aside from normal variations. Anti-A agglutinins are usually stronger than anti-B, and sera of group O with a high anti A agglutinin content usually have a high anti-B titer also.
H. EAGLE

The titration of small quantities of tetanus toxin. B. FEIERABEND. *Z. Immunitäts* 68, 286-98(1930).—The indicator used is the local tetanus produced by the intramuscular injection of a mixt. of the serum and the minimal effective amt. of toxin into the hind leg of a guinea pig. As little as 1/500 unit can be detected in this manner.
H. EAGLE

Potassium and calcium in anaphylaxis under blockade conditions. H. M. A.

KUSHNARYEV *Z. Immunitäts* 68, 299-303(1930); cf. *C. A.* 25, 1898.—Blockade of the reticulo endothelial system of a sensitized guinea pig by the injection of India ink, carmine or trypan blue 30 min. before the re-injection of the sensitizing material, prevents anaphylaxis. The usual prophylactic effect of $Ca^{++}$ in anaphylaxis and the accentuating action of $K^+$ are modified when the reticulo-endothelial system has been blocked in this manner. H. EAGLE.

**Amines as antigens.** Z. V. YERMOLAYEVA AND I. S. BUYANOVSKII. *Z. Immunitäts* 68, 312-6(1930).—A series of amines injected into rabbits caused the formation of pptg. and complement-fixing antibodies which reacted more or less specifically with the amine used for injection ($N(Me)_3$, heptylamine, heptadecylamine, etc.). H. EAGLE.

**Residual antigens of vibriones.** Z. V. YERMOLAYEVA AND I. S. BUYANOVSKII. *Z. Immunitäts* 68, 340-50(1930). Twenty-four hr. agar cultures of cholera and clear and cloudy vibriones were suspended in saline, KOH was added up to 5%, and the mixt. kept overnight in the ice box. Acetic acid was added at boiling temp., and the ppt. removed after cooling. The acetic acid pptn. was repeated 5 times, the filtrate neutralized, and pptd. with 5 vols. of 75% EtOH. The EtOH pptn. was repeated 8 times in both acid and alk. reaction. The dry powder obtained is protein free, reduces Fehling's soln. and forms an osazone with phenylhydrazine. The exts. of cholera and clear vibriones gave a strong pptn. reaction with anti cholera serum, but are non antigenic unless a protein is added (serum or gelatin). In marked contrast, the ext. of cloudy vibriones was antigenic as such. This is possibly due to its high N content (4.4%), which indicates impurities. H. EAGLE.

**The immunological behavior of normal serum. III. The appearance of complement.** I. FREIDBERGER AND J. GURWITZ. *Z. Immunitäts* 68, 351-63(1930).—The complement titer of newborn guinea pigs is usually about the same as that of the mother. The fetus of a pregnant guinea pig contains very little complement until immediately before birth, when the complement titer suddenly rises to approximate that of the mother. H. EAGLE.

**Quantitative conditions in the formation of antibodies for lipoids by combination-immunization.** FRANZ HEIMANN AND ELISABETH WEIL. *Z. Immunitäts* 68, 403-8(1930).—Very small quantities of pig serum, as little as 0.005 cc., can be used in conjunction with lecithin as a "Schlepper antigen," to induce the formation of antibodies for the lecithin in rabbits. Similarly, 1-1000 serum used in conjunction with an EtOH rabbit heart ext. suffices to induce the formation of antibodies for the rabbit lipoids. The more serum that is used, the less of the rabbit heart ext. need be used to obtain antibodies. H. EAGLE.

**The suitability of chemospecific antigen preparations for the formation of antibodies to lipoids.** G. L. SELTER. *Z. Immunitäts* 68, 409-27(1930).—The antisera obtained from rabbits following the injection of combinations of beef heart serum and diazotized atoxyl or metanilic acid give complement fixation with common lipoids, including lecithin, beef lipoids and cholesterol. A simple mixt. of the diazonium compd. and the serum possesses this antigenic activity. The antibody against the lipoids is contained entirely in the globulin fraction as obtained by acidification of the serum; the chemospecific antibody remains in the supernatant "albumen" soln. Unlike normal serum this diazonium serum mixt. added to an EtOH ext. of horse kidneys (Forssman antigen) does not make the latter antigenic. H. EAGLE.

**The identity of animal-hair allergens (horse, cat and dog hair allergens).** W. STORM VAN LEEUWEN. *Z. Immunitäts* 68, 427-33(1930). cf. *C. A.* 24, 5844.—The allergens prepd. from dog, horse and cat skin scales and hair are different. The skin sensitivity of human beings to these substances is not detd. by a common factor, yet desensitization of a given skin area with one of these substances frequently brings about a concomitant desensitization to the other 2. This may possibly be due to the fact that the repeated reaction uses up some tissue component necessary for the skin reaction. H. EAGLE.

**Comparative studies in the isoagglutinins in the blood of human beings and of the pig.** S. SCHERMER, W. KAYSER AND A. KARMPFFER. *Z. Immunitäts* 68, 437-49(1930).—The isoagglutinin $\alpha$ (anti-A) of human sera corresponds to that of the pig. Pig serum contains cold agglutinins which make comparison difficult. H. EAGLE.

**The heat susceptibility of complement fixation and flocculation reactions with syphilitic sera.** MEHMED ZÜHDI. *Z. Immunitäts* 68, 450-9(1930).—If syphilitic sera are heated at 60-68° for 5 hrs. before testing, the Wassermann and Kahn reactions are equally affected in 21-60% and the Kahn reaction is more thermostable in 59% and more labile in 19.7%. Z. considers that this indicates a certain independence of the 2 types of test. H. EAGLE.

*The heat susceptibility of complement fixation and flocculation reactions with syphilitic spinal fluids.* MITSUFU CHIBI *Z. Immunitäts* 68, 479–85(1930).—The Kahn reaction is more heat resistant than the Wassermann in spinal fluids. H. E.

*The role of protective substances of the blood in the critical termination of attacks of fever and for the development of immunity in inoculated recurrent fever.* F. PLAUT AND C. GRANOW *Z. Immunitäts* 68, 491–500(1930).—The formation of serum antibodies in patients inoculated with *Spir. dutt'oni* is not related to the bouts of fever, which are the clinical manifestation of the paroxysmal multiplication of spirochetes in the blood. They may, however, play a part in the final cessation of a fever and the death of the spirochetes. The immunity against re-infection for years following the inoculation is not detd. by circulating antibodies, as shown by the absence of protective antibodies for mice. H. EAGLE

*Physical and chemical studies of the virus of hoof and mouth disease. I. Isoelectric point and adsorption.* K. POPPE AND G. BUSCH *Z. Immunitäts* 68, 510–8(1930); cf. *C. A.* 25, 2181.—Three strains of foot and mouth disease virus had cataphoretic isoelec. points at $p_H$ 8.0, 7.6 and 7.8, resp. The virus is strongly adsorbed by 1 g. of charcoal at $p_H$ 6.5–8.4, so strongly that neither the adsorbent or the supernatant fluid is infectious for guinea pigs. This adsorption is weakest near the isoelec. point of the virus. At this reaction, the virus may not be completely adsorbed, moreover, when the charcoal is injected into guinea pigs, there may be a dissocn. of the adsorbed virus, with infection of the animal. Kaolin does not adsorb the virus. H. EAGLE

*The duration of strain-specific antibodies to trypanosomes in rabbits and the significance of the antibody content for the outcome of homologous reinfections.* F. HARTMANN *Z. Immunitäts* 68, 518–30(1930).—Using the Nagana-Prowazek strain of trypanosomes, H. finds that protective antibodies for mice persist in the blood for 17–31 weeks after the therapeutic sterilization of the infected rabbit with neoarsphenamine; they disappear in a few days from the blood of a passively immunized animal. Reinfection with a homologous strain, with the appearance of a chancre, is successful only if the circulating antibody is <1–2 units. Unlike syphilis, no infection without symptoms could be demonstrated, as shown by the injection of organ emulsions of suspected animals into normal rabbits. H. EAGLE

*Studies on blood volume. II. Influence of anaphylactic shock on blood volume.* ISTVÁN S. WENT AND CECIL KENT DRINKER *Magyar Orvosi Arch.* 31, 54–8(1930).—Expts. on guinea pigs showed that blood vol. of animals did not change during anaphylactic shock. Cf. *C. A.* 23, 3942. S. S. DE IVÁLY

*Ratio of sensitizing capacity of anti-anthrax immune sera to their content of precipitin and complement-fixing antibodies.* JÓZSEF TOMCSIK. *Magyar Orvosi Arch.* 31, 211–9(1930). cf. *C. A.* 24, 2501.—Purified ext. of encapsulated anthrax bacilli was prepd. according to Toemiessen. Dil'n of the ext. to 1:1,000,000 gave a ppt. with immune horse serum. The reaction on complement fixing bodies was neg. Immune rabbit sera gave both ppt. and powerful complement fixation in the presence of purified ext. Passive sensitization of guinea pigs could successfully be demonstrated with rabbit sera, being active in complement fixation. The passive sensitizing property of immune sera is approx. parallel to their content in complement fixing antibodies. S. S. DE I.

*Experiments to produce pure serum hemolysin.* LAJOS (LUDWIG) GÓZONY AND FERENC (FRANZ) HOFFENREICH *Matematik és Természettud. Értesitö* 46, 114–25(in German 126)(1929); cf. *C. A.*, 23, 5506.—Enzyme toxins which prevent the effect of lipase also decrease the effect of hemolysin. Methods of lipase production were used for the production of hemolysin since they show some kind of parallelism. Such hemolysin on purification was 40 times more active than the dried serum from which it was produced. Pure hemolysin is cryst. and develops acid from blood corpuscle lipoids and cannot be identified with pancreas lipase. S. S. DE I'NÁLY

*Toxin-producing capacities of recently isolated strains of diphtheria bacilli.* J. M. NEILL, R. C. AVERY, L. V. RICHARDSON, J. Y. SUGG AND B. E. KANE. *Am. J. Hyg.* 11, 399–403(1930). *Physiol. Abstracts* 15, 555.—Strains of diphtheria bacilli of diverse origin had wide variations in toxin producing capacities. A large no. of the filtrates were also tested for their content of the heat stable substance responsible for the "pseudo" reaction of the Schick test, and also for the content of the heat stable constituent responsible for the immediate skin reaction of the diphtheria hypersensitive person. The filtrates varied in their content of these heat stable substances, and the amt. present bore no relation to the content of toxin. G. G.

*The behavior of certain filterable viruses when subjected to cataphoresis.* C. V. NATARAJAN AND R. R. HYDE *Am. J. Hyg.* 11, 652–67(1930). *Physiol. Abstracts* 15,

553 —The myxoma virus of rabbits is electroneg in the range of 4 9 to 9 3 Below $p_H$ 4 9 the virus is quickly inactivated Its behavior in an elec current as a negatively charged particle agrees with the fact that it is readily adsorbed by basic substances The virus of epithelioma contagiosum behaves amphoterically, moving to both anode and cathode in an elec field between a $p_H$ range of 6 4 to 9 3 The encephalitic virus (which had been passed through a series of rabbits by intracranial inoculation) proved to be negatively charged from $p_H$ 7 6 to 8 9 Below $p_H$ 7 6 it is pos Different strains of bacteriophage were tested, and varying results obtained. All attempts to use the method of cataphoresis as a means of sepg the viruses from assocd proteins failed
G G

The chlorine-sodium ratio of blood serum in edema from Bright's disease. M Laudat and A Grandsire *Compt rend soc biol* 103, 893–5(1930), *Physiol Abstracts* 15, 305 —In edema from Bright's disease there is a marked increase of the Cl Na ratio of the serum This is maintained in some cases as the edema disappears, but a relation exists between the hydration of the tissues and the increase of the ratio
G G

The chlorine-sodium ratio of blood serum in Bright's disease. M Laudat and A Grandsire *Compt rend soc biol* 103, 1212–6(1930), *Physiol Abstracts* 15, 378 — The Cl Na ratio varies in cases of N retention in Bright's disease The increased concn of blood urea does not seem to intervene directly in the variations, which depend on assocd factors Prolonged retention of water raises the ratio, vomiting, on the contrary, diminishes it
G G

*Natural hemolysins of human serum.* J Jadin *Compt rend soc biol* 103, 951–3(1930), *Physiol Abstracts* 15, 282 —The content of hemolysins in the blood of the different human groups was detd for sheep corpuscles and for those of guinea pigs The greater no of sera contain both hemolysins, but those of group B are the most active
G G

The serum-antitoxin complex does not carry the alexin through the placenta. L Nattan-Larrier and L Richard *Compt rend soc biol* 103, 1084–6(1930), *Physiol Abstracts* 15, 413, *cf C A* 25, 1574 —Pregnant guinea pigs were immunized passively and actively against diphtheria and tetanus toxins The serum antitoxin complex filters through the placenta, but it does not contain the alexin In one instance the alexin was found in the fetal blood, but this fetus was at term, and so it is believed that the alexin was of fetal origin
G G

Antigenic properties of an extract demonstrated by the Prausnitz-Kustner method. P Vallery-Radot *Compt rend soc biol* 103, 1207–8(1930), *Physiol Abstracts* 15, 413 —When it is desired to ascertain if an ext is actively antigenic, it is enough to inject it into the skin of a human subject at the site of an injection, made 24 hrs before, of serum from an individual whose specific sensibility to the antigen is well established The proof of activity of the ext. is given by a marked local reaction This test provides the best method of demonstrating that an antigenic ext has the required properties for exptl research on anaphylaxis
G G

Action of globulins on the development of transplantable lymphosarcoma of the mouse. J Ricardo Meyer *Compt rend soc biol* 103, 1322–3(1930), *Physiol Abstracts* 15, 415 —Globulin pptd from horse serum with $(NH_4)_2SO_4$ was injected into mice, which were subsequently grafted with a lymphosarcoma, while controls were grafted without injection of globulin The percentage of pos results in the former was 90, in the latter only 50, while the dimensions of the growth were only about 1/3 in the non treated mice Grafting expts performed after the injection of U nitrate (which causes an increase of globulin in serum) show that the action of the globulin in favoring cancer growth is not a direct nutritive one, but that it is secondary to interference with the reticulo endothelial system
G G

Distribution of antibodies in the rabbit organism. O G Bier *Compt rend soc. biol* 103, 1328–30(1930), *Physiol Abstracts* 15, 413 —In rabbits deprived of their kidneys, sensitizing substances injected were maintained at the same concn in the blood during 44 hrs
G G

Diffusibility of potassium in normal human muscle and in the condition of pyramidal and extra-pyramidal contracture. O Sager and E Rothe *Compt rend soc. biol* 103, 1373–4(1930), *Physiol Abstracts* 15, 340 —No K is fixed to the colloids in human muscle All the K diffuses out in time into the surrounding medium The speed of diffusion of K is not the same for normal and pathol muscle; it differs even in the different pathol conditions which are detd by differences of the colloidal state of the fiber-sarcoplasm phases
G G

Blood $p_H$ in cases of cutaneous epithelioma. R. Reding and A. Slosse. *Compt.*

*rend soc biol* 104, 124–7(1930), *Physiol Abstracts* 15, 415.—Variations of the $p_H$ of blood in *different types of tumor* have been reported. In the present investigation 23 cases of skin cancer were examd. The results are contradictory to those of Jaumain. The $p_H$ in the 23 cases varied from 7.41 to 7.47. There is no alteration in $p_H$ in cancer of slow evolution. In case of marked activity it is natural to expect alteration of the physicochem. properties of the blood. G. G.

Excess of blood potassium in cancer. A. Remond and E. Cantegril. *Compt rend soc biol* 104, 293–4(1930), *Physiol Abstracts* 15, 487, cf. *C. A.* 25, 1575.—Excess of K has been found in the blood of 83% of cases of cancer investigated (48). The cases in which it is least marked are those with facial cancer. These observations correspond with those made on the K content of cancerous growths. The content is greatest when proliferative activity is most marked. G. G.

Urinary excretion in normal and nephritic dogs on variable diet. P. Genaud. *Compt rend soc biol* 104, 548–9(1930), *Physiol Abstracts* 15, 457.—Glucosuria always exists in U intoxication and is unaffected by change of food. In the nephritic dog chloride is not retained. The output of urea is greater in the normal animal than in the nephritic animal on a similar diet. $NH_3$ is const. in amt. and is independent of food in nephritis. The excretion of creatinine is not influenced by food, that of creatine is greater in nephritis. Uric acid is about the same in amt. in both cases. G. G.

Non-sugar reducing substances of human blood in pathological conditions. Freda K. Herbert and Marcherita C. Bourne. *Biochem J* 24, 1787–93(1930), cf. *C. A.* 24, 5354.—The concn. of the non-diffusible reducing substances is shown to vary with the hematocrit reading for the corpuscle vol. Benjamin Harrow.

Alimentary intoxication. F. Elmer Johnson. *Arch. Pediatrics* 48, 194–201 (1931).—In a case of alimentary intoxication of infancy, the blood findings were normal. In another case, the blood analysis suggested both acidosis and uremia (80 mg. total non protein N, 161 mg. dextrose, 7 mg. P, 500 mg. chloride per 100 cc. of blood; and $CO_2$-combining power 12.6% by vol.). Joseph S. Hepburn.

Flocculation experiments with variola and vaccinia virus. Leon C. Havens and Catherine R. Mayfield. *Am. J. Pub. Health* 21, 329–43(1931).—Exptl. evidence indicates that the intradermal or intravenous inoculation of vaccinia virus in rabbits is followed by the appearance of sp. flocculating properties in their sera. Vaccination of *the human subject stimulates the production of precipitins against vaccinia virus.* The serum of 4 persons acquired this power to flocculate the virus as early as the 10th day following vaccination. J. A. Kennedy.

The formation of phospholipides during the autolysis of normal and neoplastic tissue. A. H. Roffo and L. M. Correa. *Bull. soc. chim. biol* 12, 1247–54(1930).—Normal dog and rat livers and spleens were autolyzed in NaF soln. and compared with the same tissues from animals with cancer. *Differences were found* in the quantities and rates of hydrolysis of P and fatty acid compds. C. G. King.

Observations concerning the causative agent of a chicken tumor. James B. Murphy, O. M. Helmer, Albert Claude and Ernest Sturm. *Science* 73, 266–8 (1931).—A report of addnl. observation on the properties of a filtrable agent causing chicken tumor. The agent of Chicken Tumor I, a spindle-cell sarcoma, is selectively adsorbed and fixed by certain mesodermal tissues from susceptible animals. The plotted curve of the amt. of ultra-violet light of selected wave lengths required to inactivate the tumor agent shows a significant qual. and quant. variation from the curves for bacteria, typical viruses and bacteriophage. The tumor producing activity of the filtrates can be pptd. out with a protein fraction and purified. The steps in the purification of the agent are outlined and the evidence of an inhibiting principle in the chicken tumor is discussed. B. S. Levine.

*Individual differences in human blood.* Karl Landsteiner. *Science* 73, 403–9 (1931).—Precipitation and agglutination are reviewed with particular reference to blood grouping as a possible indicator of individual differences in human blood. In man there are numerous individual blood differences already demonstrated, and undoubtedly there exist still others which have not yet been established. Whether actually each individual blood possesses a special quality or how frequently there is complete correspondence with the blood of others, cannot be definitely stated at present. B. S. L.

A soluble specific carbohydrate of ragweed pollen. J. H. Black. *J. Allergy* 2, 161–3(1931).—Evidence is presented showing the presence of a complex carbohydrate in ragweed pollen. This substance reacts specifically in the skin and nasal mucosa of ragweed sensitive individuals. Julian H. Lewis.

The stabilization temperature of sera in the Meinecke and Wassermann reactions. Joseph Hohn. *Z. Immunitats* 67, 30–8(1930).—Heating sera at 51° for 4 min. does not

affect the Meinecke clearing reaction and makes the Wassermann reaction sharper If heated in amts less than 0 5 cc. or over 52° unspecific reactions with the Meinecke method are produced A quick Meinecke test in which the centrifuge is used is described JULIAN H. LEWIS

A common antigen in human cells and Shiga bacilli. M EISLER. *Z. Immunitäts* 67, 38–48(1930) —In Shiga dysentery bacilli and in cells of human organs, including *carcinoma cells but not serum, is a common antigen which produces in goats, but not in* other animals, an antiserum that agglutinates the Shiga bacilli and human red cells This antiserum does not hemolyze human red cells and does not contain Forssman antibodies JULIAN H LEWIS

The value of the citochol reaction in the diagnosis of syphilis. D P BOROVSKAYA AND S D ORLOVA *Z Immunitäts* 67, 63–6(1930) —The citochol reaction of Sachs and Witebsky is found to be a sensitive, sp , simple and const test for syphilis J H L

The normal antibodies of rabbits at different ages. E FRIEDBERGER AND D GAJZÁGÓ *Z Immunitäts* 67, 67–74(1930) —Rabbits first form normal sheep hemolysins about the 75th day after birth, this is comparable to man in whom these antibodies are formed during the first year Newborn rabbits have sheep hemolysins in their sera which may have a higher titer than either of the parents These antibodies disappear completely in 8–14 days Blood from the umbilical cord of human babies contains no hemolysins, but because of technical difficulties it is not known if the antibodies are in the general circulation during the first day of life JULIAN H LEWIS

Protein anaphylaxis in tuberculous guinea pigs as compared to non-tuberculous controls. E FRIEDBERGER AND D GAJZÁGÓ *Z Immunitäts* 67, 75-8(1930) — Tuberculous guinea pigs sensitized with sheep serum withstand larger doses of the serum on re-injection than do controls The difference is not marked but is demonstrable JULIAN H LEWIS

The immune bodies in fractions of antiserum for foot and mouth disease. The increase in titer of immune serum after parenteral injection of serum fractions. P v GARA AND K. TRAUTWEIN *Z Immunitäts* 67, 102–11(1930) —The protective action of antiserum for foot and mouth disease resides in the lyophobic euglobulin fraction *This is true of antiserum for the different types of virus and from calves and guinea pigs* It was not possible to increase the antibody content of convalescent guinea pigs by injecting the guinea pigs with immune serum fractions before infection J. H L

The production of lipoid antisera by injections of organ suspensions. FELIPE MORAN. *Z Immunitäts* 67, 115-25(1930) —Injections into rabbits of a suspension of *liver produce an antiserum specific for liver lipoids but this specificity is limited to* within the species Injections of suspensions of thyroid produce a similar but less-marked sp serum Other organs in suspension produce ubiquitous lipoid antibodies With the exception of the lens, suspensions and alc. exts of organs of the eye do not produce organ-sp antibodies Brain-sp antisera react with alc. exts of the retina. JULIAN H. LEWIS

The antagonism between group specific antigen and group specific antibody in rabbit blood. K HARA *Z Immunitäts.* 67, 125–36(1931) —Complement-fixation tests using anti group A human red cell sera as antiserum and native rabbit serum or its alc. ext as antigen show that the serum of rabbits contains group A antigen if the red cells of these rabbits lack the agglutinogen of Group A JULIAN H. LEWIS

The group differentiation of fetal membranes. R. S CHERIKOVER AND O M. SEMZOVA. *Z. Immunitäts.* 67, 240–50(1930) —Neither fetal tissues nor the uterine decidua contain group-sp antigens The antigen found by Oettingen and Witebsky (*Münch med. Wochschr* No 3, (1928)) in the decidua was the heterogenetic Forssman antigen JULIAN H. LEWIS

*The action of carbon dioxide on the coagulation and the complement action of* plasma. HANS J. FUCHS. *Z. Immunitäts.* 67, 266–71(1930).—Increase of $CO_2$ of plasma increases its complement action and coagulation speed as long as the reaction remains alk. or neutral. These properties are decreased when the reaction becomes acid JULIAN H. LEWIS

Complement and anticomplement. HANS J FUCHS. *Z Immunitäts.* 67, 272–85 (1930), cf *C A.* 24, 422 —Complement is considered as a series of chain reactions, one component of which is the middle piece that is identical with prothrombin The middle piece does not occur in the flowing blood, nor is it completely free in plasma and serum but is more or less firmly bound to its antagonist or stabilizer, antiprothrombin There are 3 classes of anticomplementary action The first includes the antiprothrombin excess of hemophilic blood, peptone blood of dogs and heparinized blood; serum inactivated at 56°; high salt concns The second class includes colloids that adsorb the

antithrombin prothrombin complex, such as $Ca_3(PO_4)_2$, $Mg(OH)_2$, $BaSO_4$, $CaC_2O_4$, org sp ppts and bacteria The third class are the phosphatides, especially cephalin, which neutralizes antiprothrombin, permitting the prothrombin to be converted into thrombin which has no complement action JULIAN H LEWIS

**Complement-fixation antibodies against alcoholic extracts of carcinoma in patients with carcinoma and in pregnancy.** L HIRSZFELD, W HALBER, M ŁOKSZTRUMPF, AND J KOLODZIEJSKI *Z Immunität* 67, 286–318(1930).—By using an alc ext of carcinomas fortified with cholesterol carcinoma can be diagnosed in 50–60% of cases with the complement fixation reaction In 5% of the controls with neg Wassermanns the reaction is unspecific. Controls with pos Wassermanns give also pos reactions with the alc ext of carcinomas Some of the carcinoma patients give pos Wassermann reactions In pregnancy 60% of the sera reacts with the alc ext of carcinomas JULIAN H LEWIS

**Demonstration of impedin in bacteria.** M YOSHITOMI *Z Immunität* 67, 353–8(1930).—Typhoid bacilli contain a substance called impedin that inhibits the production of agglutinins when they are used as antigen and that is responsible for the toxicity of vaccines While impedin is present only in the bodies of washed bacteria, they are gradually dissolved in the medium of a suspension on standing Impedin is destroyed by boiling and the resulting prepn is called cocto-vaccine J H L

**The production of coctovaccine.** R TORIKATA AND M. YOSHITOMI *Z Immunität* 67, 358–67(1930).—The optimum period of boiling for the production of coctovaccine in which impedin, a toxic and antagonistic substance, is destroyed is 30–60 min Coctovaccine is also better adapted for use as an *in vitro* antigen JULIAN H LEWIS

**Complement and media of salt solutions** JOHANN SCHUBERT. *Z Immunität* 67, 367–9(1930).—Isotonic zones of various salts are given It is shown that other salts than NaCl may serve as media for complement *Bromides* and iodides enhance the action of complement JULIAN H. LEWIS

**The rate of disappearance of proteins and lipoids from the peritoneal cavity of guinea pigs.** JOHANN SCHUBERT *Z Immunität* 67, 370–2(1930).—By means of chem and serological tests it is found that egg white, cholesterol and lecithin injected into the peritoneal cavity of guinea pigs disappear completely in 24 hrs J H. L

**Conditions and methods for demonstrating carcinoma-specific antigens.** HERMANN LEHMANN-FACIUS AND TADAO TODA *Z Immunität* 67, 373–05(1930).—Carcinoma suspensions heated 0 5 hr at 100° produce in rabbits a serum highly sp for carcinoma cells This specificity depends on lipoid antibodies Individual sp factors or the blood group of the antigen used for immunization have no effect on the specificity of the serum Antisera against boiled suspensions of carcinomas of group A contain, in addn to carcinoma sp antibodies, also antibodies sp for group A. J H. L.

**Experimental studies on the properties of diphtheria anatoxin.** M P. ISABOLINSKII AND V. I GITOVICH *Z Immunität* 67, 441–7(1930).—Guinea pigs injected with anatoxin were immune to toxin as well as to pure cultures of diphtheria bacilli No difference in the antigenic action of the usual anatoxin and Ramon's total anatoxin could be found JULIAN H LEWIS

**Experimental studies on the Abderhalden reaction.** M LURJE, N KORSAEW AND A ROSENBLATT *Z Immunität* 67, 462 74(1930).—Organs of dogs or sheep transplanted into rabbits did not produce positive Abderhalden reactions of the rabbit sera with the organs Pregnancy in rabbits and guinea pigs could not be diagnosed with the Abderhalden reaction The sera of these animals are not suitable for the test because most of the sera without antigen give positive reactions Positive reactions could not be obtained in dogs by immunizing with egg white or foreign organ emulsions but were obtained by transplanting foreign organs or after auto-immunization by injuring certain organs of the dog These positive reactions, however, were not specific. J H L

**Antibodies for leucocytes.** E WITEBSKY AND K KOMIYA *Z Immunität* 67, 480–96(1930).—Rabbits immunized with guinea pig leucocytes produce Forssman antibodies and antibodies that react with alc. exts of guinea pig leucocytes and spleen When immunized with rat leucocytes species sp lipoid antibodies are formed without any organ differentiation The specificity of organ sp antisera is increased by adding lecithin to the organ exts while the nonsp quota is inhibited The organ sp lipoid antibodies of leucocyte antiserum are usually limited to the species Guinea pig leucocyte antisera react exclusively with the homologous exts of leucocytes and spleen but not with those of blood On the other hand, antisera for guinea pig red cells react also with exts of guinea pig leucocytes and spleen Boiled suspensions of leucocytes react with the sp antisera just as well as with native suspensions Leucocyte antisera do not

*cause agglutination or lysis of leucocytes Rabbit leucocytes react with leucocyte* antisera obtained from the rabbit. JULIAN H. LEWIS

**Preservation of complement with sodium acetate and boric acid.** CURT SONNENSCHEIN *Z Immunitats* 67, 512–6(1930) —Complement is better preserved with 10% NaOAc and 4% $H_3BO_3$ added in substance than with 10% NaCl and 4% $H_3BO_3$ (*C A.* 24, 5853) JULIAN H LEWIS

**Influence of temperature on the sensitivity and specificity of the Wassermann reaction with different types of antigen.** GÁBOR OLÁH *Z Immunitats* 67, 517–38 (1930) —The sensitivity of the Wassermann reaction is increased if the serum complement *antigen mixt is incubated at low temps There is, however,* a considerable reduction in specificity of the reaction Many sera react better with exts contg no cholesterol when the test is made at low temps JULIAN H LEWIS

**The action of carbon dioxide on complement.** HANS J FUCHS *Z Immunitäts* 69, 51–7(1930) cf *C A* 24, 5843 —Blood corpuscles with their O displaced with $CO_2$ adsorb the middle piece of complement completely from plasma Hemolysis does not result The plasma treated with the red corpuscles shows a loss of spontaneous coagulability as well as of complement activity This indicates the identity of complement middle piece and prothrombin JULIAN H LEWIS

**The serological relation of the flocculi and the fluid in flocculation tests for syphilis.** D P BOROVSKAYA *Z Immunitats* 69, 76–85(1930) —The flocculi produced in the different flocculation tests for syphilis contain antigen and antibody in various proportions The supernatant fluid in the Meinicke reaction reacts like luetic serum while that in the Kahn and citochol reactions reacts like antigen JULIAN H LEWIS

*Complement fixation with snake venom immune serum* VITAL B FILHO. *Z. Immunitats* 69, 120–33(1930) —The snake venoms differ greatly in their ability to inhibit sp hemolysis In prepg the proper concn for use as antigen in complement fixation expts this had to be taken in account Complement fixation is best obtained when fresh unheated immune serum is used Normal horse serum showed a peculiar reaction in that it produces complete fixation with small doses of certain venoms but none with larger doses There is a strong complement fixation between *Crotalus terrificus* toxin and antitoxin but none between the toxins of the *Lachesis* and their antitoxin. There was an absence of reaction between the toxin and antitoxins of the *Crotalus* group and those of the *Lachesis* group No relation could be established between the complement-fixing power and the neutralizing strength of the *Crotalus* antitoxin JULIAN H LEWIS

**The chemical nature of the heterogenetic antigen in Shiga bacilli.** KURT MEYER. *Z Immunitats* 68, 98–108(1930) —By treating a suspension of Shiga bacilli with antiformin and pptg with alc. in alk reaction, a carbohydrate is obtained comprising approx *0 5 of the total heterogenetic antibody in the original bacilli* H. EAGLE

**The chemical nature of the heterogenetic antigen of the Shiga bacillus.** KURT MEYER. *Z Immunitats* 69, 134–45(1930), cf preceding abstr —The heterogenetic antigen of the Shiga bacillus is a carbohydrate and is different antigenically but not chemically from the carbohydrate that carries species specificity *Ibid* 490–517(1931) — The species specificity and heterogenetic activities of Shiga bacilli reside in the carbohydrate isolated from these organisms Sepn by sp pptn and adsorption of the carbohydrate into fractions corresponding to each of these activities could not be accomplished This indicates that the 2 properties are firmly bound and that they represent 2 reactive groups of a single substance JULIAN H LEWIS

**Respiration of bacteria and immune reactions. Experiments with B. pyocyaneus.** GYULA SURANYI AND JOZEF V PALOCZY *Z Immunitats* 69, 161–8(1930) —Agglutination with immune serum lowers the consumption of O by *B pyocyaneus* This effect is not the effect of agglutination itself but is due to a decrease of respiratory surface *Immune serum and complement producing bacteriolysis increase O consumption at first,* after which there is a complete cessation of respiration JULIAN H LEWIS

**An unusually high degree of anaphylactic sensitization. Acute lethal anaphylactic shock after subcutaneous injection of small doses of antigen.** R. DOERR AND S SEIDENBERG *Z Immunitats* 69, 169–79(1931) —In hereditary anaphylactic sensitization there is a much higher degree of sensitization in guinea pigs than after the usual active sensitization Animals react fatally to subcutaneous injections of 0 2–2 0 cc doses of serum antigen with a latent period of 15–20 min when after other forms of sensitization, except under unusual conditions, there is little or no reaction after subcutaneous injections JULIAN H. LEWIS

**The use of alcoholic extracts of meningococci for complement fixation and titration of meningococcus antiserum.** H. SACHS *Z Immunitäts* 69, 221–39(1930) —The alc. exts of meningococci give complement-fixation reactions with antimeningococcus serum

and can be used to titrate the antiserum. Meningococcus antiserum contains, therefore sp. lipoid antibodies but it also contains non-sp. lipoid antibodies since it gives positive Wassermann and cytochol reactions. The activity of alc. exts. of meningococci is increased by the addition of lecithin. JULIAN H. LEWIS

Complement fixation and flocculation with diphtheria antiserum. F. HÖRING *Z. Immunität.* 69, 244–60(1930).—Alc. exts. of diphtheria bacilli and diphtheria toxin give strong complement fixation reactions with diphtheria antiserum. These reactions are intensified by the addn. of a small quantity of lecithin to the antigens. The flocculation of toxin and agglutination of bacilli by antitoxin are facilitated by the addn. of cytochol. Treatment of antiserum with diphtheria bacilli removes the complement-fixing antibodies for the alc. ext. of diphtheria bacilli but the flocculating antibodies remain. The enhancing effect of lecithin can be substituted with cholesterolized and plain alc. exts. of organs. With none of these reactions is there a complete parallelism with the antitoxin content of the antiserum. JULIAN H. LEWIS

The role of cholesterol in the activation of lipoid antigens. G. F. DE GAETANI *Z. Immunität.* 69, 277–97(1930).—Forssman antigens that are poor in lipoids are activated by the addn. of cholesterol. This effect is due not to cholesterol antibodies but to some physicochem. influence on the antigenic substrate. JULIAN H. LEWIS

The chemical explanation of immune hemolysins. L. JARNO AND L. SZIRANYI. *Z. Immunität.* 69, 298–304(1930). cf. *C. A.* 24, 420.—A study of the enhancing effect of Na cholate and various amino acids on hemolysins and an analysis of inhibition of hemolysins by KCN and caffeine Na benzoate lead to the conclusion that normal and immune hemolysins are to be considered as compds. of cholic and contg. complexes of amino acids. JULIAN H. LEWIS

Is the diphtheria toxin-antitoxin mixture more toxic for tuberculous than for normal guinea pigs? E. FRIEDBERGER AND O. ANDERSON. *Z. Immunität.* 69, 313–7(1931).—Tuberculous guinea pigs show no increased sensitivity to underneutralized mixts. of diphtheria toxin antitoxin mixts. On the other hand they show an increased resistance to anaphylaxis and to other infections. JULIAN H. LEWIS

The consumption of complement in hemolysis. HANS J. FUCHS. *Z. Immunität.* 69, 330–42(1931). cf. *C. A.* 24, 418.—In hemolysis of sensitized red cells by complement there occur, side by side, 2 different reactions. One is the use of prothrombin as the mid piece in complement activity and the other is the conversion of prothrombin into thrombin. The speed of these 2 reactions depends on the conditions existing in the mixt. If the red cells are weakly sensitized the part of the prothrombin not used for complement is changed into thrombin through the action of the cytozyme-phosphatide liberated by hemolysis and of Ca in the serum. The prothrombin undergoing this change can no longer be utilized for complement. This explains the fact that blood fluids contg. Ca lose their complement activity sooner than those that are free from Ca. JULIAN H. LEWIS

Titration and detection of snake venom antisera by intracutaneous tests into guinea pigs. R. OTTO. *Z. Immunität.* 69, 368–78(1931).—By injecting mixts. of snake venom and antiserum intracutaneously into guinea pigs the neutralizing power of the antiserum can be titrated. Of 117 patients only 9 were found to have antivenom in their serum. JULIAN H. LEWIS

Comparison of the antigenic action and toxicity of scarlet-fever toxins modified by heat and by sodium ricinolate. CH. CH. WANG. *Z. Immunität.* 69, 395–401(1931). The immunizing action of scarlet fever cocto-antigen. *Ibid* 402–7. Vaccination with scarlet-fever cocto-antigen. K. SAITO. *Ibid* 408–12. Both heat and 1% Na ricinolate reduce the toxicity of the Dick scarlet fever toxin, but Na ricinolate lowers the antigenic action, while heat raises it as proved experimentally and with patients. *J. H. L.*

The new flocculation tests, especially the Kahn test. CARL SCHLESMANN. *Z. Immunität.* 69, 484–98(1931).—The Meinecke clearing reaction is slightly sharper and more sp. than the Kahn test and is considered the best flocculation test so far devised. JULIAN H. LEWIS

The thermic effect of death and hemolysis. V. V. LEPESHKIN. *Am. J. Physiol.* 95, 473–80(1930).—The hemolysis or the coagulation of protoplasm of red corpuscles is accompanied by the production of heat to the amt. of 2.1–2.4 cals. per g. of dry substance of corpuscles. Death is accompanied by the decompn. of some very unstable compd., probably in this case compds. of hemoglobin. J. F. LYMAN

Experimental arteriosclerosis in the rat. M. SWEENEY AND EMMA SMITH. *Am. J. Physiol.* 95, 620–5(1930).—Arteriosclerosis could not be produced in adult rats (1) by feeding for 7 months a diet contg. 5% NaCl and 10% $NaHCO_3$ or (2) by const. intensive infection for 7 months by weekly injections of *Staphylococcus aureus*. The ingestion of

50 cc. of viosterol over a period of 25 days produced definite arteriosclerosis with densely calcified aortae In one case the renal blood vessels appeared to be calcified.
J. F. LYMAN

Acidity of the gastric contents of normal, cretin and hyperthyroid rabbits. M F. GREEN AND M M KUNDE *Am J Physiol* 95, 626–9(1930) —The total HCl of the gastric contents of normal and cretin rabbits is the same ranging from 0.2 to 0.56%. With exptl hyperthyroidism, HCl of the gastric contents is depressed but not absent
J F LYMAN

Diabetes insipidus. IV. HELEN BOURQUIN *Am J Physiol* 96, 66–77(1931), cf *C A* 23, 3970 —Diabetes insipidus is not a deficiency phenomenon The mammillary bodies, or centers in their vicinity, are essential to it and the polyuria is caused by a diuretic substance, or irritation of hypothetical centers controlling salt and water metabolism
J F LYMAN

Calcium shifts in experimental rickets. J MORELLE Proc. Physiol Soc., *J Physiol* 70, xiii xiv(1930) —In healing of rickets the Ca is at least partly provided (1) by the immediate neighborhood and (2) by the spongious trabeculae which constitute a reservoir of readily available Ca
J F LYMAN

Detection of histamine-like substances in asthmatic sputa and experiments on *their possible bacteriological origin* F A KNOTT AND G H ORIEL *Proc. Physiol* Soc., *J Physiol* 70, xxxi(1930) —Biol assay indicated the presence of histamine in several sputa from asthma patients whose bronchial plugs and mucopurulent masses contained Gram-negative bacilli, apparently allied to the group of Friedlander's bacillus Cultures of these organisms also gave histamine-like effects. In bronchial infection with these bacilli, therefore, one may have one cause of sp., locally produced asthma.
J F LYMAN

The occurrence of a non-heat-coagulable protein in normal and pathological urines. G H ORIEL Proc. Physiol Soc., *J Physiol* 70, xxxvi(1930) —A non heat-coagulable protein can be sepd from the urines of persons suffering from bacterial invasions and especially in such cases of allergy as eczema, urticaria and asthma. The sepn can be made by adsorption on kaolin from acidified urine and elution by adding NaOH to the sepd. kaolin to $p_H$ 8.0 It is pptd by satn with $(NH_4)_2SO_4$ and passes through a semipermeable membrane with difficulty Rabbits can be sensitized with it so that they show the Arthus phenomenon By this technic it can be shown that the substance is not identical when obtained from persons suffering from different diseases Persons suffering from allergic diseases are sensitive to this substance from their own urines and it is possible to desensitize them by minute doses at suitable intervals. J. F. LYMAN

Starch digestion in man. A F HURST AND F A KNOTT Proc. Physiol Soc., *J. Physiol* 70, xxxvii(1930) —A type of intestinal carbohydrate dyspepsia, characterized by the presence of undigested starch in the colon, is thought to be due to a failure of normal secretion of the digestive juice produced by the small intestine and a deficiency of intestinal diastase.
J. F. LYMAN

*Some questions and problems of diabetes research including some evidence of a* metabolic-physiological theory of diabetes mellitus. H CHR GEELMUYDEN *Ergebnisse Physiol.* 31, 1–95(1931), cf *C A* 24, 5369 —"Insulin has no direct influence upon the oxidation of carbohydrates in the animal body It fails to increase the total heat production and metabolism in the animal body It can accelerate carbohydrate oxidation by providing intermediary compds. whose existence conditions carbohydrate oxidation such as muscle work (hypoglucemic convulsions), fat and glycogen synthesis. Furthermore insulin can promote counter reactions of the nervous-endocrine metabolic regulation by which the total oxidation and thereby that of carbohydrates can be accelerated positively or decreased Such considerations probably explain the diverse findings of various authors in their studies of the effect of $O_2$ intake upon insulin The basic reaction of insulin appears to produce a decrease in the formation of carbohydrates from non-carbohydrate materials, this in turn forces the body to burn preformed carbohydrates. This results in an increased R Q and a decreased $O_2$ intake. This basic type of insulin reaction is in accord with the concept of diabetes mellitus as a pathol acceleration of sugar formation from non-carbohydrate materials." C. M. MCCAY

Experimental investigation into the appearance of protein in bile. II. Heteroalbuminocholia. T MATSUDA *Japan J Gastroenterology* 3, 14–17(1931); cf *C A* 25, 328.—Egg albumin injected intravenously into rabbits is excreted into the bile by the parenchymatous cells of the liver This was found after blocking the parenchymatous and stellate cells in turn with $CCl_4$ and Indian ink, resp Rabbits whose livers were injured by $CCl_4$ displayed a decreased ability to excrete foreign protein in the bile.
C. M. MCCAY

Biochemical investigation of the blood in cases of experimental disturbance of liver function II Liver function and protein metabolism. TSUNEJIRO SAWADA *Japan J Gastroenterology* 3, 38–45(1931), cf *C A* 25, 1282.—The livers of rabbits were injured by infection with *Schistosomum japonicum*, by ligation of the ductus choledochus or by P poisoning Such injuries increase the amino acids and serum globulin of the blood and decrease the fibrinogen and serum albumin. C. M McCAY

Jaundice in malarial diseases. Clinical and experimental investigations. I. Clinical research. SANTOSHI SAIKI *Japan J Gastroenterology* 3, 46–53(1931).—The concn of bilirubin in the blood of patients inoculated with malaria was detd at regular time intervals during the course of the attacks Malarial patients suffer from hyper bilirubinemia The excretory function of the liver is impaired This contributes to the jaundice as well as the abnormal increase in hemolysis C. M McCAY

The significance of the liver glycogen in the liver function. III 1. The glucose test in cases where the liver glycogen is diminished. TANESABURO IKUSHIMA *Japan J Gastroenterology* 3, 54–9(1931), cf *C A* 25, 1277,1278.—The blood sugar of rabbits was detd by the Hagedorn Jensen method at regular intervals after the injection of 20 cc. of 25% glucose intravenously After fasting, or after the injection of *adrenaline, strychnine or phlorhizin the blood sugar rises to higher levels and persists* longer after glucose injections Ligation of the bile duct has a similar effect. I believes such phenomena are the result of impaired liver function when its glycogen content is decreased C. M McCAY

Clinical and experimental studies on urobilin bodies. III The urine-, bile- and blood-urobilin-bodies in cases of experimental hepatic disturbance. MASANORI OSHIMA *Japan J Gastroenterology* 3, 67–70(1931), cf *C A* 24, 4833.—A normal rabbit excretes 0.03–0.07 mg of urobilin bodies per day in the urine and 80 times as much in the bile Injury to the liver by either $CHCl_3$ or $CCl_4$ increases the excretion of the urobilin compds In normal rabbit bile the proportion of urobilinogen to urobilin is 5 1 After hepatic damage the urobilinogen increases in the bile C. M McCAY

Autochthonous poisons of a lysocythinic nature in the brain. G PICHINI *Boll soc ital biol sper* 5, 1131–8(1930).—Alc exts of human brain, normal and pathological, were treated with 1 $t_2O$ to ppt. the so-called lysocythins The amt of ppt. from the pathological brains was 5 to 10 times that from the normal brains The senile dementia and the postencephalitic brains gave the most ppt. (0.4–0.5 cg from 800 g tissue) The hemolytic power of these ppts. was absent. When these substances were injected subdurally into rabbits there was an intensive neurotoxic reaction, whereas the material from the normal gave little or no reaction The substances when injected subcutaneously into the ear of the rabbit produced hemorrhagic edema These properties lead to the belief that the substances isolated from the pathological brains belong to the lysocythins and are by products of the scission of one or more phosphatides contained in the nerve tissue PETER MASUCCI

The nature of the period of incubation. ENRICO SERENI *Boll soc ital biol sper* 5, 1150–5(1930).—In most biologic phenomena the interval between the application of an initial stimulus and the response to the same stimulus is very brief, in anaphylaxis, the time between the sensitizing dose and the shock dose is much longer, regardless of the delicacy of the criteria chosen as the index The long period of incubation, however, is a concept essentially bound to the symptomatic aspect of anaphylaxis and not to that strictly immunological The *period of incubation (clinical) of anaphylaxis is essentially* the interval of time necessary for the sensitization of the organs of shock, by the antibodies produced in the organs of production, it consists of the sum of the times necessary for the antibodies to pass in sufficient amts from the producing organs into the blood and from the blood into the various organs in which they are fixed The antigen reaches the organs producing the antibodies more or less rapidly according to the route of introduction, and initiate immediately the production of antibodies. At this moment the true period of incubation comes to an end In passive anaphylaxis, the antibodies have been formed by the producing organs of another animal but the role played by the organs of shock is entirely the same in that they do not play a part in the true immunological process PETER MASUCCI

The inorganic sulfur of the blood in nephropathic cases. UGO DE MICHELIS. *Minerva med* 1931, I, 318–24.—The serum was deproteinized by means of trichloroacetic acid, the filtrate was treated with $BaCl_2$ and the resulting ppt was matched against a known standard $BaSO_4$ suspension The inorg S was detd on 12 normal individuals and on 37 cases suffering from various renal lesions The inorg S in the latter group was markedly higher, often as high as 15 times the normal values There was some relation

between the gravity of the disease and degree of inorg S retention A diagnostic and prognostic value is attributed to detns of this sort PETER MASUCCI

Lipoidolysis and tumors. PIETRO RONDONI *Minerva med* 1931, I, 312–8.—The role played by lipoids in the constitution of protoplasm and in cellular multiplication is discussed R summarizes and reviews his own and the work of others on the relation of lipoid metabolism to tumors, and develops the conception that neoplastic proliferation is accompanied by lipoidolysis phenomena PETER MASUCCI

Renal diabetes. SALVATORE ROMANO *Minerva med* 1931, I, 349–53.—A case of *renal and nephritic glucosuria was studied from the standpoint of glucemia during* fasting, normal alimentary glucemia, independence of glucosuria from the amt. of carbohydrate ingested and absence of diabetic symptoms R concludes that renal glucosuria is probably independent of the renal lesion PETER MASUCCI

Total inorganic calcium and phosphorus in the blood of parathyroidectomized dogs deprived of the large and small intestines with the exception of a portion of the superior duodenum. A BILLI *Boll soc ital biol sper* 6, 6–7(1931).—Inorg Ca in *the serum did not diminish inorg P increased markedly reaching a max of 11 mg* per 100 cc serum The ratio Ca/P after the parathyroidectomy diminished appreciably in respect to the value it had before the operation PETER MASUCCI

The anavenoms. II Immunization by the anavenoms. MAURICE ARTHUS *J Physiol Path Gen* 28, 773–88(1930) cf *C A* 24, 5871.—The anavenoms, prepd by treating the venoms with formaldehyde, when injected repeatedly under the skin of rabbits, confer a certain degree of immunity against the venoms Increasing the no of injections has a greater effect in augmenting the immunity than increasing the size of the dose Cobra anavenom has an immunizing power equiv to the corresponding venom The antigenic property actually resides in the anavenom and is not the result of a min quantity of venom untransformed by the formaldehyde treatment III. Anaphylaxis caused by the anavenoms. *Ibid* 800–15.—When rabbits are repeatedly injected with the anavenom of cobra or *Crotalus adamanteus*, a subsequent injection with the corresponding venom will cause anaphylactic shock, exhibited by lowered arterial pressure and increased respiration This anaphylaxis is no more specific than the anaphylaxis caused by the venoms Shock can be brought about by injecting cobra venom into rabbits which have been prepd with the anavenom of *Crotalus* or *Bothrops* The injection of a dil soln of cobra venom (1/20,000) causes a local, congestive reaction in animals previously injected with anavenom L. A MAYNARD

Physicochemistry of the humoral reactions GAETANO VIALE *Rev sud-americana endocrinol immunol quimioterap* 14, 17–24(1931)(Italian).—Immunity, anaphylaxis, precipitin reaction and other serological reactions are discussed in their relation to $p_H$ and the colloidal and chem structure of the compds involved A E MEYER

The bile salts, bilirubin and cholesterol in blood during jaundice. B VARELA FUENTES, P RUBINO AND E APOLO *Semana méd* (Buenos Aires) 1931, I, 855–62.—The changes of bilirubin in the blood give the most reliable information about the course of the disease. The normal value of 4 mg glycocholic acid per 100 cc. blood is increased parallel with the bilirubin A high value in bile salts in blood coexists often with a neg reaction of Hay in the urine The blood cholesterol can be higher or lower than normal without evident relation to the disease. A E MEYER

Studies on the pathological function of the kidneys in renal disease, especially Bright's disease. I. CAI HOLTEN AND POUL B REHBERG *Acta Med Scand* 74, 479–518(1931).—An interesting discussion of renal function tests. S MORGULIS

The presence of proteolytic enzymes in serum K YOKOTA *Biochem Z* 232, 58–68(1931).—Human serum may hydrolyze animal fibrin to a small extent, but not human fibrin Serum from cancerous or luetic patients likewise is unable to hydrolyze human fibrin, nor does it hydrolyze animal fibrin any more than normal serum does Ligating the pancreatic duct in the rabbit frequently causes a rise in the serum proteases, but the increase is not large S. MORGULIS

Complement fixation by the interaction of normal serum and bacterial suspensions. A contribution to the study of natural immunity phenomena T J MACKIE AND M H FINKELSTEIN *J Hyg* 30, 1–23(1930).—Normal sera from a wide variety of mammals can fix complement with many varieties of bacteria The property is most marked in man, ox, sheep and horse, but there is much individual variation within a species The reactions vary in degree with different species and different strains, the strain differences being more important The reacting principle of the serum is highly thermolabile, being uniformly inactivated at 55° within 30 min Complete inactivation often occurs at 50° to 52° and partial inactivation at 40°. The complement-fixing substance is "absorbed" by bacteria at 0°, which thus become sensitized Thus substance can

be absorbed by other substances than bacteria but not so completely. As a rule the reacting power of bacterial suspensions is destroyed at 55°, but this is influenced by different conditions as the type of medium on which the cultures are grown. The reacting power of the serum is fully developed in young animals These natural antibody-like principles differ from immune antibodies in thermolability JOHN T. MYERS

Transmission of maternal immunity. J. H MASON, T. DALLING AND W. S. GORDON *J Path Bact* 33, 783–93(1930).—*In sheep, cattle and horses, antibodies do not pass through the placenta into the fetal circulation* They do appear in the colostrum and are thus absorbed by the offspring during the first few days after birth. JOHN T. MYERS

The absence of trypanocidal substances in human cerebrospinal fluid. P. REGENDANZ *Zentr Bakt Parasitenk*, I Abt., 120, 89–93(1931) JOHN T. MYERS

The antihemolytic properties of human serum. M C RUBINO-MONTEVIDEO *Zentr Bakt Parasitenk*, I Abt, 120, 145–50(1931) —*Spontaneous inactivation (3 to 5 days in the ice box) destroys complement, but not the anticomplementary properties, which on the contrary increase.* Heating to 56° destroys both properties J T. M.

The dissociation of the diphtheria anatoxin-antitoxin complex and the recovery of the anatoxin. G RAMON, R. LEGROUX AND M SCHOEN *Compt rend* 192, 512–4 (1931). cf *C A* 24, 2173.—Diphtheria anatoxin behaves like toxin in its power to form a complex with diphtheria antitoxin, and in the possibility of dissocn. of this complex in the same manner as that of the toxin-antitoxin complex. T. H. RIDER

*The ultimate fate of arrested grafts of epithelial tumors.* P VLÈS AND A DE COULON *Compt rend* 192, 641–3(1931) —*Epithelial tumors grafted in mice are often* inhibited and apparently disappear by a complete lysis Mice in which a grafted tumor had disappeared were painted with tar at another site, after as long as 130 days, causing, in some cases, a new tumor at the site of the original graft Others showed growths at the site of the painting, only 2 animals showed both T. H RIDER

*The metabolism of neoplasm tissue.* ANNA GOLDFEDER. *Med Dósmadtzalma i Spolecznа* 13, 81–99(1931)(in Russian, English Abstract) —Neoplasm tissue always contains less glycogen (I) than normal tissue. I favors the growth of neoplasm Notwithstanding the presence of lactic acid, neoplasm tissue has a $p_H$ of 7.5–7.7, because of the production of $NH_3$ T. H. RIDER

Spasmophilic forms of infantile enuresis. G MACCIOTTA *Pediatria rivista* 38, 1145–57(1930) —*The investigations were carried out on 24 children with enuresis; the children showed no other symptoms which could be regarded as the cause for the* enuresis. In 17 of the cases M found a decrease of blood Ca, a slight diminution in the H-ion concn of the blood and a more or less marked increase of the galvanic excitability, with inversion or equalization of the anodic formula M concludes from his findings that in these cases the enuresis is a manifestation of an existing spasmophila The therapy with ultra-violet rays, alone or in combination with parathyroid hormone, gave *good results The best results were obtained by the combined treatment with ultra*violet rays and vitamin B *Numerous references are given* G SCHWOCH

The possibility of the occurrence of anaphylactic phenomena in the serum therapy by the oral route. LUIGI AURICCHIO *Pediatria rivista* 39, 289–99(1931) —Five cases of alimentary serum anaphylaxis are reported In 3 of these cases sensitization was produced by parenteral administration of horse serum, slight, transitory disturbances *occurred after oral administration of horse serum preps In the 2 other cases* sensitization was caused by *oral administration of such preps and very severe ana*phylactic reactions, which led to death in 1 case, were observed after injection of serum Expts carried out in guinea pigs showed that specific sensitization can be produced by prolonged gastric administration of horse serum Such animals exhibited only slight and transitory symptoms when they were injected with cattle serum, while with horse serum *anaphylactic symptoms appeared slowly until the animals died on the 3rd or 4th day* after the injection Gastric administration of horse serum was *without influence on* guinea pigs sensitized by injection of horse serum. G SCHWOCH

The electric conductivity of the cerebrospinal fluid in normal pathological conditions. P GORINI *Pediatria rivista* 39, 300–8(1931) —G detd the elec. cond of the cerebrospinal fluid in 73 infants In the healthy infants $K$ was fairly const (168–183 at 35°) *Normal values were also found in acute and chronic diseases and in cases with pathol* alterations of the nervous system excepting *meningitis, in which condition low values* for $K$ were found (min 143) G SCHWOCH

Acute insufficiency of the adrenal glands. AUGUSTO ANTONINI. *Rass clin terap sci affini* 29, 329–50(1930) —A review. Four pages of references are given G S

The *nature of variation of agglutination titer caused by insulin.* M. NOZAKI.

*Keijo J Med* 1, 248–87(1930).—Insulin injected intravenously into rabbits immunized with typhoid bacilli causes a great but temporary increase in its agglutination titer. This increase is considered as not being due to the insulin itself but rather dependent upon hormonal action. A J Vorwald

**Serology of syphilis. IV. A more sensitive antigen for use in the Wassermann reaction.** Harry Eagle. *J Exptl Med* 53, 605–14(1931), cf *C A* 25, 139–40.—*The discovery that there are many substances with the sensitizing properties hitherto* believed peculiar to cholesterol and its derivs and that sensitizer can be added to antigen in very large quantities, many times those currently used, and yet continue to increase its complement fixing efficiency with no danger of giving falsely pos tests, has made possible the prepn of an antigen much more sensitive than any now available for use in the Wassermann reaction. This consists of the EtOH ext of beef heart muscle to which are added 0.8% cholesterol and 0.6% sitosterol, the excess of which crystallizes out on *cooling and is dissolved before using. Details of the prepn are given. There is reason to* believe that this antigen possesses almost the max sensitivity obtainable. The method of prepn insures its being almost satd with antigen-lipoids, and more sensitizer could not be added without increasing the turbidity of its dil'n in saline to a point where it would interfere with the reading of hemolysis. V. **The cause of the greater sensitivity of the ice-box Wassermann, the zone phenomenon in complement fixation.** *Ibid* 615–22.—Serum, in concns greater than 1:25, causes a marked inhibition of complement fixation in general and of the Wassermann reaction in particular. *The serum protein is probably* adsorbed by the colloidally dispersed lipoid reagin complexes, forming a protective film which prevents the fixation (adsorption) of complement. This inhibition explains the zone phenomenon in complement fixation: a weakly pos. serum may give a completely pos. reaction in, *e. g.*, 1:5 dil'n., and yet, because of this serum inhibition may appear completely neg. when tested as whole serum. The greater sensitivity of the ice-box test is due to the fact that the serum inhibition just described is less marked at lower temp., to the prolonged incubation time, making for greater sp. fixation, to a more marked non-sp. destruction of complement by antigen and a spontaneous deterioration in the longer ice box test. Because of the inhibition by serum protein in high concn., a quant. Wassermann technic involving the use of graded quantities of serum is worthless when carried out at 37°. Even the ice-box test, which is less susceptible to this inhibiting effect, will yield a pos. reaction with whole serum only when the circulating reagin exceeds a surprisingly high threshold (6–10 times the quantity which could be detected in dil. serum). C J West

**Inflammation. VII. Fixation of bacteria and of particulate matter at the site of inflammation.** Valy Menkin. *J Exptl Med.* 53, 647–60(1931), cf *C. A.* 25, 1579.—India ink or graphite particles injected into an area of inflammation fail to disseminate to the tributary lymph nodes. When injected into a normal peritoneal cavity they rapidly appear in the retrosternal lymph nodes. When injected into an inflamed peritoneal cavity, they are fixed *in situ* and fail to reach the regional lymph nodes. Graphite particles injected into the circulating blood stream enter an inflamed area both as free particles as a result of increased capillary permeability and also as phagocyted material within leucocytes. *B. prodigiosus* injected into inflamed tissue is fixed at the site of inflammation and fails to disseminate to the regional lymph nodes as readily as when injected into normal tissue; injected at the periphery of an inflamed area it does not readily penetrate into the site of inflammation; injected intravenously, it rapidly enters an inflamed area. C J West

**Congenital protein hypersensitiveness in two generations.** Bret Ratner and Helen L. Gruehl. *J Exptl Med* 53, 677–86(1931).—Hypersensitivity actively induced *in utero* is shown to persist for a longer period than passive sensitization (cf *C A* 21, 449). The degree of hypersensitivity, its duration and its transmissibility appear to be influenced by the time elapsing between the original injection of the parent and parturition. A pregnant guinea pig receiving a parenteral injection of antigen 2–4 days prior to parturition transmits a state of hypersensitivity to 2 succeeding generations. The sensitization of the $F^{I}$ generation is due to the passage of antigen. The sensitization of the $F^{II}$ generation is due to the passage of antibodies formed in the $F^{I}$ generation. This prevents any further transfer of the hypersensitive state. Though hypersensitivity occurs in 2 successive generations, the phenomenon is congenital and not hereditary. C J. West

**Lipoid metabolism. I. Lipoid metabolism in rabbits with fever.** Hidesaku Hamano. *Proc Imp Acad Tokyo* 7, 80–1(1931).—The total fatty acid of the whole blood and plasma is decreased in fever, the max. being reached in 24 hrs. The whole blood total fatty acids return to normal in 60 hrs., the plasma in a shorter time. Choles-

terol and lecithin increase both in whole blood and in plasma in the beginning of the fever; the cholesterol reaches a max. in 24 hrs., the lecithin in 6 hrs.; after this time both decrease and fall below the normal value. The serum protein decreases with the fever and becomes normal in 18–24 hrs. C. J. West

*Daily variations in sugar content of blood and urine in normal and in diabetic persons.* J. Möllerström. *Svenska Läkaresällskapets Handlingar* 56, 211–95(1929); *J. Am. Med. Assoc.* 96, 227.—About 12 000 blood-sugar tests and 7000 urine tests were made on 37 patients. In glycosuria the amt. of sugar excreted varied from day to day even on a const. diet. The excretion was sometimes periodic; thus in diabetics a min. was often noted at midday, even with frequent meals. Excretion of acetone bodies in grave diabetics was also periodic. At certain times of the day, both in normal and diabetic persons, postalimentary glycemia disappeared more rapidly or did not appear. During this stage there was a tendency to spontaneous fall of the blood sugar, sometimes so marked that in spite of ingestion of food the blood sugar was still below the starvation level. R. C. Willson

Kilduffe, Robert A. The Clinical Interpretation of Blood Examinations. Philadelphia: Lea & Febiger. 629 pp. $6.50. Reviewed in *J. Am. Med. Assoc.* 96, 1532 (1931).

A. N. Richards

Secondary and toxic effects of arsenobenzene preparations. Fritz Brezovsky. *Wiener klin. Wochschr.* 43, 1285–7(1930).—The preps. studied and the % of cases in which secondary effects were negligible were: *neosalvarsan* 37, *novarsenobenzol* (*Billon*) 6, *neoarsphenamine* 40, *myosalvarsan* 4, *arsenated lipoid* 16, *novasurol* 10. D. B. Dill.

Metal salt therapy. Concluding experiments with rabbit tuberculosis. L. E. Walbum. *Z. Tuberk.* 53, 202–9(1929); cf. *C. A.* 24, 426.—On the basis of extensive observations with 42 metals and metal salts the author concludes that Cs and Mn possess a specific healing value in rabbits infected with tubercle bacilli while only a slight action was noted with Ce, Ba, Al, La, Mo, Pt, Ni and Sn, the remaining 32 being without effect. H. J. Corper.

Metallic electrocolloids in the treatment of syphilis. Orlando Rangel. *Bol. clin. brasil. pharm.* 11, 3–22(1930).—Some advantages are given of the use of electrocolloids (Hg and Bi Hg) over arsenicals in the treatment of syphilis. C. A. A.

Clinical test of a new compound in the treatment of arthritis. D. E. Markson. *Am. Med.* 37, 116(1931).—*Novocodeinchophen* was found advantageous in the treatment of arthritis. Rachel Brown.

Field experiences in the use of calcium gluconate. J. Alley Rogers. *J. Am. Vet. Med. Assoc.* 31, 555–6(1931).—A report of the successful treatment of milk fever in cows by the injection of a 10% soln. of Ca gluconate. Rachel Brown.

The curative value of certain bismuth compounds. An experimental study. Sigmund S. Greenbaum with Anna M. Rule. *Am. J. Syphilis* 15, 50–71(1931).—The curative doses of 12 commercial Bi preps. were detd. by the lymph-gland method after intramuscular injections in rabbits. There was variation in the curative dose from 2 mg. per kg. ("bismuthodal") to more than 25 mg. per kg. ("bismodal" and "iodobismuthate"). B. C. Brunstetter.

Intravascular phagocytosis of erythrocytes in *Necturus* following prolonged immersion in lead acetate. A. B. Dawson. *Anat. Record* 45, 345–52(1930).—Extensive phagocytosis of erythrocytes occurs in the circulating blood of *Necturus* following prolonged immersion (15 days or more) in a soln. of $Pb(C_2H_3O_2)_2$. Phys. changes in the erythrocyte, involving loss of typical form and the acquisition of the quality of stickiness (to glass) appear to favor phagocytosis. The destruction of erythrocytes was accompanied by striking changes in the color of the bile. B. C. Brunstetter.

The effect of administration of thyroid substance, of potassium iodide, and of extirpation of the greater portion of the thyroid gland on the epidermis of the guinea pig. Leo Loeb, F. L. Haven, L. T. Genther and Hilda Friedman. *Anat. Record* 46, 65–80(1930).—Administration of thyroid substances or of KI daily to guinea pigs did not cause an increase in the proliferative activity of the epidermis or an increase in the number of epidermal cells. The results suggest that both multiple as well as single doses of these substances may cause a lowering of the proliferative activity and

number of cells Following a not quite complete thyroidectomy no lowering of the proliferative activity in the epidermis nor of the number of epidermal cells took place The results are discussed with reference to their bearing on the problem of the *significance of the internal secretions on the origin of cancer* B C BRUNSTETTER

The chromatophores of cephalopods. III. The effect of some poisons in vitro. E SERENI *Z vergleich Physiol* 12, 329–503(1930) —The action of the following substances on the nerve, the muscle and the zone between nerve and muscle, of nerve-muscle prepns was investigated aconitine, atropine, acetylcholine, betaine, caffeine, cocaine, choline, conine, ephedrine, guanidine, lobeline, phenol, pilocarpine, strychnine, strophanthine, tyramine, veratrine and quinine It was demonstrated that the zone between nerve and muscle is differentiated from nerve or muscle not only pharmacologically but physiologically One section of the nerve, the intermediate zone can be excited only by specific chemical stimuli it is probable that the conduction of impulses from nerve to muscle occurs normally through the intermediate zone by means of a chem mechanism Tyramine and betaine both exert a direct effect on the chromatophores, the first by increasing the excitability of the muscle (thereby resulting in the appearance of pigment clouds) and the second by stimulating the zone between nerve and muscle (which causes a contraction) As both substances occur in cephalopods, it is assumed that they control at any instant the condition of normal chromatophores by their action on the nerve centers Pharmacological analysis confirms the idea that the diffuse expansion of pigment immediately following the application of an elec stimulus to normal cephalopod skin is due to a stimulation of nerve, and not of muscle, fibers B C BRUNSTETTER

Notable cases of poisoning. R FRIDLI *Pharm Monatshefte* 12, 61–2(1931) —An address enumerating certain of the more notable cases of intoxication, either by intent or accident, from ingestion of prepns contg Hg, Cu, As, Ba, Pb, Th, Zn, I, HCl, $CO_2$, EtOH, $CH_2O_2$, acetylsalicylic and salicylic acids, pyramidone, veronal, dial, luminal, opium alkaloids, quinine, atropine, castor oil seed, mushrooms, etc W O E

The chemotherapeutic action of quinine (and its derivatives) in vitro upon Proteosoma praecox (avian malaria). W BORCHARDT *Arch Schiffs Tropen Hyg* 34, 360–4 (1930) —Quinine, hydroquinine-HCl and plasmochin incubated with the blood of infected animals *in vitro* have a definite parasiticidal action, the lethal doses being 0 5, 4, and 0 2 mg , resp , per cc of blood (5 hrs at 37°) These expts indicate that the therapeutic effect of quinine derivs in malaria is due to a direct action upon the parasite *in vivo*. H EAGLE

Experimental studies on the pharmacology of salyrgan IV. Studies on the chemistry of salyrgan. KNUD O MØLLER *Arch exptl Path Pharmakol* 153, 109–19 (1930), cf *C A* 24, 5067 —As shown by potentiometric detns against a Hg electrode, salyrgan produces practically no Hg ions at room temp The addn of acid causes a voluminous ppt of "salyrganic acid" This is only slightly sol in $H_2O$ (1 58000), and somewhat more sol in acid (1 4600 in 2 *N* $H_2SO_4$) In acid soln the Hg ion is formed Salyrganic acid is sol in NaCl soln , probably as a result of the formation of a complex salt The Hg ion concn decreases with increasing NaCl concn The acid is also sol in KCl, $NH_4Cl$, $CaCl_2$, $MgCl_2$, $BaCl_2$, NaI and NaBr, but only very slightly sol in $Na_2SO_4$, $NaNO_3$, $ZnCl_2$, $FeCl_3$ and $HgCl_2$ Salyrgan is excreted in alk urine as such, passing through the body unchanged It is excreted in acid urine as the NaCl salyrganic acid complex H EAGLE

The effect of Germanin upon the blood-coagulation system with particular reference to its prophylactic and therapeutic use in thrombosis. BERNHARD STÜBLR AND KONRAD LANG *Arch exptl Path Pharmakol* 154, 41–9(1930) —Intravenous injection of Germanin causes a slight shift in the reaction of the blood toward the alk side and a *relative increase in the albumin fraction of the serum protein There is a decrease in* the thrombocyte count and an increase in their charge which inhibits their agglutination Germanin has been successfully used in thrombosis and thrombophlebitis H EAGLE

The effect of the intravenous infusion of sugar upon the coagulation system, with particular reference to the pathogenesis of thrombosis. BERNHARD STÜBER AND KONRAD LANG. *Arch exptl Path Pharmakol* 154, 50–8(1930) —The intravenous infusion of glucose causes an increase in blood fibrinogen and globulin, an acceleration of coagulation, *an increase of thrombocytes and a decrease in their elec. charge* The *role of* these changes in causing thrombosis is discussed H EAGLE

Comparative studies on the effects of phenol and some phenol derivatives upon muscle. TAKATOSHI HASEGAWA. *Arch exptl Path Pharmakol* 154, 103–14(1930) — *The narcotic effect of various phenol derivs upon surviving muscle prepns, can be*

readily measured by the time required for complete passivity of the isolated frog gastrocnemius to maximal stimulation The effect of phenol, *p*- or *o*-cresol, and *m*-cresol are in the ratio of 1 2 5 1 75, resp *In contrast, diphenols excite the muscle, and triphenols are only slightly active,* but their ethers are pure narcotics Thymol, β naphthol, mono- and poly nitrophenols have no narcotic effect and cause an intense contraction which develops into death rigor, possibly due to protein coagulation Amino- and sulfo-phenol are ineffective, while benzene causes both narcosis *and reversible contracture* H. Eagle

**The localization of the waking effect of calcium in magnesium narcosis.** Rudolf Schoen and Siegfried Koeppen *Arch exptl Path Pharmakol.* 154, 115–27(1930) — Mg narcosis is due to paralysis of the proprioceptive and labyrinthine reflexes, the waking effect of Ca persists *as long as the reflex centers are intact,* and persists even if the thalamus, corpus striatum and cerebrum are removed from the exptl rabbit. The rigidity following decerebration is removed by Mg, but restored by Ca The waking effect of Ca upon the Mg narcosis is therefore not dependent upon an intact corpus striatum, and is not due to a quieting effect upon the brain stem H Eagle

*Direct and antagonistic effects of magnesium, calcium and potassium chlorides and sodium oxalate upon respiration.* Siegfried Koeppen *Arch exptl Path Pharmakol* 154, 129–42(1930) —Given intravenously, $CaCl_2$, $MgCl_2$ and KCl all increase respiration, given subcutaneously, the first two paralyze respiration, the third is ineffective. *The respiratory paralysis caused by* $MgCl_2$ *is instantaneously stopped by intravenous* $CaCl_2$, gradually overcome by subcutaneous $CaCl_2$, and increased by $Na_2C_2O_4$ Respiratory paralysis due to $CaCl_2$ is removed by the intravenous injection of $MgCl_2$ Neither KCl, $CaCl_2$ nor $MgCl_2$ affects the respiratory paralysis caused by urethan or dial H Eagle

**The pharmacology of gluconic acid a contribution to the effect of free acids in the body.** I. Siegwart Hermann *Arch exptl Path Pharmakol* 154, 143 60(1930) — *Bact gluconicum* was grown in media contg glucose, the gluconic acid formed was repeatedly recrystd as the Ca salt, and the Ca was removed with $H_2SO_4$ Various bacteria *oxidize the free gluconic acid to ketogluconic acid* The *toxicity of the free acid* upon intravenous injection depends upon its concn, and is less if it is given in a soln contg NaCl Org acids in general differ greatly in their toxicity, even when differences in $[H]^+$ and in molar concn are eliminated One important factor in this is that their very *rapid oxidation in the body makes for hypotonicity, partially explaining the protective* action of NaCl II *Ibid* 161 74 —Org acids vary in their ability to form hematin from defibrinated blood, moreover, the activity of each acid depends upon the species of animal from which the blood was taken Although there is a certain correlation between the effective H ion concn and molarity, roughly, $K = m[H^+]^2$, these are not the only two factors the ability of the acid to penetrate into the red cell is very important If, instead of using the intact cell, one uses a soln of hemoglobin, the activity of the acid depends upon the square of $[H]^+$, and is entirely independent of the molarity of the acid The very slight activity of gluconic acid upon the intact cell is due to the fact that it is least sol *in lipoids, and therefore penetrates least into the* cell III. *Ibid* 175–92 —The intravenous injection of org acids causes an increase in minute respiratory vol and frequency, even in the respiratory depression due to morphine Most of the acids, exclusive of gluconic acid, cause a temporary fall in blood pressure *Gluconic acid has no significant effect upon the Ca metabolism of rabbits* and dogs In the former the excretion of Ca in the urine and feces is increased, in the latter, urine Ca is increased and feces Ca decreased The parenteral administration of gluconic acid causes an increase in serum Ca, *i. e.*, a mobilization of Ca, which explains the fact that *it decreases the toxicity of citric acid* Only a fraction of gluconic acid given by mouth is absorbed as such, because of decomposition by yeast and bacteria in the intestine H Eagle

*The antagonism of adrenaline and insulin in the regulation of blood sugar (experiments upon adrenalectomized dogs).* F Meythaler and R Cario *Arch exptl Path Pharmakol* 154, 193–202(1930) —Injections of concd glucose solns into the pancreaticoduodenal artery in adrenalectomized dogs causes a fall instead of a rise in blood sugar, just as it does in normal dogs Injection into peripheral vessels, however, causes a *temporary marked hyperglucemia* This confirms the results of Grafe and Meythaler, who view the blood sugar as the adequate *hormone for the secretion of* insulin, quite apart from any effect of adrenaline There is an antagonistic action between the two in the regulation of blood sugar H. Eagle

*The effect of nicotine, pilocarpine and veratrine upon the isolated submaxillary* salivary gland of the dog. O. Nikolaev. *Arch exptl. Path Pharmakol* 154, 202–10

(1930) —Perfusion of the 3 drugs through the isolated gland has the same effect upon salivary secretion and blood vessels as in the intact animal H EAGLE

*Oxidation of benzene in the isolated livers of warm- and cold-blooded animals.* CHERNIKOV, IDA D GADASKIN AND I I GUREVICH *Arch exptl Path Pharmakol* 154, 222–7(1930) —The isolated livers of cats, rabbits and frogs oxidize benzene to phenol In benzene poisoning of the liver of warm-blooded animals, phenol is found in both free and bound forms, after benzene poisoning of frogs, phenol is found in the cloacal contents The liver may not be the only organ concerned in this oxidation H EAGLE

The effect of snake poisons upon nerve tissue. ARTHUR WEIL *Arch exptl Path Pharmakol* 154, 228–38(1930), cf *C A* 24, 3267 —The poison of *Naja nigricollis* acts like sapotoxin, that of *Bothrops atrox* is similar to Na taurocholate Both affect the medullary sheath, without affecting the affinity of the axis-cylinder for Ag stains A typical Marchi reaction (reduction of $OsO_4$) is given by the fibers affected by sapotoxin and both snake poisons, but not by fibers injured with Na taurocholate The adsorption of sapotoxin or of the snake toxins by the spinal cord follows Arrhenius' formula for the adsorption of amboceptor by red cells rather closely, as well as Schütz' rule H EAGLE

The disappearance of the hypertensive action of the hypophysis in the body. WERNER HARTMANN *Arch exptl Path Pharmakol* 154, 255–62(1930) —The vasopressor action of posterior pituitary exts is less marked if it is injected into a peripheral artery than if it is given intravenously Similarly, passage through the portal capillaries removes some of its activity H EAGLE

Experimental studies in the pharmacology of salyrgan. V. The behavior of mercury in the body after the administration of salyrgan. Continued studies on salyrgan nephritis in rabbits. KNUD O MØLLER *Arch exptl Path Pharmakol* 154, 263–79 (1930) —After the intravenous injection of salyrgan into dogs and rabbits, there is a very rapid excretion of Hg in the kidneys, far more rapid than in man (40% in one hour, 70–80% in 2 hrs ) The urine Hg concn may be as high as 90 mg % in the dog and 370 mg % in the rabbit The development of salyrgan nephritis in the rabbit does not depend upon the reaction of the urine, moreover, the course of Hg excretion is the same in acid as in alk urine Only 3 5% of the Hg is excreted by the liver in 24 hrs in the dog, and only 1% is excreted through the walls of the intestine After repeated injections of salyrgan into dogs only minimal quantities can be found in the organs, chiefly in the kidneys and liver H EAGLE

The sugar economy of the liver. I. The effect of adrenaline and insulin upon the sugar output and glycogen content of the liver. HANS MOLITOR AND LEO POLLAK *Arch exptl. Path Pharmakol* 154, 280–300(1930) —The difference between the sugar contents of the hepatic vein and of the ear vein is increased after adrenaline administration, simultaneously, there is a decrease in the liver glycogen There is no quant. relationship, however, between these two effects After insulin, the sugar content of both the hepatic and ear veins falls within 10 min , but the carbohydrate content of the liver remains either approx const , or shows a slight decrease Adrenaline therefore increases the glucose output of the liver, while insulin suppresses it H EAGLE

Clinical and experimental contributions to the pharmacology of harmine. G MARINESCO, A KREINDLER AND A SCHEIM *Arch exptl Path Pharmakol* 154, 301–16(1930) —Harmine causes clinical improvement in cases of Parkinson syndrome In normal subjects and in post encephalitic parkinsonism it causes an increased excitability of the vestibular app There is a fall in blood pressure and bradycardia, and the vascular reflexes return toward normal The hyperexcitability of the parasympathetic system and the lowered excitability of the sympathetic system characteristic of parkinsonism are also corrected by harmine It has a vagal effect upon isolated frog heart, and reduces muscle and nerve chronaxia in the isolated frog nerve muscle prepn In the patient it has a therapeutic effect upon the pathological chronaxia of nerves and muscles H. EAGLE

The cause of creatinuria. I. Acidosis and creatinuria. OTTO RIESSER AND CARLO BRENTANO *Arch exptl Path Pharmakol* 155, 1–20(1930) —Despite the fact that morphine, urethan and ether narcosis induce both creatinuria and acidosis, the two are not necessarily correlated The degree of creatine formation and excretion is not proportional to the degree of acidosis and alkalosis induced by the administration of alkali may also cause creatinuria H. EAGLE

Pharmacology and pharmacodynamics of salves and medicaments incorporated in salves VI. The pharmacology and pharmacodynamics of unguentum-hydrargyri praecipitati albi, Ph. g. CARL MONCORPS *Arch exptl Path Pharmakol* 155, 51–69

ates the poisoning of the frog muscle independently of $p_H$ There is no relation between the toxic effects of hydroquinone and its effects upon tissue respiration Muscles of fatigued animals or of animals treated with thyroxine are more susceptible to poisoning by hydroquinone, lactic, succinic and pyroracemic acids depress this susceptibility, and cane sugar accentuates it. H EAGLE

The clinical significance of the initial insulin hyperglucemia. MAX BÜRGER *Klin Wochschr* 9, 104–8(1930) —In 22 normal fasting human beings, the intravenous injection of insulin caused an initial hyperglucemia, the max rise averaging 22% of the original blood sugar, this max was reached in 10 min In cirrhosis, this initial hyperglucemia is not observed, in jaundice, it is significantly decreased Both an intact liver parenchyma and a liver store of glycogen are considered necessary for the phenomenon, this explains its absence in Basedow's disease, and its presence in myxedema In diabetes under proper treatment hyperglucemia is also observed, but not in diabetic coma H EAGLE

The venoconstrictor action of carbonic acid and its significance for the circulation KL. GOLLWITZER-MEIER AND HANS BOHN *Klin Wochschr* 9, 872–5(1930) —The inspiration of air with a high $CO_2$ content by dogs causes venoconstriction, demonstrable even in a vein being perfused with a normosal-serum mixt , quite apart from the circulation This constriction is conditioned by a vasomotor reflex, and is not observed in the perfused vein if its nerve supply is eliminated H EAGLE

The retention of uroselectan in the human body. II. The distribution of uroselectan in the animal body. W TOURNÉ AND E DAMM *Klin Wochschr* 9, 1719–20 (1930), cf *C A* 25, 1582 —Thirty five min after the intravenous injection of 10–30 cc of 40% uroselectan into rabbits the animals were killed and their organs examd Uroselectan was found to be stored chiefly in the liver, kidneys, skin, blood and urine A similar distribution was found in dogs The kidney content is ascribed to urine, that of the liver to bile Damage of either the liver or the kidneys leads to storage and excretion in the other organs Widespread kidney damage is a contraindication to the administration of uroselectan H EAGLE

The action of vasopressin and oxytocin upon intestinal peristalsis and the treatment of ileus paralyticus with vasopressin. A WL ELMER, L PTASZEK AND M SCHEPS *Klin Wochschr* 9, 1765–8(1930) —Of the hormones present in posterior pituitary exts , vasopressin stimulates, and oxytocin inhibits, intestinal contractions The former is more active than pituitrin, physostigmine, pilocarpine, atropine, etc., and its therapeutic use in paralytic ileus is indicated H EAGLE

The pharmacological significance of the sterols. HANS SEEL *Klin Wochschr.* 10, 241–4(1931) —A review H EAGLE

The properties and effects of a new class of organic bromine compounds. SIEGWART HERMANN AND MARIE FREUND *Klin Wochschr.* 10, 250–2(1931) —If $Br_2$ is combined with unsatd fatty acids (*e g*, oleic acid), and part of the $Br_2$ is removed, one attains a new type of org combination of $Br_2$, pharmacologically many times more active than the fully brominated compd A quantitatively similar relationship was observed with $Cl_2$ The pharmacol effect of $Br_2$ compds usually depends upon the type of compd rather than the amt of $Br_2$ Multibrol (Na monobromoleate) has no effect; it does not affect blood pressure, respiratory vol or frequency, and does not cause bromism H EAGLE

*The effect of caffeine in hypoglucemic conditions.* GRIEFF AND HAPPE *Klin Wochschr.* 10, 263(1931) —Contrary to the findings of Popper and Jahoda, the symptoms following an excess of insulin depend upon the fall of blood sugar Caffeine alleviates these symptoms, without affecting the blood sugar There is no reason for *assuming that insulin contains two distinct substances, one with a hypoglucemic and* the other with a toxic action Such symptoms as urticaria, and possibly convulsions, may be due to protein impurities H EAGLE

*The circulatory effect of ephedrine.* F HILDEBRANDT AND H MOGGE *Klin Wochschr* 10, 291–4(1931) —The circulatory effects of ephedrine are due not to an increase in cardiac activity, but to a direct action upon the vessel walls Ephedrine may have a toxic action upon the heart H EAGLE

The appearance of indican and aromatic substances in the blood in severe cardiac decompensation and morphine poisoning. J E W BROCHER *Klin Wochschr* 10, 294–7(1931) —In a case of morphine poisoning, coupled with myocardial insufficiency, there was marked retention of urea, uric acid and indican in the blood, with a prompt return of the abnormal blood findings to normal when diuresis was established H E

Gänsslen's liver extract for injection. Further evidence against liver resistance

and in favor of the susceptibility of cord degeneration to treatment. VIKTOR SCHILLING *Klin Wochschr* 10, 301–3(1931). H. EAGLE

*The effect of atropine upon glucemia in human beings.* D DANIELOPOLU *Klin Wochschr* 10, 311–3(1931).—Contrary to current belief, stimulation of the parasympathetic system increases the blood sugar. H EAGLE

The treatment of pernicious anemia with a stomach extract which can be injected. W I NERLE, H KRITCH AND M GANSSLEN *Klin Wochschr.* 10, 313(1931).—Good results are reported in this preliminary report. H EAGLE

A new mechanism of the insulin effect. H SCHWARZ AND M TAUBENHAUS *Klin Wochschr* 10, 313–4(1931).—A preliminary report H EAGLE

Thyroxine and percutaneous sensitization. M. LUCACER *Klin Wochschr* 10, 314(1931).—Thyroxine accentuates the allergic reaction due to percutaneous sensitization, and therefore has a peripheral action H EAGLE

The specific treatment of gonorrhea with soluble gonotoxin. W WOLFFENSTEIN *Klin Wochschr* 10, 354–6(1931) H EAGLE

Experimental studies on the effect of the inspiration of small quantities of [benzine] and [benzene] upon the respiratory organs and the whole body. L TR LARIONOV AND N V LAZAREV *Klin Wochschr* 10, 356–7(1931).—The authors take issue with the conclusions of Schmidtmann (*C A* 25, 1006) H EAGLE

The insulin reaction of the leucocytes of the blood. W STOCKINGER AND K. KOBER *Klin Wochschr* 10, 389–92(1931).—Within 2 hrs following the administration of insulin, there is an abs rise in the no of leucocytes, reaching a max. at the end of the 2nd hr Simultaneously, or a little later, there is a neutrophilic leucocytosis There is no correlation between the hypoglucemia and these changes in the blood picture H. EAGLE

The treatment of lymphogranulomatosis inguinalis, particularly with a copper preparation. W FREI AND J WIESE *Klin Wochschr* 10, 404–6(1931).—Although Sb preps are effective, they work very slowly and irregularly The authors suggest the use of cuprosol H ( a proprietary prepn ) as an adjunct to therapy, particularly effective if given with Stibenyl H EAGLE

Ephedrine in local anesthesia. M KOCHMANN. *Klin Wochschr* 10, 408(1931).—Ephedrine is valuable as an adjunct to local anesthetics, but cannot replace adrenaline H EAGLE

Further studies in the demonstration of Germanin (Bayer 205) in the animal body. HEINZ ZEISS AND KENIA UTKINA-LYUBOVTTOVA *Z Immunitats* 68, 170–81(1930).—Following the intravenous injection of Germanin, the highest concns are found in the serum the drug is also stored in the kidneys, lungs, spleen and liver H. EAGLE

*Colloid-chemical combination reactions of Germanin and protein complexes.* II. The effect of Bayer 205 upon the protein components of the hemolytic system. VASSILI A NOVOSSELSKII *Z Immunitats* 68, 328–41(1930).—Germanin has no effect upon the hemolytic properties of normal or sensitized sheep cells and does not decrease the hemolytic titer of an amboceptor serum It does, however, depress the hemolytic properties of complement H EAGLE

The residual quantities of arsenic remaining in animal organs after the intake of neoarsphenamine E REMY *Z Immunitats* 68, 395–402(1930).—Following the injection of neoarsphenamine into rabbits, considerable quantities of As are stored in the organs, particularly in the spleen, lymph glands, liver, bone marrow and brain for some time R. opens the question as to whether the excess As is ever completely excreted H. EAGLE

3,4-Dihydroxyephedrine and 3,4-dihydroxynorephedrine. RAYMOND HAMET *Compt rend* 192, 300–2(1931), cf *C A* 25, 1590.—Both 3,4 dihydroxyephedrine (I) and 3,4-dihydroxynorephedrine (II) when injected produce a hypertension which, like that produced by adrenaline (III), is increased by cocaine The effect of ephedrine (IV) is decreased by cocaine Large doses of IV are hypotensive but large doses of I and II are hypertensive like III. While IV in small doses has but a slight transient effect on intestines *in vitro*, I and II, like III, have a strong and lasting inhibiting effect. *Conclusion*.—The addn. of a Me group to the β C of III or noradrenaline does not greatly modify the physiol action of these substances, while substitution in the nucleus of ephedrine of 2 phenolic OH groups in the 3,4-position profoundly changes the action of this compd L E GILSON

Lectures in *materia medica*. W A DEWEY *J Am Inst Homeopathy* 23, 1224–34(1930), 24, 186–98(1931), cf *C A* 24, 5377.—A discussion of the physiol action and therapeutic use of *Stramonium*, *Solanum dulcamara*, tobacco, *Capsicum annum* and *Nux vomica* JOSEPH S. HEPBURN

The influence of the intravenous injection of urea on the exchange of substances between the blood and the tissues. H DONOVAN AND D BRENNER *Brit J Exptl Path* 11, 419–38(1930) —Five g. urea was injected intravenously into healthy individuals and patients with various diseases, and the urea, NaCl and $H_2O$ contents of the blood and urine were detd at intervals for a period of 2 hrs after the injection By the time the urea has mixed with the blood (3 min ) 80% has left the blood stream It is suggested that the urea leaves the blood by a process of simple diffusion, passing into the water of the cells as well as into the free water, and that the process is complete in 15 min , when the concn of urea in the blood equals that in the tissues In this respect urea is unique as with no other substance investigated is the distribution uniform over blood and tissues The sudden introduction of urea into the body delays the formation of urea, and may even bring it to a standstill in the first 2 hrs after the injection The osmotic attraction of the urea injected is greatly reduced by its rapidly leaving the blood NaCl also leaves the blood so that the osmotic attraction of dissolved substances in the blood is not raised even 3 min after the injection There is some evidence that except in edematous patients urea injection causes some NaCl to pass out of the body fluids, to be stored in a "dry" form in the salt depots of the body, thus reducing the crystalloid content of the body fluids which had been raised by the injection of urea, but that in most cases of edema, NaCl is liberated from the depots and enters the body fluids It has been suggested that an important factor in the production of edema is a deficient power of the tissues to hold and bind water, which therefore accumulates *in the tissue spaces as edema fluid The writers suggest that in edema the tissues are* also less able to bind NaCl, which also accumulates in the free tissue fluids H F H

The influence of adrenaline on the immediate variation in alkaline reserve. Role of apnea. Comparative action of formaldehyde and acetylcholine. J GAUTRELET D BENNATI, E HERZFELD AND L VALLAGNOSC *Bull soc chim biol* 12, 1100–44 (1930) —Intravenous injection of 0 1 mg adrenaline per kg into anesthetized dogs caused an av rise in alk reserve (I) of 15% in 1–3 min , followed by a rapid fall A condition of apnea is produced but it is not an important factor in relation to I. Apnea produced by intravenous injection of HCHO and acetylcholine is not accompanied by a rise in I. *Injections of 0 0001–0 01 mg adrenaline produced a distinct rise in I* without appreciable apnea Increased respiration may be due to a sudden release of $CO_2$ into the blood stream C G KING

The action of potassium salts on the Golgi apparatus of the liver cells. M SHIRASAKA. *Arb Med Univ Okayama* 1, 481–95(1930); *Physiol Abstracts* 15, 588 —The administration of large quantities of KBr and KI to rabbits causes a marked disturbance in the liver cells. KCl, $KNO_3$ and $Na_2SO_4$ have only a slight effect The halogen ions have a destructive action on the Golgi app of the liver cells and penetrate the bile capillaries, causing an increased bile secretion It would appear that the Golgi app bears no relation to the bile capillaries $KNO_3$ and $Na_2SO_4$ have no action on either the Golgi app or the bile capillaries. G. G

Action of cholesterol and lecithin on the Golgi apparatus of the nerve cells of rabbits. S OKADA *Arb Med Univ Okayama* 1, 503–14(1930), *Physiol Abstracts* 15, 559 — The increase of cholesterol content by lanolin injection favors the development of the nerve cells of rabbits, while the growth of the mitochondria is inhibited Lecithin has the reverse effect G G

Action of potassium and calcium on the Golgi apparatus and mitochondria of the epithelial cells of the kidney. R KAMAKURA *Arb Med Univ Okayama* 1, 515–45 (1930), *Physiol Abstracts* 15, 559 —Repeated injections of $CaCl_2$ bring the Golgi app of kidney cells into prominence but lessen that of the mitochondria KCl has the reverse effect. If, however, the injections are carried on for a longer period, the *reverse effect of the salts, as noted above, is evident* G. G

Action of cholesterol and lecithin on kidney tubule cells. R. KAMAKURA *Arb Med. Univ Okayama* 1, 628–43(1930), *Physiol Abstracts* 15, 560 —Repeated injections of lanolin cause a shrinkage of the cells of the kidney tubules The Golgi app is intensified, while the mitochondria sink into the background Lecithin causes a swelling of the cells, and the mitochondria are intensified Injections continued over a very long time have the reverse effect in the 2 cases. G G

Effect of histamine and peptone on the portal pressure of cats. W. FELDBERG *Arch exptl. Path Pharmakol* 140, 156–67(1928), *Physiol Abstracts* 15, 376; cf *C A* 22, 633 —When histamine or peptone is injected into the jugular vein of a cat, the pressure *in the portal vein falls secondarily to the fall of general blood pressure* This is sometimes followed by a rise, caused apparently by an increase in the resistance of the liver vessels When it is injected in the portal vein, there may be a small preliminary rise

in portal pressure which is probably due to the same cause This constriction of liver vessels is much smaller than that which occurs in dogs, and in some cats it does not occur G G

The action of pilocarpine and physostigmine on the isolated cat heart after degeneration of the vagus nerve W Brandhendler *Arch exptl Path Pharmakol* 140, 168–73(1928), *Physiol Abstracts* 15, 361 —Physostigmine and pilocarpine still act on an isolated cat heart (Langendorff prepn ) after degenerative section of the vagi It is argued that their point of action must be peripheral to the nerve endings G G

The action of pituitary extract and insulin on the secretion and the blood vessels of isolated suprarenals. M P Nikolaev *Arch exptl Path Pharmakol* 140, 229–36 (1929); *Physiol Abstracts* 15, 390 —Ringer soln was perfused through the suprarenals of cattle and its adrenaline content subsequently detd on a perfused rabbit ear. It was thus shown that pituitary (posterior lobe) ext and insulin stimulate the suprarenals to secrete adrenaline G G

Quantitative investigation on the reversibility of the glucosides of squill as a contribution to the mechanism of the action of heart remedies. W. Graf *Arch exptl Path Pharmakol* 140, 375–79(1929), *Physiol Abstracts* 15, 401 —The action of the glucosides of squills was studied on the heart of *Rana temporaria* (Straub's prepn ) The threshold concns for systolic arrest are given scillaren A, $1/1.8 \times 10^6$, scillaren B, $1/3 \times 10^6$, scillaridin B, $1/1.5 \times 10^6$. The action is more easily abolished by washing than is the case with digitoxin, and the drugs act quicker and in lower concns The ease with which the effect could be abolished by washing the heart with various prepns was studied, and the conclusion was reached that the effect depended on a destruction of the drug by the heart rather than on its diffusion out of the muscle The addn of dialyzed serum delayed the effect but did not alter the threshold concn G G

The narcotic action of the vapors of chlorine derivatives of methane, ethane and ethylene. N V Lazarev *Arch exptl Path Pharmakol* 141, 19–24(1929), *Physiol Abstracts* 15, 403, cf *C A* 24, 2182 —*The Cl derivs of* $CH_4$, $C_2H_6$ *and* $C_2H_4$ *were* investigated by exposing mice to their vapors in hermetically sealed glass bottles The min. concn of the vapor necessary to make the animal (1) lie on its side, (2) lose its reflexes, (3) die, was detd for each substance In general it was found that the narcotic action increased with the increase in the no of Cl atoms There were some exceptions to this rule, for instance, $CCl_4$ is less powerful than $CHCl_3$ In these cases it was found that the less powerful compd had a very small soly coeff G G

Investigations on the pharmacology and pharmacodynamics of ointments and medicaments incorporated in ointments. C Moncorps. *Arch exptl Path Pharmakol* 141, 25–104(1929), *Physiol Abstracts* 15, 494–5, cf *C A*. 24, 5863 —I. Ointments and pastes all fall into 2 groups Either the water is the continuous phase and the fat the disperse phase, or *vice versa* The former type is expressed as oil-water in this paper, and the latter as water-oil The properties of ointments vary according to the type to which they belong, and the type can be varied according to the emulsifying agent used II. The adsorption and absorption of salicylic acid from ointments was investigated by following its excretion in the urine of men after the various ointments had been applied for 12–24 hours to the skin of the leg Pasta zinci oxidi, vaseline, lanolin, eucerin and physiol A, B, C, were among the ointments tested. The absorption of salicylic acid was greatest from eucerin (a water-oil ointment) and physiol C (an oil-water one), but both these have a keratolytic action. The amt of salicylic acid absorbed is small, and none can be demonstrated until the strength of the ointment reaches 25%. III. S, on the other hand, is absorbed less from physiol C and eucerin than it is from pasta zinci oxide During absorption it is reduced, and $H_2S$ can be demonstrated in the blood. IV. After 10% S ointments had been applied for 12 hrs, the total S of the sulfates in the urine was increased. G G.

Tests of anthelmintics on the vinegar eel. E Ratti *Arch exptl Path Pharmakol.* 141, 129–41(1929), *Physiol Abstracts* 15, 407 —A description is given of a series of tests made on the vinegar eel, *Anguillula aceti*, in which its resistance to various substances was compared with that of parasitic worms, earthworms and small fishes The vinegar eel withstands acids well, while its resistance to alkalies depends on their lipoid-soly Most of the common anthelmintics were tested, and it was found that the vinegar eel is comparable with the nematodes rather than with the cestodes The anthelmintics tested include morg substances, alkaloids, org halogen compds , benzene derivs , *Filix mas* and terpenes Of the phenol group, it appeared that the higher the mol. wt., the greater the toxicity for vinegar eels, while the toxicity to mammals decreases with increasing mol. wt. Paracymol had the greatest anthelmintic power of the substances

tested It is suggested that the vinegar eel is a convenient exptl animal for the testing of anthelmintics and gives much better results than the earthworm G G.

The curare-like action of tellurites on the frog R Labes. *Arch exptl Path Pharmakol* 141, 142–7(1929), *Physiol Abstracts* 15, 408.—Small doses of $K_2TeO_3$ injected into the lymph sac of frogs were found to produce an effect like that due to curare. One to 2 days after the injection the hind limbs were completely paralyzed and the fore limbs partially paralyzed Stimulation of motor nerves produced no response, but the muscles still responded to direct stimulation Sensation was intact. The paralysis was a peripheral motor paralysis, but it was not possible to demonstrate the presence of Te in the motor end plates G G

The action of histamine and adrenaline on rabbit ears. E Platow *Arch exptl Path Pharmakol* 141, 161–3(1929), *Physiol Abstracts* 15, 364.—Intravenous injections of 0.025 to 0.05 mg histamine into the vessels of a rabbit ear produced dilatation, while injections of adrenaline, even as small as $10^{-6}$ mg always produced a constriction G G

The mechanism of polyphasic action [of drugs] E Rentz *Arch exptl Path. Pharmakol* 141, 183–227(1929) *Physiol Abstracts* 15, 400, cf *C A* 23, 908.—A large no of cases have been collected from the literature in which the most diverse substances produce a biphasic effect on isolated smooth muscle In some cases both stimulation and inhibition occur successively while the drug is still in contact with the tissue, in others the 2nd phase of the effect is only seen on washing out the drug The theories which have been propounded to account for the various cases are discussed and found to be inadequate to explain all the cases quoted, which are all thought to be examples of a fundamental property of the tissue It is pointed out that when biphasic effects are seen in the whole animal, they may be examples of the same phenomenon, and it is unnecessary to postulate special mechanisms such as reflexes to account for them. G G

Tolerance of nerves to poisons. A Lanczos *Arch exptl Path Pharmakol* 141, 248–56(1929), *Physiol Abstracts* 15, 403.—The sciatic nerves of frogs were immersed in solns of urethan, and the strength of current required to stimulate them was measured at intervals of 15 min It was found that a nerve left in a soln of urethan became narcotized and subsequently recovered while still in the soln Also a nerve which had been previously immersed in a weak soln of urethan was not narcotized by a soln which would completely narcotize an untreated nerve Motor-nerve endings, on the other hand, could not be shown to acquire any tolerance to urethan. G G

Pharmacology of the rare-earth metals. II. Yttrium. H. Stemple and M Ding *Arch exptl Path Pharmakol* 141, 273–9(1929), *Physiol Abstracts* 15, 408, cf *C A*. 24, 4839.—Yt ppts albumin, inhibits the action of yeast cells, paralyzes frogs and causes at 1st excitement and dyspnea, and later paralysis and death in mice. It stops an isolated frog heart in diastole In general Yt may be said to resemble Al and Ce in its action, and its toxicity is about the same as that of Ce, except in its local action, in which it is more powerful than Ce. G G.

Sensitivity of the rabbit heart to strophanthin after feeding with irradiated ergosterol. R. Mancke *Arch exptl Path Pharmakol* 141, 280–91(1929), *Physiol Abstracts* 15, 401.—With normal rabbits, a concn of strophanthin of $10^{-4}$ in the perfusion fluid invariably made the heart stop in systole Hearts of rabbits which had been fed with irradiated ergosterol, but in which no pathol changes could be demonstrated, behaved like normal hearts. Hearts of rabbits with pathol changes took a longer time to stop in systole, and before that stopped periodically in diastole They also showed no dilatation of the coronary arteries during the perfusion, whereas in normal hearts a slight dilatation occurred G G

Disposal of digitalis and its action in warm-blooded animals. II. Extra-cardiac consumption of digitalis and the conditions of glucoside combination in the heart. H Weese *Arch exptl Path Pharmakol* 141, 329–50(1929), *Physiol Abstracts* 15, 400, cf *C A* 24, 4840.—It has been shown that only a small proportion of the active principles of digitalis is stored in the heart on intravenous injection An attempt is here made to trace the fate of the rest Various organs were perfused by a cat's heart-lung prepn, and the digitalis (or strophanthus) injected into the arterial cannula going to the organ The lethal dose for the heart was known. The amt. injected in excess of this before the heart stopped was presumed to be stored in the tissue It was thus shown that about half the min lethal dose could be taken up by the voluntary muscles, but the heart and kidneys absorbed the largest quantity in proportion to their wt. By working with almost poisoned hearts it was shown that the different organs allowed no digitalis to pass them till they were nearly satd Uptake of digitalis by the isolated

serum. J La Barre and J Louis Wodon *Compt rend soc biol* 104, 111-2(1930); *Physiol Abstracts* 15, 414 —Guinea-pig uterus *in vitro* was treated with sensitizing serum in Locke's fluid contg tissues from animals sensitized some weeks previously The hypertonic contractions indicated anaphylactic shock This was produced in 1 cornu, the other serving as control The addn of Mg salts effected immediate cessation of the symptoms of shock The salts produce tissue desensitization or render the uterus insensible to stimulation The hyposulfite is the most suitable salt G. G.

Action of hypertonic sodium chloride on intestinal motor activity. L Bouisset and P Fabre *Compt rend. soc biol* 104, 462-5(1930), *Physiol Abstracts* 15, 452 — The record of intestinal contractions taken from a dog shows increase of activity when 10–20 cc of a 30% soln of NaCl is injected into a vein This stimulating influence of hypertonic NaCl is const. G G

Action of vagotonin on glucemia. T Briel G Fuchs, D Santenoise and M Vida covitch *Compt rend soc biol* 104, 768–70(1930), *Physiol Abstracts* 15, 594 — The vagotonic substance secreted by the pancreas and isolated from insulin in pancreatic exts by frequent washing with alc. possesses some hypoglucemic action Its action on the blood sugar is effected through the vagus nerve, thus it differs from insulin, the action of which is direct G G

Anticoagulating action of sulfarsphenamine E Zunz and M A Camacho *Compt rend soc biol* 104, 793–4(1930), *Physiol Abstracts* 15, 571 —The clotting of recalcified oxalated plasma from the rabbit was found to be retarded by the action *in vivo* of sulfarsphenamine. The effect is essentially due to a combination or complex of the arsenical compd with fibrinogen The arsenical compd seems also capable of combining with and hindering the action of thrombin, and it prevents the conversion of proserozyme to serozyme G G

Action of hypertonic sodium chloride in intestinal occlusion L Bouisset and P Fabre *Compt rend soc biol* 104, 847–50(1930), *Physiol Abstracts* 15, 452 —By injection of hypertonic NaCl at varying intervals after occlusion of the small intestine in the dog it has been found that the muscular tone passes through 2 distinct phases In the 1st the wall is sluggish but ready to react violently under the influence of the excitant. The pressure within the lumen rose from 2 5 cm Hg to 8 cm after the injection In the 2nd phase atony is pronounced, and the reactions are weak or neg It requires 5 or 6 days of occlusion to show the complete change G G

Action of camphor and its derivatives on the isolated intestine. H Busquet *Compt rend soc biol* 104, 869–72(1930), *Physiol Abstracts* 15, 550 —Camphor and its sol. derivs, campho-sulfonate and campho-carbonylate of soda, act as excitants of the central nervous system and as cardiac tonics Pure camphor exercises a marked inhibitory action on the isolated intestine, but the derivs mentioned cause a distinct increase of amplitude of the contractions The sedative action of camphor must have been suspected when it was introduced into paregoric, but it is essential, in prescribing it for intestinal spasm, to bear in mind the difference of action from that of the derivs G G

Action of vasomotor substances on albuminuria. A Hanns *Compt rend soc biol* 104, 877–8(1930); *Physiol Abstracts* 15, 529 —Injection of adrenaline in one subject of Bright's disease was invariably followed by diminution of albumin in the urine which lasted some hrs The excretion of water in excess may have accounted for the change In a 2nd case the drug had the opposite effect on the albumin and none on the excretion of water Postural influences on the amt of urine and the albumin content were different in the 2 cases, and it is uncertain if the differences in the action of the drugs were related to this influence G G

*Absorption capacity of dental pulp.* A E Obiglio *Rev soc Argentina biol* 6, 79–98(1930); *Physiol Abstracts* 15, 551 —The 1st molars of dogs were trephined, and substances were introduced into the cavities KI (tested in blood, urine and saliva) and phenolsulfonephthalein (in 24 hrs 4–26% passes into the urine) are easily absorbed In doses varying between 1 and 20 mg the following substances are absorbed apomorphine (vomiting), strychnine (convulsions), atropine (mydriasis and vagus block), cocaine (death), nicotine (death), cyanides (slight symptoms) Absorption of the following substances could not be proved venoms of *Lachesis alternatus* and *Naja tripudians*, insulin and adrenaline Perforation of the tooth produces a slight hyperglucemia G G.

Chemical structure of insulin. Study of some synthetic sulfur compounds having hypoglucemic action. C Ruiz, L. Silva and L Libenson *Rev soc Argentina biol* 6, 134–41(1930); *Physiol Abstracts* 15, 530 —Since S is found in insulin, the hypoglucemic action of S compds was tested in rabbits *per os* and by injection Cyclodecamethylene-

thiourea is insol and inactive Thiophenol, thioacetic acid and 4- or 5-methyl-2-thioimidazole have some activity (blood sugar falls from between 0 099 and 0 132 to between 0 072 and 0 08%) G G

Calcium and magnesium salts and the healing of wounds. G Mazzacuva *Riv patol sper* 5, 327–42(1930), *Physiol Abstracts* 15, 483 —The formation of scar tissue on superficial wounds is hastened by the subcutaneous injection of small quantities of Ca and Mg chlorides G G

Suppression of glucose combustion by adrenaline administration. A. R Colwell *Endocrinology* 15, 25–33(1931) —Cats were anesthetized by means of amytal, and the effects of continued administration of 2 g glucose per hr and 0 001 mg of adrenaline per min per kg upon the total and non protein respiratory quotients, and blood sugar, were detd After 3–5 hrs of glucose and adrenaline, the non protein quotient reached a level near 0 7 and did not change appreciably until the adrenaline was discontinued, whereupon it rose to normal in 4 hrs Therefore, adrenaline interferes with, and may even abolish, glucose combustion W D Langley

The toxicity of amyl nitrites. Otto Gerhardt *Chem -Ztg* 55, 128(1931) —G describes the toxic effects exerted upon himself and his associates by amyl nitrite in the process of its prepn experimentally and on a large scale The toxic products become manifest in the early stages of the nitration of the amyl ales and cause headache, increased blood pressure, general dizziness, noises in the ears, etc. The effects are cumulative, hence the danger of repeated slight intoxications B S Levine

Chlorophyll and its nephrohepatic extracts in experimental anemia. Carlos A Sagastume and José A Pezzani *Rev facultad cienc quím (Univ La Plata)* 7, Pt II 7–22(1930) —Chlorophyll possesses interesting pharmacodynamic properties, the study of which may lead to important therapeutic applications In expti anemias studied S and P found chlorophyll acting as an agent regenerating erythrocytes and hemoglobin B S Levine

The combined action of ultra-violet rays and neoarsphenamine on trypanosoma equiperdum. G Giemsa and V Ellenbogen *Z Immunitäts* 67, 78–82(1930) — Neosalvarsan in amts slightly less than the curative dose injected into mice infected with *trypanosoma equiperdum* causes all the organisms to disappear from the blood in 2–10 days only to reappear within several days Radiation of the mice after the injection of the salvarsan does not alter this course of events, contrary to the findings of Roskin and Romanowa (*C A* 24, 5867) Julian H Lewis

The combined action of ultra-violet rays and a series of trypanocidal substances on trypanosomes. Gr Roskin, A Bichovskaya and S Shishliaieva *Z. Immunitäts* 67, 91–4(1930) cf following abstr —Among several trypanocidal substances novar solan was the only one whose action was enhanced by exposure of the infected mice to ultra violet rays after injection of the drugs Julian H Lewis

The method of combined therapy with arsenicals and ultra-violet light. Gr Roskin *Z Immunitats* 69, 240–3(1930), cf 2 preceding abstrs —G and E failed to confirm the observation of Roskin that mice infected with trypanosomes and injected with ineffective doses of novarsolan are sterilized if the mice are exposed to ultra violet light after injection of the novarsolan This failure is attributed to the fact that Giemsa and Ellenbogen failed to remove the hair of the mice before irradiation J H L

The analysis of the combined action of arsphenamine and ultra-violet light in protozoan infections. G Roskin and K Romanova *Z Immunitats* 67, 94–101(1930), cf 2 preceding abstrs —Serum of mice exposed to ultra violet light can change a non curative dose of novarsolan into a curative one Serum of radiated mice alone has no trypanocidal action Julian H Lewis

Analysis of the combined therapy with drugs and ultra-violet light. Gr Roskin *Z Immunitats* 69, 473–83(1931) —In the serum of mice irradiated with ultra violet light there is a factor transferable to other mice that enhances the effect of neoarsphenamine in the treatment of trypanosome infections in mice This factor is destroyed by heating the serum at 56° for ½ hr and by irradiating the serum *in vitro* with ultra violet light It is adsorbed by kaolin The factor arises from the mesenchyme of the skin and the entire reticulo endothelial system Julian H Lewis

Further chemotherapeutic studies of a new benzenearsonic acid derivative (arsenic preparation 4002). Giemsa *Z Immunitats* 69, 86–99(1930) —Theoretically the arsonic acid compds should be better adapted to the treatment of trypanosomal diseases than the arseno compds, since they are more easily diffusible and do not combine with the colloids of the blood This assumption is borne out by expts which show that As prepn 4002, a benzenearsonic acid deriv, cures trypanosome infections in mice better

than do atoxyl and tryparsamide Syphilis in rabbits is also cured by this prepn given either parenterally or orally JULIAN H LEWIS

**Can biological tests of toxicity of arsenobenzol derivatives be replaced with chemical tests?** H BAUER AND M ROTHERMUNDT *Z. Immunitats* 69, 213–9(1930) —The chem method of Kielbasinski (*C A* 24, 5868) does indicate the full toxicity developed in arsphenamine through oxidative processes JULIAN H LEWIS

**Changing arsphenamine fastness.** HEINRICH CITRON *Z Immunitäts* 69, 464–71 (1931) —Repeated injections of $Na_2S_2O_3$ into mice infected with arsphenamine fast trypanosomes permanently destroyed the arsphenamine fastness The low toxicity of $Na_2S_2O_3$ permits the use of this principle in patients JULIAN H LEWIS

**The behavior of lead in the animal organism II. Tetraethyl lead.** ROBERT A KILLIAN AND FREDERICK THAMANN *Am J Hyg* 13, 478–98(1931), cf *C A* 22, 2800 —The distribution of tetraethyl lead in rabbits following absorption by the skin of the abdomen was detd over short and long periods Any excess was washed off after 60–90 min Inhalation of the lead was prevented Tissues, bones and blood were analyzed by steam distn of the tetraethyl lead from them From pure tetra ethyl lead the absorption rate is rapid from 0.1% in gasoline (the percentage in treated gasoline) absorption was negligible through the skin During rapid absorption the dis tribution in tissue corresponds to that of an oil sol material The compd is rapidly decompd by tissue, so that after a period of 1–2 weeks the lead deposit resembles that of a water sol lead compd The nervous system is very susceptible to lead absorption excretion follows quantitatively that of water sol compds G H W LUCAS

**Brain-water movements during anesthesia** H G BARBOUR *Science* 73, 346–7 (1931) —As a possible explanation of anesthesia, the dehydration of nerve cells has been suggested, but exptl proof of this is a difficult undertaking Anesthetic substances vary in their effect on the water content of the brain as a whole and of certain por tions of it In some ether and morphine expts a hydration was evident and again withdrawal of morphine from young rats and dogs resulted in hydration Other expts have indicated in the first 2 hrs after morphine the cerebrum is dehydrated but the medulla is hydrated This increase in ratio of medulla $H_2O$ to cerebrum $H_2O$ has been found with amytal and others Ether excitement prolonged for half an hour did not cause an increase in the ratio The ratio for normal rats is 0.922 ± 0.003 morphinized rats showed 0.939 ± 0.007 Possibly the colloidal conditions of the cells are altered in such a way as to extrude water G H W LUCAS

**Effect of continuous intravenous injection of adrenaline on the carbohydrate metabolism, basal metabolism and vascular system of normal men.** C F CORI AND K. W. BUCHWALD *Am. J. Physiol* 95, 71–8(1930) —Adrenaline was injected intravenously into normal men for a period of 30 min , 0.00005 mg per kg per min was the lowest rate which still caused a rise in blood pressure, blood lactic acid and basal metabolism, 0.000025 mg per kg per min caused an increase in pulse rate, respiration and blood sugar J F LYMAN

**Effect of adrenaline on sugar utilization in animals under amytal anesthesia.** G T CORI *Am J Physiol* 95, 285–91(1930) —Amytal anesthesia, which in itself has but a slight effect, greatly intensifies the depressive action of adrenaline on glucose utilization Glucose utilization by rats was as follows unanesthetized 98%; un-anesthetized + adrenaline 89%, amytal anesthesia controls 91%, amytal + adrena-line given subcutaneously 40%, amytal + adrenaline given intravenously 27% J F LYMAN

**The effect of various anterior pituitary preparations upon basal metabolism in partially thyroidectomized and in completely thyroidectomized guinea pigs.** W J SIEBERT AND R. S SMITH *Am J. Physiol* 95, 396–402(1930) —Armour pituitary tablets caused a marked rise in the basal metabolism of guinea pigs, independently of the thyroid glands An acid ext of the anterior lobe of the pituitary caused a rise in metabolism only when the thyroids were intact and seemed to depend on stimulation of the thyroid by the pituitary ext. J F. LYMAN

**Depletion of muscle sugar by adrenaline. II.** F BISCHOFF AND M LOUISA LONG *Am J. Physiol* 95, 403–11(1930), cf *C A* 24, 3561 —Adrenaline injected subcutaneously or by the continuous intravenous method (at least 4 times the min hyperglucemic dose) caused a fall in muscle sugar J F LYMAN

**β-Tetrahydronaphthylamine hyperthermia and fat metabolism.** JEAN J. BOUCK AERT AND E SOLOMON *Am J. Physiol* 95, 417–21(1930), cf *C A* 24, 5065 —The increased metabolism observed after injecting β tetrahydronaphthylamine is inde pendent of the exchanges of fat between the liver and the other tissues It is probable

that the excess material metabolized after taking the drug is protein after the carbohydrates have been depleted J F LYMAN

**The action of histamine on the motility of different parts of the intestinal tract.** MARGARET F MACKAY *Am J Physiol* 95, 527–30(1930).—Intravenous doses of 0.25 to 0.50 mg histamine activate a quite characteristic motor response in different parts of the intestine, most marked in the ileum and decreasing toward the duodenum Local application of histamine to the outside of the intestine provoked the typical reactions, but injection of the drug into the lumen of the bowel did not activate a motor response J F LYMAN

**The effect of a solution of acacia in restoring diminished body fluid.** M A WALKER AND N M KEITH *Am J Physiol* 95, 561–72(1930).—Conclusion Acacia has the property of holding the injected fluid in the circulation for a considerable time It does not inhibit renal excretion of water J. F LYMAN

**The heart rate after sympathectomy and vagotomy, and the blood sugar as affected by posterior hypophyseal extracts (pitressin and pitocin).** Z M BACQ AND S. DWORKIN *Am. J. Physiol* 95, 605–13(1930).—In normal cats pitressin, intravenously injected, causes a prompt reduction in heart rate Pitocin has little effect In vagotomized cats, pitressin reduces the heart rate, but to a level far above the av basal rate for a normal animal After removal of both sympathetic chains, pitressin slows the heart when the vagi are intact, but causes marked acceleration when these nerves have been cut In normal animals both pitressin and pitocin, given intravenously, cause a prompt rise in blood sugar which may persist as long as 2 hrs In sympathectomized cats the glucemic effect of pitressin is somewhat less than in normal animals, but not markedly so J F. L.

**The action of parathyroid extract in sympathectomized animals.** Z. M BACQ AND S. DWORKIN *Am J Physiol* 95, 614–9(1930).—The absence of the central sympathetic nervous system does not appreciably influence the response of cats and dogs to parathyroid ext J F. LYMAN

**The effect of adrenaline upon the nitrogen metabolism of rabbits.** O WATKINS AND G VAN S SMITH *Am J Physiol* 96, 28–34(1931).—Intravenous, subcutaneous or intraperitoneal injections of 0.1 mg of adrenaline cause marked rises in blood sugar and urea of the blood in rabbits Since it was shown that the excretion of urea by the kidney is not interfered with, the rise in blood urea is a result of some catabolic action of adrenaline upon protein metabolism The intravenous injection of glucose after adrenaline injection does not affect the rise in blood urea, while glucose and insulin together exaggerate and prolong the urea rise J F LYMAN

**The temporary control of post-operative tetany in thyro-parathyroidectomized dogs by the administration of thyroid hormone.** M M KUNDE, R. M OSLUND AND R. KERN *Am J Physiol* 96, 45–53(1931).—In approx 55% of 31 dogs, tetany, following the removal of the thyroid and parathyroid glands, was temporarily allayed by administering dried thyroids or thyroxine In unoperated dogs, moderately large doses of thyroid or thyroxine caused an elevation in acid sol P of the blood to as much as 100% above normal This high blood P persisted after removal of the thyroids and parathyroids regardless of the decrease in serum Ca J F LYMAN

**The action of atropine and adrenaline on gastric tonus and hypermotility induced by insulin hypoglucemia.** R L. WILDER AND F W SCHULTZ *Am. J. Physiol* 96, 54–8(1931).—The increased tonus and hypermotility of the stomach, which takes place when the blood sugar is markedly lowered following insulin is due, in part at least, to increased irritability of the vagus motor nerves to the stomach Atropine and adrenaline lower this increased tonus without raising the blood sugar J. F. L.

**Thiocyanate contracture in skeletal muscle. Permeability of muscle.** E GELLHORN *Am J Physiol* 96, 203–13(1931).—The immersion of a frog sartorius muscle in a Ringer soln contg NaSCN in a concn. which is below that causing contracture has no direct effect upon the muscle but gives rise to a contracture when this soln is replaced by common Ringer soln The effects of various salts on this indirect contracture were studied. Conclusion The velocity with which NaSCN leaves the muscle cell dets the strength of indirect contracture J F LYMAN

**The physiological action of glyoxals.** A HYND Proc Physiol Soc., *J Physiol* 70, ix–xi(1930).—Solid hydroxymethylglyoxal, prepd by the method of Evans and Waring (*C A* 20, 3692) is as a rule, contaminated with an unstable, highly toxic by product, possibly a thiol deriv There is no essential difference in the effects produced by the monomeric and dimeric forms of hydroxymethylglyoxal There is a close analogy between the effect of glyoxal and of that hydroxymethylglyoxal, but no similarity between that of the latter and glucosone J F. LYMAN

"Dial" as an anesthetic for surgical operations on the nervous system. J. F. Fulton E G T Liddell and D McK Rioch Proc. Physiol. Soc., *J Physiol* 70, xxiii(1930) cf *C A* 25, 2202.—"Dial Ciba" is a liquid prepn of diallylbarbituric acid (10%) combined with small amts of urethan and monoethylurea (to assist soln.) With this anesthetic the spinal reflexes remain active even in profound anesthesia In exptl surgery of the nervous system the drug has 2 important uses (1) It appears to constrict small blood vessels of the brain so that removal of the cerebellum or cerebral hemispheres can be carried out almost bloodlessly without occlusion of any of the great arteries to the head. (2) Animals remain quiescent for a period of 12–36 hrs and thus give opportunity for satisfactory healing of the incision J F Lyman

The influence of adenosine and related compounds upon the coronary arteries in the perfused rabbits heart. A N Drury and A M Weed Proc Physiol Soc., *J Physiol* 70, xxviii–xxix(1930) cf *C A* 24, 2756.—Adenosine dilates the coronary arteries of the heart. Yeast adenylic acid and muscle adenylic acid have about 66% of the effect of adenosine and inosinic acid adenine guanosine and $NaNO_2$ are about 33% as effective as adenosine while thymus nucleic acid and yeast nucleic acid have an inconstant effect a slight constriction is sometimes produced J F Lyman

The selective vasoconstrictor action of pituitary pressor extract. G A Clark *J Physiol* 70, 53–9(1930).—Pituitary pressor ext (pitressin) intravenously injected in cats caused a redistribution of blood so that the intestine contained much less and the muscles more the skin and connective tissues usually contained less but if the blood pressure was greatly increased, might contain more Pitressin exerts its most powerful vasoconstrictor action on intestinal vessels and its weakest action on the vessels of voluntary muscles, while those of skin and connective tissue occupy an intermediate position. J F Lyman

The effect of adrenaline on muscle glycogen. A B Corkhill and H P Marks *J Physiol* 70, 67–85(1930).—Adrenaline alone and adrenaline and insulin together were administered to decapitated cats whose viscera had been removed and the subsequent changes in carbohydrate content of blood and muscles observed Conclusion Adrenaline causes discharge of glycogen from resting muscle Part of this glycogen appears as lactic acid and another part as some unknown substance which is non reducing or has a lower reducing power than glucose does or it fails to be extd. for analysis by the methods used. A similar discrepancy was noted when insulin and adrenaline acted together J F Lyman

The production of hypoglucemia in rabbits by oral administration of precipitated insulin. H. N Mukherjee *J Physiol* 70, 182–3(1930).—The phosphotungstic acid ppt. of crude insulin, administered to fasting rabbits by mouth, lowered blood sugar to the convulsion level within 1 to 2 hrs Beneficial effects have been noted with diabetic patients after its administration. It appears to have no toxic effects J F Lyman

The effect of insulin and other endocrine extracts on the cholesterol content of tissues. E. N Chamberlain *J Physiol* 70, 441–8(1930), cf *C A* 24, 4822.—Overdosage of rabbits with insulin caused a marked decrease in the cholesterol content of the suprarenals, but this effect was not so pronounced if the hypoglucemia was prevented by simultaneous administration of glucose Neither insulin, thyroid nor pituitrin produced any material changes in the cholesterol content of the blood, liver or spleen It is suggested that the synthesis of cholesterol by the adrenals is controlled by the internal secretion of the pancreas J F Lyman

Intraocular pressure. I. The action of drugs on vascular and muscular factors controlling the intraocular pressure. J Colle, P M Duke Elder and W S Duke-Elder. *J Physiol* 71, 1–30(1931).—The effects of adrenaline, pituitrin, histamine, choline, nicotine, atropine, physostigmine and curare on intraocular pressure were detd All the changes observed are compatible with the theory that the aq humor is a dialyzate. J F Lyman

The influence of creatine on the excretion of phosphates by the kidney. Marion Brown and C G Imbrie *J Physiol* 71, 222–8(1931).—The administration of creatine to cats is followed by a temporary fall in the output of phosphates by the kidney, which is most marked when the larger amts of creatine are retained. The concn of P in the blood may be above the normal when phosphates are absent from the urine J F Lyman

Experimental investigation on the fate of bilirubin introduced into the blood vessels. II. The excretion of bilirubin from the liver. 1. The localization of the excretion of bilirubin of the liver. S Saiki. *Japan J Gastroenterology* 3, 1–13(1931), cf *C. A.* 25, 1277.—When bilirubin is injected intravenously into rabbits, it is excreted into the

bile by the parenchymatous cells of the liver This was shown by blocking the reticulo-endothelial cells of the liver with colloidal silver and India ink injections Since neither retarded the excretion of bilirubin, these cells do not function in such an excretion Injury to the parenchymatous cells by injecting the rabbits with hepatotoxins decreased the rate of excretion of bilirubin from the blood, so these cells must be responsible C. M McCay

Experimental study on the influence of poisonous gases upon the pigment-excreting function of the liver and the kidneys. II. Cyanogen. H Yagata. *Japan J Gastroenterology* 3, 80–4(1931) *cf C A* 25, 351 —In rabbits the pigment-excreting function of the liver and kidneys is injured by HCN poisoning The kidneys suffer greater injuries, which increase the dye-excreting function of the liver Similar expts were carried out with rabbits after the administration of such liver poisons as hepatotoxin, $CHCl_3$ and P or kidney poisons such as cantharidin, $K_2CrO_4$ or U nitrate The common liver poisons seem to injure the kidneys so severely when acting with HCN that the liver dye excretion increases Kidney poisons alone increase the dye excretion of the liver but accompanied by HCN the liver excretion is decreased. C. M McCay

The effect of pilocarpine in a case of sympathicotonia in childhood. Eugene M. Landis and J C Gittings. *Am J Diseases Children* 39, 1022–30(1930) —Hyperactivity of the sympathetic portion of the autonomic nervous system, termed sympathicotonia appears to be reduced following the intramuscular administration of physostigmine or the intravenous administration of pilocarpine The symptoms of the disease appear to be aggravated by atropine or thyroid ext F R. Main

The toxicity of α-butyloxy-cinchonic acid diethylethylenediamide hydrochloride (nupercaine). W R Bond and N Bloom *J Lab Clin Med* 16, 447–51(1931) — The min fatal dose of nupercaine, injected subcutaneously, is approx 20 mg per kg for guinea pigs and 25 mg per kg for dogs On intravenous injection, it is 2.5–3 mg per kg for dogs It is rapidly absorbed from the nasal and buccal passages, but very slowly from the bladder or vaginal canal and appears to be rapidly detoxicated *in vivo* F R. Main

Purine elimination in the rat. Pietro Rondoni *Arch sci biol* (Italy) 15, 579–85(1930) —Studies were made on the elimination of uric acid and allantoin in the urine of the rat following the administration of purine free diets and of hyperpurine diets (horse liver and calf thymus) The rat has a high protein metabolism which is further increased following the prolonged administration of a thymus diet Uric acid is essentially the end product of the endogenous purine metabolism, while following the administration of hyperpurine diets allantoin in marked amts is also eliminated The transformation of uric acid into allantoin is a sort of protective action against the accumulation of uric acid and is brought into play by the organism which has been subjected to a forced purine metabolism Repeated applications of $CHCl_3$ seem to reduce the tendency of the rat to transform excess uric acid Peter Masucci

Hematoporphyrinuria and intoxication by fenchone plus sulfonal and camphor oxime plus sulfonal. A Bonanni *Boll soc ital biol sper* 5, 1105–7(1930) —Functional alterations in the liver were induced by administering to rabbits under const diet, sulfonal (I), sulfonal and fenchone (II), sulfonal and camphor oxime (III) The urine of all the animals had a normal color, no albumin was present. In regard to hematoporphyrin, the animals receiving (I) gave results similar to those previously reported by B., while no hematoporphyrin was found in the urine of animals receiving (II) or (III) Peter Masucci

The influence of certain drugs on pulmonary ventilation in normal and phrenicectomized dogs. A Jappelli. *Boll soc ital biol sper* 5, 1125–8(1930) —Pulmonary ventilation was detd. in (*a*) normal and (*b*) phrenicectomized dogs after the administration of certain drugs Morphine HCl in doses of 0.003 g per kg had a depressive action in the normals both as to respiratory frequency and pulmonary ventilation; in the phrenicectomized animals the action was more accentuated and more persistent. *Heroine-HCl* in doses of 0.002 g per kg produced in (*a*) a slight diminution of frequency and a marked diminution of pulmonary ventilation, in (*b*) the injection was followed by an increase in frequency and in ventilation. Eucodale, in doses of 0.002 g per kg produced in both (*a*) and (*b*) a marked and prolonged diminution of frequency and ventilation The other drugs studied were: atropine sulfate, bellafoline, caffeine, lobeline HCl, adrenaline HCl, synthetic ephedrine and ergotamine tartrate The general conclusion is drawn that the respiratory app of the bilateral phrenicectomized dog is relatively sufficient under ordinary conditions but does not function sufficiently when, through the agency of drugs, one seeks to raise its activity Peter Masucci

The influence of physostigmine on the contractile activity of the spleen. P Tes-

TONI *Boll soc ital biol sper* 5, 1128(1930) —Physostigmine produces a polyglobulia which is essentially the concomitant of the degree and duration of the splenic contraction PETER MASUCCI

**Thallous acetate and hematoporphyrin.** P TESTONI *Boll soc ital biol sper.* 5, 1130(1930) —While in Pb poisoning hematoporphyrin appears in the urine, in acute or chronic TlOAc poisoning, hematoporphyrin is absent, although the urine is highly pigmented PETER MASUCCI

**Studies on the calcium-fixing power of the lung subjected to artificial pneumothorax. I. The fixation of calcium in the collapsed lung.** RENATO PACHIOLI. *Boll soc ital. biol sper* 5, 1184–6(1930) —Unilateral pneumothorax treatment (in rabbits) does not cause a greater fixation of Ca in the collapsed lung in contrast to the non-collapsed lung **II. The action of a protracted calcium treatment on the fixation of the metal in the collapsed lung.** *Ibid* 1186–9 —Rabbits were subjected to unilateral artificial pneumothorax and one week later injected daily with 10 cc Ca gluconate soln (10%) for a period of 12–17 days The amt of Ca was then detd in the collapsed and normal lung There was an increase of Ca in both lungs compared with the value found in the lungs of untreated normal rabbits the increase was 4.08% mg for the non-collapsed and 10.03% mg for the collapsed lung PETER MASUCCI

**Cerebral lipoids in relation to hypno-anesthesia.** IVO NOVI *Boll soc ital biol sper* 5, 1190–2(1930) —Crit observations PETER MASUCCI

**Studies on phlorhizin. III. The action of phlorhizin on the isolated heart of the tortoise.** P S ISRAEL *Boll soc ital biol sper* 6, 8–10(1931) —The heart was perfused with Ringer soln contg 0.1% phlorhizin, 15–20 min afterward the ventricular contractions became less and diminished in amplitude, after ½–¾ hr they stopped completely With concns less than 0.1%, the frequency of the contractions diminished without appreciable changes in amplitude the contractions stopped after 5–6 hrs of perfusion Phlorhizin affected the auricles to a lesser degree After washing the heart repeatedly with Ringer soln alone, the contractions became normal 30 min later The heart was then perfused with Ringer soln contg 0.01% atropine sulfate The introduction of phlorhizin induced a phenomenon similar to that already described When the atropine and phlorhizin were introduced simultaneously in the perfusion liquid, there was a marked decrease in the frequency of contractions Adrenaline 0.05% and phlorhizin, when added simultaneously to the perfusion liquid, caused no changes in the contraction of the ventricle or auricles **IV. The influence of phlorhizin on imbibition.** *Ibid* 10–2 —The gastrocnemius and liver of the frog were immersed in Ringer soln contg 0.10–0.15% phlorhizin and weighed at intervals of 1, 2, 4, 6 and 10 hrs. Phlorhizin tended to increase the imbibition after the first 3 or 4 hrs , the increase was 6–10% greater than that of the controls immersed in Ringer soln alone The imbibition was more marked with the liver the increase in wt was about 20% greater than the controls PETER MASUCCI

**The action of synthetic thyroxine on the electric excitability of the vagus nerves.** V. G BARONE *Boll soc ital biol sper* 6, 18–20(1931) —The threshold of excitability of the vagus nerves of the dog was detd before and after the injection of the drug The intravenous injections of 5–6 mg thyroxine were well tolerated by the animals and caused neither a change of arterial pressure nor variations in the frequency of the pulse or respiration Even with repeated injections, there was always an increase of the elec excitability of the vagus nerves lasting 30–45 min The increase in excitability was more marked with doses of 1–2 mg , it was distinct but not so marked with doses of 5–6 mg These results show that in regard to the vagal excitability, this analogy between the pharmacol action of thyroxine and thyroid substances confirms the point that the former has the property of a thyroid hormone PETER MASUCCI

**The effects of intravenous injections of glycine in normal and diabetic individuals.** A COSTA AND V G BARONE *Boll soc ital biol sper* 6, 21–4(1931) —The hyperaminoacidemia obtained by intravenous injections of 5 g glycine is not accompanied by any appreciable modifications of the glucemic titer either in the diabetics or in the normals The hyperaminoacidemia observed after the ingestion of proteins cannot be held as the cause of the hyperglucemia in diabetics The amino acid curve is not noticeably different in the normals than in the diabetics The clinical observation that certain proteins have a marked hyperglucemic power in diabetics in contrast to other proteins, indicates possibly that the hyperglucemia induced by the ingestion of proteins and occurring simultaneously with the hyperaminoacidemia is caused by the presence of special amino acids, among which glycine must be excluded PETER MASUCCI

**Variations in toxicity obtained by certain respiratory drugs after cutting the vagus nerves.** EMILIO TRABUCCHI. *Boll. soc. ital. biol. sper.* 6, 49–52(1931).—The purpose

was to det whether after cutting the vagus nerves a difference might be detected in the immediate m l d of certain drugs which kill by arresting the respiratory function. The expts were made on rabbits using $MgCl$ $SrCl_2$, morphine-$HCl$ and $NaOH$ The solns were injected into the jugular vein A marked difference in the m l d was revealed between the animals having the cut and uncut vagi The percentage diminutions of the m l d in animals having the cut vagi were $MgCl_2$ 38, $SrCl_2$ 37, $NaOH$ 40 and morphine $HCl$ 33 The conclusion is that after cutting the vagi, the respiratory centers are much more sensitive to the paralyzing action of certain drugs, and probably in general, to all drugs which kill by depressing the respiratory centers P. M

**Apnea from strontium.** Emilio Trabucchi *Boll soc ital biol sper* 6, 53–6 (1931).—The injection of $SrCl_2$ solns of various strengths into rabbits produces typical periods of apnea The bilateral cutting of the vagus nerves does not impede the apnea The apnea is probably of central origin, since Sr has little action on the neuro-motor terminal junctions Peter Masucci

**Calcium therapy. Calcium pyruvate** Angelo Puglisi and Domenico Romoli-Venturi *Minerva med* 1931, I, 366–71.—Ca pyruvate is easily sol in water, its aq solns are stable, since neither boiling nor long exposures to ice box temps produces a ppt The salt is easily absorbed when injected intramuscularly or subcutaneously, and on reaching the circulation Ca ions are rapidly liberated The substance is non-toxic and may be administered intravenously in high doses to man, it favorably influences the cardiac function without any noticeable changes in the pressure or in respiration, stimulates the automatic contractions, and increases the muscular tone of the intestine and in general of smooth muscle tissue. Peter Masucci

**The effect of adrenaline on the circulating blood volume in individuals with normal and enlarged spleens and after splenectomy.** Chi shih Yang and Hsiao-ch'ien Chang *Chinese J Physiol* 4, 21–9(1930), cf *C A* 22, 2022.—The injection of adrenaline into human subjects with normal or enlarged spleens, following the inhalation of CO, resulted in an increase in red cells and CO content of the blood but no change in the computed blood vol Splenectomized subjects showed no significant polycythemia The results suggest that "under the influence of adrenaline corpuscles equally satd with CO, as those in the peripheral blood, are suddenly added to the circulation, thereby producing a true polycythemia without appreciable change in blood vol" L A M

**The site of action of thallium.** Hsi Chun Chang *Chinese J Physiol* 5, 79–82 (1931).—The depilatory action of thallium is not dependent upon either thyroid or ovarian activity Suggestive evidence is also furnished that nerve action is not involved L A Maynard

**The effects of histamine, adrenaline and atropine. The sympathetic and vagus systems, acid-base equilibrium, movements of chlorides and water.** P. Saradjichvili and R Rapelin *J physiol path gen* 27, 795–814(1930).—The subjects used were epileptics and chronic alcoholics Subcutaneous injection of histamine causes a reddening of the face, augmentation of pulse rate, increase in $p_H$ of the blood and a decrease in blood chlorides Similar but less consistent results are obtained with adrenaline and atropine It is concluded that the action of the neuro-vegetative system on the acid base equil consists in the modification of the tissues for certain ions, such as Cl, which are retained or expelled according to whether the sympathetic or the vagus system is affected L A Maynard

**Insulin and the hypoglucemic syndrome.** V Zagami *Arch fisiol* 28, 339–71(1930), *Physiol Abstracts* 15, 503.—Insulin in direct application on the centers of the brain, has no influence on the nervous function The influence on the blood sugar is the same as in subcutaneous application A E Meyer

**Choline action on the cardiovascular system.** Vittorio Susanna *Arch fisiol* 28, 432–42(1930).—Choline has a peripheral vasoconstrictor action It causes a transitory decrease of the arterial pressure In vagotomized and atropinized animals, a const increase of the blood pressure is observed The modifying effect on the heart function is due to an action on the sp intracardiac app A E Meyer

**Delayed absorption of pharmaceuticals caused by the vasomotor principle of the hypophysis (Vasopressin).** G Spagnol. *Rev sud-americana endocrinol inmunol quimioterap* 14, 1–16(1931).—In subcutaneous injections of the mixed solns of vasopressin and strychnine or novocaine the absorption, as detd by the onset of toxic symptoms, is considerably retarded Vasopressin is still effective in a dln of 1:15000000, whereas adrenaline has its limit at 1 100000 The action of vasopressin can not be explained by the pressor activity, but by a sp influence on the permeability of the capillaries A. E Meyer

**Sodium bromide and thiosulfite in the treatment of eczema.** Pablo Lavezzo

Influence of radiation on the behavior of silver in the organism. I. Investigations on the whole organism of young rats. Ludwig Pincussen and Wadim Roman *Biochem Z* 232, 202-8(1931).—In untreated young rats receiving injections of $Ag_2SO_4$ equiv to 0.6 mg Ag, 54% of the Ag is found in the organism in the form of AgCl, 28.6% in combination with protein and 17.3% as metallic Ag. Irradiation with the Vitalux lamp increases the portion bound to the protein to 57.2%, while it causes only a slight diminution in the metallic Ag fraction. On the contrary, radiation with the Hg lamp increases the Ag salt fraction to 61.2%, the other 2 fractions being somewhat diminished. S. Morgulis

The life-saving action of portions of plants and of the juices removed from them in the case of otherwise fatal subacute uranium intoxication. Georg Eisner. *Biochem Z* 232, 218-28(1931).—*Rabbits poisoned with very small amts of U almost invariably* die when kept on a diet of oats and water but survive when to this are added beets or fresh green stuffs, also cabbage leaves. The fresh juice of the latter or boiled and *filtered press juice* likewise exerts a life-saving action. Aq. exts. made from alc.-treated material are also quite effective. S. Morgulis

Studies on the relationship between chemical composition and biological action. II. Takaoki Sasaki and Hidenosuke Ueda *Biochem Z* 232, 260-8(1931), cf. *C. A.* 25, 1589.—The Et esters of 2,3-, 2,4-, 2,5-, 3,4- and 3,5-diaminobenzoic acid have been prepd. The HCl salts of these were employed in animal expts. The 2,4-compd. was the most toxic for the mouse, the lethal dose being 3 mg. in aq. soln. (1:50) per 10 g.; the 2,5-compd. is only half as toxic, while the other 3 isomers are about equally active and again half as toxic as the last. For the guinea pig the 3,4- and 3,5-compds. are fatal even in a dose of 0.01 g. per 100 g., while the 2,4- and 2,5-compds. are much less toxic than for the mouse, and the 2,3-isomer is the least toxic. Guinea pigs can at times survive even a subcutaneous injection of 0.1 g. per 100 g. These substances are all amyostatic poisons producing muscular motor incoördination with rigidity. S. Morgulis

Influence of adrenaline on the blood and organ lipoids. Irvine H. Page and Lydia Pasternak. *Biochem Z* 232, 295-309(1931).—After injecting 0.3 mg. adrenaline every 15 min. for 4 hrs. into rabbits there was found a diminution in the phosphatides, cholesterol, fatty acids and total fat of the serum, while in the liver there was an increase in fatty acids, cholesterol and total fat. In the kidneys the phosphatides, fatty acids and total fat were diminished. In the brain the phosphatides were diminished, while the cholesterol was increased, and the fatty acids became somewhat less unsatd. In the heart also the phosphatides and cholesterol were diminished. The effect of adrenaline is the same on lipemic rabbits, though this may be marked by the progressing lipemia. Insulin and adrenaline both cause a lowering of the lipoids in the serum, but the effect of the former is somewhat more pronounced. So far as the influence on the lipoids of organs is concerned, with very few exceptions the two hormones do *not act in the same way*. S. Morgulis

Influence of arsenic and antimony compounds on the enzymic functions of the organism. VII. Buffer capacity of arsenous and arsenic salts. A. N. Adova and I. A. Smorodintzev *Biochem Z* 232, 459-68(1931), cf. *C. A.* 23, 2493.—The buffer capacity of a 1% $Na_2HAsO_4$ is about 1/4 as great as that of $Na_2HAsO_3$. Dilg. $Na_2HAsO_4$ with an equal vol. of $H_2O$ causes a lowering of the $p_H$, dilu of $Na_2HAsO_3$, if moderate, causes a shift of the $p_H$ to the alk. side, but strong dilu (1:50) also causes a lowering of the $p_H$. The buffer effect of 1% $Na_2HAsO_3$ is the same as that of a phosphate buffer and is 6 times as great as that of the citrate buffer. To secure the same $p_H$ in $Na_2HAsO_3$ and $Na_2HAsO_4$ solns., the normality of the former must be diminished *30* times. $H_3AsO_4$ has twice the buffer capacity of a phosphate and 12 times that of a citrate buffer toward alkali. The buffer capacity of 1% $Na_2HAsO_4$ is half as great as that of phosphate toward acid and only 1/4 toward alkali. The buffer capacity *of the phosphate mixt. for alkali is 6 times that of citrate*, but for acid only 1½ times as great. The injurious effect of $Na_2HAsO_3$ injections is attributed to the disturbance of the acid base balance of the organism. S. Morgulis

The fate of colloidal iron administered intravenously. II. Long experiments. Cyril J. Polson *J. Path. Bact.* 32, 247-60(1929).—Fe held by the lungs is essentially a foreign substance and is transferred principally to the liver. It is suggested that the path of the Fe from the lung is by way of the spleen. Fe is probably excreted by the cecum and the kidney, while part of the liver excess of Fe is transferred to the lymph nodes and remains in the body for some time. John T. Myers

The antagonism between trypsin and insulin. Zdzislaw Świder and Julian Walawski. *Med. Doswiadczalna i Spoleczna* 13, 1-24(1931). (In Russian, French

Abstract) —Insulin (I) lowers the tone of isolated rabbit intestine Trypsin (II) restores the movements arrested by I. I and II when mixed have no effect. Boiled I arrests the intestinal movements, but boiled II does not restore them A mixt of I and II boiled arrests the movements I arrests the digestion of casein by II, this action being independent of the $p_H$ It is possible that the antagonism between I and II is due to a combination of the two rather than to the destructive action of II upon I. T H RIDER

**The use of therapeutic effects as end points in the biologic titration of the digitalis bodies.** HARRY GOLD, BEN GELFAND AND WILLIAM HITZIG *J Pharmacol* 41, 89–102 (1931) —Electrocardiograms were taken on cats after administration of tincture of digitalis (German leaf), tincture of digitalis (American leaf), tincture of digitalis ($CHCl_3$ fraction), and tinctures of adonis, ouabain and digitoxin The percentages of the fatal doses producing the following effects were noted first change in T wave, or R-T interval, first increase in P R interval, first appearance of ectopic beats and ventricular fibrillation The degree of individual variability is least for the doses necessary to produce ventricular fibrillation, and by using the latter as the end point it is possible to standardize digitalis with greater precision than by the use of other phenomena C RIEGEL

**Acquired tolerance to and cross tolerance between the nitrous and nitric acid esters and sodium nitrite in man.** L A CRANDALL, JR., C D LEAKE, A S LOEVENHART AND C W MUEHLBERGER *J Pharmacol* 41, 103–19(1931) —Tolerance in human subjects (as measured by headache production) was established by periodic administration of erythrol tetranitrate, ethylene glycol dinitrate, Me nitrate and Am nitrite *No tolerance to Na nitrite was developed Cross tolerance was demonstrated, and* tolerance to Na nitrite was conferred by tolerance to the other substances The effect lasted for approx 10 days after discontinuation of the administration There was no cross tolerance to histamine Tolerance to the action on blood pressure and pulse rate was less easily produced and was less complete C RIEGEL

**The acute toxicity of glyceryl trinitrate and sodium nitrite in rabbits.** THEODORE V OLTMAN AND LATHAN A CRANDALL, JR *J Pharmacol* 41, 121–6(1931) —The lethal dose for sodium nitrite was 80–90 mg and for glycerol trinitrate 45 mg per kg The symptoms of poisoning are given C RIEGEL

**Guanidine structure and hypoglycemia. II.** FRITZ BISCHOFF AND M LOUISA LONG *J Pharmacol* 41, 127–37(1931) —The toxicity, effect on blood urea N, amino acid N and sugar and damage to liver and kidney are reported for di *p*-phenetylguanidine, di-*o* anisylguanidine, benzimidazoleguanidine, benzothioazoleguanidine and benzoxazoleguanidine C RIEGEL

**Further observations on the pregnancy response of the uterus of the cat.** R G GUSTAVSON AND H B VAN DYKE *J Pharmacol* 41, 139–46(1931) —Subsequent to a series of 6–25 injections of urine obtained from pregnant women, the uteri of ovariectomized cats relaxed in response to epinephrine injections, while the uteri of animals having one or both ovaries intact contracted if the ovaries contained mature corpora lutea, or relaxed if no corpora lutea were present C RIEGEL

**A study of the skin vessels in some forms of inflammation of the skin.** G H. PERCIVAL AND C M SCOTT *J Pharmacol* 41, 147–63(1931) —Histamine caused further dilatation, while adrenaline and Bier's spots overcame the existing vasodilatation of dilated minute skin vessels in exfoliative dermatitis, ultra violet erythema, oil of mustard erythema, psoriasis, dermatitis venenata and tinea corporis The results fail to support the hypothesis that the vasodilatation has been produced by liberation of histamine, or a histamine like substance C RIEGEL

**Intestinal bleeding following administration of posterior pituitary extracts.** S J WEINBERG *J Pharmacol* 41, 165–72(1931) —Intravenous injection of toxic quantities *of posterior pituitary extracts and of pitressin into normal unanesthetized dogs was* followed in 6 of 14 cases by intestinal bleeding C RIEGEL

**Chloroform poisoning during narcotization.** A SARTORI *Chem.-Ztg* 55, 222 (1931) —Qual analysis of the vital organs of an 11-months old child that died while subjected to $CHCl_3$ anesthesia showed the presence of $CHCl_3$, especially in the stomach and kidneys neg quant results were obtained, however Hofmann's carbylamine reaction was used for the detection, the detn was made by conversion of $CHCl_3$ to HCl, and absorption in $AgNO_3$ soln W. GORDON ROSE

**The prevention of malaria with Schweinfurth green.** A MISSIROLI *Rivista malariol* 9, 667–705(1930) R. SANSONE

**Insulin therapy in malaria.** C TOSCANO. *Rivista malariol* 9, 734–40(1930) R. SANSONE

Plasmochin in chronic malaria. M Frizzero *Riv sci malariol* 9, 754-8 (1930).—Favorable results were obtained in 4 cases R. Sawsong

Chemical constitution and physiological action. Behavior of the stereoisomers of α-bromoisocapronyl-*l*-asparagine. Maddalena Furia *Boll chim farm* 70, 137-9 (1931), cf *C A* 24, 829.—Differences were found in the physicochem and physiol properties of the stereoisomers of α-bromoisocapronyl-*l*-asparagine The soly of the *l* form (I) in $H_2O$ was 1.8%, the content in the aq soln after extn with oil was 0.503%, and the soly in oil was 1.297% The resp figures for the *d* form (II) were 2.414, 0.688 and 1.720% II produced sleep in shorter time in *Carassius auratus* L. than did I. When returned to fresh water, the fishes subjected to I regained their vitality without passing through a stage of excitement, in contrast to the fishes treated with II. C. S.

The influence of the combination of the alkaline earth chlorides with sodium chlorides on urethan hemolysis. R. Mochlnicki *Protoplasma* 8, 215-21(1929).—When the ion of Ca, Ba, Sr or Mg and the Na ion were present in about equal concns., the max. hindering effect on urethan hemolysis was observed M. H. Soule

The action of narcotics of the urethan series on the colloidal activity of serum. P. J. Jurisic. *Protoplasma* 8, 378-88(1929).—The addn. of certain concns of methyl and phenyl urethan caused gel formation when added to beef serum The gelation was due to an alteration in the structure of the serum M. H. Soule

The action of preparations of beer yeast on chemical processes in the liver and muscles of exercising animals. L. C. Pi-Suñer Bayo, G. Liss and T. Osuna *Anales soc espan fis quim* 29, 193-9(1931).—Previously (*C A* 25, 744) the effect of a prepn. from yeast autolysate on the chem. properties of muscle and liver of normal rats in exercise has been shown These tests were repeated with pure, dry yeast (*Levurinose Blues*) on 20 white rats exercising 1 hr. daily and receiving a regular diet. Ten of these were fed 0.2 g. dry yeast in 2 cc. $H_2O$ per day, the other 10 were held as controls. Glycogen, lactic acid and phosphoric acid content of liver and muscles were detd. after killing Liver glycogen rose appreciably, muscle glycogen less Lactic acid and phosphoric acid contents were slightly higher in muscle and liver of yeast fed rats. IL. C. Pi-Suñer Bayo and G. Liss. *Ibid* 29, 200-5(1931).—Muscular effort was regarded as important as regular muscular activity Dogs were fed daily 2 g. yeast per kg. of body wt. Controls had a normal diet The exercise was 0.75-1 hr. daily on a treadmill, 48 hrs. in all After quick killing the glycogen and lactic acid of liver and muscle and the fat content were detd. In yeast fed dogs the fat content was 6-8 times greater, the glycogen unchanged Glycogen collected in the first few hrs. in liver and muscle is converted into fat, this proving the conversion of carbohydrates into fat in the organism E. M. Symmes

The active principle of Hsi-sin. T. Kondo *Keijo J. Med* 1, 223-47(1930).—By distillation of the Chinese drug, Hsi sin, a yellow, slightly sticky oil was obtained Large doses of this oil administered to frogs, rats and rabbits causes at first an increased irritability with a gradual central paralysis and finally a cessation of respiration With small doses administered over longer periods of time, paralysis affecting first the extremities is the chief symptom The conclusion is that this oil is the active principle of Hsi sin A. J. Vorwald

The pharmacology of Panax ginseng N. Sughara and P. Min *Keijo J. Med* 1, 347-408(1930).—*Panax* when fed to rats augments the action of injected picrotoxin, camphor, caffeine and sodium salicylate, but is antagonistic to the action of chloral hydrate, urethan, alc. and veronal A. J. Vorwald

The pharmacology of Panax ginseng N. Sughara and P. Min *Keijo J. Med* 1, 685-702(1930).—Panax when fed to rats is antagonistic to the action of atropine, and adrenaline but is synergistic with pilocarpine and physostigmine A. J. V.

Pharmacology of the active principles of ginseng. N. Sughara and K. Kin. *Keijo J. Med* 1, 711-72(1930).—Panax acid, when administered to frogs, mice and rabbits, causes first stimulation of the spontaneous movements, then a gradual central paralysis. When applied directly to an isolated frog heart, it causes first a stimulation, then a paralysis Panax acid dilates and then contracts the blood vessels It brings about a decrease and final cessation of peristaltic movements of the bowel Panacens, another active principle, acts likewise A. J. Vorwald

Amino alcohols. VI. Preparation and pharmacodynamic activity of four isomeric phenylpropylamines. Walter H. Hartung and James C. Munch *J Am Chem Soc* 53, 1875-9(1931), cf *C A* 24, 5578.—Four isomeric phenylpropylamines ($PhCH(NH_2)Et$, $PhCH_2CH(NH_2)Me$, $Ph(CH_2)_3NH_2$ and $PhCH(Me)CH_2NH_2$) were prepd by catalytic hydrogenation of an appropriate intermediate A preliminary pharmacol examination of these compds indicates that The optimum skeleton for pressor compds

is $PhCH_2CH_2NH_2$, a shift in the relative positions of the Ph and $NH_2$ groups very greatly decreases pressor potency substitution of a Me group on either of the 2C atoms in the side chain of this skeleton confers oral activity, the presence of the secondary alc HO in $PhCH(OH)CH(NH_2)Me$ serves to decrease the toxicity to a degree that becomes significant therapeutically C J West

**Biological investigation of the active constituents of digitalis leaves.** Yoshito Kobayashi *Proc Imp Acad Tokyo* 7, 76–9(1931).—The LtOH ext was divided into 29 fractions by the use of various precipitants and solvents and their biol action studied The glucosides easily sol in $H_2O$, which are not pptd by NaCl and $(NH_4)_2SO_4$, are less active than those insol or difficultly sol in $H_2O$, as far as cardiac action is concerned C J West

**Parathormone dosage and serum calcium and phosphorus in experimental chronic hyperparathyroidism leading to ostitis fibrosa.** Aaron Bodansky and Henry L Jaffe *Proc Soc Exptl Biol Med* 27, 797(1930), *J Exptl Med* 53, 591–604(1931).—On a low Ca intake hypercalcemia tended to disappear in chronic hyperparathyroidism on a given dose of parathormone (as large as 6 units per kg), apparently because of the reduction of a readily available Ca reserve An increase of either the Ca intake or of the daily dose of parathormone caused a rise in serum Ca and symptoms of overdosage. Hypocalcemia developed in chronic hyperparathyroidism in young puppies on a low Ca diet Tetany occurred at a Ca level which was higher and a P level which was lower than in tetania parathyreopriva of young puppies About 0.1 g of Ca daily was apparently sufficient to maintain the serum Ca at a normal level The serum P in chronic hyperparathyroidism in young puppies continued at or rose above the high level normal for young animals Toward the end of long periods of treatment on large parathormone dosage (about 5 units per kg) serum P approached normal levels, pronounced hypercalcemia was absent but hypotonia and other symptoms of hyperparathyroidism were present A single dose of parathormone caused early in the treatment and on liberal Ca intakes a more marked relative rise of serum Ca than in normal adult dogs, confirming previous observations Later in the treatment and on low Ca intakes this effect was greatly reduced Serum P rose after a single injection of parathormone, even when the effect on the serum Ca was slight or absent The continued effect of parathormone on serum Ca after prolonged periods of treatment and the modified response of the serum P indicate tolerance due to some compensation, rather than immunity The bone lesions, presenting the essential features of ostitis fibrosa cystica in varying degrees of severity, depending on the relation of the parathormone dose to the Ca intake and to the duration of the treatment, were most prominent on low Ca intakes, which permitted the use of large doses of parathormone without fatal hypercalcemia and without symptoms of overdosage C J West

**The effect of iron on blood formation as influenced by changing the acidity of the gastroduodenal contents in certain cases of anemia.** Stacy R Mettier and George R Minot *Am J Med Sci* 181, 25–35(1931).—Responses of reticulocytes were observed (1) after small daily doses of Fe citrates with an alk beefsteak meal, (2) after the same doses with an acid meal and (3) after the same doses followed by a 4- to 12-fold increased dose of Fe The responses after feeding meals with high $p_H$ were slightly less than after low $p_H$, the dose of Fe being const The responses induced by increased doses of Fe indicate that the small doses of Fe were not optimal R C Willson

**Dihydranol. Control of intestinal putrefaction in man by oral administration of 2,4-dihydroxyphenylheptane.** Veader Leonard and Wm A Feiker. *Bull. Johns Hopkins Hosp* 48, 25–38(1931).—The administration of dihydranol in doses of 0.3–0.45 g, thrice daily, destroys the true putrefactive flora of the intestinal tract with great certainty and regularity R C. Willson

**Thymophysin Temesváry.** Erwin E Nelson *J. Am Med Assoc* 96, 352–6 (1931).—Experimentally no difference could be found in the pressor or oxytocic activity of pituitary alone as compared with pituitary plus thymus exts The strength of "thymophysin" ampules examd by pressor and oxytocic methods was found to be from 25 to 33% of that claimed on the labels When equiv doses of pituitary ext and "thymophysin" were compared on the excised uteri or on blood pressure, no differences could be demonstrated R. C Willson

**The renal changes following the intravenous injection of hypertonic solution of sucrose.** H. F Helmholz *Proc Staff Meetings Mayo Clinic* 6, 124(1931).—The epithelium of the convoluted tubules is specifically affected Vacuolar degeneration is evident after 3 hrs Within 48 hrs the swelling of the tubular epithelium is so marked that the lumen of the tubules is practically obliterated The large cells, filled with clear protoplasm, resemble the cell of hypernephroma The epithelium regains its

normal appearance within 10 to 15 hrs after the height of the swelling has been reached As many as 22 injections at intervals of 5 days did not permanently reduce the output of phenolsulfonephthalein or increase the blood urea (1 exception) The chronic changes consisted of irregularities in the lining of the tubules, atrophy of the convoluted tubules lying close to the corticomedullary junction and increase in the connective tissue in this region The glomeruli were unchanged R C. WILLSON

Synthesis and pharmacodynamic action of homoisopapaverine (and laudanosine) (KONEK) 10 Existence of 2 thioimidazole group in insulin (RUIZ, *et al*) 10 Hygienic importance of S. of sulfuretted waters and S baths (GRUNEWALD) 14

## 12—FOODS

F C. BLANCK AND H A LEPPER

The influence of pasteurization upon the preservation of buttermilk. LEV PIK. *Chem Listy* 24, 396–8(1930) —Sweet cream centrifuged from raw milk was churned for 3 hrs., yielding butter and buttermilk contg 0 9% butter fat. Aliquots (200 cc.) were heated to 87° and poured into wide-mouthed bottles Unheated controls were also prepd All series were inoculated with spontaneously soured milk and were kept at 33°. A few were protected from the air by a layer of paraffin oil The pasteurized buttermilk showed a lesser degree of lysis analyses for pasteurized buttermilk show total N 460 mg., N in casein 23, N in whey 176, analyses for untreated buttermilk show total N 460 mg., N in casein 15, N in whey 184 The heating made the protein more resistant to the action of bacteria The lysis is anaerobic and occurs from 3 to 5 mm below the surface of the soln. The aerobic process occurs in the superior layer and leads to an oxidation of butter The proteolytic bacteria cannot attack the proteins because of (1) the increased insoly and coagulation of the protein and (2) the increased viscosity of the substrate and soln FRANK MARESH

Chemistry in food freezing—storage. J C IRWIN *Refrigerating Eng* 21, 348–9 (1931) —Recent chem., phys and biol investigations on frozen and stored foods are discussed A H JOHNSON

Humidity and air circulation in cold storage. M W BROWNE *Refrigerating Eng* 21, 27–8(1931) —B calls attention to the importance of humidity and air circulation in refrigerated rooms where food products are stored Proper atm conditions operate to prevent loss in wt., the development of bad odors and wilting and to assist in the maintenance of unvarying temp and in the successful storage of the products for extended periods A H JOHNSON

The composition of the wheat grown in Lettland. E ZARIŅŠ AND O AUZINA *Acta Univ Latviensis Kim Fakultat Serija* 1, No 4–6, Fasc. 2, Burtnica (in German) 138, (in Lettish) 127–37(1929) —The results of a study of the compns of 36 samples of wheat are given in 3 tables Table 1 lists the various amts of water, crude protein, fat, starch, pentosans, sugar before inversion, sugar after inversion, crude fiber, mineral matter, Fe, Mn, CaO, MgO, $H_2SiO_3$, $H_3PO_4$, alky of the ash toward methyl orange, total alky., degree of acidity, $p_H$, soly and sp gr Table 2 gives the detn of catalase in the wheat Table 3 shows the amylase content RUSSELL C ERB

Chenopodium quinoa Willd C M ALBIZZATI AND R FALRA *Anales soc cient Argentina* 111, 137–46(1931) —A comparison was made of the protein, fat, carbohydrate and mineral content of the quinoa seed with that of other cereals Phosphorus and K predominate in the mineral fraction A good white flour can be obtained from the seed, which can be mixed with wheat flour for the prepn of bread M H SOULE

The F. A. Q. wheat sample. W. R JEWELL. *J Dept Agr Victoria* 29, 134 (1931) —Analyses of the annual sample of wheat of fair av quality and of the flour, bran and pollard produced therefrom are tabulated K D JACOB

Brabender apparatus for the fumigation of meal moths. JOSEF SPOUSTA *Chem Obzor* 6, 59–62(62 English)(1931) J KUČERA

A practical method for sorting flours according to their bran-meal contents. P NOTTIN AND M LEMOIGNE *Compt rend acad agr France* 17, 239–41(1931) —A soln of pyrocatechol is added to a cup of flour The flour is thoroughly mixed to obtain a homogeneous and not too liquid pat At the end of ½ hr the flours rich in bran are

rose colored, while those with less bran are much lighter in color Phenol, guaiacol, hydroquinone, pyrogallol, gallic acid, diaminophenol and tyrosine were also tested, and while they all gave good results, pyrocatechol was found the most satisfactory The proportions of flour and pyrocatechol can vary between wide limits without modifying the results While this method is not extremely accurate, it furnishes a simple and practical technic for classifying flours J R Adams

**The role of milk constituents in bread making.** L A Allen and J Bell *J Roy Tech Coll Glasgow* 2, 550–63(1931) —A study has been made of the effect on bread of whole milk sepd milk, whey and whey, from which albumin has been removed All milk products improved the color, texture and flavor Albumin has an inhibitory effect on loaf vol This was shown by the fact that loaves made with whey had lower vol than the control, while loaves made with whey from which the albumin was removed had increased vol Addn of egg albumin decreased vol, while milk which had been heated to coagulate the albumin increased vol Dried sepd milk reduced loaf vol unless it had been boiled before drying Lactose had no effect on vol, while lactic acid improved it Whey products increased the rate of gas evolution, while milk reduced it This indicates an inhibitory effect of the casein Amy Le Vesconte

**The metals in the milk industry.** Popp *Landw Vers Sta* 111, 271–91(1931) — The order of decreasing resistance to corrosion of the 5 pure metals which were used is Ni, Cu Fe Zn and Al The best alloy is a mixt of Fe, Ni and Cu J R H

**Testing milk.** P Guarnieri *Atti III congresso naz chim pura applicata* 1930, 484–5 —A cryoscopic method for testing the water content of milk is advocated E Gebauer Fuelnegg

**The freezing point of milk and its applications.** G D Elsdon and J R Stubbs *J Soc Chem Ind* 50, 135–41T(1931) cf *C A* 24, 4338 —A review and critical discussion are given of the methods in use for the detn of the f p of milk, especially in its application for the detection of added water After a fairly extensive experience of the test, particularly of the Hortvet app, the authors are satisfied that it is of the highest value, not only for the detection of added water, but also for proving the purity of a genuine milk when the solids-not fat fall below the min allowed An extensive list of references is given J C Jurrjens

**The occurrence of peptidases in milk.** Alfred Heiduschka and Ernst Komm *Z physiol Chem* 196, 187–94(1931) —Samples of cow, goat and human milk obtained under aseptic conditions were treated with glycyltryptophan and tested for free tryptophan by the Br reaction The results were neg, indicating the absence of dipeptidase Milk contg large nos of bacteria gave a pos reaction Peptidase in milk is therefore of bacterial origin A W Dox

**Easy and exact method for ascertaining the presence of foreign fat in milk and butter.** S Camilla *Giorn farm chim* 80, 10–2, 15–8, 21–3(1931) —After describing the methods given in a previous paper (*C A* 24, 4339) C proposes another simpler method for the detn of foreign fat in butter A sample of the butter to be examd is melted, and 0 3 cc of it is transferred to the butyrometer Then are added 10 cc water-free ether, 10 cc 95% EtOH and after some agitation, 10 cc distd $H_2O$ The butyrometer is stoppered, well shaken and placed in a water bath at 37–40° until the fat has ascended to the top Then the app is allowed to stand at 18–19° for 15–20 hrs When the ethereal layer is limpid, the butter is probably not adulterated However, when partial solidification of the fat occurs, an addn of foreign fat must be suspected. In order to ascertain the foreign nature of the solidified fat, the latter is examd under the microscope The presence of typical stearin crystals is a pos proof of adulteration, since the foreign fats commonly used for sophistication (margarine, etc) contain stearin in various quantities If the presence of coconut butter is suspected, the method just described cannot be used, since coconut butter contains little stearin, if any In such a case 5–6 cc of the melted butter is emulsified with 100 cc of skimmed milk, and the presence of foreign fat is established by means of Quesneville's method G S

**Dissolving effect of sour milk on lead plates.** J Csiszár *Kisérlet Közlemények* 32, 495–501(1929) —Soln of Pb depends on the acid no of the milk, time of exposure and quality of the Pb plate surface In each expt a 0 1 mm thin Pb plate of 12 sq cm surface was treated with sour milk in a 100 cc Erlenmeyer bottle Pb plates with metallic luster were not attached by milk of 24 5 Soxhlet-Hinckel acidity no on exposure during 26 hrs Pb plates of a shiny but rough surface showed a decrease of 0 04 to 0 7 mg Plates with an oxidized surface did not lose more than 0 4 mg Pb Oxidized Pb plates with a rough surface were mostly attacked Milk of 23 8 Soxhlet-Hinckel acidity dissolved 1 5 mg Increase of acidity no also increased the quantity of dissolved Pb to a max Then a decrease was observed S S de Finály

**Small-scale research on spray-drying of milk.** A W. Scott *J. Roy Tech Coll. Glasgow* 2, 456–60(1931) —An app with a drying chamber 6 ft high and 1 ft. square is used to dry milk Milk is forced under low pressure through a capillary tube with a nozzle of 0 005 in. diam against compressed, heated air. From sepd milk, a fine powder is obtained with a soly of 99 5% AMY LE VESCONTE

**The milk powders, single and mixed, and their hygienic control.** VIRGILIO ARTERO *Boll chim farm* 69, 937–43, 981–4, 987–9(1930) —A review G SCHWOCH

**The utilization of dry skim milk in the manufacture of ice cream and cream cheese.** J C MARQUARDT N Y State Agr Sta., *Tech Bull* No 174, 3-24(1931) —Chem and phys analyses of dry skim milk, including moisture, fat, titratable acidity and detns of soly., were made at various intervals, and the quality of mfd goods as related to the apparent soly., of the dry skim milk was followed throughout the work It was concluded that dry skim milk can be kept at 40° or 70°F in sealed containers for 8 months without any deleterious effects on its flavor or soly., but it was impossible to make good ice cream or cream cheese from dry skim milks that had been stored unsealed for more than 60 days Structural changes were observed by the microscope The H ion changes, however, could not be followed by colorimetric methods J K

**The effect of feeding raw and steamed potatoes on the yield and fat content of milk.** K RICHTER, K E FERBER AND N ODAISKY *Wiss Arch Landw Abt B Tierernähr Tierzucht* 4, 695–715(1931) —The yield and fat content of milk from cows on a normal diet were compared with those obtained when 12 kg raw potatoes replaced an equal amt. (starch values) of the diet The fat content did not vary, but the yield of milk decreased 5% Potatoes were steamed and placed in a silo for 3 months, these potatoes were used in an expt similar to the one using raw potatoes, the amt. of milk decreased 4%, and the fat content dropped from 3 4 to 3 14% Analysis showed that the steam treatment had no appreciable effect on the chem compn of the potatoes W G R.

**Milk cows in nymphomania.** F MAYR AND K WURSTER *Milchwirtschaft Forsch* 9, 335–8(1930) —The milk from 3 cows was studied All had an unpleasant odor and taste The fat varied from 3 87 to 4 9, total solids not fat from 8 0 to 16 2, Cl/lactose ratio from 1 49 to 1 80, *n* of the $CaCl_2$ serum from 41 4 to 42 1, elec cond from 37 7 to 42 1 Great care was exercized in selecting animals and collecting data, but the results are rendered of little value, because no data were obtained on the animals before the onset of this condition GEORGE R. GREENBANK

**New chemical developed for testing butter fat.** W G GOSS *Ice Cream Trade J.* 27, No 5, 52(1931) —A modification of the Babcock test for butter fat is given Accurate results are obtained in detg the butter fat contents of ice cream, condensed milks, buttermilk, skim milk cream and milk A H JOHNSON

**Determination of biacetyl in butter.** G TESTONI AND W CIUSA *Ann chim applicata* 21, 147–50(1931) —As a possible method for identifying *pure* butter, a method has been developed for detg the biacetyl in butter The biacetyl is sepd from butter by steam distn and treated in boiling soln with $NH_2OH$, and a few drops of a 0 1% $NiSO_4$ soln and $NH_4OH$ (concd.) A red ppt of nickel dimethylglyoxime is formed The ppt may be weighed or estd colorimetrically Melted and pasteurized butter as well as margarines do not contain any biacetyl, whereas fresh butter contains about 0 0005% Its presence becomes a measure of the freshness of the sample of butter A W CONTIERI

**Fungi found in butter.** M GRIMES V C D KENNELLY AND H A CUMMINS *Sci Proc Roy Dublin Soc* 19, 549–69(1930) B C A

**Manufacture of low-acid rennet cottage cheese** H L WILSON AND C S TRIMBLE *Creamery and Milk Plant Monthly* 20, No 5, 27–32(1931) —The process of mfg low acid rennet cottage cheese is described When the milk contg a starter and rennet has developed an acidity of 0 50 to 0 55%, it is cut into cubes Water is then added and the curd is cooked and finally washed Before creaming with cream or skim milk the curd is allowed to set in the refrigerator for 12 hr At the time of creaming 1 5 lbs of NaCl is added per 100 lbs of dry curd A H JOHNSON

**Composition of some rabbit carcasses.** W K. WILSON *J Ministry Agr* 36, 1203–6(1930) —The chem compn of rabbit flesh (Angora) closely resembles that of chicken, the av protein content differing by less than 1% The compn of the flesh from male and female rabbits was noticeably different, especially in the fat content, females contg 4–6% more fat than the males B C A

**Use of acetaldehyde in the storage of fruit.** S A TROUT AND R G TOMKINS *J Council Sci Ind Research* 4, No 1, 6–11(1931) —Fruit stored in atms contg small quantities of AcH sometimes remained in sound condition for a longer period than fruits stored in air AcH may be effectively introduced into fruit stores in sufficient concns

to check wastage due to mold growth without injuring the fruit The concn controlling mold development without injuring the fruit is about 1 500 Expts were made with grapes, strawberries, raspberries, cherries, plums and oranges The AcH effectively controlled mold growth and decay in all fruits in concns varying from 1.250 to 1·1000. Control was not obtained by dipping fruits in solns of AcH C R FELLERS

**Ethylene oxide as a new fumigant for dried fruits.** J. E THOMAS *J Council Sci Ind Research* 4, No 1, 53–4(1931) —Limited tests showed that 2 lb of ethylene oxide per 1000 cu ft in enclosed rooms was fully effective in destroying eggs, larvae and pupae of the dried fruit moth, *Plodia interpunctella*, in 56 lb boxes of artificially infested sultana raisins C R FELLERS

**Studies of tomato quality. IV. Variability in quality and food value of tomatoes.** JOHN H MACGILLIVRAY *Proc Indiana Acad Sci 38, 159 63(1029)* —In tomatoes taken from the same field dry matter varied from 6 0 to 10 62%, total N from 1 74 to 5 72%, acidity from 3 28 to 11 63% and reducing sugars from 32 38 to 45 70% of total solids H M STARK

**Studies of tomato quality. V. Clearing is not essential in determining reducing sugars of ripe tomato fruit extract.** J H MACGILLIVRAY AND A H WATSON *Proc. Am Soc Hort Sci* 26, 137(1929), *Dept Sci Ind Research Index to Literature of Food Investigation* 2, No 2, 55(1930) E J C

**Organic acids of spinach, broccoli and lettuce.** E K NELSON AND H H MOTTERN *J Am Chem Soc* 53, 1009 12(1931) —Fresh spinach contains 0 31% $(CO_2H)_2$, citric acid and a small quantity of malic acid were sepd by the ester distn method Analysis of broccoli shows that the leaves and buds have materially the same compn and nutritive value Both buds and leaves contain proteins somewhat in excess of that reported in spinach The predominating org acid in broccoli is citric acid, it also contains *l*-malic acid and small quantities of oxalic and succinic acids The proportion of citric and malic acids is 3 2 The org acids of lettuce were found to be oxalic 0 011%, *l*-malic about 0 065%, and citric about 0 048% C J WEST

**Utilization and composition of oriental vegetables in Hawaii.** H L CHUNG AND J C RIPPERTON Hawaii Agr Expt Sta, *Bull* No 60, 64 pp (1929) —The proximate compn, mineral elements and alky of the ash were detd in 56 varieties of oriental vegetables commonly used for human food in Hawaii Of the group of 30 leafy and stem vegetables, all are comparatively rich in Ca with the exception of bamboo shoots, small bean sprouts and tender fern fronds The vegetables classed as Ca deficient are all immature stems Large bean sprouts are exceptionally high in protein, fat and carbohydrates The several cabbage-like plants are characterized by high water content, comparatively low protein and energy values, and high Ca The superiority of the green leaf, non heading Chinese cabbage over the blanched heading variety is marked Kale, radish and turnip greens stand out as rich sources of Ca Of the spinaches, the Chinese variety is superior in Ca but inferior in Fe Both have a decided excess of basic elements Honewort and matrimony vine are rich in protein, energy constituents and minerals and merit greater utilization in the human diet Matrimony vine contains nearly twice as much of the mineral constituents, except P, as does any vegetable in this group Twelve fleshy or pod vegetables were examd, the former are characterized by high water content and low protein and energy values but are very succulent, and the latter by their high protein content and generally high minerals The balsam pear is remarkably high in P (0 107%) and base forming elements The soy bean has not only a high protein content but the protein is of very high quality. Fourteen aquatic and starchy root vegetables showed generally high N free ext, low protein and Ca and moderate amts. of P Kudzu and Chinese taro are among the most desirable foods in this group The lotus root and water chestnut are important and nutritious foods Bibliography C. R FELLERS

**Determination of sand in vegetables.** I RÜB *Chem.-Ztg* 55, 221–2(1931).—Introduce 5 g of an air-dried sample into a Spaeth sediment glass, filled ⅓ full with $CCl_4$. Let stand for 1 hr, stirring several times with a wire Pour off most of the $CCl_4$, transfer the residue quantitatively to a porcelain dish, and remove the org matter by heating at a dull red heat For the detn of sand in rice, add 20 cc 30% NaOH to the ash, heat on a water bath for 15 min, filter, wash and ash W. GORDON ROSE

**Decarboxylation studies on pectins and calcium pectates.** C. M. CONRAD *J. Am. Chem Soc.* 53, 1999–2003(1931) —Decarboxylation of apple and lemon pectins with mineral acids occurs at low concn of acid and is very appreciable with as weak as 0 1% $H_2SO_4$ The extent of decarboxylation of apple pectin in various concns of $H_2SO_4$ and HCl and of lemon pectin in various concns of $H_2SO_4$ is reported for a 16 hr period of boiling Decompn of the galacturonic acid of apple pectin is complete with

12% HCl but is not complete with 18% $H_2SO_4$. A comparative study of the Ca pectate from several sources shows that the rate of decarboxylation with 2% $H_2SO_4$ is approx the same in each C J West

**Photomicrographic studies of sucrose crystals.** Sybil Woodruff and Helen van Gilder *J Phys Chem* 35, 1355–67(1931).—Photomicrographs were made of fondants prepared by partially hydrolyzing sucrose by boiling with one half its vol of water and $KHC_4H_4O_6$, tartaric acid, citric acid or HCl and also of fondants prepared by boiling aq solns of sucrose and glucose or fructose. The moisture content of fondants was about 13%. Glucose, fructose and invert sugar served equally well in regulating the size of crystals. 6–15.8% of invert sugar or 7% glucose or fructose gave most desirable crystal sizes. Sirups contg 43.43% invert sugar or more would not crystallize, and those contg 16.3–23.56% formed a semifluid mass of crystals. Candy observed to be coarse in texture contained crystals 45μ in size, below 20μ seems desirable, as the sense of touch in the mouth can detect gritty texture when the crystals are 25.5μ in size but not when they are below 19.6. The difference of 6–10μ represents the difference between a smooth and a gritty texture. Storing the fondant does not appreciably alter crystal size. Oden I Sheppard

**The determination of phosphoric acid in organic substances especially feed stuffs.** W. Lepper *Landw Vers Sta* 111, 159–61(1930).—Five g of the substance and 2 g $CaCO_3$ are heated to ash. With $P_2O_5$ rich material (0.5% or more) the ash is washed into a 500 cc flask, the dish rinsed with $HNO_3$ and the ash dissolved without heating by shaking with about 20 cc $HNO_3$. The flask is filled to the mark with water, and the $P_2O_5$ detd in 15 cc of the filtrate by the method of Lorenz. With $P_2O_5$ poor material the method is the same, except that a 250-cc flask and 50 cc of the filtrate are used. John R Hill

**The use of copper sulfate in place of mercury for the Kjeldahl analysis.** W. Lepper *Landw Vers Sta* 111, 155–8(1930).—For the detn of crude protein in feedstuffs 1 g of material is heated with 5 g of $CuSO_4.5H_2O$, 15 g $K_2SO_4$ and 20 cc $H_2SO_4$ until the soln has a clear green color (about ¼ hr.). The soln is heated for ½ hr longer and distd in the usual manner with NaOH. John R Hill

*Carbohydrate foods.* Alois Jodlbauer and Franz Kleinvikel. Austrian 121,732, Oct 15, 1930. The albumin content of carbohydrate foods, especially chocolate or cocoa or confectionery made therewith, is increased by incorporation of yeast.

**Food material from malt-grain residues.** Margaret M Koller. U S 1,799,142, March 31. In treating the residue collected after extg sol constituents from malt grain the acid pressed juice "is sepd from spent grain," and an elec current is passed through the juice for a sufficient time to effect a substantially complete pptn of the suspended solids in the juice and to render the juice alk in character, so that fermentation o the solids is inhibited. These solids are suitable for use as an animal food. App is described.

**Increasing the baking capacity of flours.** F Gruzl and A Szabó. Hung 102,064, Jan 18, 1930. Peroxides stabilized by addn of enzymes or org compds are mixed with the flour or with the leaven. *E g* 3 g asparagine is added to 10 cc $H_2O_2$ and cooled. The cryst product is mixed with 3 g malt diastase, and 0.1–0.5 g of the mixt is added to 1 kg flour or leaven.

**Apparatus for pasteurizing and cooling milk.** Georg Röttger. Ger 516,818, Aug 28, 1926.

**Apparatus for sterilizing milk by heating and cooling.** Bergedorfer Eisenwerk A.-G. Astra Werke. Ger 516,812, Nov 20, 1929.

**Milk of high vitamin and low bacterial content.** Roy R Graves. U. S 1,798,413, March 31. Milk is taken from the cow and transferred to a pasteurizing app under vacuum conditions without release of the vacuum during the transfer, and the milk is allowed to remain under vacuum conditions at body temp for 30–60 min before being pasteurized.

**Sour milk product.** Walter L Kulp. U. S 1,799,303, April 7. There is added

to skimmed milk about 1% of concd tomato juice in which about half the titratable acidity has been neutralized, the mixt is stirred, heated at 96–99° for about 1–25 hrs, cooled to about 38°, and there is then added about 0·25% of a pure culture of *Lactobacillus acidophilus* developed in milk, and the mixt is held at a temp of about 36–38° until a curd is formed The product may also be made with use of yeast instead of tomato juice

**Tubular heat-exchange apparatus suitable for heating or cooling milk or cream.** Fritz G Cornell, Jr (to Jensen Creamery Machinery Co) U S 1,799,356, April 7 Structural features

**Cheese.** Alexander Axelrod Fr 698,478, Dec 19, 1929 Milk is cooled to 30–40°, and submitted to fermentation with ferments such as *Bacillus caucasicus*, kephir yeast, *Bacillus bulgaricus* or peptonizing bacteria, if necessary with the addn of agents to neutralize the lactic acid formed The mass is then thickened to about 1/3 of its vol treated with acid and pressed

**Device for drying and smoking meat, etc.** E Winkelmeller & Co Ger 516,753 Mar 15, 1927

**Use of refrigeration and carbon dioxide in preserving fruits and vegetables, etc.** Charles Brooks (dedicated to the free use of the public) U S 1,798,781, March 31 Food products to be preserved are chilled to a low temp suitable for preservation and simultaneously submerged in an atm having a $CO_2$ content of 15–40% at the beginning of the cooling and which is decreased to 0–10% when a suitable preserving temp is attained

**Conserving animal and vegetable foods.** Richard Willstätter Ger 516,923, Sept 11, 1929 Addn to 513,665 (*C A* 25, 1021) In preserving food by HCN as described in 513,665, inert gases such as air may be present in the HCN current Cf *C A* 25, 2494

**Preserving fruit juices, etc** Henriette A Liesenfeld Landau Fr 698,297, July 2, 1930 Fruit juices, jams, etc, are preserved by bringing them in contact with sugar, either solid or in soln and with a fungicide such as HCOOH, whereby, due to the osmotic action of the sugar and the action of the HCOOH, a sterile product is obtained

**Apparatus for freezing liquid confections, etc.** Hans K Christensen and Louis J Bennett U S 1,798,725, March 31 Various details are described of an app comprising a cylindrical chamber with a screw conveyer within it and a pipe coil around it for circulation of cooling fluid

**Pectin.** Roger Paul and Robert H Grandseigne Fr 698,161, June 28, 1930 An app is described for treating pectic juice with acetone to obtain purified white pectin Cf *C A* 25, 1299, 2193

**Pectin solution from apple pomace.** Elton R Darling and Howard F MacMillin (to Hydraulic Press Mfg Co) U S 1,799,140, March 31 The pomace is subjected to high pressure to remove any remainder of platable juice, it is then broken up, and not more than 10% by wt of hot water is added, and the mixt is subjected to much higher pressure to express the pectin from the pomace

**Beverages.** Eduard O Ornfeldt and Makoto Lorw Fr 698,140, June 27, 1930 "Mate" or Paraguay tea made from the dried leaves of "Ilex paraguayensis" is improved in taste and smell by the action of carbonyl compds, *e g*, AcOH or ketones

**Working up lupine seeds.** Ges für Lupinenindustrie m b H Ger 522,335, June 24, 1924 After the seeds have been steeped in known manner, the swollen seeds, which are those from which the poisonous constituents have been adequately removed, are sepd from the unswollen or slightly swollen seeds by sifting Cf *C A* 25, 1298

**Preserving green fodder.** Gustav Fingerling Ger 522,333, Nov 20, 1925 The fodder is steeped for about 8 days in water which is protected from the air by an oil layer and contains a bactericide in a concn sufficient to disinfect the fodder without rendering it inedible Alternatively, a stronger disinfectant soln may be used, and replaced after a time by water Cf *C A* 25, 1923

**Method and apparatus for preserving green fodder by the cold-pressing process.** Adolph Hupertz Ger 522,331, Jan 8, 1926

## 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S MINER

**Acid-resisting materials for chemical and building industries.** P. N Grigor'ev and I I Silvistrovich *Zhur Prikladnoĭ Khim* 3, 1155–8(1930) —$Na_2SiF_6$ is recommended as a binder for materials contg silicates V. Kalichevsky

**The steam and electric power plant of Imperial Chemical Industries, Ltd., at Billingham** H A Humphrey, D M Buist and J. W. Bansall *J. Inst Elec Eng.* 68, 1233–75, 1276–90(1930) E J C.

**Blowing bulk chemicals about the plant.** E H. de Coningh *Chem. Markets* 28, 497–499, 501, 503(1931) E. H.

**Safety in handling compressed gases.** Robert H Ferguson *Chem. Markets* 28, 505, 507, 509–511(1931). E H

**Smokes and smoke gases.** E Smolczyk *Z ges Schiess-Sprengstoffw* 26, 132–5 (1931).—A discussion of the products of a fire from the standpoint of danger to exposed personnel particularly firemen The greatest danger comes from the smoke, composed of both solid and liquid particles These are present in the largest quantity early in the fire before the temp is sufficiently high to prevent the approach of firemen They frequently contain substances which deaden the nerves in the mucous membrane and act as narcotics, causing sudden collapse The mechanism of this action is described Less dangerous are irritant gases and CO Suitable gas masks contg smoke filters are described A L Kibler

**The toxicity of certain benzene derivatives and related compounds.** Henry F. Smyth *J Ind Hyg* 13, 87–96(1931).—The toxicity of many compds used industrially has been studied The blood changes which Selma Meyer (*C A* 22, 1417) found after benzene, toluene and xylene poisoning have not been in agreement with those reported by American investigators Long exposure showed evidence of lung inflammation and degeneration of internal organs Xylene and toluene, because of their higher b ps., are not so hazardous as benzene, and they are not absorbed through the skin to any extent Aromatic nitro compds act on the central nervous system, whereas amino compds are blood poisons Headache, dizziness, visual disturbances, cyanosis, abdominal cramps, coma and convulsions are characteristic of both Poisoning from amino derivs is less serious but they are absorbed readily through skin as well as through the lungs Aniline poisoning may result in malignant bladder tumors, 25 g is a toxic dose, but 0.4–0.6 mg per l may be breathed for about 1 hr without much effect Toluidines produce less cyanosis than anilines The diamines used in dyeing furs may be very toxic, and poisoning is sudden Some destruction of red cells results A study of guanidine derivs revealed a sharp line between the fatal dose killing in a few hrs and the dose from which there was recovery Death from these resembled cyanide poisoning All these benzene poisons produced one outstanding lesion, namely a tendency to extravasation of blood in the lungs This varied from scattered minute petechiae to massive lobular or lobar hemorrhage The lesions were present in exptl animals and in man In industry, accidental poisoning with any material having a lethal dose over 250 mg per kg *per os* is rare With a limit of 100 mg per kg there is little danger if reasonable precautions are taken Personal idiosyncrasy and the fact that absorption through the skin is often very rapid must be kept in mind G H W. Lucas

**Destruction of mustard gas (dichlorethyl sulfide) in the ground by means of fire.** Hugo Stoltzenberg *Z. ges Schiess-Sprengstoffw* 26, 135–7(1931).—An app is described A. L. Kibler

**Commercial cooling units.** F E Stewart *Refrigerating Eng* 21, 21–6(1931).—The effect of the spacing of fins and design of the box interior are considered in relation to heat transfer characteristics It was noted that max heat transfer was dependent on the total heat load, the resistance offered to free air circulation and the depth of the fin in the direction of air travel over the surface The most effective spacing varied from 3/8 in for fins 4 in deep to 1 in for fins 14 in deep A H Johnson

**Refrigerant properties—some refinements.** H D Edwards *Refrigerating Eng* 21, 106–7(1931).—The phys consts of 15 refrigerants are tabulated A H J

**Economical marine insulation.** E B Joelson *Refrigerating Eng* 21, 13–20 (1931).—Peculiarities in marine insulation, as well as insulants suitable for ship's holds, are discussed Methods and formulas are given for computing economically practical insulation for ships Charts are included to illustrate the use of the author's formulas A H Johnson

**Molding powders for electrical use—wide range available.** J R. Dolphin *Times Trade and Eng Suppl* 28, No 664, 20(1931).—Illustrations of hot and cold molding are shown E M Symmes

**Effect of surface conditions on heat transmission.** S J Kohli *Trans Inst Chem Eng*, Advance copy, 19 pp., Oct., 1930.—The over all and film coeffs of heat transfer through a Cu tube, within which a current of hot air passed, and which was cooled with water outside, were studied with special reference to variations in the character of the surface. Results were obtained for the over all coeff in fair agreement

with Joule and Ser's formula, $k = 16v$ to $19\sqrt{v}$, where $\sqrt{v}$ is the gas velocity in m./sec. K.'s results are summarized by the equations $k$ (over all) $= 16.912v^{0.491}$ and $k$ (air-Cu) $= 16.116(w/a)^{0.486}$, where $w/a$ is the mass velocity. Other formulas are discussed and criticized. Coatings with red, green and violet enamels increased the heat transfer throughout. It is suggested that radiations of short wave lengths may be absorbed and converted into heat energy. At high velocities convection plays an overwhelming part, and therefore the thickness of the air film is important. At lower velocities radiation and absorption are of more importance. The metal water film coeffs. calcd. in a few cases show an increase with the logarithmic mean temp. difference, undoubtedly because of increased convection. These coeffs. are markedly increased by black surfaces on the gas side. B. C. A.

---

Porous masses from gypsum [for heat insulators]. (Ger. pat. 522,139). 18.

**Gaseous reactions.** Nikodem Caro and Albert R. Frank. Fr. 698,169, Aug. 17, 1929. In gaseous reactions substances are added to the gases which may afterwards be removed. Thus in the production of $N_2O_4$ or $HNO_3$ by the catalytic oxidation of $NH_3$ or HCN, steam is added to the gases before the reaction zone and is condensed after the reaction.

**Separating carbon monoxide from gases.** Harald Kremer. Fr. 697,752, June 21, 1930. CO is sepd. from gases contg. it by converting the greater part of it into $CO_2$ and H by means of steam and catalysts and the remainder into $CH_4$ and water by hydrogenation. Details of the process and an app. are described.

**Treating gases with liquids.** Emile Deplasse. Fr. 699,713, Oct. 14, 1929. The known method of washing a vapor by passing it through a liquid, with the use of venturi tubes, is extended to the neutralization, superheating, cooling and purifying of gases, vapors and fluids.

**Recovering organic substances from aqueous solutions or emulsions, or from gas mixtures.** Isidor Traube. Ger. 522,480, Mar. 8, 1928. The solns., mixts., etc., are brought into contact with a powd. ore, *e. g.*, galena or zinc blende. The ore adsorbs the org. substances, which are then recovered by treating the ore with a hydrophile colloid, *e. g.*, gelatin or albumin, or with an org. compd. of stronger polarity than the adsorbed compd. Thus, $C_6H_6$ may be sepd. from a mixt. with water by shaking the mixt. with powd. galena, the adsorbed $C_6H_6$ is reliberated by addn. of a little oleic acid. Other examples are given also. The method may be applied to the purification of water.

**Dispersions of solids.** I. G. Farbenind. A.-G. Fr. 697,099, April 21, 1930. Stable dispersions of metals, metalloids or their mixts. or alloys are prepd. by disseminating the solids in a finely divided state with rubber or like masses previously masticated and dissolving the mixt. in a solvent after the dispersion is pushed to the point where a sample forms a soln. in an appropriate solvent without a deposit even on standing.

**Recovery of solvents such as those used in the manufacture of the alkali metal phenylglycines.** Justin F. Walt (to National Aniline & Chemical Co.). U. S. 1,798,713, March 31. Aniline, an alkali metal cyanide and $CH_2O$ are caused to react in a solvent comprising alc. and water to form a reaction mixt. contg. an alkali metal phenylglycine, alc., aniline, $NH_3$ and water. Liquids are vaporized from the reaction mixt., the vapors are condensed and $NH_3$ is sepd. from the condensate. Substantially all the condensate is refluxed and brought into contact with the vapors, and the operations of distn., condensation, sepn. of $NH_3$ and return of condensate are continued until the

condensate contains only a small quantity of $NH_3$. A portion of the condensate is then withdrawn from the system, while the distn. and condensation are continued. App. is described.

Combustible solvent containing hydrocarbons. Wolf Krumbhaar and Elliott Morrell. Fr. 627,500, June 17, 1927. Light hydrocarbons used for cleaning, etc., are rendered incombustible by a content composed of a light petroleum distillate and a compd. of the formula $R_2=N-X-FA$, in which R is H, an alkyl group or a substituted alkyl group; X is an alkyl group or a substituted alkyl group and FA is a fatty acid such as oleic, stearic or palmitic acid.

Desulfurizing extraction agents. Gewerkschaft Mathias Stinnes. Ger. 517,000, Apr. 30, 1929. Ammoniacal extn. agents used in depurifying materials are desulfurized by passing into an agent, such as Cu cement or bog iron ore which absorbs $H_2S$, but leaves the $FeOH$ still in the free state.

Deflocculating colloids. Walter O. Robinson to New Jersey Zinc Co. U. S. 1,790,877, April 7. For promoting the deflocculation of solids in a liquid medium such as mineral pulps, the material is treated, without added heat, with prepd. white waste liquor.

Heat carriers for high temperatures. I. G. Farbenind. A.-G. Fr. 627,313, June 13, 1928. A mixt. of org. liquids stable at 300°, such as binary or ternary mixts. of $CH_3Ph_2$, $Ph_2$ and $Ph_2O$, are used as heat carriers.

Drying storage-battery plates or other articles with heated gases. Willard L. Repinhart (to Willard Storage Battery Co.). U. S. 1,790,214, April 7. The articles are placed in a chamber through which a heated gas is passed until a predetd. amt. of the moisture has been carried away, and the chamber is then connected in series with another chamber cont'g. wet articles. An arrangement of app. is described.

Filter for gas and smoke masks. Harry A. Kuhn and Wm. A. Boyle (Boyle to Kuhn). U. S. 1,790,194, March 31. A fibrous cellulose material is impregnated with activated charcoal in a discrete condition.

Brine for refrigerators, etc. Robert Mayrhofer. Austrian 121,988, Nov. 15, 1928. The corrosive action of the brine on metals is reduced by adding a small quantity of an org. nitro compd., e. g., picric acid.

Condenser with flat sinuous coils suitable for condensing gases in refrigerating systems. George Hilger. U. S. 1,790,795, March 31. Structural features.

Condenser suitable for ammonia condensation in refrigeration. Charles H. Wertz. U. S. 1,790,824, March 31.

Pipe-coil condenser suitable for condensing ammonia. Gustaf M. J. Backqvist (to Platen-Munters Refrigerating System, Aktiebolag). U. S. 1,790,081, March 31.

Insulating materials. I. G. Farbenind. A.-G. Fr. 627,312, June 13, 1928. Insulating and coating materials are made by mixing and molding under heat and pressure waste wood, peat or residues from the acid treatment of peat, or lignin from the saccharification of wood, with condensation products of urea and aldehydes or their polymers. Cf. C. A. 24, 754.

Heat-insulating material suitable for lining flues, ovens, etc. Arthur J. Ross (to Armstrong Cork Co.). U. S. 1,790,253, April 7. After laying down a substantially dry facing mix of cementitious material such as cement, sand and asbestos, there is placed over this a body material comprising a dry siliceous earth mixt. cont'g. water, and liquid from the body material is utilized by the facing material.

Waxing paper and wrapping it around wire. Neil C. Lanyon (to National Electric Products Corp.). U. S. 1,790,892, March 31. App. and various details of operation are described.

Electrical insulators. Edmund Burke (to Brown Co.). U. S. 1,790,580, April 7. Impregnated insulators are formed with a stem member composed of long wood fiber and a comminuted absorbent filler such as wood flour and with a flange member having a greater amount of absorbent filler and a smaller proportion of fiber.

Cold-molded insulation. Roy E. Coleman (to Monowatt Elec. Corp.). U. S. 1,790,004, March 31. A binder is formed by heating and mixing an asphaltic substance, a drying oil and a dispersing medium in the form of a fatty acid of a drying oil. The binder is mixed with filler material such as finely divided asbestos, and the mixt. is cured.

# 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Recent progress in water supply.** C A EMERSON, JR., H B CLEVELAND, H. F. FERGUSON, J C PRITCHARD AND ROBERT S WESTON *Public Works* 61, No 6, 23–4 (1930) —The report discusses advances made in methods for the improvement of water color, taste, odor and softening For color removal superchlorination followed by dechlorination is effective when the Fe content of the coloring matter is high Chlorinated copperas has been used effectively, as well as filters loaded with ferric hydrate H ion control and improved mixing devices have decreased the cost of color removal Progress has been made in eliminating mud balls from filters The use of air during filter washing has been recently introduced Filter sand may be kept clean by employing velocities sufficient to produce 50–60% expansion of the sand bed Variations in temp must be corrected for by varying the wash water velocity Cleaning of filter sand may be accomplished by the use of caustic soda Improved methods for recovering phenols at coking plants have reduced considerably the tastes and odors caused by industrial wastes *Activated C filters are especially effective for removing objectionable* odors and tastes Another method is pre ammoniation Improvements in filter plants include the use of mech devices to replace cleaning by hand and the utilization of the coagulating effect of sludge from the coagulating basin on the silt contained in raw water The zeolite and lime soda water softening processes have been improved by the adoption of re action tanks, settling basins and mech mixers and conveyers

C C RUCHHOFT

**Philadelphia water supply and health.** ANON *Public Works* 61, No 5, 29–30 (1930) —The report of the Philadelphia Hospital and Health Survey Comm gives the following data concerning the city's water supply Water intakes are located on the Schuylkill and Delaware rivers Both rivers receive domestic sewage and trade wastes from numerous municipalities Av *B coli* indices at the Schuylkill intakes vary from 10,000 to 34,500 per 100 cc, and at the Delaware intakes the av is 21,000 per cc Because of a total flood tide travel of 5 95 miles per tide of the Delaware River, the major pollution is caused by the city of Philadelphia In all there are 29 sewer outlets The city is operating 2 obsolete and overloaded sewage treatment plants which handle about 10% of the total flow By-passing of raw sewage into the rivers is common During the summer months, there was no dissolved O content in either river The O content of the Delaware intake samples is often 30–40% of satn Five filtration plants are in operation, but no provision is made for adequate preliminary storage or for prefiltration All filter plant effluents are chlorinated, the dosage being regulated according to the *B coli* index of the treated water and not by the residual Cl data Each plant is operated according to the policy of the individual filter plant superintendent The water supply has not been approved by the Pennsylvania Department of Health or the U S Public Health Service, since July, 1925 Numerous cases of cross connections were reported In 1913, 1300 cases of typhoid were attributed to pollution caused by cross connections

C C RUCHHOFT

**Water-supply problems in Holland.** F A LIEFRINCK *Public Works* 61, No 9, 19–20(1930), cf *C. A* 24, 3294 —Water has been one of the enemies of the inhabitants *of the Netherlands Much of this water is salt or brackish Because of unfavorable* geo-hydrological conditions difficulties are encountered in providing fresh potable water Sixty one % of the population, divided over 444 communities, now has water supplies In rural districts water supplies are built by a combination of several communities The Government Bureau of Water Supply coöperates and often takes over the financial risks of new enterprises Of the 444 water supplies 142 are drawn from dunes, 253 take ground water outside of dunes and 49 have river water supplies The dune supplies are taken from typical lens shaped fresh water accumulations The water is captured either by means of shallow wells (Haarlem), by open channels (Amsterdam) or by covered drains (the Hague) Future problems arise because of the reclamation of the Zuider Zee which will add some 550,000 acres of fertile land to the country. One of the 4 polders will be ready for occupation in 1931 The soil of these new polders has been under salt water for centuries, so there is little hope of finding fresh water for the population which will settle there

C C RUCHHOFT

**Improvements to the Bluefield water supply.** GEO D NORCOM West Va Univ. Eng Expt Sta., *Tech Bull* No 3, 49–56(*1930*) —To increase the quantity of the Bluefield Water Supply a slab-type dam was built to impound the waters from several springs Storage capacity for water now amounts to 172,000,000 gallons Daily chem

and bacterial examns. of the water are made. Alga control is practiced to eliminate tastes and odors. A. L. Elder

**Water-treatment works of Ida, Kansas.** M. P. Harrold. *Water Works and Sewerage* 77, 296–9(1930).—Water for this town, obtained from the Neosho River, is at present settled and chlorinated before distribution. The hardness of the water varies from 140 to 500 parts per million, principally on account of Ca carbonate, which represents 65–75% of the total hardness, and Mg, which is usually lower than 20 parts per million. During low flow, the chloride content is as high as 500 to 700 parts per million, because of the effect of oil-field pollution; most of the year the chloride content is less than 400 parts per million. The new filtration and water softening plant is designed to treat 2 million gallons per day with provisions for extension of the plant facilities. Raw water will be delivered by the present low-service pumps to the mixing chamber below the chem. application room. Lime is applied at the entrance of this chamber, and the water has a retention period of about 9 min. and a velocity of 0.8 ft. per second. The water next goes to the reaction tanks for about 30 min. The discharge from the reaction tanks passes to the existing preliminary settling basins for a 3-day retention period. The water is then aerated and passed to a chamber for carbonation. Aeration is obtained by the use of a Sacramento spray nozzle, and $CO_2$ from a natural-gas generating plant in the chem. head house is distributed through a grid system on the floor of the carbonation chamber. A 30-min. retention period is provided in this unit. Following this the water is treated with alum, and it then goes to the filters. There are 3 filter units, each capable of filtering 667,000 gallons per day. Storage is provided for 2,750,000 gallons. Cl is applied at the entrance to the last reservoir. C. C. Kneeland

**Present-day water-treatment processes.** A. E. Clark. *Public Works* 61, No. 9, 50(1930).—C. discusses recent standard practice in clarifying, filtering and chlorinating water, with examples from Tennessee practice. C. C. Kneeland

**Treatment of water and its effect on ferruginous incrustations.** Arthur Goffit. *Water and Water Eng.* 33, No. 387, 121(1931).—The primary causes of Fe oxide incrustations are acidity of the water, dissolved Fe, Fe bacteria and dissolved O. Dissolved Fe may be partially ppd. and removed by aeration and filtration, which also tend to eliminate dissolved O where present in excess under pressure. The ultimate source of the incrustation is dissolved Fe in the water itself. Addn. of lime or other alkali to water counteracts acidity, but only slightly retards bacterial action. Addn. of lime in sufficient quantity to be effective is costly and makes it unsuitable for certain technical processes. No useful results are seen from the addn. of Na silicate until prohibitive costs are reached. This seems true, in general, of addn. of chemicals. Filtration removes only a part of the Fe bacteria. The only sure means of preventing red-pecking after scraping is to recoat pipes after scraping. Alice W. Epperson

**Water of wells and rivulets of the northern bank of Lake Balaton.** G. Rozlozsnik. *Magyar Biol. Kut. Int. Munkái* 3, 125–45(1930).—Waters from Tihany to Aszófö were examd. Wells mostly originate from cracks of dolomite or limestone, therefore the salts consist of Ca and Mg $HCO_3$. The water of the rivulets contains less salt, since bicarbonates are ppd. Data of 12 detailed analyses are given. S. S. de Finály

**Floating matter contained in the Danube water at Budapest.** T. Takács. *Hidrol. Közlöny* 10, 53–6(1930).—Water of the left part of the Danube contained 0.2196 g. l. floating matter (av. of 9 detns.) that of the right part only 0.1874 g. l. The av. of the 2 is 0.2035 g. l. The Danube water above Budapest (at Lipót) contained 0.2002 g. l. floating matter. Dams proved to be of no influence on the floating-matter content. The above data mean that the floating matter content of the Danube amts. to about 10,000,000 metric tons in a year. Analyses of the floating matter gave: $SiO_2$ 18.05, $TiO_2$ 0.21, $Al_2O_3$ 3.61, $Fe_2O_3$ 0.56, FeO 1.27, CaO 35.20, MgO 6.45, $P_2O_5$ 0.24, $Na_2O$ 0.59, $K_2O$ 0.96, MnO 0.06, water (driven off above 110°) 5.76, $CO_2$ 25.79% (total 99.43%). The large content of $CaCO_3$ was caused by ppn. of bicarbonates during evapn. of the soln. Mech. analyses gave: clay (under 0.002 mm.) 10.20, silt (0.02–0.002 mm.) 30.13, fine sand (0.2–0.02) 56.22, sand (2–0.2 mm.) 3.35%. Microscopical examn. showed that it consists mostly of crystals of calcite. In addn., quartz, biotite, plagioclase, orthoclase, microcline, green and brown fragments of amphibole, limonite, garnet, pyrite and hypersthene were found. S. S. de Finály

**Efficiency of water-purification plants on the Great Lakes.** H. W. Streeter. *Water Works and Sewerage* 77, 295–300(1930). cf. C. A. 25, 1316.—The lake system studied provides approx. 10,000,000 people with drinking water and receives sewage and industrial waste equiv. to a population of five and one-half million persons. There is a striking similarity in all plants in regard to the existence of a well-defined relationship between the bacterial quality of the raw water and the corresponding quality of the effluent at each

successive stage of purification The marked variability in av bacterial efficiency between plants was found to be the outstanding dissimilarity. *In comparing the bacterial* efficiency of the Great Lakes plants with Ohio River plants it was found that the former were slightly less efficient with chlorination included and considerably less efficient with chlorination excluded It is suggested that these divergencies might be due to the differences in the chem compn of the 2 waters The study further indicates that a *B coli* index of 4500 per 100 cc represents an upper limit of permissible pollution With av indexes ranging below 1000 per 100 cc the majority of plants would be overburdened for a very small proportion of the time The following areas are listed in their order of decreasing intensity of pollution extreme southern end of Lake Michigan, extreme western end of Lake Erie, outlet of the Detroit River and southern shore of Lake Erie between Cleveland and Sandusky C C RUCHHOFT

**Laboratory-control tests and their practical significance.** PERKINS BOYNTON W Va Univ Eng Expt Sta., *Tech Bull* No 3, 103–6(1930) —Perkins emphasizes the necessity of lab -control data *E g*, the water of the West Fork River coagulates best between a $p_H$ of 6 2 and 6 8 Detns of turbidity at 3 hr intervals make it possible to predict the amt of alum needed From 5 to 10 parts per million of alkalinity should remain in the water after treatment A L ELDER

**Analysis of water from the Odiel river (Huelva).** L BLAS *Anales soc españ fis quím* 29, 162–3(1931) —High mortality of fish in the Odiel River led to analyses which showed 0 45 mg $As_2O_3$ per l and $p_H$ 4 7, quite sufficient to explain the mortality and migration of fish E M SYMMES

**Chemical analysis of the water of "Margit" well of Zánka-Vérkut (Hungary).** F MARSCHALL *Hidrol Kozlony* 10, 136–40(1930) —The dissolved matter totalled 1707 87 mg /l S S DE FINÁY

**Chemical analysis of the waters of Cave Aggtelek (Hungary).** R MAUCHA *Hidrol Közlony* 10, 201–7(1930) —The data for analyses of 6 samples are given The content of org matter is small S S DE FINÁY

**Combined nitrogen in rain water.** C SRIKANTIA *Half-Yearly J Mysore Univ* 4, 195–8(1930) —Sixty two samples of rain water collected in Bangalore over a period of 1 year were analyzed for $NH_3$, $N_2O_3$ and $N_2O_5$ The amts found show a max in April The total rainfall was 32 40 in., giving 1 37 lb $NH_3$ per acre, 0 861 lb $N_2O_3 + N_2O_5$ per acre and a total of 2 40 lb of combined N per acre GEORGE CALINGAERT

**The taste problem solved.** JOHN R BAYLIS *Water Works and Sewerage* 77, 299–304(1930) —The elimination of tastes in water has been along 2 lines One is to prevent the taste from being more pronounced when Cl is added to the water, and the other is to eliminate all objectionable tastes by removing them from the water by changing them to inoffensive compds The success of the superchlorination treatment depends upon the power of the Cl to break down the offensive compds and also on the effectiveness of the dechlorinating process The most common tastes, such as those produced by microörganisms and by the phenolic compds, are readily changed to inoffensive compds with Cl With superchlorination all bacterial life is destroyed, the oxidizable org matter is reduced and the water is more likely to remain stable when stored $SO_2$ is a very effective dechlorinating agent In practice, it is best to add an amt of $SO_2$ equivalent to residual Cl present Na bisulfite is also used for dechlorination. The most successful treatment for the removal of tastes is the Cl activated-carbon process The water is superchlorinated, and a residual Cl content of 0 5 to 1 0 part per

million, prior to dechlorination, is sufficient if there has been 3–4 hrs' contact time. Charcoal, I, ignite and activated C are dechlorinating agents. Activated C is best suited for the purpose and removes the excess Cl as well as offensive compds. not changed by the Cl. Another process is the $NH_3$–Cl treatment. $NH_3$ is added to the water prior to Cl. This is done to prevent chloro tastes. The Cl unites with the $NH_3$ to form a chloramine, a weak oxidizing agent which does not readily oxidize the org. material present in the water. Chloramine is a more effective bactericide than Cl. It prevents after-growths. It eliminates objectionable odors and tastes. It allows a 50% reduction of the amt. of Cl required for actual sterilization. It retards the oxidizing action of the Cl and prevents its absorption, thus allowing practically all the Cl to be available for germicidal action. More time is required to sterilize the water with chloramine than with Cl. $KMnO_4$ has been used to eliminate taste-producing compds., but it gives the water a slight bitter and astringent taste. Ozone has not been used extensively to eliminate tastes because of its cost, but it may be quite effective. C. C. Pitchford

Substances producing taste in chlorinated water. L. B. A. Adams. *Water and Water Eng.* 33, No. 387, 109–13(1931).—$CHI_3$ taste in chlorinated water may arise from the presence in the water of (a) certain products of destructive distn. of coal, (b) certain salicyl derivs. of natural origin, (c) unknown products of bact. metabolism or decomps., and of purely chem. action, (d) iodides of natural occurrence. Taste may be due to a no. of org. substances, confined to the lower monohydric phenols of the benzene series, their monocarboxylic, aldehydic, alcoholic derivs. or their inorg. salts. Tastes more nearly resembling those met with in actual practice are produced by phenol, monohydric phenols with substituted groups in the ortho position or inorg. iodides. Para compds. yield tastes resembling $CHI_3$, less, but of greater pungency than the tastes of meta compds. The strongest tastes are produced by phenol, *o*-cresol, salicylaldehyde and *o*-hydroxybenzyl alc. The tastable products are probably mixts. of *o*- and *p*-chlorophenol, trichlorophenol or their homologs. As *o*-chlorophenol possesses the strongest taste and more nearly resembles $CHI_3$, it may be said that the substances producing more intense tastes yield a greater proportion of *o*-chlorophenol.

Alice Whitson Jefferson

Prevention of chlorophenol tastes. Chas. R. Cox. *Public Works* 61, No. 5, 77 (1931); cf. *C. A.* 24, 1164.—Expts. concerning the effectiveness of superchlorination, $NH_3$ treatment and $KMnO_4$ treatment disclosed the following. Superchlorination is effective but expensive. $NH_3$, when used before or with Cl prevents formation of chlorophenols. $KMnO_4$ is feasible and economical. It is necessary to compensate for its influence upon the results of the *o*-tolidine test for residual Cl. C. C. R.

The determination of total alumina in filtered water. F. O. Baldwin. *Water Works and Sewerage* 77, 311(1931).—The new method for the detn. of unpptd. alum is simple, rapid and sensitive to 1 part in ten million as $Al_2O_3$. The reagents required for the test are: (1) Three tenths % aq. soln. of alizarin red S (alizarin sodium monosulfonate) in 2 *N* $H_2SO_4$. (2) Satd. soln. of $NaHCO_3$. Filter through alumina free filter paper and add 2 cc. distd. water per 100 cc. of filtrate. The strength of this soda soln. should be held close to a normal soln., that is, 5.4% $NaHCO_3$ (Arm & Hammer bicarbonate may be used). (3) Fifty % AcOH made with the highest grade reagent and boiled distd. water. Use the following procedure: To 50 cc. of the freshly collected and well-shaken water add 1 cc. of No. 1. Use phosphorus acid flasks, size 2½ oz. Boil 2 min. on the hot plate, neutralize with No. 2 to just barely purple by adding the soda soln. very carefully drop by drop, then add exactly 0.5 cc. excess, boil 2 min. and cool in *cold water*. When cold, add 1 cc. of No. 3, let stand 1 min. and compare with the color standard sealed in pyrex 2½ oz. flasks similar to the above flask. These color standards are sealed in partial vacuum and have to be standardized very accurately. C. C. Pitchford

Spectrographic determination of cations of some Spanish medicinal mineral waters. L. S. Piña de Rubies and C. Serment d'Argent. *Anales soc. espan. fis. quim.* 29, 440–46(1931).—Spectrographic tests in the ultra violet region of dry residues from 43 medicinal mineral waters identified Pb, Cu, Ag, Sn, Mo, Ga, Ge and Ti, in addn. to the usual elements. E. M. Symmes

The relation between the fixed residue and electrical conductivity in mineral waters. E. Bovalini and L. Vallasi. *Ann. chim. applicata* 21, 51–73(1931).—To approximate the compns. of natural waters a large no. of solns. were prepd. of the following 6 types: (1) from $Ca(HCO_3)_2$ alone, (2) from $SiO_2$ with $NaOH$, (3) from $SiO_2$, $Ca(HCO_3)_2$ and different amts. of $NaOH$, (4) from $SiO_2$, $Ca(HCO_3)_2$ and different amts. of $NaHCO_3$, (5) from $SiO_2$, $Ca(HCO_3)_2$ and different amts. of Ca and Mg as sulfates, (6) from $SiO_2$ and $Ca(HCO_3)_2$ plus various salts. The fixed residue at 180° and *E* at 15° were detd.,

and the ratio $r$ = fixed res /$K$ was calcd Results for $r$ varied from 584 to 4100 The only uniformity is observed for waters of the same type but varying concn , in which case $r$ varies less than 20% A W CONTIERI

**Influence of water plants on the electrical conductivity of Balaton water and of bicarbonate solutions.** GY LUDÁNY *Magyar Biol Kut Int Munkái* 3, 482–5 (1930) —Water plants cannot decrease $K_{18}$(= 4 5 × $10^{-4}$) of Balaton water to 0 5–0 8 × $10^{-4}$ Five g Potamogeton was used in 100 g water, and $K$ was measured in 3 hrs by Pleissner's app The value of $K$ at first decreased, then increased in diluted Balaton water An increase of cond was found under the influence of light at far higher $K$ values than those obtained by Ruttner in the water of Lunzer Sea The cond under the influence of light at first increased, then decreased in $Ca(HCO_3)_2$ solns Plants liberate $CO_2$ in the absence of light Ruttner's phenomenon was observed on the 3rd day, under $p_H$ 8 5 and $K_{18}$ 0 9 × $10^{-4}$ S S DE FINÁLY

**Protozoölogical examination of water.** MISE N L WIBAUT *Chem Weekblad* 27, 526–9(1930) —Tabulations of the nos of bacteria (*B coli*) and protozoa present in previously sterilized waters at successive intervals after seeding show that in most cases both increase at first, the latter much faster than the former after the period of increase both decrease The conclusion is drawn that the protozoa can entirely eliminate the bacteria in most cases Comparative tests of the no of protozoa and bacteria present in a water may be used to det the date of infection of the water with bacteria B C A

**Direct method for the quantitative study of bacteria in water, and some considerations on the causes which produce a zone of oxygen minimum in Lake Glubokoje.** S I KUZNETZOV AND G S KARZINKIN *Zentr Bakt Parasitenk* , 2 Abt , *83*, *169–74(1931)* — The diminished content of O in the water below the temp leap can be easily explained by its continuous consumption by bacteria The greater d of these water layers precludes their rising to the surface in consequence of wind circulation Thus the O in them cannot be renewed by that of the atm The sharp increase in d of the water of the temp - leap layer contributes to the retention of the dead organisms of the plankton This favors the increased development of bacteria JOHN T MYERS

**Gas production and $p_H$ determination of coli-aerogenes cultures in sugar broths.** C C RUCHHOFT, J G KALLAS AND BEN CHINN *J Am Water Works Assoc* 23, 565–81*(1931)* —*Buffering broths with 0.2% $K_2HPO_4$ is recommended to control $p_H$ and* increase gas production The effect of the initial $p_H$ values with different media is stated. D K FRENCH

**Private cross-connections and similar menaces to the quality of water.** JOEL I. CONNOLLY. *Water Works and Sewerage* 77, 309(1930) —To prevent water pollution through submerged inlets to fixtures and direct waste connections, all water pipes and waste pipe installations must be carefully supervised Safer fixtures should be developed, and devices to prevent back pressure provided All direct water connections to waste pipes should be severed Submerged inlets should be removed, and the water should enter over the rim of the fixture, or a non-siphoning device should be installed C. C. RUCHHOFT

**The use of sea water for the regeneration of base-exchange materials in water softening.** HORACE INGLESON AND BASIL A ADAMS *J Soc Chem Ind* 50, 123–4T (1931) —Sea water contg $Na^+$ 1 092, $Mg^{++}$ 0 127, $Ca^{++}$ 0 046 and $K^+$ 0 043% was used to regenerate glauconite "Kenzelite " It was possible to substitute sea water for NaCl solns usually used to regenerate water softeners Further studies will be made to det whether or not a film of $CaSO_4$ forms on the sand during the regeneration process It was considered that sulfate ions in the sea water might ppt the Ca ions during treatment of the filters with sea water A L. ELDER

**Pasadena's sewage-disposal plant.** G K Hooper *Municipal Sanitation* 2, 174–6(1931) —This plant serves a combined population of 121,000 The *activated-sludge* process is used, preceded by an equalization tank and grit chamber Part of the effluent is diverted for irrigation purposes, and the remainder discharged into a stream The sludge is converted into a *com fertilizer* Fifty lb of this material per annum per unit of population served is obtained Receipts from sales of fertilizer practically cover labor costs of operating the entire plant G L K

**Barrington sewage-treatment plant.** E Bender *Public Works* 61, No 9, 33 and No 10, 21(1930) —The sewage of Barrington, N J, is clarified and treated by mech aeration The settled effluent is filtered through sand and chlorinated The sludge-digestion tanks and covered sludge beds are provided for digesting the activated sludge C C. Ruchhoft

**Sewage chlorination for the protection of masonry sewers against disintegration.**

LINN H ENSLOW *Water Works and Sewerage* 77, 306(1930).—Sewers are often attacked by the $H_2SO_4$ produced in septic sewage by bacteria. This can be prevented by chlorinating the sewage, the chlorination suppressing biological action and simultaneously preventing odors and reducing the O demand. Cl is applied during max. sewage flow, about 9 to 12 hrs. daily. The quantity of Cl used is about 5 parts per million.
C. C. R.

**Laboratory studies of sludge digestion.** A. M. BUSWELL AND S. L. NEAVE. Ill. State Water Survey, *Bull.* No. 30, 84(1930).—The major nitrogenous constituents were shown to be urea, nucleoproteins and simple proteins, and their degradation products. The hydrolysis of urea to $NH_4$ carbonate was rapid and complete. Insol. proteins were hydrolyzed and peptized slowly in acid sludges ($p_H$ 5.0) but rapidly above $p_H$ 6.4. Fatty acids, $NH_3$ and free amino acids were the normal products, but amines also were produced in acid sludges. Fatty acids were decompd., with the production of $CH_4$ and $CO_2$. Amino acids were in part resynthesized into bacterial protein. The purine fraction of the nucleoproteins suffered almost complete destruction. During the remobilization in forms of N, not more than 5% of that present escaped as gaseous N. $NH_3$, living bacteria and amino acids were the main nitrogenous end products. Besides proteins, the sewage solids were shown to contain grease (soaps and fats), crude plant fiber and humus-like bodies. Grease degradation was demonstrated, and lower fatty acids, $CH_4$ and $CO_2$ were found as end products, thus grease was proved to be an important source of $CH_4$ in digestion tank gases. The degradation of lower fatty acids was studied to det. the biochem. mechanism involved. For the degradation of lower fatty acids (and by inference for higher ones) an anaerobic oxidative mechanism has been demonstrated in which water acts as the oxidizing agent. Methane and $CO_2$ were produced in nearly *theoretical yields. This mechanism probably has the same wide application in anaerobic processes that the β oxidation mechanism has in aerobic metabolism.*
F. W. TANNER.

**Chemical studies on sludge digestion.** S. L. NEAVE AND A. M. BUSWELL. Ill. State Water Survey Division *Circ.* No. 8, 3–9(1930).—See preceding abstract. F. W. T.

**Two questions on sludge digestion answered.** JOHN R. DOWNES. *Water Works and Sewerage* 77, 247–8(1930).—D. discusses the necessity of using circulating pumps for heating coils of sludge-digesting tanks and also the necessary pitch for the floor of digestion tanks. Pumps are preferable to secure equiv. heat transfer at a lower initial water temp. The lower water temp. is necessary to prevent baking sludge on the outside of the heating coil. D. recommends a 60° slope for the bottom of the digestion tanks when sand and grit are present. If grit chambers and screens are used, a slope of 18 in. in 19 ft. is sufficient.
C. C. RUCHHOFT.

**Molds utilized to make sewage sludge inodorous.** CHESTER G. WIGLEY. *Public Works* 61, No. 5, 38(1930).—Sewage sludge from sedimentation tanks having a detention period of 45 min. is pumped onto sludge drying beds. When dried so as to be shoveled easily, it is removed and spread for further air drying. It is then ground or broken up and stored in a dark building where mold growths complete the deodorization. The ground material is used as a *fertilizer* and sells for $20 per ton. The av. analysis after treatment is N 1.96%, available N 0.76%, $P_2O_5$ 0.62%, potash 0.13% and organic matter 35.9 per cent. The process has been patented.
C. C. RUCHHOFT.

***Trickling filters.*** *JOHN R. DOWNES. Water Works and Sewerage* 77, 313(1930).—Different factors must be considered. The type of influent, the depth of the filter and other factors det., to a large extent, the operator's method. In general, the sewage should come to the filters as fresh as possible and with the least possible suspended matter, which will provide against filter-clogging. This keeps down odors at the sprays and passes on to the sprinklers the fine particles which can be better treated aerobically in the filters than anaerobically with the sludge. Clogging of trickling filters is more likely to be due to growths on the bed than to the sewage solids themselves. Such growths can be eliminated by chlorinating or using bleaching powder. Odors also can be controlled by the use of Cl in sufficient quantities to oxidize the $H_2S$. The other objectionable feature of trickling filters is the presence of the filter fly. The only method of control at present is that of submerging the filter media at regular intervals, by which means the eggs, larvae and pupae are washed out of the filter bed. The adult flies are best destroyed by spraying the walls and walks with kerosene.
C. C. RUCHHOFT.

**Present practice in industrial-waste treatment.** ERNEST W. STEEL. *Public Works* 61, No. 9, 21(1930).—A review is given of the methods used for treating milk wastes, beet sugar waste, corn product wastes, cannery wastes, packing house wastes, tannery waste, textile and wool washing wastes, paper mill wastes, coke by product wastes, acid wastes and mine wastes. The methods suggested for various wastes include

coagulation, sedimentation, treatment on sprinkling filters or coke filters and activated sludge treatment. It is pointed out that there is no satisfactory treatment for wool-scouring wastes. C. C. RICHMOFF

**Treatment of trade wastes, a necessary feature of stream-pollution control.** W. W. HOOVER. W. Va. Univ. Eng. Expt. Sta., *Tech. Bull.* No. 3, 75–83(1930).—A review is given of some of the research projects which have led to the recovery of valuable products for industry and at the same time decreased the pollution of streams into which industries had been dumping wastes. A. L. ELDER

**An innovation in meat-packing waste treatment.** H. O. HALVORSON. *Municipal Sanitation* 2, 166–70(1931).—Biol. treatment of sewage from a meat packing plant killing 5000 hogs daily was found to be too costly and did not allow for protein recovery. The waste from this plant carried $120–300 worth of N per day. Chem. pptn. methods were unsatisfactory because of the high cost of filtering and drying the ppt. By use of Cl 80% of the org. N was pptd., and suspended solids were reduced 95%. The best results were obtained with the strongest sewage. The sewage is subjected to a short period of settling, a thorough mixing with Cl and final sedimentation in a Dorr thickener. From 1500 to 1700 lb. of Cl are used per day. Five tons of sludge are recovered per day from 750,000 gallons of sewage. The dry sludge will contain 8.5% $NH_3$. At $30.00 per ton for the sludge the plant will be self-supporting. G. L. KELSO

**Stream-pollution investigations in West Virginia.** L. KERMIT HENDON. W. Va. Univ. Eng. Expt. Sta., *Tech. Bull.* No. 3, 68–74(1930).—The activities of the State Water Commission are outlined. A report of the pollution of Cheat River indicated the pollution of the river from the following sources: 80 coal mines discharging acid waters, a tannery with a biochem. O demand equiv. to 13,000 people, 7 sawmills, a wool washing plant, cement factory, blanket factory and domestic sewage from 10,000 people. No satisfactory program for eliminating the pollution from coal mines is available at this time. A. L. ELDER

**Atmospheric pollution in 1929–30.** JOHN B. C. KERSHAW. *Engineer* 151, 257–9 (1931).—A review of reports on conditions at Hamburg, Germany, and at Southport and Salford, England. D. B. DILL

**Hygienic importance of sulfur, of sulfuretted waters and sulfur baths.** MAX GRÜNEWALD. *Pharm. Presse, Wiss. prakt. Heft* 1931, 38–40.—A general discussion is given of the element in its varied forms and combinations, its therapeutic application and reputed effect on the animal economy. W. O. E.

**Solving the garbage problem in Alton, Ill.** THOMAS BUTLER. *Public Works* 61, No. 5, 51(1930).—By the adoption of a municipal system of rubbish and garbage collection and disposal, a savings of $35,000 per year was effected. C. C. RICHMOFF

NURSE, C. J. Purification and Disposal of Sewage. London: Crosby Lockwood and Son. 4s. 6d. Reviewed in *Water and Water Eng.* 33, 187(1931).

---

Composition for preventing boiler incrustation. HERMANN JURESCH. Austrian 121,756, June 15, 1929. The compn. comprises powd. gallnut 5, powd. pine bark 2, powd. larch bark 2 and resin or grafting wax 1 part. 100 g. of the compn. are used for 1 cubic m. of very hard water.

Sewage-disposal apparatus. WM. W. SAYERS and MARCUS B. TARR (to Link Belt Co.). U. S. 1,799,150, April 7. Structural features.

Filter suitable for filtering water as drawn for use. ANTON C. MENGE. U. S. 1,800,093, April 7.

Sewage treatment. FREDERICK W. SPERR, JR. (to Koppers Co.). U. S. 1,799,444, April 7. Sewage is aerated in the presence of a compd. of a metal, the sulfide of which is insol., such as $Fe(OH)_3$, and a foam is maintained on the surface of the liquid during the aeration. App. is described. Pine oil may be used as a flotation agent.

# 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J J SKINNER AND M S ANDERSON

**Agriculture and soils of the coastal plain of Palestine. Soil survey of the Jaffa Sub-district.** H E. Z RACZKOWSKI *Palestine Dept Agr and Forests, Agr. Leaflets* 11 Ser., *Soil Survey* No 1, 24 pp (1929) *Expt Sta Record* 61, 17 8—The usual soil survey information is given, with the addn of some detailed chem and mech analyses given in an appendix G G

**Investigation of soils and of the mineral content of pasture grasses at Waranama Ranch, Berbice River.** R R FOLLETT-SMITH *Agr J Brit Guiana* 3, 142–59(1930)—Both soils and pastures examd were deficient in CaO, phosphate and potash, and grazing cattle became quickly emaciated The feeding of bone meal to cattle is recommended B C A

**Negative values in Neubauer-Schneider tests of soils.** M GRAČANIN *Z Pflanzenernähr Düngung u Bodenk* 18A, 115–8(1930)—Neg values for phosphate assimilation in Neubauer tests are ascribed to the transference of phosphatic material from the germinating seeds to the soil and its subsequent fixation by the soil The phenomenon is characteristic of highly adsorptive soils deficient in phosphate B C A

**Water condition of the soil and plant growth.** HANS GRADMANN *Naturwissenschaften* 19, 257–64(1931)—A review dealing with the mechanism of utilization of soil water by plants, mobility of water in soil, etc Many references are given B J C VAN DER HOEVEN

**Soil moisture content at which barley wilts.** L SMOLÍK *Bull Czechoslov Acad Agr* 1930, *166—Barley plants can utilize, at least partly, the hygroscopic moisture* of soils, particularly in heavy soils B. C A

**The problem of the accuracy of soil moisture determinations.** D S KUZNETZOV *Zhur Opuit Agron Yugo Vostoka* (*J Expt Landw Südost Eur Russlands*) 6, No 1, 155–80(1928), *Expt Sta Record* 63, 716—K presents the results of a math treatment of data on the moisture of a soil under sunflowers The moisture content was detd on each 10-cm layer to a depth of 200 cm For each layer 8 borings were made, so that each plat gave 160 detns The genetic horizons in the soil investigated were found not to influence the moisture content From a math point of view it was more rational to det the moisture on each 10 cm layer A sharp break in the moisture content and its constancy could be noted at a depth of 100 cm It is important to note the presence of a correlation between corresponding values of moisture in 2 different 10-cm layers on the one hand and 2 different borings on the other. The correlation value of the moisture in two borings is detd by the distance between them The character of the change in the accuracy of individual measurements of moisture within the m layers (0–100, 100–200 cm) or of independent expts is analogous to the character of the change in the constancy of the moisture, both the accuracy and constancy being measured by the same mean quadratic departure G G

**The coagulation of aqueous suspensions of soil with barium sulfide and calcium sulfide.** B G ZAPROMETOV *Pochvovedenie* 24, No 3–4, 37–42 (in German 43–60) (1929)—Z. compared the coagulation powers of CaS and BaS for soil suspensions and for mastic with those of $BaCl_2$, $CaSO_4$, $CaCl_2$ and $Al_2(SO_4)_3$ If 0 05 *N* (0 02 *N* of $CaSO_4$) *solns were used, a comparative value could be obtained for each of the cations.* BaS and CaS were effective as coagulants and were adsorbed by the mastic, $BaCl_2$ and $CaCl_2$ were also effective as coagulants but were not adsorbed by the mastic J. S JOFFE

**Replaceable bases and water sorption of soils.** L SMOLÍK. *Bull. Czechoslov Acad Agr* 1930, 10—The moisture absorbing capacity of soils satd with different bases varied with the base used in the order $Na > Ca > Mg > K > NH_4$. B C. A

**Degree of saturation of the adsorptive complex in Moravian soil types.** B. MALÁČ. *Bull Czechoslov Acad Agri.* 1929, 853 B. C. A.

**Role of humus in the absorption complex.** L KOTZMANN *Mezögazdasági Kutatások* 2, 537–55(1929)—No connection was found between the total amount of org. matter and that of alkali- or $NH_3$-sol matter detd by the method of Grandeau Hilgard. The $NH_3$-absorbing capacity of humus ppts made from different soils is the same, indicating an equiv wt of 308 The $NH_3$-absorbing value for soils is much larger than the satn values detd by the method of Hissink The conductometric titration value stands between above data S S DE FINÁLY

**Optical method for the investigation of humus.** G I. POKROVSKII *Pochvovedenie* 24, No 1–2, 124–30(in English 131–6)(1929)—P. presents a photometric method for

the detn of humus. The method is based on the well known phenomenon of reflection and absorption of light by variously colored, variously dispersed substances or by a difference in compn of the substances exam'd. A description of the app as well as a math discussion of the formula employed is given, and data presented check with the chem methods. J. S. Joffe

**Chemical changes in the organic matter [of soils] during the natural decomposition of the humus layers of woodlands. I. Variation in pentosan content.** A. Němec. *Z. Pflanzenernähr. Düngung u. Bodenk.* 18A, 65–104(1930).—The decompn of pine, fir and larch needles does not commence until after that of the cell wall substance. In general the pentosan content (ash free basis) decreases as humification proceeds although this relationship is less marked in soils under deciduous trees. Humification precedes pentosan decompn. Matter sol. in $C_6H_6$-alc. is decomposed at a relatively greater rate than is the total org. matter and is greater in pine than in fir soils in a similar stage of humification. The high proportion of resin in the needles tends to inhibit the normal humification process. The I consumption of $C_6H_6$-alc. exts. varies directly with the amt. of material extd. The nitrifying power of these soils is closely allied to the amt. of $C_6H_6$-alc.-sol. matter present, the latter becoming toxic when present in quantities exceeding 5% of the ash free dry matter. B. C. A.

**Occurrence and distribution of salinity in a virgin mallee soil.** J. E. Thomas. *J. Council Sci. Ind. Research* 4, No. 1, 12–9(1931).—Water sol. salts and chlorides were detd. at 1 ft. intervals to a depth of 16 ft. At the surface the Cl content in parts per 100 000 was 0.029, at 4 ft. 0.134, at 10 ft. 0.182, and at 16 ft. 0.278, indicating that leaching action had concd. the salts at the greater depths. The botanical flora of the soil was decidedly halophilic. Diagrammatic soil profiles and mech. analysis are given. The study was conducted with a view to possible future irrigation. C. R. Fellers

**Can a water extract serve as an index to characterize the degree of salt treatment of soils?** D. I. Tarasov. *Pochvovedenie* 24, No. 3–4, 61–99 (in English 99–101)(1929).—Analyses on aq. exts. of 5 different alkali soils are reported. They show that $H_2O$ exts. all of the sol. salts, which indicates that the chlorides and sulfates are not in an adsorbed state. The methods used are described in detail. An English summary is given. J. S. Joffe

**The biodynamics of alkali soils.** M. I. Prikhodko and M. I. Belikova. *Pochvovedenie* 24, No. 3–4, 145–66(in English 167)(1929).—On soils in the open field NaCl hindered the activity of *Azotobacter*, whereas $Na_2SO_4$ stimulated their multiplication, and the amt. of N fixed was just as great as that in the check plots. *Clostridium pasteurianum* developed better on the NaCl soil, especially in the upper horizons. Anaerobic as well as aerobic decompn. of cellulose was also stimulated by treating the soil with salt. Nitrification was stimulated in the soils treated with $Na_2SO_4$ but not in those treated with NaCl. The alky. of the soils also increased because of the salt treatment and subsequent leaching by rain water. J. S. Joffe

**Repeated soil extractions according to the method of Th. Saidel for the estimation of the solubility of the potassium in the soil.** H. Linsegang. *Landw. Vers.-Sta.* 111, 261–9(1931).—The Saidel method for the detn. of the soly. of the K in the soil is not of much value for practical use but gives some information as to the mechanism of soln. John R. Hill

**Replaceable sodium in soils.** K. K. Gedroiz. *Pochvovedenie* 24, No. 1–2, 1–14 (in English 14–21)(1929).—Ten g. of soil (if it contains more than 0.1% replaceable Na) or 100 g. (if less than 0.1% of Na is present) is mixed with 10% c.p. $CaCO_3$. 1000 cc. $H_2O$ is added and a current of $CO_2$ is passed into the mixt. for 2–3 hrs. The Na is detd. on the filtrate. If sol. Na salts are present, they are washed out before the soil is treated with the $CaCO_3$ and $CO_2$. The soil is washed until dark streams of humus begin to appear. J. S. Joffe

**The method of determining the lime requirement of the soil.** V. M. Filipenya. *Udobrenie i Urozhai (Fertilizers and Crops)* 2, 642–5(1930).—*By a method similar to* that of Yarusov, F. calcs. the lime requirement from a detn. of the hydrolytic acidity by the $CH_3COONa$ method. He uses the coeff. 2.0 instead of 1.75, figuring that the acid extd. represents only 50%. F. used the Trenel potentiometer for the detn. of the $p_H$. J. S. Joffe

**A simplified method for determining the lime requirement by the hydrolytic acidity of the soil.** S. S. Yarusov. *Udobrenie i Urozhai (Fertilizers and Crops)* 2, 638–42 (1930).—With the equation (1) $[H^+] = K[AcOH]/[AcONa]$ as a basis, Y. deduces a series of equations from the reactions which take place when a soil is treated with AcONa for the detn. of hydrolytic acidity. From the $p_H$ or the $[H^+]$ it is easy to det. the AcOH concn. in the soln. and, hence, the hydrolytic acidity without titrating the

soln By substituting the numerical values of formula (1) in terms of mg Ca the following equation (2) is obtained $[H^+] = 1.8 \times 10^{-5} (X/5000)$ or $[H^+] = 3.6 \times 10^{-9} X$ ($1.8 \times 10^{-5}$ being the dissocn const of AcOH), where $X$ is the content of AcOH in 250 cc expressed in terms of mg Ca Hence (3) $\log [H^+] = \log 3.6 \times 10^{-9} + \log X$ or (4) $p_H = 8.4437 - \log X$ In this equation $X$ consists of 2 components the content of AcOH in the original soln of AcONa before the detn and the AcOH obtained by the reaction of the acid soil with the AcONa, or $X = X_0 + X_1$ Substituting for $p_H$ in (4) its value 8.2 (the original $p_H$ of the AcONa) and solving, $X_0$ (calcd in terms of Ca in 250 cc) = 1.75 mg If $X_1$ is multiplied by the coeff 1.75 (the Kapper coeff for podzol soils) the hydrolytic acidity is obtained In practice the detn is made as follows A sample of soil (100 g) is mixed with a 1.0 *N* soln of AcONa ($p_H$ 8.2) in the ratio of 1:2.5 and shaken for 1 hr The soln is then filtered and $p_H$ detd Let the $p_H$ be 6.8 then from equation (4) $Y = 44$ Subtracting 1.75 mg ($X_0$) gives $X_1 = 42.25$ *mg of Ca By multiplying this by 1.75 (the Kapper coeff)* the hydrolytic acidity is detd directly in terms of Ca, and thus the lime requirement is detd directly without titrating J S Joffe

**The influence of calcium sulfide on the percolation of water through the soil.** A N Rozanov *Pochvovedenie* 24, No 3-4, 34-5(in German 35-6)(1929).—Expts with CaS as a coagulating agent on heavy clay soils have shown that when applied as the salt it is more effective than $CaSO_4 \cdot 2H_2O$ as measured by the percolation of water Applications of CaS also decrease the alky of the soil and increase the $SO_3$ content and CaO Adsorption expts with mastic have shown that the Ca from CaS is adsorbed in a quantity of 80-83%, whereas only 37-40% is adsorbed from $CaCl_2$ J S J

**Biochemical investigations on arable soil** Alb J J Vandevelde A Verbelen and L. Dekoker *Compt rend* 192, 706-7(1931); *cf C A* 24, 4881.—Three soil factors are detd the volumetric acid value the volumetric alk value and the volumetric value of adsorption The volumetric acid value is obtained by shaking 5 g of soil every hr for 9 hrs with 40 cc of distd $H_2O$ and 10 cc of 0.1 *N* $H_2SO_4$ or HCl The flask is then allowed to stand for 15 hrs, after which 25 cc of the liquid is decanted and titrated with 0.1 *N* NaOH From this is calcd the acid retained by the soil or the volumetric acid value The alk value is obtained in a similar way by treating the soil with NaOH and titrating with $H_2SO_4$ The difference between the amt of 0.1 *N* $HC_2H_3O_2$ retained and 0.1 *N* HCl or $H_2SO_4$ retained is called the volumetric value of adsorption The volumetric acid values and volumetric values of adsorption follow the order obtained in using dyes or centrifuged milk, and these values increase as the concn. of the $H^+$ diminishes The volumetric alk value generally decreases as the corresponding acid value increases J R. Adams

**The direct method of counting bacteria in relation to the adsorption capacity of the soil adsorbing complex.** N N Malchevskaya *Pochvovedenie* 24, No 3-4, 131-43 (in German 143-4)(1929).—By the Vinogradski method of direct microscopic count, bacteria counts were made on several soils, samples were taken from the resp horizons Two counts were made on each soil sample (1) as the soil appeared in nature and (2) after the soil had been satd with Na by the Gedroiz method It was found that by dispersing the soil—through satn with Na—the no of bacteria increases. J S Joffe

**Colloidal content and related soil factors as indicators of [forest] site quality.** I. T. Haig *Yale Univ School Forestry Bull* 24, 33 pp (1929), *Expt Sta. Record* 63, 420-1.—The main purpose of the work was to measure the value of colloidal content as an indicator of site quality, and to make such incidental observation of the value of other soil measures as the character of the data would permit The conclusions are considered sp for the brown, slightly podsolized forest soils of southern Connecticut and of certain adjacent territory, and to be applicable particularly to such of these soils as occur commonly in the vicinity of New Haven Colloidal content and silt-plus-clay content are fair measures for site quality The org.-matter content varied between 2 and 10% and was without significant influence on soil fertility The value of soil type as an indicator of site quality cannot be accurately estd with the data available A knowledge of the soil class (the textural quality of the A horizon or surface soil) permits classification of soil quality within approx one broad site class G G

**Additional data on the mutual coagulation of colloids in the soil.** V N Simakov. *Pochvovedenie* 24, No 1-2, 22-77(in German 78-123)(1929).—S tested out the crit concns of $MnO_2$ with a const quantity of $Fe(OH)_3$ at which mutual coagulation would take place He found that the zone of coagulation is at a point between 0.577 and 1.227 moles of $MnO_2$ for 1 mole of $Fe(OH)_3$ Mutual coagulation of $Fe(OH)_3$ and $SiO_2$ takes place within narrow limits from 2.757 to 3.452 moles of $SiO_2$ for 1 mole

of $Fe(OH)_3$. With an excess of $Fe(OH)_3$ the mixt. becomes pos., whereas with an excess of $SiO_2$ the mixt becomes neg. Mutual coagulation of $Fe(OH)_3$ and Na-satd. soil suspension takes place within a definite zone, for 1 $Fe_2O_3$ (by weight) it takes 3 753–8 043 unit weights of Na satd soil. Two zones were noted at which a stable mixt. of the 2 colloids persists either an excess of $Fe(OH)_3$ or of the soil suspension. These mixts. behave differently towards electrolytes, with an excess of the soil suspension the point of coagulation with an electrolyte is equal to that of a pure suspension. With an excess of $Fe(OH)_3$ the mixt is sensitive to the anions. Mutual coagulation of $Al(OH)_3$ and $MnO_2$ takes place as follows: It takes 1 mole of $Al_2O_3$ to 0.085–0.447 of a mole of $MnO_2$, or for 1 mole of $MnO_2$ it takes 2.237–11.765 moles of $Al_2O_3$. A comparison with the $Fe_2O_3$ sol shows that 1 mole $MnO_2$ will take 0.815–1.733 moles of $Fe_2O_3$ against 2.237–11.754 moles of $Al_2O_3$. Thus, the $MnO_2$ is 6.8 times as effective for the $Al_2O_3$ as for the $Fe_2O_3$. With $SiO_2$ the relation is 1 $SiO_2$ to 0.577–1.302 $Al_2O_3$, whereas with $Fe_2O_3$ the relation is 1 $SiO_2$ to 0.290–0.363 $Fe_2O_3$. With the soil suspension the relation is: 1 unit weight of suspension to 0.228–0.810 unit weights of $Al_2O_3$. Just as with $Fe(OH)_3$, an excess of $Al(OH)_3$ in the mixts is sensitive to anions, but the proportions are not the same as for the $Fe(OH)_3$. From the data obtained calcns were made for the coagulation values of each sol in terms of another or a combination of them. Thus from the $Fe(OH)_3$ data 1 mole of $MnO_2$ = 2.813 $SiO_2$, or 1 $SiO_2$ = 0.355 $MnO_2$. From the $Al(OH)_3$ data 1 $MnO_2$ = 3.879 $SiO_2$ or 1 $SiO_2$ = 0.258 $MnO_2$. By combining 2, 3, 4 or more sols of the same charge, the amt. of the sol of the opposite charge can be calcd. by taking the figures for each individual sol. Numerous examples and calcns are given. J. S. Joffe

Proportions of easily and difficultly mobilizable acid within the zone of exchange acidity in soils, and the bearing of buffer values on this. S. Goy, P. Müller and O. Roos. *Z. Pflanzenernähr. Düngung u. Bodenk.* 18A, 104–14(1930); cf. *C. A.* 24, 5094.—Differences in the exchange acidity values of soils as detd. by Daikuhara's method (*C. A.* 9, 500) and by electrometric titration are attributed to the varying proportions of easily and difficultly sol. acids present. The latter are not necessarily recorded by Daikuhara's process. Electrometric titration curves are adapted to show base fixing areas and areas characteristic of easily and difficultly sol. acids. In humus soils there is a greater proportion of difficultly sol. acids concerned in producing exchange acidity than is the case with mineral soils. Buffer values of soil are calcd. from electrometric titration curves (in *N* KCl) over the range *p*H 6.8–7.2. Detn. of exchange acidity in soils by this means is limited to mineral soils with less than a prescribed buffer value. B. C. A.

The colorimetric determination of phosphoric acid in hydrochloric acid and citric acid extracts of soils. R. G. Warren and A. J. Pugh. *J. Agr. Sci.* 20, 532–40(1930).—The colorimetric detn. of $P_2O_5$ in HCl and citric acid exts. of soils, by a method involving the evapn. of the ext., ignition and acid extn. of the residue with either the Denigès or Fiske-Subbarrow methods of color development, was satisfactory only with light soils. Clay soils gave low results because of the presence of larger amts. of Fe. A method is given in which the org. matter and Fe are removed by treatment with $NaMnO_4$ and $K_4Fe(CN)_6$. For HCl exts. 20 g. of powd. soil (1 mm.) is boiled for a short time with 70 cc. of concd. HCl and allowed to digest on a water bath for 48 hrs. The soln. is then cooled, diluted, filtered and made up to 250 cc. Fifteen cc. of this ext. is treated with 0.5 cc. of 20% $NaMnO_4$ and kept on a hot sand bath for about 15 min. The liquid (which should now be free of any brown Mn ppt.) is cooled, diluted to about 30 cc., and treated with 6 cc. of 10% $K_4Fe(CN)_6$ followed by 5 cc. of 10% $MnSO_4$ soln., the mixt. is shaken frequently. After standing several min. the mixt. is titrated with $NH_4OH$ until the blue color just turns purple. 3.5 cc. of 2 *N* $H_2SO_4$ is added, the whole is transferred to a 100 cc. volumetric flask, made up to vol. and filtered. Aliquots of the filtrate are taken for color development by the Fiske-Subbarrow or Denigès method. For citric acid exts. 25 g. of soil (2 mm.) is shaken for 24 hrs. in a half liter bottle with 250 cc. of 1% citric acid (extra citric acid equiv. to the $CaCO_3$ present being added). The soln. is then filtered. Seventy-five cc. of this filtrate is treated in a 300 cc. Kjeldahl flask with 10 cc. of concd. HCl and 12 cc. of 20% $NaMnO_4$, this is allowed to stand ½ hr. and then vigorously digested until no Mn ppt. remains. The mixt. is then transferred with a min. of water to a 100-cc. volumetric flask, and 4 cc. of 10% $K_4Fe(CN)_6$ is added drop by drop with shaking. After several min. the mixt. is titrated with $NH_4OH$ as in the method for HCl exts. 1.5 cc. of 2 *N* $H_2SO_4$ is then added and the soln. made up to vol. After filtering, the color is developed in an aliquot as with HCl exts. The results are in good agreement with the gravimetric method. P. R. Dawson

**The phosphoric acid and lime content of some arctic and Norwegian soils.** E. G. Doerell. *Superphosphate* 4, 105–9(1931).—Uncultivated soils from 5 localities in Spitzbergen and Norway contained 0.2–3.8 mg. of readily sol. $P_2O_5$ per 100 g. of soil, as detd. by the Dirks method. Two samples of soil from potato fields contained 3.8 and 17.4 mg. of readily sol. $P_2O_5$ per 100 g. There was no connection between the $P_2O_5$ content of the soil and the type of rock from which the soil was derived. K. D. Jacob

**Distribution of assimilable phosphoric acid in the soil under influence of factors of production.** L. Dworák. *Kisérlet. Közlemények* 33, 336–43(1930).—Oats were grown in expt. containers filled with an alk. (limed) soil and with a weakly acid one. Fertilized alk. soils showed evidence of translocation of some of the added $P_2O_5$. The greatest amt. of $P_2O_5$ was consumed in the horizon 10 to 20 cm. in depth. Unfertilized soils showed no evidence of translocation of the native $P_2O_5$. These soils showed the highest content of citrate-sol. $P_2O_5$ in the horizon 10 to 20 cm. in depth. As young plants oats require a large amt. of $P_2O_5$. S. S. de Finály

**Laws of solubility of phosphates and potash in mineral soils.** R. Ganssen. *Mitt. Lab. Preuss. Geol. Landesanst.* No. 9, 1929.—The influence of the $Al_2O_3$ content of soils on the soly. of K and phosphates is indirect. A high $Al_2O_3$ content in soil usually corresponds with a high proportion of base-exchanging silicates which tend to "fix" K, and also with relatively large amts. of $Al_2O_3$ gel, with which phosphate combines. Humus increases the soly. of phosphates in soil by decreasing the proportion of active $Al_2O_3$. B. C. A.

**The fineness of grinding phosphates for podsolized soils.** N. D. Smirov. *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 765–9(1930).—Eight different raw phosphates, among which were also Florida and Tennessee phosphates, were ground up to various degrees of fineness, and their effects were studied in pot expts. on podsolized soils. It was found that the fractions with a fineness of 0.01 mm. and lower gave 75% and 100% effects, resp., in comparison with acid phosphate. Ural and Florida phosphates gave but slight effects, whereas Tennessee phosphates and apatite gave no effects even with the finest fractions. J. S. Joffe

**The influence of liming chernozem on the yield and chemical composition of wheat.** V. N. Kharchikov. *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 751–9(1930).—The results of 5 years' liming expts. on chernozem with N, P or a combination of the 2 are summarized as follows. At a moisture content equal to 40% of the total moisture-holding capacity limestone alone increased at times the yield of wheat, also in combination with P there was an increase. The neg. results were more frequent than the pos. At 60% of the total moisture-holding capacity there was an increase on the unfertilized plots as well as on the plots fertilized with either N or P. With N and P together liming gave neg. results. The N content of the wheat increased whenever the lime depressed the yield, but it decreased the N content whenever the yield increased. Caustic lime was more effective than limestone in connection with monosodium phosphate when the amt. of phosphate did not exceed the amt. added with manure. With $(NH_4)_2SO_4$ the caustic lime produced very little effect. Analyses of the wheat show that caustic lime increased the N and P content of the grain, indicating that the $Ca(OH)_2$ is capable to mobilize the N and P content of the soil. J. S. Joffe

*Nitrogen transformation in cultivated soil.* F. Hansen. *Tids. Planteavl* 35, 713 (1929).—$NH_4$ salts applied to soil at the end of April or early in May are completely converted into nitrate by the end of June. After plowing in liquid manure or farmyard manure, the $NH_3$ contents are converted into protein like substances which by mid June are being rapidly mineralized at a rate which exceeds the assimilation of $NH_3$ by the microörganisms. Nitrification of the $NH_3$ derived from well rotted manure is more rapid than that of ammoniacal fertilizers. The effects of various nitrogenous fertilizers on soil reaction are discussed. B. C. A.

**Soil and cane composition in relation to Lahaina failure at Waipio Substation.** F. Hansson. *Repts. Assoc. Hawaii Sugar Tech.* 6, 33–7(1927); *Expt. Sta. Record* 63, 148.—Many factors are causally active in the so-called Lahaina disease, or failure of root development, in the cane of that name. Chem. influences supposedly assocd. with growth failure are (1) high salt concns. in the soil soln., (2) sol. salts of Fe and Al in the upland acid soils and (3) lack of availability in one or more of the major plant foods. But Lahaina failed in some cases where soil conditions were to all appearances normal, and in order to obtain information regarding this failure in good soils, exptl. plats were planted at the Waipio Substation, the results from which are tabulated and discussed. The failure of Lahaina at Waipio is not assocd. with an injurious salt content in the soil, harmful acidity or a shortage of the major nutrients. Studies of the

compn of the poor Lahaina cane from Waipio contrasted with good Lahaina from Maui showed a lower percentage of potash, a higher content of $SiO_2$ and a higher Mg CaO ratio in the Waipio canes Spectroscopic examns of the ash of poor Lahaina cane from Waipio compared with the ash of the cane from Maui showed the presence of B and Pb in practically all of the latter and in but few cases of canes from the former station The effect of these rarer elements is being tested at Waipio, as no conclusions appear safe at this time regarding their definite function in plant nutrition G G

**Sulfate sulfur in certain types of soils.** H Stremme. *Chem Erde* 5, 254–9 (1930) —Peaty soils from the neighborhood of Danzig contain small amts of sulfates, free $H_2SO_4$ and sulfide S, which vary at different depths and in different seasons of the year (cf Schroedter, *C A* 23, 5448) B C A

**The role of peat in increasing the absorption capacity and buffer properties of soils** D V. Druzhinin *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 645–50(1930) —From a series of pot expts where peat, satd with Ca was used with or without fertilizers, with or without $CaCO_3$ on podsolized soils it was found that peat increases the buffer capacity and thus the adsorption capacity of the soils Especially is this important in connection with physiologically acid fertilizers J S Joffe

**[Relation among] soil, fertilizers and chemical composition of plants.** D J Hissink *Chem Weekblad* 27, 529–33(1930) —Examples are given to show that while the proportions of mineral constituents in the plant depend primarily on the plant itself, they are also dependent on the minerals present in the soil or added as fertilizers Analysis of the plant and the soil cannot, however, suffice to det the nature and amt of fertilizer which will produce the best crop B C A

**Fertilizer inspections. Report for 1930.** W. C. Robertson *J. Dept Agr Victoria* 29, 136–40(1931) —Analyses of official inspection samples of fertilizers marketed in Victoria are tabulated K D Jacob

**The results of a five-year field experiment on the influence of various fertilizers on the yield and the reaction of strongly acid-exchangeable sandy soils.** H Rössler and L Schmitt *Landw Vers-Sta* 111, 293–326(1931) —KCl, kainite and $K_2SO_4$ were used over a period of 5 years without any increase in soil acidity $(NH_4)_2SO_4$ should not be used on sandy soils which are readily subject to acid exchange without previous application of lime Of the alk reacting fertilizers, $CaCN_2$ exerts the greatest neutralizing action $K_2CO_3$ has a harmful effect on the soil acidity J R H

**Action and value of hot-fermented stall manure.** F. Löhnis *Z Pflanzenernähr Düngung u Bodenk* 9B, 268–72(1930), cf *C A* 24, 1924 —A reply to recent criticisms (Gerlach, *C A* 24, 3852, Ehrenberg, *C A*. 24, 5098) B C A

**The composition of manure and chemical manures.** L. Brétignière *J. agr. prat* 55, 269–70(1931) —A comparison of the analyses of manures made in 1926 and 1931 shows that the amts of N, $P_2O_5$ and $K_2O$ are greater in the samples taken in 1931, while there is a decrease in the CaO and MgO content The decrease in CaO and MgO appears to be due to the $H_2O$ used and the methods of wetting the manure piles The N, $P_2O_5$ and $K_2O$ increases seem to be brought about by the use of complementary fertilizers on the soil J R Adams

**The decomposition of organic manures. III. The decomposition of green manures.** Sigeru Osugi and Taro Goto *J Agr Chem Soc Japan* 7, 138–56(1931) —The quantities of moisture, C and N of air dried green manures, vetches, winter vetches, serradella, *Lespedeza bicolor* Turcz and oats were estd for the various stages of growth The C/N ratio is generally larger according to the growth stage of the plants The decompn of these green manures in the field proceeds more readily for younger plants than for older ones The less the C/N ratio is, the easier the decompn is There is the same relation under paddy-field conditions, but the decompn is generally slow During the growth of these plants, protein and water sol N compds decrease while hemicellulose, cellulose and pentosans increase markedly The changes in the other constituents are not remarkable or regular Therefore, the C/N ratio becomes larger for the older plants Y Kihara

**The practical preparation of artificial manure.** Delucq *J. agr. prat* 55, 238–9 (1931) —The straw is spread on the field until there has been sufficient rain to soak it thoroughly It is then mixed with cyanamide, urea or $(NH_4)_2SO_4$ and $CaCO_3$ and stacked on a bed of natural manure After standing a month this artificial manure is ready to be spread on the fields J R Adams

**The decomposition of the green parts of lupine in the soil.** Z P Uspenskaya. *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 635–8(1930) —Green lupine in the blooming stage was added to 5 kg of soil at the rate of 100 g and 200 g, which was equal to 5.0 and 10 g of N Another series was prepd to which 0.5% $CaCO_3$ was added

Pptd. phosphate and raw phosphates were used as the source of P. The plant used was millet The soil was a podsolized loam The course of the decompn of lupine in soil was followed simultaneously with the pot expts The 100-g application of lupine gave just as good results as those obtained with $(NH_4)_2SO_4$, the 200-g application gave a higher yield The lime with the 100-g application gave just as good results as the 200-g application alone Lupine with $(NH_4)_2SO_4$ gave the highest yield The amt of org matter increased, but the increases with the 100- and 200 g applications were the same The $p_H$ of the ext decreased because of formation of the acids The amt. of absorbed $NH_3$ increased more in the soils in which lupine was used than in the soils which received $(NH_4)_2SO_4$ Composits of lupine at the rate of 5 and 10 g of lupine for 200 g of soils were prepd These were sampled after 10, 20, 35, 60 and 85 days The reaction became more alk on account of $NH_3$ formation The nitrate content in the first period decreased with or without addns of lime From the third period on the nitrates appeared in the soils without lime With the lime, nitrification was decreased In all cases there were considerable amts of $NH_3$, especially with the lime With the increase in nitrate content the amt of absorbed $NH_3$ decreased

J S Joffe

**The effect of the main forms of nitrogen fertilizers.** V P Brl'skii *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 600–13(1930).—From a series of expts for 3 yrs with various forms of N on the different soil zones with several crops the following conclusions have been made (1) In the podsol zone on the forest gray soils and on the degraded chernozem N gives large yield increases (2) In the southern chernozems—pre-Caucasian and Azov types—N, as well as a complete fertilizer does not give any appreciable increases The deep chernozems occupy an intermediate position (3) A definite relation has been noted between the physiol reaction of the N sources and the K and P fertilizer and yield increase in the various soil zones In the podsol zone the basic N salts added to an acid K-P fertilizer gave better results than the physiologically neutral or acid N salts A similar tendency was observed on the forest gray soils and degraded chernozems In the southern chernozems the acid N salts were better with the acid K-P fertilizer (4) The physiologically neutral salts—$CaCN_2$, $(NH_4)_2CO_3$ and urea—give considerable increases in yield, but at times they are the poorest sources of N This is due to the instability of the first 2 and to the methods of applying them (5) $NaNO_3$ and $Ca(NO_3)_2$ proved to be the best sources of N Whenever a physiologically acid salt was required, the $NaNO_3$ and $Ca(NO_3)_2$ were not as good as the others *By careful manipulation* the $CaCN_2$, $(NH_4)_2CO_3$, and urea can be used to just as good advantage as the other N fertilizers. No objection was found to the use of $(NH_4)_2SO_4$, especially when lime is to be used $NH_4NO_3$, when added to an acid fertilizer, was not so effective as the other forms of N, but with a neutral fertilizer it was as good as any av. N carrier $NH_4Cl$ proved to be inferior except on the chernozems Almost all forms of N seem to decrease the starch content of potatoes

J. S Joffe

**Organic industrial wastes as nitrogen fertilizers.** S P Gusev *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 614–32(1930).—Stomach contents from slaughter-house wastes contg 0.18% N, 0.86% $P_2O_5$ and 0.55% CaO and stomach contents with 1.27% N, 1.51% $P_2O_5$ and 1.04 CaO were tested in pot and field expts The results with potatoes and oats indicate that these wastes can be utilized to advantage, but since their keeping qualities are poor and the low fertility value prohibits long hauls they can be used only in the vicinity of the slaughter houses Mineralization expts.—*accumulation of nitrates as an index*—show that these substances are slowly mineralized and the addn of lime increases the amt and speed of mineralization Waste products from the leather industry have a high N content—from 8.82% in leather shavings after tanning to 5.83% in the green hides. But the N is not available Composting these for 5 months, even with $CaCO_3$, gave no available N Vegetation expts in pots and fields showed that leather waste decreased the yield of oats These products have to be treated with either acids or alkali before they can be used as a N source. From the data available at the Inst for Fertilizers, the alkali treatment is preferable Other wastes from the leather industry, like the inside trimmings from the raw hide, which contain about 1.86% N were tried out and proved to be useful, but they can be used locally only Horn shavings contg 13.97% N, 0.124% $P_2O_5$ and 0.55% CaO and French burned horn contg 14% N were tried in pot expts. with oats The results show that 50% of the N was utilized Various tobacco dusts contg about 2.35% N were used in pot expts with oats It was found that the N is rapidly mineralized, and in the early stages accumulations of $NH_3$ were injurious Wastes from intestines when dried gave a material contg 11–12% N which is very readily available. The

pulp from the fruits in the fruit juice industry, contg up to 1.5% N, proved to be of no value except the residues from cherry juices, which was somewhat beneficial for oats. Bouillon from steamed dead carcasses with a N content of 1.0% proved to be readily available and can be used locally. Blood meal obtained from blood, after the albumin has been sepd out, with 10% N content, is readily available. Ground peat, contg 1.48% N, on oats was not effective because of its slow availability. Sewage waste was tested in pot expts., it was found to be of some value, but its bulkiness is a hindrance in its utilization. Feathers and down proved to be easily mineralized. They contain 6.09% N. The large vol. these materials occupy makes them hard to handle. Wastes from fats used in margarine contain 1.73% N, but they gave neg. results. Shells from sunflowers proved to be injurious, producing denitrification reactions. Wastes from the sausage industry gave very good results. Fish scrap contg 9.92% N and 7.36% $P_2O_5$ gave very good results with oats. Wastes from the wool industry gave fairly good results in vegetation expts. with oats. Waste from the silk industry contg 10.44% N and 2.2% $P_2O_5$ are easily mineralized and give good results. J. S. J.

Action of various nitrogenous fertilizers on acid soils. D. Meyer. *Z. Pflanzenernähr. Düngung u. Bodenk.* 9B, 474(1930). The injurious effects of cyanamide on acid soils previously referred to (cf. Meyer and Obst, *C. A.* 24, 5098) are limited mainly to acid soils poor in humus and of low biol. activity. B. C. A.

Nitrogen fertilizer for the potato. Jean Deterre. *Engrais* 46, 207–11(1931).—A discussion of the problems arising in the fertilizing of potatoes. The proper fertilizer is one with a phospho-potash base and with N in the $NH_4$ form. J. R. Adams

Nitrogen top-dressing of wheat. Experiment with various forms of fertilizer. A. Y. Montgomery. *New Zealand J. Agr.* 42, 193–02(1931).—$(NH_4)_2SO_4$ was the most satisfactory N fertilizer for the top-dressing of wheat, followed in order by $NaNO_3$, urea, Ca cyanamide and Calnitro. Because of its poor phys. condition, it was difficult to apply small quantities of urea through a drill, while it was impossible to drill Calnitro. The irritating effects of Ca cyanamide on the eyes and skin of the operator constitute a serious drawback to its use as a fertilizer. The yield of flour, percentage of protein, and the baking qualities of the flour were not affected to a significant extent by the different N fertilizers. K. D. Jacob

The effect of nitrogen fertilizers on the yield and quality of sugar beets. A. G. Mikhalovskii. *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 633–5(1930).—Urea, Ca cyanamide, Chili saltpeter, $(NH_4)_2SO_4$, Leunasaltpeter and $NH_4Cl$, together with a mixt. of P and K, were tried out on degraded chernozem soils for beets. $(NH_4)_2SO_4$ proved to be most effective, followed by urea, $NH_4Cl$ and Leunasaltpeter. $NaNO_3$ and $CaCN_2$ gave neg. results. The highest sugar content was obtained with $NaNO_3$, the sugar content was increased 1.5%. This is followed by urea. Leunasaltpeter and $NH_4Cl$ decreased the sugar content in the beets. The amt. of "injurious" N which accumulates in sugar beets is affected variously by the different N sources. $CaCN_2$ gave the highest value, followed by $NaNO_3$. In expts. without P the yield increase for N was only 5%, whereas with P it became 15%. J. S. Joffe

The effect of mineral fertilizers and manure upon the quality of sugar beets. I. A. Strachenko. *Nauk. Zapiski Tsukrovoi Prom.* 10, 477–90(1930).—With repeated application of mineral fertilizers the $p_H$ of the soil decreases. Easily sol. compds. in the upper layers move downward and therefore increase the fertility of the lower layers. The mineral fertilizers, compared with manure, decrease the sucrose and maltose content in the beet. The development of the beet is better in the first part of the summer with manure and in the second part with mineral fertilizers. V. E. Barlow

Fertilizing action of magnesia. Ch. Brioux and Edg. Joffs. *Compt. rend. acad. agr. France* 17, 201–7(1931).—Pot tests with white mustard show that the addn. of a fertilizer contg. MgO to a soil low in total and assimilable MgO produces a marked increase in the dry wt. of the crop and in the MgO content of the dried material. The MgO also appears to favor the absorption of $P_2O_5$ but has little effect on the absorption of N. Similar expts. with maize indicate an increased yield and quantity of MgO in the dried plant, but the MgO has no apparent influence on the absorption of $P_2O_5$ or N. The addn. of a MgO-bearing fertilizer to a field planted in sugar beets gave a marked increase in the yield. J. R. Adams

The action of chemical fertilizers on nature meadows. R. Bonnicel. *J. agr. prat.* 55, 230–1(1931).—A preliminary report on the effect of fertilizers on soil plots of various geological formations shows that the most efficacious fertilizer is not necessarily the one contg. the elements that are deficient in the soil. The natural richness of some of the soils in $K_2O$ does not impede the action of added $K_2O$. J. R. Adams

A study of the composition of pineapple plants at various stages of growth as in-

fluenced by different types of fertilization. J M HORNER. *Hawaii. Pineapple Canners' Sta Bull* 13, 42 pp (1930), *Expt Sta Record* 63, 641 —The pineapple crop removes more potash from the soil than any other mineral constituent, under the conditions of the expt an av of 1456 lbs per acre of $K_2O$ as compared with 491 lbs of N and 111 lbs of $P_2O_5$ The rate of growth was very similar on all plats, being slightly but not significantly greater on the potash areas Potash constituted about 37, 32 and 45%, resp, of the total ash in the leaves, stems and fruit. There was a very close similarity between the potash and total-ash curves The greatest content of total and reducing sugars was reached at fruiting time, being apparently correlated with the age of the plant Starch content was highly variable, starch continuing to accumulate on some plats even during the time of fruit formation when large quantities of sugar were being produced The ratio between N and Ca was observed to be fairly const N stimulated growth for a short time but did not appear to have an enduring influence. P did not cause as large growth as did the other nutrients, and in excess quantities actually depressed growth H recommends the shredding of pineapple waste and its return to the soil G G

The availability of phosphatic fertilizers as shown by an examination of the soil solution and of plant growth. A W GREENHILL *J Agr Sci* 20, 559–72(1930) —In pot expts conducted with an acid soil deficient in $P_2O_5$, liming with $CaCO_3$ at the rate of half the CaO requirement increased the concn of $P_2O_5$ in the soil soln from about 0 7 p p m to about 1 p p m, and at the rate of twice the CaO requirement to over 2 p p m *Phosphates depressed the concn on the lightly limed soils and had variable effects on those heavily limed* The superphosphate treated soils showed rather lower concns than those treated with slag Cropping raised the concn on the lightly limed treatments, but on the heavily limed reduced it on the control and had a variable effect on the phosphate treatments The concn of $P_2O_5$ in the untreated soil was practically const After treatment it fluctuated considerably, but tended to become more *const later There was no indication of relationship between the concn and the soil*-moisture content The heavily, compared with the lightly, limed treatments produced more extensive tillering and higher yields Phosphates increased the yields, particularly of grain, but had no effect on tillering Slag and superphosphate were equally effective on the heavily limed soil, but the latter was the more effective on the lightly limed No correlation was apparent between crop growth and the concn of $P_2O_5$ in the soil soln *The possibility of plant roots taking up phosphate directly is suggested* In further pot expts higher yields were obtained from freshly treated soils than from soils treated a year before sowing on the lightly limed treatments, while the reverse was the case with the heavily limed On the soils treated the previous year the heavily limed treatments gave higher yields than the lightly limed on the freshly treated soils the 2 gave similar yields with early sowings Slag and superphosphate gave similar results throughout, and their application was more effective on the freshly treated soils than on those treated the previous year P R DAWSON

Quantitative analysis of phosphoric acid. VI. Determination of phosphoric acid in a phosphate fertilizer. M. ISHIBASHI *Mem Coll Sci. Kyoto Imp Univ* 13A, 291–301(1930), cf *C A* 23, 4645, 4907, 25, 2663 —I 's improved volumetric phosphomolybdate method is especially suitable for the detn of small quantities of $H_3PO_4$ For the extn of free $H_3PO_4$, $Me_2CO$ is more satisfactory than either alc. or ether. B. C. A.

Experiments with increasing dressings of phosphoric acid on Riesling and Burgundy vines. C. DREYSPRING AND H KURTH *Superphosphate* 4, 93–103(1931) — The height, no of knots, internodes and thickness of the wood of young grape vines were in direct relation to each other, and to the amt of phosphate fertilizer applied, up to 150 kg of $P_2O_5$ per hectare The total wt. and percentage of $P_2O_5$ in the wood of the vines were also directly related to the amt of phosphate applied K D J.

The decrease in citrate-soluble phosphoric acid in Rhenania phosphate. K. SCHARRER *Landw Vers Sta* 111, 1 10(1930) —Fifteen samples of Rhenania phosphate were kept for a year in cork stoppered vessels at room temp All showed a decrease in citrate-sol $P_2O_5$ But only 5 showed losses (0 3–0 54%) greater than the exptl error The decrease is due to the action of moisture JOHN R. HILL

The production of precipitated phosphate from Aktyubinsk raw phosphates. K. K. APUSHKIN AND L M GUREVICH *Udobrenie i Urozhai* (*Fertilizers and Crops*) 2, 740–8 (1930) —Increasing the concn of $H_2SO_4$ from 15 to 25% decreased the coeff of decompn of raw phosphate from 95 to 93 1%, but the concn of $P_2O_5$ in the ext. increased from 5 86 to 10 67%. At a 25% concn of $H_2SO_4$ (the stoichiometric quantity) the pulp was so thick that it barely flowed on the filter By dilg the acid with wash water

the viscosity of the pulp increased, and it worked nicely even with 30% $H_2SO_4$. Even with 10% $H_2SO_4$ below the stoichiometric quantity the coeff. of decompn. was as good as with optimum concn. With a 15% concn. of $H_2SO_4$ with 10% below the stoichiometric the time factor is of no importance. By using a 4% concn. of $H_3PO_4$ to dil. the 15% $H_2SO_4$, the coeff. of decompn. decreased 2%, but the amt. of $P_2O_5$ in the ext. increased 2 to 3%. With 8% $P_2O_5$ the coeff. decreased slightly, and the amt. of $P_2O_5$ increased up to 15.78%. The most economical procedure for the production of pptd. phosphate was thus 15% concn. of $H_2SO_4$ diluted with water, the time of contact being 40 min. A 5.2% soln. of milk of lime gave from the Aktyubinsk exts. a ppt. of 37.5 to 40.8% $P_2O_5$, of which 90% is citrate sol. if dried at 80%. J. S. Joffe

**The new complex ammonium phosphates and the raw materials for their manufacture.** Ugo Orlandi. *Industria Chimica* 6, 18–22(1931).—The 3 complex phosphates $NaNH_4PO_4$, $KNH_4PO_4$ and $MgNH_4PO_4$ have become very important in the *fertilizer industry* since the development of the manuf. of synthetic $NH_3$. The raw materials used and the manuf. of the above 3 fertilizers are described, and their role as fertilizers is noted. A. W. Contieri

**Manufacture and use of insecticides and fungicides. V. Organic compounds.** Arthur S. Carlos. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 16, 222–3(1931); cf. *C. A.* 25, 765.—The manuf. and use of *nicotine, pyridine, hellebore* and *pyrethrum* prepns. are briefly discussed. K. D. Jacob

**Fumigants.** C. L. Williams. *U. S. Pup. Health Repts.* 46, 1013–31(1931).—This is chiefly a discussion of the use of *HCN*. Other fumigants are briefly mentioned. J. A. Kennedy

**The control of loose smut in wheat.** D. B. Adam and R. T. M. Prescott. *J. Dept. Agr. Victoria* 29, 141–5(1931).—Practically complete control of loose smut of wheat (*Ustilago tritici*) was obtained by soaking the seed in water at 120°F. for 1 hr. and 40 min. The treatment had a depressing effect on the germination of the seed, the effect increasing with the length of time of treatment, but the total yield of the crop from the treated seed was not affected. K. D. Jacob

**"Target spot" of tomato seedlings.** S. Fish. *J. Dept. Agr. Victoria* 29, 132–3(1931).—The percentage of "target spot" infection, caused by the fungus, *Macrosporium solani*, on tomato seedlings was reduced from 97 to 17.5 by spraying with Bordeaux mixt., prepd. in the proportions of 6 lb. $CuSO_4$ and 4 lb. CaO to 40 gallons water. K. D. Jacob

**Heart rot of fodder and sugar beets.** E. Gaumann. *Landw. Jahrb. Schweiz* 44, 143–50(1930).—The disease occurs exclusively on alk. or neutral soils. When the $p_H$ falls below 7.8, beet cultivation is unprofitable because of the disease. Susceptible varieties contract the disease at $p_H$ 7–7.2, while the resistant varieties remain healthy at $p_H$ 7.6. Where soil conditions are critical the use of resistant varieties may serve as control of the disease. Omission of N from the fertilizer caused an increase in the infection. George R. Greenbank

**Fertilizer.** Hans Brenek (to Rhenania Verein Chemischer Fabriken A.-G.). U. S. 1,799,882 April 7. A mixt. of raw phosphate, silica and alkali metal carbonate *is heated, in* the absence of steam, to about 1200°. The mixt. used contains about such amounts of $P_2O_5$, CaO and $SiO_2$, and at least such an amount of alkali metal oxide as would be present in a mixt. of $Ca_2Na_2P_2O_8$ and $Ca_2SiO_4$ having the same content of $P_2O_5$ and CaO as the raw phosphate employed.

**Fertilizers.** Paul Askenasy, Alfred Stern, Friedrich Nessler and Andreas

VON KREISLER Ger. 516,970, Dec 23, 1928 A mixt. of $NH_4H_2PO_4$ and $KH_2PO_4$ for use as a fertilizer is prepd. by treating an aq. soln of $NH_4H_2PO_4$ with a suitable amt. of KCl. The soln is preferably hot. Examples give the proportions of KCl $NH_4H_2PO_4$ as 1:1 and 1:2 A 94 6% yield of $NH_4H_2PO_4$ $KH_2PO_4$ is given

**Fertilizers.** GASVERARBEITUNGSGES M B H Fr 697,580, June 17, 1930 Fertilizers are kept stable by adding salts such as $Ca(NO_3)_2$ or $CaCl_2$ which have hygroscopic properties in amt. sufficient to oppose any change of moisture content of the fertilizer

**Fertilizers.** I G FARBENIND A -G Fr 697,916, June 26, 1930 The double salts $K_2HSO_4$ $NO_2$ or the double salt $(NH_4)_2HSO_4$ $NO_2$ or the mixts of salts obtained, as the double salts mentioned, by directing nitrous vapors into a $H_2SO_4$ and $HNO_3$ soln of K or $NH_4$ salts are mixed with appropriate substances for forming compd. fertilizers Cf *C A* 25, 2236

**Fertilizers.** SOC CHIM DE LA GRANDE PAROISSE (AZOTE ET PRODUITS CHIMIQUES). Fr 697,966, Oct 1, 1929 A compd fertilizer is made by the action on natural phosphate of gases coming from the oxidation of $NH_3$ without a preliminary transformation into $HNO_3$ A mud of phosphate suspended in water may be used Cf *C A* 25, *1026*

**Fertilizers.** KUNSTDÜNGER PATENT-VERWERTUNGS A G Fr 698,155, June 27, 1930 In the treatment of phosphatic rock by $HNO_3$ and pptn of $CaSO_4$ by $K_2SO_4$, the reaction products are dild by the addn of a soln contg phosphoric acid or an $NH_4$ salt or both before pptn of $CaSO_4$ A mixt of phosphoric acid and $CaSO_4$ obtained by dissolving phosphatic rock in $H_2SO_4$ may be used as addn

**Fertilizers.** ALFRED MENTZEL Fr 698,424, July 5, 1930 Granular or fragmented masses such as fertilizers contg easily volatilized or decomposed substances are stabilized by coating the grains with a more stable substance which is volatilized and condensed on the grains $NH_4HCO_3$ may be coated with $NH_4Cl$, urea or $(NH_4)_2SO_4$

**Fertilizer.** KIYOSI OKADA and OSAKA ALKALI TOYI KABUSHIKI KAISHA Japan 89,510, Dec 11, 1930 Extract of $Ca_3N_2$ is mixed with $H_3PO_4$, $K_2SO_4$ or $(NH_4)_2SO_4$ is added, $CaSO_4$ filtered off $CaSO_4$ and the soln concd and mixed with $NH_3$, $K_2CO_3$, $Ca_3(PO_4)_2$ to neutralize the remaining free $H_3PO_4$

**Moisture-proof fertilizer.** KÔTA OSADA and NIPPON KALI KOGYO KABUSHIKI KAISHA Japan. 89,509, Dec 10, 1930 The fertilizer is a mixt. of $(NH_4)_2SO_4$ 40, Ca perphosphate 46 5, KCl 13 5, $Ca_3N_2$ 2 and $H_2O$ 5–10 parts

**Fertilizer from distillery and sugar factory residues.** ZDENKO METZL (to Soc. anon Selbi, Soc d exploitation de licences de brevets industriels) U S 1,799,176, April 7. In prepg. a dry and non hygroscopic fertilizer from alc distillery or sugar factory residue and superphosphate, the manuf is effected in 2 sep stages at different temps, the residue being heated in the first stage to about 70° with a quantity of superphosphate the wt of which is about equal to that of the residue, while in the second stage the temp. is raised to about 130° to complete the expulsion of water and org acids set free in the first stage.

**Ammonium potassium phosphate fertilizer.** KASEI KUNE and KATAKURA BEIKOKU HIRYO KABUSHIKI KAISHA Japan 90,174, Feb 6, 1931 Excess of $H_2SO_4$ is mixed with Ca perphosphate to make a soln contg free $H_2SO_4$ and $H_3PO_4$ in the ratio of 2 1. $Ca_3N_2$, $(NH_4)_2SO_4$, KCl and org matter such as soy bean cake are added The whole is kept for about 24 hrs in a brick chamber to complete the chem reaction The product is sol in $H_2O$ and contains no cyanamide

**Insecticide and fungicide.** FREDERICK W SULLIVAN, JR., and ELMER W ADAMS (to Standard Oil Co of Ind.). U. S 1,800,114, April 7 A compn capable of being dispersed in water to form a relatively stable horticultural insecticidal and fungicidal emulsion comprises mineral oil, an As compd such as Pb arsenate, an oil sol Cu rosin soap, a non soap colloid such as glue and mineral oil sulfonic soap

**Fungicides and insecticides.** FRITZ LEIMBRANDT. Fr. 697,038, June 18, 1930 Compds contg Cu and As which are valuable fungicides and insecticides are prepd by transforming Schweinfurt green (a mixt of arsenite and acetate of Cu) with salts formed from a strong base and an acid which is weaker than AcOH and preferably stronger than arsenious acid, *e g*, a fatty acid of high mol wt, the amt of salt being such that the 2AcOH residues of the Schweinfurt green are changed. An example is given using Na palmitate

**Insecticide.** YUZIRO TUBAKIMOTO and DAIICHI KÔGYÔ SEIYAKU KABUSHIKI KAISHA. *Japan 90,229, Feb 10, 1931.* *The insecticide is a mixt of sericin, Cu soap, gum arabic, agar agar and $PbHAsO_4$*

**Protecting plants against insects, etc.** RICHARD SCHLÖGL. Austrian 122,023,

Nov. 15, 1930 Use is made of the sulfurous waste waters from the manuf. of films, artificial silk, etc., from viscose

Anticryptogamic products. Soc. Seloxyde Fr 698,604, Oct. 8, 1929 An anti-cryptogamic paste is obtained by mixing a hydrated oxychloride of Cu and a compd such as a base, a carbonate or a basic salt capable of displacing HCl from this oxy chloride

Seed disinfectant. Morris S Kharasch and Max Engelmann (to E. I du Pont de Nemours & Co) Can 300,904, Mar 31, 1931 Org mercury compds are produced by the reaction of $HgCl_2$ with $PbI_4$ in the presence of a hydrocarbon solvent. These compds are used in the prepn. of seed disinfectants. *Cf C. A. 24, 4579*

Seed disinfectant. Morris S Kharasch, Max Engelmann and Wendell H. Tisdale (to E I du Pont de Nemours & Co) Can 300,905, Mar. 31, 1931 A seed disinfectant in dust form comprises HgCl, tolanite, activated carbon and lime, the total amt. of diluent being not less than 90% by wt. *Cf C. A. 25, 2237.*

*Organic mercury compounds and dust disinfectants containing these compounds.* Morris S Kharasch and Max Engelmann (to E I du Pont de Nemours & Co) Can. 300 903, Mar 31, 1931 A seed disinfectant comprises the product of a reaction between $HgCl_2$ and $PbEt_4$ obtained directly in dust form in the presence of an inert solid diluent.

## 16—THE FERMENTATION INDUSTRIES

C. N FREY

Science and the fermentation industries. Arthur R. Ling *J Inst Brewing* 36, 446–55(1930) —An outline is given of the rise of scientific education along brewing lines and the need for its continuation. Peter J F Weber

Progress and development of the fermentation industries. A. Fernbach. *Chimie & industrie* 25, 570–6(1931) —A brief review A Papineau Couture

Influence of $p_H$ on alcohol recovery in cane-molasses distilleries. N E Lamont. *Intern Sugar J* 32, 630(1930), *Sugar Abstracts* in *Facts About Sugar* 26, 88 —In expts. made by the author the following acidities were maintained during fermentation of molasses washes in the wash before entering the vat, and before fermentation commenced, 4 4, on completing the filling of the vat, 4 0, after fermentation, 3 7, and 12 hrs. after fermentation was stopped, 3 6 Ordinarily, the yield of alc. wash was 5.5% (alc. of 42.5 Cartier), but repeated expts. along the lines indicated above gave a yield of 6.5 and over This practice is therefore being continued as standard, once a week the vats are thoroughly washed and disinfected. G G

Sulfurous and lactic acids in the production of fruit wines. Rüdiger and K. Sichert *Wein u Obst* 11, 500–8(1930) —The addn of lactic acid (2–6 g per l.) to perry prepd. from pears low in acid is recommended in place of that of $H_2SO_3$. B C. A

Institute of Brewing research scheme. I. The prediction of extract. L. R. Bishop *J Inst Brewing* 36, 421–34(1930) —A statistical study made of the analytical data of the Institute research scheme shows, in any one variety of barley, that the N content is in reverse relation to the yield of ext. of the resulting malt. For one type of barley the ext. of the malt can be predicted within close limits by the equation $E = 110\,1 - 11.2\,N + 0\,18\,G$, where $E$ = ext. in lb per quarter of dry malt, $N$ = N % of dry barley and $G$ = wt. in g of 100 dry barley kernels. The equation assumes similar modification of the malt, although individual maltsters can adjust the const. (110 1) to their requirements. Also for other varieties of barley, predictions can be made with reasonable accuracy by a change in the const. of the equation. Peter J F Weber

Adsorption in the brewing industry. J Raux. *Brasserie & malterie* 21, 6–12, 22–4(1931) —*An address outlining* the nature and laws of adsorption and the part it plays in beer making A. Papineau Couture

Steam turbine as power source in brewing. H. Herbracht *Wochschr. Brau* 47, 549–54(1930). S. J

The Elmocid process (a new way of disinfection). F. Stockhausen *Wochschr. Brau* 47, 523–8, 545–9, 561–4, 575–9(1930) —A new process of disinfection was developed by the Elektro-Osmose Gesellschaft. Two products are used "Alkaline-Elmocid" (0.58% NaCl and 0 4% NaOH, $p_H$ 13 07) and "Acid Elmocid" (NaCl and $HNO_3$, both in 0 1 *N* concn., $p_H$ 1.07) Alk. Elmocid is generally used, whereas Acid Elmocid is preferred for Al tanks and pitch-coated equipment. The efficiency of these products

was carefully investigated, and the reports are favorable in both small scale lab and large-scale factory expts The disinfecting action of "Alkaline Imocid" was found to be somewhat greater, or at least more rapid, than that of the acid product The advantage of Alkaline Imocid over hypochlorite is emphasized by its chem stability. It can be used over again several times and brought up to its original strength Conclusion The process can be used successfully in breweries S Józsa

**Fluorescent indicators in acidity determinations of colored wines.** Y. Volmar and J. Mª. Clavera *Anales soc espaň fis quím* 29, 217–54(1931) —The application of the volumetric method with the fluorescent indicators acridine and umbelliferone in Wood light to exact titration of total acidity in red wines was studied Umbelliferone at a concn of 4 to 6 drops per 5 cc. of wine dild. to 100 cc. gives a change at exactly $p_H = 7$ E M. Symmes

**Malt dust, its disturbing effect on fermentation.** K. Schuster. *Wochschr. Brau* 47, 481 3(1930) The last portions of malt from large concrete silos often showed unsatisfactory fermentation attributed to malt dust Expts on a small scale proved this assumption the fermentation was sluggish at first, the head was undeveloped and coarse in texture The final attenuation is reached in the vat; the yeast does not settle well and shows a dusty or powdery character The beer leaving the vat is cloudy; the haze in many cases cannot entirely be removed S advised handling and transporting the malt carefully, avoiding rough treatment, to minimize the formation of dust Too fine grinding will cause similar troubles S Józsa

**Determination of liquefying power of malt amylase.** L Fletcher and J B. Westwood *J Inst Brewing* 36, 550–7(1930) —Investigation of the method of Józsa and Gore (*C A* 24, 1170) shows results to be relative if all conditions are kept const *Within certain limits the changes taking place during liquefaction comply with Kjeldahl's law of proportionality*, but it is necessary to increase the proportion of enzyme to substrate to get near 100% liquefaction, since Józsa and Gore's curve, as well as tests made, shows that with the low ratio of Józsa and Gore, liquefaction comes to a practical standstill at 90% Peter J F. Weber

**Observations of some malting and brewing trials with a six-rowed winter barley.** H. Lloyd Hind *J Inst Brewing* 36, 435–9(1930) —Growing, malting and brewing tests of a British-grown 6 row barley Peter J F Weber

**Action of ultra-violet rays on the germination of barley in malting.** R. De Fazi. *Atti Accad. Lincei* [6], 11, 1022–4(1930) —The action of ultra violet rays on germinating barley accelerates the germination even at low temps (10–15°), prevents mold growth, facilitates the formation of enzymes and increases the vitamin content. Expts on the large scale show that malt of improved quality is obtained in this way B. C. A

**Swedish brewing barley, its cultivation, improvement and brewing value.** C. Wirth *Wochschr. Brau* 47, 483–6, 495–8, 505–8(1930) —The principal barley-growing districts are the provinces Schonen and Östergötland and the islands Gotland and Öland The early ripening barleys are chiefly cultivated, and great importance is attached to purity of type. The details of cultivation are given These Swedish barleys which are better suited for pale than for dark beers, have a rather high moisture content (17–17½%), and drying is advisable The samples showed a low protein content and high yield on ext The worts saccharify well, and the beers obtained show a good head forming power S Józsa

**The nitrogen content and "quality" of barley.** L R Bishop *J Inst Brewing* 36, 352–69(1930). cf *C A* 24, 1029 —A résumé of studies made and suggested required knowledge to lead to a sound, quant method of assessing barley value P J F W.

**Barley husk.** H Lüers *Wochschr Brau* 47, 557–61, 571–5(1930) —The aq extn of various constituents from barley husk was studied under different conditions Detailed analysis of the husk gave fat 2 22, pentosans 37 05, protein 5 9 and ash 5 9 The ash analysis showed $P_2O_5$ 5 70, $SiO_2$ 64 91, Ca 2 77 and Mg 2 06% The results showed that the acids might be removed from the husk by a suitable alk treatment in the steep Barley was subjected to a preliminary steep contg 0 2% NaOH. The malt was equal to the check, and the pale beer was finer and milder in flavor L suggests such steeping for barleys having a rough and coarse husk It is not necessary, however, when dark malt and beer are processed S Józsa

**Modern wine-making methods.** J A Dorrow. *Can Chem Met* 15, 93–4, 97 (1930) —The control of microörganisms, the development of wine yeast-control factors *and temp control are discussed* W. H Boynton

**Improvements in the fermentation and maturation of beers.** L. Nathan. *J Inst Brewing* 36, 538–60(1930) —A comparison of the English brewing methods and

the Nathan System, which consists essentially of quick removal of boiled wort from the hops, aeration with sterile air and removal of volatile constituents, chilling and removal of suspended matter, and pitching with pure, culture yeast The fermentation is regulated by passing finely subdivided $CO_2$ into the fermenting liquid, purifying the $CO_2$ after use and subsequently using the $CO_2$ to remove young flavors from the fermented beer after sepn from the yeast Beer is then further cooled and satd with $CO_2$ The production of a 12% original gravity beer requires 12 days' time

PETER J F WEBER

**Studies on tannin. II. Determination of the "tannin-N" and the tannin number as a new method for defining the protein conditions in beer.** H FINK AND W. RIEDEL *Wochschr. Brau* 47, 491–4, 501–5 511–5(1930), cf. *C A* 24, 2830 —The authors found that the amt of nitrogenous matter pptd from beer is a measure of the amt of complex proteins of high mol wt An analytical method is developed The term "tannin N" is suggested for the proteins pptd by tannin The tannin no of a beer is the fraction (expressed in %) of the total proteins pptd by 1% (tannin no I) and 2% (tannin no II) pure tannin solns. under exactly specified conditions *The method is similar to the* procedure applied heretofore for the detn of coagulable N The new method gives results which can easily be duplicated It is immaterial whether the tannin soln is run in rapidly from a pipet or added drop by drop, but the subsequent filtration is facilitated if the tannin soln is run in rapidly and the mixt cooled as prescribed Low temps are more favorable for the pptn Various tannin prepns will give different results, and comparative estns should be made with the same prepn The tannin-protein pptn is not in proportion to the tannin concn but decreases in higher concn The character of the beer is not altered by the tannin pptn, and the tannin no is not changed by pasteurization Dark beers show a higher tannin no than pale ones Export beers which are especially fit for pasteurization show very low tannin nos.

S JÓZSA

**Thirteenth report on the trial of new varieties of hops, 1929.** E S. SALMON *J. Inst Brewing* 36, 533–8(1930)

PETER J. F. WEBER

**Some recent ideals on the evaluation of hops.** THOMAS K. WALKER. *J. Inst Brewing* 36, 440–6(1930) —The aspect is given of researches in progress toward correlating analytical data of hops, with the results to be expected in practice

PETER J. F WEBER

**Analysis of hops.** W WÖLLMER *Wochschr Brau* 47, 521–5(1930) —The method was proposed by W (*C A* 23, 4011) and was adopted, with some modifications, as a standard method by the Analysis Commission of the German Brewing Industries. The sampling and prepn of samples (reduced to a fine uniform powder) are standardized Moisture is detd at 104–105° for 3 hrs The exact details of the estn are given

S JÓZSA

**A colorimetric method for the determination of the soft resins of hops.** JOHN M GUTHRIE AND GEORGE G PHILIP *J Inst Brewing* 36, 455–9(1930) —A preliminary report A 0.5% soln of U acetate in MeOH, filtered from insol matter and added to MeOH solns of α- and β hop resins, produces an orange-yellow color of such intensity as to be capable of measurement by comparison with a standard MeOH soln of α-resin The ratio of the color of the α resin to that of β resin is as 1 1+4 17, which relation is similar to the ratio of concn of α- and β resin of equal antiseptic value, i e, 1 1+4 3 (cf Ford and Tait, *C A* 20, 2892) As adapted to the soft resin detn of hops, 10 g of finely minced hops are extd with 100 cc of MeOH with continuous agitation for 10 min The supernatant liquid is decanted through a folded filter, and 20 cc of the filtrate is measured into a separatory funnel, 40 cc of 0.25 *N* $H_2SO_4$ is added and extn of the resins is made with 4 successive portions of 40–50 cc. each of petroleum ether The petr ether exts are filtered into a 200-cc volumetric flask, the filter paper is washed with petr ether and the vol is made up to 200 cc Ten cc is then put into a 100-cc volumetric flask and the solvent evapd by immersion for a few min in a water bath at 40°, and the residue is dissolved at once in MeOH Ten cc of the 0.5% *U* acetate soln is then added and the vol adjusted to 100 cc The color is then compared in a Hellige colorimeter with a wedge of a standard color made up with 0.015 g α resin per 100 cc The colorimeter reading multiplied by 0.15 gives the sum of the α resin and the colorimetric equiv of the β resin in terms of α-resin, expressed as % of the hops Results are in good general agreement with gravimetric results using the formula $\alpha + (\beta/4.3)$ Where α- and β resin are required separately, total soft resins are detd by evapn of a sep portion of the petroleum ether ext., and the % of each resin is calcd from the colorimetric relationship of the 2 resins.

PETER J. F WEBER

Manufacture of sulfite spirit from waste pulp liquors in Germany during the war period 1914–18 (Sembritzki) 23. Proteolytic enzymes. VII. Peptidases of green malt (Sato) 11A. Coating concrete [fermentation vats] (Fr. pat. 698,562) 20. Fertilizer from distillery residues (U. S pat. 1,799,176) 15.

---

Ethyl alcohol. August Uick Ger 522,380, Aug 14, 1923 In the manuf. of EtOH by fermentation, saccharification of starch is effected with very finely cut up or comminuted malt, as distinct from bruised or crushed malt.

Gluconic acid. Siegwart Hermann and Pharmaceutische Werke "Norgine" A.-G Ger 522,147, Feb 20, 1927 Gluconic acid is prepd by fermenting nutrient solns contg saccharose or glucose with a ferment present in a material stated to be known in Japan as "kombucha" Thus, an ext of Russian tea may be treated with 7 5% of sugar and inoculated with kombucha After standing for 20 days at 15–40°, the mixt. is evapd to remove AcOH, then dild again, neutralized with $CaCO_3$ and evapd to recover Ca gluconate

Fermenting cellulosic materials. Herbert Langwell Ger 522,146, Sept 10, 1925. See U S 1,602,306 (*C. A* 20, 3771)

Apparatus for the production of distilled liquors using a naked gas flame. Emile Gazagne Fr 698,446, July 5, 1930

Distilling flask for determining the acidity of wine, etc. Martin Vialatte (Soc. A r. b.) Fr 698,630, July 7, 1930

Hopping wort. Karl S Felix Ger 522,145, Dec. 24, 1927 The hops, enclosed in a perforated container, are boiled with the wort in known manner, and the container is lifted out and rinsed The hops are then treated with water under pressure at 110–125°, and the resulting ext is added to the boiling wort

Beer. Heinrich van de Sandt Fr 698,375, July 4, 1930 Vitamins are added to or produced in beer at a stage in the production of the beer when no destruction of the vitamins would take place

Beer. Otto Borg Ger 516,978, June 28, 1929 Colored beer is deprived of its bitter taste by treating with $O_3$ in the cold

Yeasts. Hugo Windesheim and Friedrich W Thiele Fr 698,316, July 2, 1930. The fermenting power of yeasts is increased by adding cholesterol, cholesterol compds or substances resembling cholesterol in a fine state of subdivision The cholesterol may be in the form of an emulsion with fats Phosphates or superphosphates may be added at the same time

Degrading yeast. I G Farbenind A.-G. (Otto Ambros and Erwin Walz, inventors). Ger 520,853, Jan 3, 1928 Addn to 517,499 (*C A.* 25, 2157). Yeast is subjected to enzymatic degradation, preferably under sterile conditions, until the greater part has become sol in water The sol portion is then sepd from the insol. residue, without heating, and the soln and the residue are separately worked up Thus, yeast may be liquefied with AcOEt, brought to a hydrion concn. of $p_H$ 6–7 by addn of dil aq $NH_3$, and allowed to stand for several days until tyrosine begins to sep This is removed by means of a fine sieve, and the liquid autolysate is centrifuged to sep the undissolved portion This contains all the ergosterol, which may be isolated by alk sapon Leucine, etc., can be isolated in known manner from the liquid portion.

---

## 17—PHARMACEUTICAL CHEMISTRY

W. O. Emery

General occurrence of alkaloids in Buxaceae. E Martin-Sans *Compt. rend.* 191, 625–6(1930).—The occurrence of alkaloids (usually situated in morphologically distinct secretory cells) in 9 species of *Buxaceæ* has been demonstrated microchemically, no alkaloid was detected in *Daphniphyllium macropodium*, which is possibly not to be included among the *Buxaceæ* B. C. A.

Vacuum microsublimation of synthetic drugs. R Eder and W Haas. *Mikrochem., Emich Festschr.* 1930, 43–82.—Various methods available for the sublimation of small quantities of material are described The types of sublimate obtained with Eder's microsublimation app and with Diepolder's vacuum app are described, and details, including photomicrographs, are given of the results obtained with a no of synthetic drugs Four groups are recognized, according to the ease with which a crystalline sublimate is obtained Although the m p is of little significance for the sublimation process, the difference between the sublimation temp and the m p is

a deciding factor as to whether or not well-defined sublimates can be obtained. Tables are given showing for a no. of drugs the m. p., mutual and optimum sublimation temps., and the nature of the sublimate, and these data, in connection with the crystal form of the sublimate, serve in most cases for identification. Sepn. of a mixt. of such compds. by sublimation is rarely possible, as for the majority the sublimation temp. lies between 100° and 140°. B. C. A.

**Crystallographic investigation of microsublimates of synthetic drugs.** W. Haas. *Mikrochem., Emich Festschr.* 1930, 83–119.—Details are given of the detn. of the optical properties of sublimates, and tabulated data are presented for a no. of synthetic drugs, comprising the appearance and crystalline form of the sublimate, the extinction, interference colors, optical character, dispersion and $\epsilon$, $\alpha$, $\beta$ and $\gamma$. B. C. A.

**Infusum radicis ipecacuanhae.** K. H. Bauer and K. Herrle. *Pharm. Zentralhalle* 71, 513–8(1930).—Infusions of concns. below 1:400, prepd. by the method of D. A.-B. VI, contain the bulk of the alkaloids present as detd. in the original drug by the D. A.-B. VI method (ammoniacal ether extn.). More concd. infusions contain less of the original alkaloids, thus a 1:20 infusion contains only about one half. Concn. *in vacuo* of dil. infusions results in considerable decrease of alkaloid content. Decoctions prepd. by the above method contain the same amts. of alkaloid as infusions of equal concn., and prolonged treatment does not raise the yield in either case. When the residue from a concd. infusion is again extd., a further quantity of alkaloid is removed, but the total yield remains deficient. Infusion of such a residue with dil. HCl brings the total yield almost to that indicated by the D. A. B. VI detn. Infusion of the original drug with dil. HCl (2 g. with 40 cc. of water and 10 cc. of 0.5 *N* HCl, followed by a 2nd infusion with 50 cc. of water) gives, however, higher values for the alkaloid content than does the German official method, the figures from the latter representing only about 87% of the alkaloid present. The original drug therefore, contains alkaloid in a form (possibly glucosidic) that is removed neither by infusion nor by ammoniacal ether extn. B. C. A.

**Chemical composition of the [Russian] tobacco crops of 1927 and 1928.** V. Balabucha Popcova and V. Zapolskii. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 66, 52 pp. (1930).—A large no. of data for tobaccos grown in different parts of Russia are given. B. C. A.

**Steam-air method of treating tobacco.** P. K. Dopokov, I. I. Losev, A. O. Reppik and A. A. Smirk. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 68, 36 pp. (1930).—By the method described which consists in treating the leaves with steam and air, and effects uniform moistening and sorting the time occupied is reduced to a few min., all the conveying of the tobacco being by mech. devices. At the same time the nicotine (recovered as sulfate), $NH_3$ and MeOH are considerably diminished in amt., and the flavor is improved. The process has been tested on a semi mfg. scale with satisfactory results. B. C. A.

**Polyphenols of tobacco.** A. Smirk. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 69, 7–13(1930). cf. *C. A.* 24, 2235.—From the ppt. formed by addn. of basic Pb acetate to the aq. ext. of unfermented tobacco (Tyk Kulak), a substance may be isolated which dissolves readily in water, exhibits tanning properties and gives an intense green coloration with $FeCl_3$. It does not reduce Fehling soln., but yields a reducing methylpentose (rhamnose) on acid hydrolysis, which takes place only with difficulty. The substance is apparently a glucoside, another of its components being a depside, contg. both caffeic and quinic acids. Treatment with alkali hydroxide soln. yields protocatechuic acid. B. C. A.

**Inositol in tobacco.** A. Smirk. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 69, 15–8(1930). cf. preceding abstr.—The aq. ext. of fermented tobacco (Tyk Kulak) contains a considerable proportion of inositol, and this may play a part in the biochem. processes resulting in the formation of nicotine and may serve to explain the presence in the nicotine mol. of a 6-membered ring which is absent from the protein mol. When tobacco seeds are treated with dil. mineral acid and the resulting soln. is pptd. with alkali, phytin is obtained to the extent of 7–10% on the dry matter of the seeds. B. C. A.

**Acids of tobacco. II.** A. Smirk and Platnicki. U. S. S. R. State Inst. Tobacco Inv. *Bull.* 69, 19–26(1930). cf. *C. A.* 23, 4771.—The ethereal ext. of fermented tobacco (Samsun) contains citric, caffeic and probably chlorogenic acids. Although the presence of quinic acid has been observed by various authors, it could not be detected and it may form one of the components of chlorogenic acid. B. C. A.

**Content of formic acid in tobacco.** A. Smirk and S. Kashirin. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 69, 29–32(1930).—By using a modification of Fincke's method

for detg HCOOH (*C. A.* **7**, 3983), it is found that this acid is present in both fermented and unfermented tobaccos to the extent of 0.02–0.17%. Tobaccos of high and low grades contain rather more than those of medium quality. Fermented tobaccos are richer in the acid than unfermented ones, the proportion increasing with the energy of the fermentation process. Both HCOOH and its salts diminish the strength of flavor of tobacco. B. C. A.

**Determination of the essential oils of tobacco.** V. V. Semenova. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 69, 45–53(1930).—The following procedure does not det. the total essential oils in tobacco, but serves for obtaining a comparative measure of the proportions present in different tobaccos. Five g. of the finely-divided tobacco, heated in a flask in a boiling water bath, is distd. in a current of steam under definite conditions, 4 cc. of water being distilled from a small boiler to furnish the steam. Air is drawn through the app. at const. rate (30 bubbles in 15 sec.) during the whole time of the distn. and for 30 min. afterward and passes through 3 washing vessels each contg. 3 cc. of $H_2SO_4$ (d. 1.84). The whole of the acid, together with washing water, is made up to 20 cc. and mixed, and is then compared colorimetrically with standard solns. of tobacco essential oils in $H_2SO_4$. B. C. A.

**Free nicotine or free alkalinity of tobacco.** A. Shmuk and M. Chmura. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 69, 65–9(1930); cf. *C. A.* **24**, 2235.—The content of nicotine in tobacco is related to the reaction of the material. Distn. in a current of steam of tobacco which has not been rendered alk. yields high proportions of nicotine (37–40%), which increase progressively as increasing amts. of alkali are added. Extn. of tobacco with light petroleum gives considerably smaller yields of nicotine. The proportion of free nicotine present is much greater than that calcd. theoretically from the degree of hydrolysis of nicotine salts and the dissocn. consts. B. C. A.

**Steam distillation of nicotine from tobacco.** A. Shmuk and M. Chmura. U. S. S. R. State Inst. Tobacco Inv., *Bull.* 69, 71–80(1930).—Addn. of CaO and NaCl to tobacco not only shortens the time of steam distn., but results in increased yields of nicotine. B. C. A.

**Estimation of hexamethylenetetramine methylenecitrate and of hexamethylenetetramine in the presence of each other.** D. Marotta and F. Di Stefano. *Ann. chim. applicata* **21**, 150–4(1931).—The method of estg. these 2 compds. in the presence of each other depends on the fact that the methylenecitrate is decomposed by alkali with liberation of $CH_2O$, while $(CH_2)_6N_4$ is stable. Dissolve 0.4–0.5 g. of the mixt. in 100 cc. $H_2O$, neutralize with 2 *N* NaOH, distil the liberated $CH_2O$ into another flask, and det. according to Romijn (*Z. anal. chem.* **36**, 18(1897)). To the remaining liquid add 100 cc. water and 50 cc. of 5% $H_2SO_4$, collect the $CH_2O$ liberated from the base and det. as above. A. W. Contieri.

**The preparation and properties of colloidal aluminum hydroxide for medicinal use.** J. J. L. Zwikker. *Pharm. Weekblad* **68**, 328–43(1931).—A series of $Al(OH)_3$ prepns. was made for the purpose of obtaining a product with the properties of "Alucol" a com. $Al(OH)_3$ prepn. used in the treatment of gastric disturbances. The desirable properties which distinguish "Alucol" from other $Al(OH)_3$ prepns. are ready dispersion in dil. HCl, slow neutralization, and gelatinization with concd. HCl. Such a prepn. was eventually obtained by the method of Kohlschütter (*C. A.* **14**, 242, **17**, 2983) *in which a solid cryst. Al salt is treated with $NH_4OH$.* A product practically identical with "Alucol" was obtained as follows. Powd. $Al_2(SO_4)_3$ was allowed to stand 4–5 days at room temp. or 18 hrs. at 40° with 10 vols. of 6% $NH_4OH$ contg. 5% $(NH_4)_2SO_4$, the ppt. washed with tap water and finally with distd. water, then dried at 40° and finely powdered. A. W. Dox.

**Micro melting-point determinations of drug products.** L. Kofler and W. Dernbach. *Arch. Pharm.* **269**, 104–14(1931).—*A report of results obtained in the examn.* of some 54 different D. A.-B. VI drug products by the use of Kofler and Hilbck's app. (*C. A.* **25**, 1121). Except with dionine, scopolamine-HBr, terpine hydrate and cocaine-$HNO_3$, the m. ps. observed by the micro method showed satisfactory agreement with those obtained with the usual macro procedure. The exceptions to the rule find probable explanation in the water of crystn. or constitution of the substances noted. W. O. E.

**Essential oil of Taiwania cedar.** Kinzo Kafuku and Ryo Kato. *Bull. Chem. Soc. Japan* **6**, 65–74; *Chem. News* **142**, 273–6(1931).—The wooden chips of *Taiwania cryptomerioides Hayata* give on steam distn. 0.23% of an oil, consisting chiefly of sesquiterpenes and sesquiterpene alc. The sesquiterpenes in the oil are mainly cadinene, with a little humulene and caryophyllene. From the cadinene a new oxidation *product*, $C_{15}H_{22}O_2$, m. 142–3°, was obtained. The sesquiterpene alc. in the oil, for which the

authors suggest the name "taiwanol," closely resembles cadinol of Semmler and Jonas From cadinol no cryst phenylurethan could be obtained, but with taiwanol it affords a cryst phenylurethan, m 134-5°, and furthermore, it gives a neutral oxidation product m 170° if oxidized with $KMnO_4$ in AcMe soln W O E

**Color of tinctura valerianae aetherea.** G Deiming *Apoth Ztg* 46, 47-8 (1931).—Ethereal tincture of valerian freshly prepd is bright yellow, and, as the D A -B VI states, becomes darker with age W O E

**Reaction of cod-liver oil and castor oil.** Lad Ekkert *Pharm Zentralhalle* 72, 209–12(1931).—The tests specified in the U S, Italian, German, Dutch and Hungarian Pharmacopeias for cod liver oil are reviewed The behavior of this oil, as also that of castor oil when treated with aldehydes and concd $H_2SO_4$, is described Thus, if 1 drop of cod liver oil is dissolved in 1 cc *strong* EtOH, *then treated with 3 drops of* 1% aldehyde, and the mixt thereupon underlaid with 1 cc concd $H_2SO_4$, a color zone develops After shaking the liquid is examd under the quartz light The various color changes are described when different aldehydes are used W O E

**Biological differentiation of morphine-containing tinctures of varying potency.** K. Feist and F Klatt *Apoth Ztg* 46, 30(1931).—Evap 1.5 g of the sample (opium tincture) to dryness on the steam bath, add 3 cc dil AcOH and again evap to dryness *to expel excess acid, then dissolve the residue in* 1.5 cc distd $H_2O$ Inject the clear soln subcutaneously in the back of a white mouse, and note the typical tail reaction and subsequent death of the animal Addnl samples are prepd as above, from which 1 cc and 0.5 cc, resp, are injected in other mice If the 1st died in 3 min, the 2nd in 7 and the 3rd in 22 min, a basis of comparison is established for opium tincture, which is about 10 times stronger in morphine content than cholera drops, the 2 prepns under consideration in the present paper W. O L

**Tincture diacolation.** H Breddin *Pharm Ztg* 76, 400–2(1931).—The results obtained in the prepn of a few special tinctures, notably of sabadilla, by the process of diacolation are reported with favorable comment W O E

**The reactions of oleum jecoris and oleum nigrum.** L. Ekkert. *Magyar Gyógyszerésztud Társaság Értesitoje* 7, 115-20(1931).—One cc oil is dissolved in 1 cc concd ale., *3 drops of* 1% *ale solns of the aldehyde are added and 1 cc concd* $H_2SO_4$ *is poured* in a layer underneath The colors of the rings and liquids given by oleum jecoris with the different aldehydes before and after thorough mixing and in the light from a quartz lamp (Q) are, resp (1) *HCHO*, rust brown ring, brown and (Q) light yellow liquid, (2) $PhCH_2CHO$, reddish brown ring, rust red and (Q) light pink liquid, (3) *BzH*, rust red ring, rust red and (Q) reddish yellow liquid, (4) *2 furaldehyde*, ring dark red underneath and dark green on top, liquid violet red and (Q) Bordeaux red, (5) *anisaldehyde*, dark brown ring, dark violet and (Q) Bordeaux red liquid, (6) *salicylaldehyde*, dark red ring, blood red and (Q) reddish violet liquid, (7) *vanillin*, ruby red ring, carmine-red and (Q) reddish violet liquid, (8) *cinnamaldehyde*, dark red ring, then dark reddish violet and (Q) brownish red liquid, (9) *piperonal*, ruby red ring carmine red, and (Q) orange- to brick red liquid The colors given by oleum nigrum *under the same conditions were* (1) (2) or (3) brown ring, reddish brown and (Q) light olive green liquid, (4) dark brown and dark green ring, dark red and (Q) liver-red liquid, (5) carmine red ring, dark violet and (Q) liver red liquid (6) yellow and red ring, blood red and (Q) grayish olive-green liquid, (7) ruby red ring, carmine-red, and (Q) liver red liquid (8) dark red ring, carmine red and (Q) olive-brown liquid; (9) ruby red ring, carmine red and (Q) brownish yellow liquid S. S de Finály

**Proposed standards for fennel fruit.** De Graaf *Heil u Gewürzpflanzen* 12, 41 (1929), *Quart J. Pharm and Pharmacol* 3, 282.—*Recommendations are put forward* for the fixing of an international standard for fennel fruit The chem requirements with which the fruit should comply are as follows *Bitter fennel*, first quality—volatile oil at least 5% ash not more than 8%; sand content not more than 0.2%. *Sweet fennel*, first quality—volatile oil at least 2.5%, ash and sand content as for bitter fennel G G

**Sirup of ferrous iodide.** G Kullerud *Norg Apot Tids* 29 (1929); *Quart. J Pharm and Pharmacol* 3, 544.—Small quantities of sirup kept in half filled bottles in the dark became pale yellow after 2 months On exposing these bottles to bright sunlight the color was not affected, but a portion of this sirup in a completely filled bottle became colorless after 3 days' exposure to sunlight The author concludes that, in completely filled vessels, sirup of $FeI_2$ does not become colored, in opened bottles the sirup can be kept for nearly 2 months Decompn is caused by the O of the air, and not by light G G

**Determination of chlorine numbers of drugs.** J Stamm *Farm. Notisblad* 39,

21; *Quart J Pharm and Pharmacol.* 3, 253–4.—To det. the Cl no ext 0.25 g of finely powd drug with boiling water and make up to 250 cc. Transfer 3 portions of 5, 10 and 15 cc., resp., to stoppered conical flasks and make up to 25 cc with water To each flask add 25 cc. of a filtered 0.1 *N* soln of chlorinated lime, followed by 2 cc of 20% $H_2SO_4$. Let the flasks stand out of direct sunlight for 5 min., add KI, and after a further 5 min titrate with thiosulfate soln Make a blank detn at the same time The Cl no is the no of cc of thiosulfate used up by 0.025 g of the drug The chlorinated lime soln must be used fresh but may be kept in the form of a more concd filtered soln contg about 20 g of active Cl per l G G

**Chlorine numbers of drugs.** K Killinen. *Farm. Notisblad* 39, 125(1930), *Quart J Pharm and Pharmacol* 3, 254.—K records the Cl nos of a large no of drugs, detd according to the method of Stamm (see preceding abstract) The Cl no depends upon the age, ripeness and manner of preservation of the drug In many cases there appeared to be a difference between fresh and old samples, though in general the no of samples examd was not sufficient to draw final conclusions in this regard G G

**Ethylene as a dental anesthetic.** Harry M Selden *Dental Cosmos* 73, 454–7 (1931).—$C_2H_4$ has its place as an anesthetic in major surgery in hospitals where adequate precautions can be taken against explosions $C_2H_4$ in mixts with other gases ($CO_2$, $O_2$) is not suitable as a dental anesthetic because of the danger of either explosion or asphyxia Joseph S Hepburn

**The principles and methods of biological assay.** J M Watt *J S African Chem Inst* 13, No 2, 41–7(1930) E H

**Recent advances in medicinal preparations in Germany.** Konrad Schulze *Mfg Chemist* 2, 103–5(1931).—Brief discussions are given of *Eupaverine* (1-(3,4-methylenedioxybenzyl)-3-methyl-6,7-methylenedioxyisoquinoline), *Fantan* (phenylcinchoninyl urethan, $PhC_9H_5NCONHCO_2Et$), *iodine sticks* (a colloidal I prepn.), *Gultajod* (an I-contg tablet), *Lacarnol* (a "heart-hormone" *e* prepn consisting of specific parts of the heart muscle together with skeletal muscle and other body tissues), *Pantocaine* (*p*-butylaminobenzyldimethylaminoethanol), and *Sympathol* (*p*-hydroxyphenylethanolmethylamine) E H

**Posterior pituitary preparation.** C G MacArthur *Science* 73, 448(1931).—Beef lobes were repeatedly treated with acetone, ether, petroleum ether and a mixt of 70 parts alc., 25 AcOH and 5 water The final ext was moderately sol in boiled distd water, easily sol in dil acids and alkalies and was pptd by Cu and Zn salts It seemed to be a polypeptide containing labile S It gave a strong reaction on blood vessels and isolated uterus Mary L Lear

**Limitations of phenol-coefficient tests in determining germicidal activities.** Geo F. Leonard *J Infectious Diseases* 48, 358–65(1931).—The phenol coeff. test is limited in value when applied to substances, like certain Ag prepns., that have a high bacteriostatic action By adding the transfer test to the regular phenol coeff test, one can readily det which products are actually germicidal and which have only a restraining effect on bacterial growth A method for testing growth restraining action is described which depends on color changes rather than turbidity to det growth and is therefore applicable to substances that cloud the media Both the mild and strong Ag prepns have high bacteriostatic action, restraining typhoid and staphylococcus cultures in dilns of 1:5,000 to 1:20,000 Colloidal Ag prepns have a feeble bacteriostatic action, restraining growth only in dilns of 1:50 or 1:100 Julian H Lewis

**Organic antiseptics. A bacteriologic study of a new series.** W. Lric Drake and Fitzgerald Dunning *J Infectious Diseases* 48, 366–71(1931).—A series of derivs of resorcinolsulfonephthalein and of halogenated resorcinolsulfonephthalein was prepd and tested bacteriologically The introduction of halogen atoms did not greatly increase the bactericidal activity of the parent compd., resorcinolsulfonephthalein The Hg deriv is considerably more bactericidal than the parent substance The increase in bactericidal activity is greatest when both Hg and halogen atoms are introduced The various halogens when added along with Hg increase the bactericidal activity in the order: Cl, Br, I Di Hg derivs are not greatly more bactericidal, but are considerably more toxic than the corresponding mono-Hg compds The Na salt of monohydroxymercuridiiodoresorcinolsulfonephthalein proved to be by far the best compd of this series from a therapeutic standpoint Julian H Lewis

**The influence of irradiation on adrenaline. I. The action of ultra-violet rays (of artificial light) and of sunlight on adrenaline.** Bunjiro Terata and Ryôichi Ito *Folia Pharmacol Japon* 12, No 1, 74–81, Breviaria 5–6(1931).—The action of adrenaline decreases with an increase in color of its soln When adrenaline is treated with ultra-violet light, there is an increase in potency The soln also gains strength

*when* irradiated with artificial light, but when *10 sunlight units* are applied the action is decreased. The action of the soln *does not correspond* to the color developed. Exposure to sunlight increases the *adrenaline* action, but over-exposure is injurious. The color developed is no *indication of the strength*. Adrenaline soln left unstoppered loses its strength, but this *may be* revived by irradiation with Röntgen, *ultra violet* or sunlight rays. G H W Lucas

Studies on *"ovarmina" (Erba)*. V. Cianci *Boll soc. ital biol sper* 6, 55–9 (1931) —"Ovarmina" when tested by the Allen Doisy technic contains not less than 150 rat units per cc Peter Masucci

Cod-liver oil of Japanese Dorsches *"Tara."* X. K. Kawai. *J. Pharm Soc Japan* 51, 177–95(1931), cf *C. A.* 25, 381. F I Nakamura

Pharmacognostic study of Aralia *chinensis* L. var. glabrescens Matsum. T. Muneda. *J. Pharm. Soc Japan* 51, 200–6(1931). F I Nakamura

The iconoclast. Frederic Walker *J. Chem. Education* 8, 885–95(1931) —W. calls attention to the lives and works of Paracelsus and Galen showing how each took exception to the established authority of medicine of his day and pleaded that progress is possible only as the result of expt. E R Schierz

Behavior of quinine salts with some acids and salts. V Macri *Boll chim farm* 69, 497–500, 503–4, 507–10, 539–40, 543–6(1930) —A detailed description of the reactions of quinine salts with some org and inorg acids and salts is given G S

Practical contribution to the preparation of solutions for hypodermic use. Gino Baratieri *Boll chim farm* 69, 1029–31(1930) —The app permits the sterile filtration, measuring, and filling in vials of solns for hypodermic injection The filtration can be carried out with suction and the procedure can be performed in an atm of an inert gas. G Schwoch

Somnival Erba and Passiflorine Béolet. Vittorio Zanotti *Boll chim farm* 69, 1031–2(1930) —Somnival Erba and Passiflorine Beolet are fluidexts of *Passiflora incarnata*, which contain an essential oil and tannin The reactions given by the essential oil are described. G Schwoch

The Italian Pharmacopeia in its fifth edition. Serafino Delani *Giorn farm. chim* 80, 101–11(1931) G Schwoch

Chemical constituents of the bark of Melicope erythrococca. T G H Jones and M White *Proc Roy Soc Queensland* 41, 154–7(1929) *Australian Sci Abstracts* 9, 28 —The results confirm the view of Cohen (*C A* 2, 1447) that lupeol is a mixt. of 2 substances, one, however apparently present to a much greater extent than the other J D S.

Essential oils from the Queensland flora. I. Baeckea virgata. T G H Jones and M White *Proc Roy Soc Queensland* 42, 49–51(1930), *Australian Sci Abstracts* 9, 40 —The essential oil was from one lot of leaves collected near Goodna; yield 1% $d^{15.5}$ 0.9021 $[\alpha]$ +18°, $n$ 1.4742 The principal constituents were *d*-α-pinene, cineol (30%), aromadendrene, a sesquiterpene alc. and possibly pinocarveol. J D S

The preparation of the tinctures of plants. B Cristini *Ann soc. pharm chim Sao Paulo* 2, 91–8(1931) —A critic of methods in use with recommendation that the procedure of the U S P be followed. M H Soule

Preparation used in the treatment of addiction to morphine, heroine and cocaine. F Mastrangioli *Ann soc pharm chim Sao Paulo* 2, 106–11(1931) —A discussion with an attempt to det. the compn. of these substances. M. H Soule

The handling of balsam of Peru. F Pitombo *Ann soc pharm. chim Sao Paulo* 2, 138–43(1931) —The method of collecting pure balsam of Peru and the phys. consts. of this substance are given. The materials frequently used as adulterants are discussed M H Soule

New method of evaluation of canthariides. L. J Olivella Riu *Anales soc españ fis. quim* 29, 164–9(1931) —The dry material is extd. to completion with a mixt. of acetone and HCl, the soln. evapd., and the crystals obtained are purified by 90° alc. and petroleum benzine satd. with HCl and cantharidin, then recrystd from acetone and washed with petroleum benzine. Material from all parts of the world varied in cantharidin content from 0.060 to 1.825%, differing markedly from the value 0.60% accepted by the Brussels International Conference The cantharidin obtained m. 216°. E M Symmes

Australian sandalwood oil. W H. Simmons. *Chemist and Druggist* 114, 80 (1931) cf *C A.* 25, 773 —The statements of Walmsley are refuted, those of Penfold, Marr, etc., are upheld. S Waldbott

Dog fat. J Pritzker and Robert Jungkunz *Pharm Acta Helv* 6, 55–63

(1931)—Dog fat has long been used in Swiss and Austrian domestic medicine In 7 samples of supervised origin and 2 com samples, consts were detd and the results tabulated They largely agree with results from hog fat except that the Bömer no (m.-p. difference, cf *C. A.* 8, 1174, 2433) is lower in dog fat (67-69) than in hog fat (not below 71) An admixt of hog fat to dog fat may thus be detd to a certain extent. Adulteration of 1 sample of dog fat with hog fat was established on the basis of the Bömer no as well as by the method of Grossfeld and Simmer (*C. A.* 24, 5173) for the sepn of the solid from the liquid fatty acids, and by means of the method of Kreis and Roth (*C. A.* 7, 1815) of fractional crystn The Grossfeld method also demonstrated for dog fat (as previously shown for hog fat) the absence of unsatd solid fatty acid S WALDBOTT

Comments and criticisms on the (British) pharmacopeia revision. A. J. JONES *Pharm J* 125, 647(1930), 126, 10(1931), cf *C A* 25, 1919—*In the prepn of infusum digitalis*, the use of a concd infusion should be expressly prohibited Similarly, in the use of industrial methylated spirits for the prepn of galenicals the cases where its use is objectionable should be specifically noted Addnl suggestions are made Syrupus ferri phosphatis compositus. E R MEACHEM *Ibid* 126, 10, 31—To prevent pptn when the formula given by the subcommittee is followed, the partial substitution of $H_3PO_2$ for $H_3PO_4$ has been suggested (cf J H Franklin) but was not adopted New expts show that sirups contg 2% + of dil $H_3PO_4$, Brit Pharm Codex, when exposed to bright light for 2 5 months remained clear, the others not contg $H_3PO_2$ gave a heavy ppt Use the formula of the subcommittee, modified Fe (wire) 4 3 g, $H_3PO_4$ (d 1 75) 28 cc, dil $H_3PO_2$ 20 0 cc, $CaCO_3$ 8 9 g $KHCO_3$ 1 0 g $Na_2HPO_4$ 1 0 g, cochineal 3 4 g, sugar 700 g, $H_2O$ to make 1000 cc Add the $H_3PO_2$ to the mixed solns just before filtration into the cold sirup Cataplasma kaolini. J H RIDGEWAY *Ibid* 126, 31—To avoid retention of the total $H_2O$ of reaction in the subcommittee's method of mixing $B(OH)_3$ and glycerol, dissolve the $B(OH)_3$ in the glycerol and heat with vigorous stirring to expel as much $H_2O$ as possible before adding the kaolin Estimation methods. J F LIVERSEEGE *Ibid* 126, 31—Suggestions are made on the definition and method of detn of the sapon no in pharmacy, on "normal pressure" reading in measuring NO gas from sweet spirit of nitre, etc In the *detn of As*, the use of strips of $HgCl_2$ paper in place of a cap permits of quant comparisons when allowed to act overnight in the cold The use of a hot plate is condemned, as it gives erratic results Practical notes. J J BLACKIE *Ibid* 126, 4 7, 16–18, *Chemist and Druggist* 114, 20–31(1931)—Detailed comments and suggestions are made and discussed on exts., glycerins, infusions, ointments, tinctures and waters Pharmacopeia revision. DAVID HARLEY *Pharm J.* 126, 109–12, *Chemist and Druggist* 114, 185(1931).—An extensive discussion by H and others The substitution of other oils for olive oil in linimentum camphorae proposed by the subcommittee is strongly deprecated S WALDBOTT

Liquor plumbi subacetatis fortis. J E WOODHEAD *Pharm J* 126, 28(1931).—Examn of 38 samples of semi-official lotions contg definite vols of Goulard's ext., Brit. Pharm (*A*) indicated excess of Pb present In 4 com samples of *A*, the required min of Pb subacetate was exceeded by an av of 16 0% W suggests that if the present formula for *A* be retained, d should be between 1.275 and 1 290, and the Pb subacetate content between 26 5 and 28 0%, which figures conform to actual conditions. S WALDBOTT

Psyllium seeds. HUBERT B FIGG *Pharm J* 126, 29(1931)—The seeds of *Plantago psyllium* L., fleawort, are used as a mild natural laxative in chronic constipation The mucilage test differentiates the (worthless) pale variety of seeds from the medicinal dark variety. Cover a small quantity of the seeds in a test tube with about 3 or 4 times their wt of $H_2O$ After a short time only the dark seeds have swelled to a semisolid mass which will remain in place when the tube is inverted S WALDBOTT

Phenol-water mixtures. G J W. FERREY *Pharm J* 126, 58(1931).—Detns of f. p. of PhOH-$H_2O$ mixts. (78 1–96 17% PhOH) gave results which agreed well with those of Rhodes and Markley (*C. A.* 16, 670) The f p of the liquid carbolic acid (80% PhOH, 20% $H_2O$) proposed by the subcommittee for the new Brit Pharm. is 3.1°; the sp. gr. close to 1.0615 F. suggests that the limiting values for $H_2O$ 19.4–21.9%, sp. gr. 1 062–1 060, f. p. 2 3–3 4° be adopted for the new liquefied carbolic acid. S. WALDBOTT

The preservation of sirupus acaciae, Brit. Pharm. Codex. H. A TURNER *Pharm. J.* 126, 160(1931).—With mucilage of acacia and sirup of acacia fermentation takes place quickly when preservatives are not added, but addn. of BzONa or $CHCl_3$ prevented fermentation, but not formation of acidity. As the use of BzONa may be

objected to, the use of 0.25% $CHCl_3$ is recommended (*cf. C. A.* 23, 5010; 24, 202, 5938). S. WALDBOTT

The pharmacist and the pharmacopeia. W. A. KNIGHT. *Pharm. J.* 126, 161 (1931).—In some cases the pharmacopeial tests are unnecessarily strict and too elaborate for the ordinary pharmacy, *e. g.*, the As test (5 p. p. m.) in $NaNO_3$ of "reagent" quality, where a simpler darkening test with soln. of $H_2S$ or $(NH_4)_2S$ should suffice. K. suggests that the Brit. Pharm. tests be of 2 classes: (1) Delicate and complicated but important tests, *e. g.*, those for biol. products which are bought in sealed containers under guarantee. (2) Tests of identity and purity which are within the pharmacist's scope to perform. S. WALDBOTT

Linimentum camphorae, modified. A. N. WHITE. *Pharm. J.* 126, 184 (1931).—Rub down camphor, 1 oz., with essential oil of camphor 0.5 oz. and add sufficient olive oil to make 10 oz. A clear non-pptg. and satisfactory liniment results. The formula is recommended for adoption in the Brit. Pharm. S. WALDBOTT

Notes on some leguminous seeds. G. E. TREASE. *Pharm. J.* 126, 211–2 (1931).—Pharmacognostical descriptions and photographs are given of the seeds of *Cassia fistula*, *Tamarindus indica* and of *Indian* and *Alexandrian senna*. S. WALDBOTT

Medicinal composition containing agar. FERDINAND W. NITARDY (to E. R. Squibb and Sons). U. S. 1,799,804, April 7. In prepg. liquid products contg. agar in a quantity greater than that which would normally form a firm jelly in the presence of water, the agar is dissolved in hot water in the proportions required to form a firm jelly, and the soln. is cooled and stirred to produce a semi-liquid mass of comminuted jelly particles and the latter are emulsified with a mixt. of a laxative oil and water.

Irradiating medicaments, foodstuffs, etc. OSKAR RIED. Austrian 121,657, Oct. 15, 1930. The activating effect of ultra violet rays on medicaments, foodstuffs, etc., is enhanced by subjecting the materials to the action of other rays, *e. g.*, Röntgen rays or rays of long wave length, before, during or after irradiation with ultra-violet rays.

Apparatus for making physiological salt solution in large quantities. RUDOLF A. HARTMANN. Ger. 522,495, Aug. 3, 1927.

Calcium carbohydrate compounds. ERNST STERN. Ger. 522,302, Oct. 13, 1925. Assimilable products of therapeutic value, mostly sol. in water, are prepd. by treating solns. or suspensions of carbohydrates of the sugar type with $Ca(OH)_2$ at a temp. not exceeding 60°. The concn. of the $Ca(OH)_2$ is gradually increased during the initial stage of the process, *e. g.*, up to 5% of CaO, calcd. on the carbohydrate. After about 12 hrs., the product is dried *in vacuo* at a temp. not above 70°. The feeble alky. of the product may be removed by incorporating a sol. acid salt, *e. g.*, $NaH_2PO_4$.

Cyanamide-formaldehyde condensation product. I. G. FARBENIND. A.-G. (Hans Schmidt, inventor). Ger. 522,056, Sept. 11, 1924. Cyanamide is condensed with

$CH_2O$ directly or in aq soln, yielding a nitrogenous product useful as an *intermediate for drugs*, etc The cyanamide may be prepd from an aq soln of its Ca compd, and the condensation may be accelerated by means of alkali Examples are given. Cf *C. A.* 25, 1645

Ephedrine and structurally similar substances. Richard H. F. Manske (to Eli Lilly & Co) U. S. 1,799,110, March 31. Numerous details and examples are given of the prepn of ephedrine and structurally similar substances by a process which consists in: (1) the condensation of a diketone of the general formula RCOCOR′ with a primary amine of the general *formula* $H_2NR''$ *in which R is a benzenoid radical*, R′ is $H(CH_2)_x$, with $x$ any desired integer including zero, and R″ is an org radical which contains a C atom by which it is linked to the N atom, (2) the subsequent hydrogenation of the product of the first step Ten detailed examples of the process are described

Vitamins. Tiburius Reiter Fr 697,367, Jan 30, 1930 Substances contg ergosterol are vitaminized by treatment with ultra-violet light, only rays the wave length of which is above 2,800 A U are used

Gland extracts Georges L A Pellerin Fr 698,564, June 20, 1930 In extg opotherapeutic products from animal glands, the glands are stabilized at the moment of killing so that the products are preserved in full vigor Thus the glands are removed when the animal is killed, kept for 10–20 min at 40° in the absence of air, then cooled to about 4° at which temp stabilization is definitely established

Anesthetics. Schering-Kahlbaum A.-G (Walter Schoeller and Hans G Allardt, inventors) Ger 522,064, Aug 11, 1928 Alkamine esters of aminobenzoic acid having an alkoxy group substituted in the nucleus, are prepd by the customary processes from monoalkoxy-nitro- or -amino-benzoic acids or their derivs Thus, 4-nitro-3-methoxybenzoyl chloride may be heated in $C_6H_6$ soln with $Et_2NC_2H_4OH$, and the product reduced with $SnCl_2$ and HCl, yielding *diethylaminoethyl 4-amino-3-methoxybenzoate-HCl*, m 156° Examples are given also of the prepn of *diethylaminoethyl 4-ethoxy-3-aminobenzoate-HCl*, m 162–3°, and *diethylaminoethyl 3-amino-4-methoxybenzoate-di-HCl* m 223°

Bactericides. Theodor Sabalitschka and Nährmittelfabrik Julius Penner A.-G Ger 522,005, April 17, 1927 Use is made of water-sol products obtained by fusing esters of carbocyclic acids with sugar A suitable product is prepd by fusing Me *p*-hydroxybenzoate 1 with sugar 9 parts

Compositions of silicates with other compounds Henri Baland Fr 698,543, June 18, 1930 Solid compns are made from alkali silicates sol in cold water and products such as *antiseptics* or *dyes*

Face powder. Yuzi Nagai and Takuzi Nisimura Japan 89,531, Dec. 11, 1930 The powder is a mixt of $TiO_2$, talc, fibroin prepd from HCl soln of silk, glycerol, $H_2O$ and perfume.

Hair shampoo. Henri Ciaudo Fr. 697,993, Aug 5, 1929 A hair shampoo contains $CCl_4$, EtOH, acetone, PrOH and essential oils

Fumigating rooms, etc. Farbsalz Ges m b H Ger 522,316, Feb 10, 1928 In fumigating rooms, etc, by strewing them with cyanides unstable in the air, the evolution of $H_2S$ from sulfide impurities in the cyanides is hindered by adding to the cyanides an oxidizing agent, *e g*, $PbO_2$ or $MnO_2$ The action of the oxidizing agent may be enhanced by adding also a powd dehydrating agent, *e g*, $CaCl_2$

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E M Symmes

Phosphoric acid. W. C. Weller *J. S. African Chem Inst* 12, 50–7(1929).—A review of the methods of manuf E. H.

Concentration of phosphoric acid by submerged combustion. C. Featherstone Hammond *Trans. Inst Chem Eng*, Adv copy, *March 24, 1931, 6 pp*—*In the Hammond* unit the burner is central in a refractory-lined combustion chamber, wholly submerged below the level of the liquid The fuel gas and air are adjusted for complete combustion Seger cones showed a temp. in the combustion zone of 1740°. The burner is made of non-corrosive metal cut from the solid, instead of from sheet or rod Trapping the exhaust showed 0.02% loss of $P_2O_5$ in concg from 43° to 111° Tw The acid is practically free from contamination, and the burner has a long life. High thermal efficiencies are obtained E. M Symmes

Improvements effected in the production of nitric acid by oxidation of ammonia.

GIACOMO FAUSER. *Chimie & industrie* 25, 556–69(1931).—See *C. A.* 25, 382.
A PAPINEAU-COUTURE

New applications of ammonia. M H. MERRISS *Compressed Gas Manufacturers' Assoc 18th Ann Repl* 1930, 28–37(1931).—At present about 32 5% of the synthetic $NH_3$ of the U. S A is employed in agriculture For other purposes the percentages are. 17 for explosives, 12 for refrigeration, 20 for miscellaneous purposes and 51 for chemicals and acids $NH_3$ is used as an alkali, a reducing agent, a source of $HNO_3$, H and N, a fertilizer material and a means of prepg foods, treating rubber and purifying drinking water. A good bibliography is included W. H. BOYNTON

Data and experiences in the manufacture of artificial nitrate. T. SZAFFKA *Technika* 11, 126–35(1930), cf *C. A.* 25, 2525.—Expts were carried out on concg 29 7° to 31 8° Bé $HNO_3$ and a waste acid contg 69–70% $H_2SO_4$, 5–10% $HNO_3$ and 20–25% water. The usual heating with steam dilutes the acid, therefore heating with warm air was tried successfully. The detailed literature of patents on the concn. of $H_2SO_4$ is listed The boiler method is advised for artificial nitrate factories. The manuf of $NaNO_3$ and its decompn to $HNO_3$ are described. S S DE FINÁLY

Some properties of commercial nitrates of lime. CAMILLE MATIGNON *Compt rend* 192, 777–80(1931).—The 2 principal forms of com nitrate of lime used in the *fertilizer industry* are the Norwegian, contg 13% N and 22 to 23% $H_2O$; and the ammoniacal nitrate of lime, contg about 5% $NH_4NO_3$ and 14% water Both varieties are very hygroscopic. A sample of the ammoniacal form increased in wt 42% after 2-hr. exposure to the air, and 72% after 6 hrs., then dissolving The possibility of spontaneous combustion of these products during shipment or storage was investigated Thermochem data are presented to show that decompn of both forms is endothermic and cannot occur spontaneously at ordinary temp Ammoniacal nitrate of lime, which is the more active form, was mixed with org combustibles such as might be derived from the containers in which it is usually shipped, and the mixts were heated gradually Up to 300° the combustibles in the mixts were unchanged Combustion first occurred between 320° and 350°. Com nitrates of lime, therefore, should not be susceptible to spontaneous combustion during shipping and storage Actual absence of such accidents verifies this conclusion There is no warrant for increased insurance rates based on spontaneous combustibility R. H LOMBARD

New process for the recovery of sodium nitrate in Chile. MAX SELIGMANN *Z Ver. deut Ing* 75, 513–6(1931).—Descriptive E. H

Separation of soda ash from brines of the Lake Tanatar. S Z MAKAROV. *Zhur. Prikladnoi Khim* 3, 1031–40(1930); cf *C A* 24, 5438.—Possibility of sepg soda ash from $Na_2SO_4$ is shown V. KALICHEVSKY

New procedure for manufacturing permanganates. LASZLÓ DE PUTNOKY AND BÉLA DE BOBEST *Matematik es Termeszettudományi Értesito* 47, 751–67 (in German 768–9) (1930).—*Pyrolusites with a low $SiO_2$ content are dissolved in $H_2SO_4$, forming $MnSO_4$*; more ore and HF are added to the soln., producing $MnF_3$, the electrolytic oxidation of which requires less current As the electrolyte contains 10% $H_2SO_4$ and 5% HF, special diaphragms should be made, which are resistant to this acid mixt Expts proved that material contg 90 parts fluorite and 5 parts cryolite formed into diaphragms and burnt at 750° is resistant, its loss of wt amounting to only 0 1% daily The anodic liquid should be worked up instantly, since it decomps quickly. Permanganates of alk. earth metals can be made directly, those of alkali metals indirectly only. The process is therefore not economical for producing alkali permanganates S S DE F.

Working up cyanide solutions to give potassium ferrocyanide and the preparation of potassium ferricyanide by treatment with compressed air and subsequent electrolytic oxidation W GLUUD, W KLEMPT, K KELLER, FR BRODKORB AND CL DIECKMANN *Ber ges Kohlentech* 3, 385–94(1931).—Cyanide solns are converted into $Ca(CN)_2$ which is converted into $Ca_2Fe(CN)_6$ by treatment with $FeSO_4$ From this, $K_4Fe(CN)_6$ is obtained by double decompn with $K_2CO_3$ To obtain the ferricyanide, the method found most successful was *oxidation of $Ca_2Fe(CN)_6$ with compressed air* in an autoclave, $CO_2$ likewise being present to remove $Ca(OH)_2$, since the action is reversible in presence of an alkali From 90 to 95% of the ferrocyanide can be oxidized in this manner To complete the oxidation of the remainder, the soln is electrolyzed between Ni electrodes, at a c. d of 0 01–0 005 amp per sq cm., an initial e m f. of 7–8 v and a final e. m f of 10–12 v A porous diaphragm is used, and a small quantity of CaO is added to the anode compartment to neutralize the free $H_4Fe(CN)_6$ formed there
H. STOERTZ

Increasing the purity of common salt. THOS B BRIGHTON AND CARL M DICE *Ind Eng Chem* 23, 336–9(1931).—Purification of solar salt made from Great Salt

Lake brine is described Special attention was paid to elimination of odor and color L. A. PRIDGEON

Is solid-carbon dioxide manufacture as a kiln by-product practical? C. L. JONES *Pit and Quarry* 22, 53–7(1931). E. H.

Chromite in 1929. LEWIS A. SMITH. *Bur. Mines, Mineral Resources of the U S* 1929, Pt. 1, 203–29 (preprint No 10, published March 5, 1931) E. H.

Colloidal graphite as a protecting medium for automobile radiators. O STEINITZ. *Automobiltech Z* 34, 236(1931) —A suspension of a colloidal graphite of 0 000001 mm diam in water (about $^1/_{10}$%) prevents the sedimentation of salts on the walls of the app and inhibits the corrosive action of the water on metal parts A A BOEHTLINGK

Revivification of bleaching earths. O ECKART *Seifensieder-Ztg* 58, 200–1 (1931) —A revivified earth recovers on the av 60% of its original bleaching power The oil is first extd. by some solvent and the solvent and the earth are then roasted or burned. P. ESCHER

The manufacture of bromine in France. M KALTENBACH. *Chimie & industrie* 25, 543–55(1931) —A detailed description of the process in use in French Br-mfg plants, dealing more particularly with the latest refinements in the processes for the manuf and refining of the Br A PAPINEAU-COUTURE

Properties of iodine. J LANZA *Anales soc españ fis quim* 29, 221–34(1931) — Aq I solns show marked supersatn phenomena, which explains many high soly results There is a max soly at 60° of I in $H_2O$ or aq KI soln In the system $H_2O$–KI–I contg an excess of the 2 latter components there is a reciprocal soly of KI for I, so that a soln satd with KI can still dissolve considerable quantities of KI when I is added, and reciprocally In dil solns the molar relation KI I is practically const between wide concn and temp limits E M SYMMES

An outline of the manufacture of carbon black. D F CRANOR AND L J VENUTO *Am Paint J* 15, No 26, 21–2(1931) —The history, manuf., uses and testing of carbon black are discussed briefly G G. SWARD

Preparation of copper-chromium oxide catalysts for hydrogenation. RALPH CONNOR, KARL FOLKERS AND HOMER ADKINS *J Am Chem Soc* 53, 2012–3(1931) — $(NH_4)_2CO_3 H_2O$ (71 g.) in 400 ml $H_2O$ is added to a soln contg 50 g $Cu(NO_3)_2 3H_2O$, 5 4 g $Ba(NO_3)_2$ and 77 g $Cr_3(NO_3)_4 15H_2O$ in 575 ml $H_2O$, the ppt. washed twice with 50-ml portions of $H_2O$, dried at 100–10° overnight, ground to a powder and heated to approx. 230°. C. J WEST

---

Utilizing C saturated with O [for manufacture of CO] (Ger. pat. 506,274) 21. Apparatus for carbonating solutions (U S pat. 1,799,354) 1.

---

Packing for autoclaves, etc. I G FARBENIND A.-G (Otto Leuchs, inventor). Ger 511,761, Jan 9, 1925. The packing consists of fibrous material soaked in starchy fatty acids or derivs The example mentions asbestos fiber soaked in glycerol and treated with the Na salt of a starchy fatty acid.

Nitric acid. E I DU PONT DU NEMOURS & Co Ger 522,167, May 7, 1929 See Brit 336,638 (*C A* 25, 1953)

Use of hydrocyanic acid gas. SOC. FRANÇAISE DU GAZ SANOS Fr 697,923–4, Sept 24, 1929 App are described for emitting an alarm gas along with hydrocyanic acid gas to prevent poisoning of persons thereby.

Sulfuric acid. RICHARD ZEH Fr. 697,884, June 25, 1930 See Ger. 509,703 (*C. A.* 25, 778)

Removing fluorine compounds from gas for sulfuric acid manufacture. TAKESABURO IKEBE, TAITU OTANI, TATU KIKUTI AND MITSUI KOZAN KABUSHIKI KAISHA Japan 89,600, Dec. 18, 1930 F compds are removed from $SO_3$ by passing through a layer of inorg material, such as pieces of glass or bricks contg $H_4SiO_4$ or sand and then washing with $H_2SO_4$ (30° Be.) contg alkali sulfites, sulfates or nitrates Silica gel or $K_2SiF_6$ or the like is recovered from the washing liquor

Ammonia synthesis. ALPHONS O JAEGER (to The Selden Co.). Can 310,208, Apr 7, 1931 $NH_3$ is synthesized by passing a gaseous mixt contg. H and N at an elevated temp over a contact mass contg at least one dild "permutogenetic body," at least part of the diluents being Fe-contg products Cf *C A.* 24, 1941.

Alkali nitrates. FRIEDRICH JOST Fr 698,404, July 4, 1930. An alkali nitrate is made from an alkali chloride, $HNO_3$ and $NH_3$ by using an alkali sulfate as intermediate product The latter is transformed by $HNO_3$ into alkali nitrate and a soln. of alkali bisulfate in $HNO_3$ The alkali nitrate is sepd and the soln neutralized with $NH_3$ and alkali chloride. The alkali sulfate formed is reutilized Cf *C. A.* 24, 1943

Aluminum-alkali chlorides. Metallges. A.-G. (Freiherr Conway von Girsewald, inventor) Ger. 522,031, July 5, 1923. Al is treated with a fused heavy metal chloride, *e. g.*, $PbCl_2$, in the presence of an alkali chloride. The heavy metal is obtained as a by-product. An example is given.

Cyanogen compounds. Georg Bredig and Egon Fild. Ger. 522,253, Dec. 8, 1922. A mixt. of a volatile N compd., a considerable excess of a volatile C compd., and a substantial amt. of H is passed at a dull red heat over a metal oxide, other than an oxide of a metal of the Pt group. Thus, a mixt. of $NH_3$ 5, CO 15, and H 50 pts. by vol. may be passed over $Ce_2O_3$ at 600°, yielding HCN. Other suitable oxides are $Al_2O_3$, $ThO_2$, and $ZrO_2$.

Nitrates from nitrites. Friedrich A. Henglein (to I. G. Farbenind. A.-G.). U. S. 1,798,533, March 31. Nitrites such as those of K or Na are treated with O at temps. of 180–500° in the presence of a catalyst of the group consisting of the alkali metal hydroxides, alk. earth metal oxides or their mixts. (at least one of the reaction materials being in the fused state).

Metaphosphates. I. G. Farbenind. A. G. (Otto Balz and Ernst Mische, inventors). Ger. 522,169, Nov. 29, 1929. Alkali or alk. earth metaphosphates are prepd. by heating the corresponding monoorthophosphates to about 400–500° in the presence of inert solids which do not soften or melt at the reaction temp.

Separating potassium phosphates and aluminates. I. G. Farbenind. A. G. Ger. 522,168, Nov. 24, 1929. Solns. contg. phosphates and aluminates of K, with or without KOH or $K_2CO_3$, are treated with $NH_3$ gas. The soln. seps. into two layers, the upper contg. mainly aluminate, and the lower contg. the phosphate with some aluminate. The layers are sepd., and the sepn. is completed by moderately dilg. the lower layer with water and repeating the treatment.

Phosphorus halides. N. V. Electro-Chemische Industrie. (Henri C. J. H. Gelissen, inventor). Ger. 522,270, Sept. 26, 1928. See Fr. 664,850 (*C. A.* 24, 926).

Zirconium salts. Deutsche Gasglühlicht Auer-Ges. m. b. H. Fr. 698,193, June 28, 1930. Ores of Zr contg. $ZrO_2$ and $SiO_2$ are attacked or dissocd. by alkali in amt. such that for one mol. of $ZrO_2$ one mol. of alkali oxide is used. $Na_2ZrO_3$ and $Na_2ZrSiO_5$ are formed, and if $SiO_2$ is present to excess $Na_4Zr_2Si_3O_{12}$ is also formed.

Alumina purification. Basil T. Horsfield (to Aluminum Co. of Am.). U. S. 1,798,261, March 31. For obtaining substantially pure alumina from alumina partially purified by reaction of a reducing agent at high temp. with assocd. oxide impurities such as Fe, Ti, Si and Ca oxides, the partially purified alumina in subdivided form is passed countercurrent through a stream of acid reagent of gradually increasing strength so that some unreduced oxide impurities are dissolved, and is then passed countercurrent through a stream of wash water contg. acid in quantities decreasing to zero.

Ammonium sulfate. Wm. G. Adam. Fr. 697,657, June 19, 1930. Crystals of $(NH_4)_2SO_4$ which have little tendency to agglutinate on standing are made from an aq. soln. contg. a small proportion of a free acid and a small proportion of an appropriate metallic salt favoring the formation of elongated crystals, *e. g.*, $Fe_2(SO_4)_3$. Cf. *C. A.* 24, 5048.

Ammonium sulfate. Patentverwertungs A.-G. "Alpina." (Soc. Anon. pour l'Exploitation de Brevets "Alpina." Patente Exploitation Cy. "Alpina," Ltd.). Fr. 698,485, Jan. 31, 1930. $(NH_4)_2SO_4$ is made by neutralizing $H_2SO_4$ with $NH_3$ in 2 or more steps, the lye being cooled between each step. An app. is described.

Barium hydroxide. Friedrich Rüsberg and Gustav Clauss (to Rhenania-Kunheim Verein Chemischer Fabriken A. G.). U. S. 1,799,939, April 7. Ba silicate is subjected to fine grinding in the presence of water to cause hydrolyzing of the finely ground material. Cf. *C. A.* 24, 5115.

Calcium cyanamide. Nikodem Caro and Albert R. Frank. Fr. 698,231, June 30, 1930. $CaCN_2$ and other cyanamides are prepd. free from dust by treating the ground carbide in the form of pieces or briquets. Cf. *C. A.* 25, 1041.

Bleaching powder. Soc. elettrica ed elettrochimica del Caffaro, Achille Carughi and Carlo Paoloni. Austrian 121,976, Nov. 15, 1930. Bleaching powder contg. more than 40% of active Cl is prepd. by chlorinating a suspension of $Ca(OH)_2$ in $CCl_4$ or other inert non-solvent for $Ca(OH)_2$ and $CaOCl_2$. The $Ca(OH)_2$ is ground in the inert liquid before, during or throughout the reaction, which is effected at a temp. above 40°. When the reaction is finished, the mixt. is cooled to below 20° and the product is dried. App. is described.

Bleaching powder. I. G. Farbenind. A.-G. Fr. 698,361, July 3, 1930. See Ger. 508,167 (*C. A.* 25, 781).

Bleaching lye. I. G. Farbenind. A.-G. Fr. 698,753, July 8, 1930. A lye for

bleaching and other purposes contains $Na_3PO_4$ and sol glass. It is made from phosphoric Fe contg Si (obtained in the electrothermal manuf. of P) by reaction with $Na_2CO_3$ and air, leaching the product with water and evapg to dryness

Lime from limestone. GLENN H. NILES (one-half each to Doherty Research Co and Arthur E Truesdell) U S. 1,798,802, March 31. A charge of limestone is heated in a kiln under a subatm pressure which varies in different portions of the kiln. Heat for burning is supplied by means of a circuit of hot gases which are passed upwardly through the charge, then removed from the top of the charge and reintroduced at a controlled rate and pressure into the lower portion of the charge admixed with heating gases in sufficient volume to maintain lime-burning temps, and the amt. of air employed is limited to that which is supplied at a controlled rate and pressure to produce the heating gases App is described

Iron oxide and sulfur dioxide. HORACE FREEMAN (to The Sulphide Research Corp, Ltd) Can 311,130, May 5, 1931 Iron sulfide ore is passed in finely divided form through a zone in which it is preheated to ignition temp. by contact with hot furnace gases, and through a second zone in which it is heated to fusion temp and burned with a deficiency of gaseous oxidizing agent whereby most of the S is oxidized and through a third zone in which it is further heated to a state of fusion and is burned with an excess of gaseous oxidizing agent whereby substantially all the Fe and the residual S are oxidized, and finally through a fourth zone in which the fused particles are chilled sufficiently to avoid agglomeration

Potassium phosphate. ROBERT D PIKE U S 1,799,479, April 7 In making $K_3PO_4$ from KCl and $H_3PO_4$ in a single furnace operation, a mixt. of KCl is furnaced with sufficient $H_3PO_4$ to form the tri-K phosphate and with sufficient $H_2SO_4$ to drive off substantially all the HCl, and a carbonaceous reducing agent such as coal or coke is added to complete the conversion of the furnace contents An arrangement of app. is described.

Sodium sulfate from natural deposits. ARTHUR T W WARNKEN (one half to Emanuel Johnson). U. S 1,798,993, March 31 The natural deposit is covered with fresh water which is then subjected to natural temp conditions of day and night so that the water is heated during the day to collect the $Na_2SO_4$ and cooled during the night to ppt. the material, and the warmed water is led during the day to a collection vat

Purification of carbon dioxide. RALPH H MCKEE Can 310,569, April 21, 1931. $CO_2$ contg low-boiling hydrocarbons is purified by cooling under a pressure of approx. 400–1000 lbs per sq in to provide a density of the $CO_2$ of approx. 5–60 lbs per cu. ft., and contacting with activated C, silica gel, solid paraffin in granular form or a heavy odorless oil such as refined white petroleum oil

Apparatus for making solid carbon dioxide of high density. MASATOSI OHKOTI, YOSITOSI OYAMA and INSTITUTE OF PHYSICAL AND CHEMICAL RESEARCH. Japan 89,547, Dec. 13, 1930

Gaseous sulfur compounds. KOLOMAN VON SZOMBATHY, KORNEL KELL and PAUL SCHMITZ. Fr 698,165, June 28, 1930. Ores contg. a metal and S are mixed with C and, while heated to incandescence, are exposed to a current of gas contg. steam. $SO_2$ as well as $H_2S$ is obtained if an excess of air is mixed with the steam. $Fe_2O_3$ may be added as a catalyst Fr 698,166 describes an app for absorbing $H_2S$ and $SO_2$ in gases by means of a finely divided concd soln of polythionates sol in water, *e. g.*, pentathionates or hexathionates of alkalies or alk earths The S which seps is extd from the soln and dried, while the soln freed from S is returned to the reaction vessel The process is accelerated by adding to the soln small amts of alcs, *e g*, 1–2% of glycerol, *and keeping the temp at 45–65°.*

Continuous calcination of gypsum. ALVA W TYLER U S 1,798,857, March 31. Finely divided raw gypsum is moved through a chamber in a stream of superheated steam at a suitable pressure; the superheat of the steam over its temp. of condensation at the pressure is sufficient to impart to the gypsum the heat necessary for its calcination without reduction of the steam to its temp of condensation App. is described. *Cf. C. A* 24, 1720

Catalytic reduction of carbonyl compounds. ALPHONS O. JAEGER (to The Selden Co). Can 310,207, Apr 7, 1931. Carbonyl compds are catalytically reduced by reaction with reducing gases in the presence of a contact mass contg a dild "permutogenetic body."

Hydrogen. JOHN S BEEKLEY (to DuPont Ammonia Corp). U. S 1,799,452, April 7. A mixt. of steam and $CH_4$, in the vol. ratio of at least 2:1, at a pressure of 1–50 atm. and at a temp. below 600°, is subjected to the combined action of a Ni cata-

lyst and magnesia (the latter being present in the proportion of at least one mol of MgO per mol of $CH_4$ in the gaseous mixt.) Cf. *C. A.* 25, 1345

Hydrogen. Heinrich Bomke Ger 516,843, Oct. 17, 1926 H is prepd. by passing water gas or similar mixts over a MgO catalyzer $CO_2$ absorbents may also be mixed with the catalyzer A suitable catalyzer mixt. is given by burned lime contg MgO

Hydrogen. Patentverwertungs A.-G. "Alpina" (Soc. anon pour l'exploitation de brevets "Alpina" Patente exploitation Cy. "Alpina," Ltd.). Fr. 698,481, Jan 31, 1930 H is obtained by washing coke-oven gas with water under pressure The gas which is first liberated from the water on reducing the pressure contains 20–35% of H and is returned to fresh unwashed gas

Hydrogen and other gases. George F Jaubert Fr 698,706, Oct. 9, 1929 Gases such as H are prepd with or without pressure by interposing between the liquid (caustic alkali or other) and the solid substance (Si or other) to be attacked by this soln., a partition or pocket made of appropriate material attackable itself by the reaction liquid but with less rapidity, to permit the charging of the reservoir which is to contain the gas under pressure, and the closing of it before the reaction takes place.

Graphite and hydrogen. I G Farbenind A.-G. (Hans Bahr, inventor) Ger. 516,991, Oct 4, 1929 Graphite and H are produced by the decompn of hydrocarbons in metal baths App for leading the hydrocarbons into the molten metal at suitable temps and at a suitable velocity is described In examples, hydrocarbons are led into fused Fe and fused Cu at 1300°

Active carbon Akt.-Ges. für Stickstoffdünger (Theodor Geis and Walter Pechtold, inventors) Ger 516,881, June 6, 1923 Highly active C is prepd by heating flue ashes of all varieties (*e. g.*, from coal, lignite, peat and wood fuel) to about 1000°, and not exceeding 1050° Cf *C A* 24, 1710

Apparatus for production of activated carbon. Wm M Williams (to Activities Ltd.) U S 1,798,827, March 31 Carbonaceous material such as coal dust is injected in a tangential direction into a combustion chamber in the form of an elongated furnace of rounded cross section Cf *C A* 24, 1710

Apparatus for producing carbon black by partial combustion of hydrocarbons. Chauncey Matlock (to Monroe Louisiana Carbon Co.) U. S 1,798,614, March 31. Various structural details are described

Adsorptive charcoal. Bernardino Oglietti Fr 698,752, July 8, 1930 Charcoal having the power of adsorbing gases and vapors, decolorizing charcoal and charcoal resembling lamp black are prepd by calcining, in the absence of air, residues obtained by evapg solns of org substances obtained by treating vegetable materials with hot solns of NaOH or KOH, washing the residue with water, treating it with strong mineral acids ($H_2SO_4$, HCl, etc.), washing with water, drying and grinding

Phenol-formaldehyde condensation products. Edward S Hole U. S 1,799,816, April 7 A non-sticking condensation product is made by condensing carbolic acid and $CH_2O$ by boiling in the presence of an alkali salt and ddg the material with water while it is still boiling, cooling the dild mixt., and subsequently adding more water contg a Cr salt The product is suitable for coating or impregnating

White phenol-formaldehyde condensation product. Tyozi Ariyama and Tyutaro Sibuya Japan 89,615, Dec. 19, 1930 A mixt. of ammonium or alkali borate, sol salts of Sn, Ti or Sb, HCHO and PhOH is heated to give a white condensation product.

Condensation products from formaldehyde. Ludwig Orthner Fr. 697,678, June 19, 1930 A mixt of glycolic aldehyde, trioses and tetroses is prepd. by heating an aq soln. of $CH_2O$ with the addn. of an alk reacting condensing agent such as $Pb(OH)_2$ until the reducing power of the reaction liquid for cold Fehling soln. has reached a max.

Gelatinizing urea-formaldehyde condensation products by heating with sucrose. Oscar A Cherry (to Economy Fuse and Mfg Co.) U S 1,799,954, April 7.

Artificial substances I G Farbenind A.-G Fr 697,693, June 19, 1930 A mixt. of vinyl compds or a mixt of one or more vinyl compds is polymerized with other compds capable of being polymerized and contg the group $=C=CH_2$, if necessary in the presence of a catalyst and a solvent and adding fibers and emollients Thus Et acrylate and vinyl acetate are polymerized together Other examples are given. Cf *C A* 24, 4128

Molded articles. John H Schmidt (to The Bakelite Corp.). Can. 309,680, Mar 24, 1931 Molded articles are made by shaping a fusible resinous substance of glycerol-polycarboxylic acid type in a mold, converting it while under pressure into an infusible resin, removing it from the mold and hardening it by further application of heat. *E g.*,

a mixt of 200 parts by wt of glycerol with 400 parts of phthalic anhydride, with or *without fillers or coloring materials*, is allowed to react at 140–200° to incipient gelation, and then poured into molds and heated under pressure until gelation occurs and the resin passes into the infusible state (the essential requirement is that the chem or phys change from fusibility to infusibility should take place in the mold and preferably under the molding pressure) The shaped article does not tend to lose its form or alter its dimensions on further heating

**Plastic materials.** C F Boehringer & Soehne G m b H Fr 698,321, July 3, 1930 The elasticity of plastic materials and objects made therefrom having a basis of cellulose derivs is increased by producing, either by addn, subtraction or substitution a layer free from or poor in plastifying agents. Thus, the articles may be dipped in ether or sprinkled with a soln of ethylcellulose in $C_6H_6$.

**Plastic materials.** Soc anon de décoration architecturale et mobilière. (Gustave Moncany, inventor) Fr 697,435, June 14, 1930 A plastic material capable of being molded is made by mixing plaster, fibers and asbestos powder and incorporating albumin or dextrin, molding, baking, dipping into a bath of water and glycerol, baking again, dipping into synthetic resin in alc. and baking Fr 697,436 describes a plastic material from asbestos fiber and paper beaten up with a synthetic-resin varnish to which metallic fibers may be added

**Plastic materials.** Thomas & Cie G m b H Fr 698,213, June 30, 1930 Pentamethylenediaminedisulfine is used as a constituent of plastic materials, either as the principal constituent or as a flux or softening agent.

**Porous masses from gypsum.** Riebenhold & Co., Vereinigte Kieselguhr- und Korkstein-Ges. Ger 522,139, Mar 6, 1929 Gypsum is mixed with relatively large amts of substances which increase the porosity of the product, *e g*, sugar or glue, and to compensate for the delaying action of these addns on the binding of the product, *there are added also accelerators of the binding, e g, a sulfate or a nitrate* The products are useful as *heat insulators, filter stones*, etc.

**Unbreakable transparent sheets.** Louis C. F. Pechin Fr 698,411, July 5, 1930 Unbreakable transparent sheets are made from condensation products of phenols with aldehydes, having transparent sheets of celluloid as interior or exterior supports.

**Silica gel.** Kozo Ikawa, Sizuka Isikawa and Mitsui Kozan Kabushiki Kaisha Japan 89,590, Dec. 18, 1930 Silica gel is manufd. by introducing $Cl_2$ or a mixt. of $Cl_2$ and a gas which does not react with alkali into water-glass soln. The product is washed with $H_2O$ and dried The filtrate contains about 80% NaOCl

**Adsorbents from gels.** Fritz Stoewener (to I G. Farbenind A.-G.). U S. 1,798,766, March 31 Part of the water sol impurities are removed from a gel such as that of silica by washing, the material is partially dried, washed again and then completely dried

**Material for drying gases.** Kozo Ikawa and Mitsui Kozan Kabushiki Kaisha Japan 89,593, Dec. 18, 1930 Anhydrous $MgSO_4$ is mixed with porous or colloidal material like $CaSO_4$ cement, silica gel, activated C, Japanese acid clay, powdered glass, $Al_2O_3$, etc. The product absorbs much $H_2O$, and can be used repeatedly by drying with heating

**Dehydrating material suitable for use in show casings, buildings, etc.** Howard H. Baker. U. S 1,798,862, March 31. A solid molded mass is formed of $CaCl_2$ 99% and 1% of metallic particles such as iron filings Sawdust may be added.

**Adhesive.** I. G. Farbenind. A.-G Fr. 697,874, June 25, 1930. A cold adhesive is made from condensation products of urea, thiourea or their derivs. with aldehydes or their polymers, water, and, if necessary, acids, salts or substances liberating acids and substances which increase the consistency of the adhesive.

**Adhesive for gummed paper.** Ferdinand W. Huempfner (to Mid-States Gummed Paper Co.) U. S 1,799,797, April 7. Paper or fabric is coated with an adhesive comprising a mixt. of 2 resinous gums (such as pontianak and copal) having different rates of soly. and a small percentage of non-drying vegetable oil such as castor oil.

**Cement.** Conrad Mahler. Fr. 698,010, May 13, 1930. A cement for repairing porcelain, etc., consists of a mixt. of flowers of chalk, freshly slaked lime, milk casein, quartz powder, glass powder, asbestos powder and coloring material.

**Cement.** Myron E. Delaney (to The Bakelite Corp.). Can. 310,617, April 21, 1931. A cement comprises about equal parts by wt. of a wax, such as chlorinated naphthalene, ester gum and about 5% of rubber latex This cement is used for securing glass to glass or metals, wood to wood, etc

**Clutch-facing fabrics treated with lead oleate.** Samuel P. Howe. U. S. 1,798,605,

March 31 A fabric such as that for use as a clutch facing is treated with Pb oleate Mica, Pb wire, Pb linoleate and asbestos also may be used in the material

Composite sheet material such as fiber and bakelite products. LOUIS T. FREDERICK (to Fibroc Insulation Co.) U. S. 1,799,506, April 7. Fibrous particles such as comminuted scrap canvas are felted by the action of suction operating through a pervious backing strip such as textile fabric which forms a part of the finished sheet, and the latter is treated with a suitable resin such as reactive "bakelite" compn. App. is described.

Impregnated bands. BAKELITE CORP. Fr. 698,358, July 3, 1930. Fibrous materials and plastified resinoids are mixed in the presence of water. The mixt. is formed into bands which are dried, superposed and united by compression and heat.

Emulsions. FREDERICK W. ATACK. Can. 309,760, Mar. 24, 1931. Stable, fluent emulsions are made by emulsifying a chlorinated hydrocarbon with water and Turkey red oil in the presence of a colloidal silicate, *e. g.*, 67% $C_2HCl_3$, 4.5% Turkey-red oil, 2% bentonite, 26% water, 0.45% ammonia (d. 0.89).

Sealing composition. ERNEST R. HANSON and MYRON E. DELANEY (to Bakelite Corp.) Can. 309,681, Mar. 24, 1931. A sealing compn. is prepd. by melting a wax-like halogenated naphthalene and dissolving gilsonite therein. This compn. is adapted for use in the manuf. of fixed *elec. condensers*.

Potting compositions. MYRON E. DELANEY (*to The Bakelite Corp.*). Can. 311,044, May 5, 1931. A potting compn. comprises 25–40% of a wax-like chlorinated naphthalene, 20–30% of gilsonite and 30–50% of montan wax and has a flow point ranging from 80° to 100° and a viscosity of less than 100 at 130°. This compn. is used on fixed elec. condensers, dry batteries, etc.

Arc-resistant composition. FRAZIER GROFF (to The Bakelite Corp.) Can. 309,679, Mar. 24, 1931. An article resistant to the carbonizing action of an elec. arc is prepd. by causing phenol to react with tung oil and a methylene-contg. agent in proportions to yield a resinoid product, admixing a cellulose filler therewith, partially baking the mixt. and molding under heat and pressure. Cf. *C. A.* 25, 1046.

Wetting, etc., agents. H. TH. BÖHME A.-G. Fr. 698,380, July 4, 1930. Wetting, cleaning, emulsifying, etc., agents are prepd. by sulfonating amines or hydroxyamines of the aliphatic series contg. more than 8 C atoms. Examples are given of the sulfonation of octadecenylamine. Cf. *C. A.* 25, 2532.

Wetting, etc., agents. CHEMISCHE FABRIK VORM. SANDOZ. Fr. 697,350, June 13, 1930. Monoaryl esters of glycerol and glycol are used along with carboxylic or sulfonic acids as wetting and emulsifying agents.

Wetting, foaming, dispersing and emulsifying agents. I. G. FARBENIND. A.-G. (Karl Daimler inventor). Ger. 521,035, Jan. 26, 1929. Quaternary ammonium salts suitable for the above purposes are prepd. by converting $Et_2NC_2H_4OH$ into a quaternary salt by reaction with a aralkyl halide, and then esterifying the OH group by means of a fatty acid chloride contg. at least 5 C atoms in the mol. Thus, a mixt. of $Et_2NC_2H_4OH$ and $PhCH_2Cl$ may be kept at 80–100° until the $PhCH_2Cl$ has disappeared, and oleic acid chloride then run in.

Wetting, cleansing and emulsifying agents. I. G. FARBENIND. A.-G. Fr. 698,637, July 8, 1930. There are introduced into org. compds. aliphatic, cycloaliphatic, mixed aliphatic-aromatic or aromatic radicals contg. alc. OH groups, ethylenic double bonds or sulfuric ester groups and also other reactive groups. (The esterification of COOH groups of fatty acids contained in fats and oils and their sulfuric esters is excepted.) The products are converted into sulfuric esters or their salts if they do not already contain sulfuric ester groups. Thus a mixt. of BuOH contg. HCl and the product obtained by the partial chlorination of fish oil are boiled under reflux and the product is sulfonated. The Na salt of the product has a high wetting and emulsifying power. Other examples are given. Cf. *C. A.* 25, 2824.

Detergent. E. KOLOZSY. Hun. 102,126, June 11, 1930. An aq. dispersion of natural or artificial latex is mixed with ethereal or other org. perfume and inorg. or org. filling materials.

Waterproofing agents. CHARLES H. THOMPSON and WM. J. MCGIVERN. Fr. 697,800, June 24, 1930. A product useful for waxing, waterproofing, etc., consists of an emulsion prepd. by adding to molten wax an alk. compd., *e. g.*, NaOH, KOH, $Et_3N$ or ammo compds., and with or without a protein soln. or a colloidal substance. The emulsion may be mixed or combined with soap and used as a supplying agent.

Anti-freeze solution. CHARLES V. MCAVOY (to *McAvoy Products Co.*) U. S. 1,798,547, March 31. See Can. 299,764 (*C. A.* 24, 3093).

Freezing mixtures. EMIL HUSEMANN. Ger. 516,880, Aug. 10, 1929. A freezing

mixt which maintains a low temp for a considerable time is obtained by adding ice to an aq -salt mixt below a layer of specifically heavier non miscible liquid such as $CCl_4$. The salt soln may contain glycol and the salt is preferably in granular condition

"Artificial" (imitation) snow. MAX C BAUMANN U S 1,800,187, April 7. A white readily crystallizable org acid such as benzoic and salicylic acid is mixed with a light-colored adhesive material such as sugar, potato flour and alum

Stiffening sheet material such as toe boxes of shoes. WILLIS A BOUGHTON (to Bennett Box Co) U S 1,799,949, April 7 A material such as cloth, leather or paper is treated with a sol silicate and glycerol Cf *C A* 24, 2848

Porous water-laid felt. HENRY P SHOPNICK (to Arden Box Toe Co) U S. 1,799,931, April 7. A porous water-laid felt is made with a preponderating proportion of long fibers bonded together with a smaller proportion of the gelatinized corium portion of untanned animal skins This product is suitable for use as a *box toe stock*

Planographic printing process. VALENTIN DIETZ (to American Multigraph Co) U S reissue 18,013, March 31 Reissue of original pat No 1,741,758 (*C A* 24, 1191)

Stencil sheet. SHINJIRO HORII. U S 1,799,793, April 7 A base of fibrous material such as Japanese yoshino paper is coated with a compn comprising a gelatinous org colloid such as gelatin dispersed in water in admixt with naphthenic acids Cf *C A* 25, 1958

Transfer. WINTHROP S. LAWRENCE (to Kaumagraph Co). U S 1,799,754, April 7 A paper base permeable to steam and free from any filler which would prevent the passage of steam is provided with a surface marking comprising a dye sol in water and embodied in a surface film such as a gum arabic compn which is sol in water, so that if steam is forced through the base it can act directly upon the film and dye Cf *C A* 25, 605

Cigaret tips. I G FARBENIND A -G (Walter Becker, inventor). Ger 516,716, Oct 6, 1929 Use is made of an under layer of resinous polymerized vinyl derivs and a water proof over layer In an example, the over layer is the product of cellulose acetate, tricresyl phosphate and acetone, and the under layer of bronze powder and vinyl resin

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G E BARTON, C H. KERR

Opacification of glass by blast lamp. M A BESBORODOV AND M F. SHUR. *Keram. i Sticklo* 6, 466–70(1930) —The authors describe tests made to ascertain the dependence of the velocity of glass opacification on (1) the chem compn of the glass; (2) the kind of flame used, (3) the method of working the glass, and (4) the quantity of cullet used in the glass Fifteen kinds of glass were treated with reducing and oxidizing flames. The results are tabulated and show that the velocity of opacification depends on the chem. compn. of the glass Glass contg CaO and alkalies becomes opaque most rapidly; glass contg ZnO becomes opaque less rapidly. Glasses having a high content of $Al_2O_3$ and $B_2O_3$ become opaque only with reducing flames With oxidizing and reducing blast flames they do not become opaque at all The presence of MgO in glass seems to aid opacification Glass contg $Al_2O_3$ (9 3%) does not become opaque when worked with any kind of flame Glass contg PbO becomes opaque less rapidly in a reducing flame than in an oxidizing flame A high quantity of $SiO_2$ aids opacification. All glasses become opaque more rapidly in a reducing flame than in an oxidizing flame The opacification of glass is a reaction taking place on the surface of glass through the building of new formations by the red hot gas particles Some formations have the character of crystals, others that of amorphous efflorescences The quantity of cullet does not influence the opacity of glass while being worked in a blast lamp flame. A series of other salt compds besides NaCl was tested to det their influence on the opacity of glass KCl removes the opacity completely and more rapidly than NaCl Br and I salts of K and Na also remove opacity, although the glass is not as transparent as when KCl is used Boric acid removes opacity in glasses contg $B_2O_3$. $Pb_3O_4$ and ZnO also remove opacity M V. KONDOIDY

Glass technology and industrial progress. W. E. S TURNER *J. Soc Glass Tech.* 14, 173–84P(1930) —A general discussion by T. and others. H F. KRIEGE

Progress in glass technology under the auspices of the glass delegacy. ANON. *J. Soc Glass Tech* 14, 307–13T(1930) —The annual rept. of the Glass Research Delegacy includes a list of the departmental publications. H F. KRIEGE

**International glass standards.** ANON *J Soc Glass Tech* 14, 158 9 P(1930) —The Deut Glastechnische Ges and the Soc of Glass Technology agreed upon the following standards (1) For general comparative purposes the thermal expansion of glass shall be detd for a mean temp of 50° over a range of 25° ± 5° to 75° ± 5°. The specimens shall be 5 6 mm thick and normally free from strain as detd optically The symbol of mean linear coeff of thermal expansion shall be $\alpha_{25}$. With measurements made at high temps a test piece shall be used only once and the rate of heating shall be 2° per min (2) The viscosities and the corresponding temps important in the characterization of glass are (*a*) $10^{7}$ c. g s units—furnace working temps, (*b*) $10^{6}$ c. g s. units—temp of the lower limit of the working range, (*c*) that at which a break occurs in the temp property curve This is given as $10^{14}$ c. g s. units where the property considered is elec cond (3) The symbol $T_g$ shall replace all other conventions to denote the transformation temp of glass The max point on the complete thermal-expansion curve for glass, namely, its softening temp, shall be denoted by $M_g$. H F KRIEGE

**Thermal endurance of glass.** W. J. A WARREN *J Soc Glass Tech* 14, 313–29T (1930) —The thermal-endurance data proposed by Gould and Hampton is critically examd Their formula is $\theta\sqrt{l}$, where $\theta$ is the min temp difference causing a tall conical beaker (200 cc. capacity) contg hot wax to fracture when plunged into cold water and $l$ is the max thickness in the bottom of the beaker along the course of the fracture W finds it necessary to specify that the max thickness shall lie within the concave part of the bottom in order to have concordant results Circumferential fractures give very slightly higher and more consistent values than transverse cracks Uneven distribution of the glass has no apparent effect where the ratio of max /min thickness is 1.5–2 0 The thermal endurance of beakers of sheet glass compn was found to be deteriorating several months after manufacture The best value of $\alpha$ in the formula, thermal endurance, $B = \theta/a^{\alpha}$, was found to be 0 36–0 40, where the beakers average 1 4 mm in thickness A more satisfactory expression is $B = \theta + (l-1)A$, where $A$ is a const for any definite compn which is deduced from a few beakers tested by putting $A = B/3\ 75$ H F. K

**A provisional standard test for the thermal endurance of glass.** ANON *J. Soc Glass Tech* 14, 160–3P(1930) —The test procedure accepted by the Glass Standards Comm of the Soc of Glass Tech uses a tall conical beaker (200 cc.) 140 mm. high, 72 mm diam base and 49 mm diam top as the standard article The thickness of the beakers should be as close as possible to 1 mm The beakers are tested from 2 to 48 hrs after manuf to avoid irregularities due to weathering, etc Beakers of satisfactory standard of annealing are selected Paraffin wax is melted in each beaker to form a layer 4 5 cm deep and heated to a few degrees above the temp desired When the immersed thermometer reads the desired temp such as 75°, the beaker and contents are plunged into water at 15° ± 1° If fracture does not occur the process is repeated at the next higher heating temp The testing should begin at a temp low enough to insure a no of chillings before rupture occurs The heating temps. increase in steps of 5° The difference between the temp of the chilling bath and the temp to which the beaker was last heated before fracture occurred is recorded, likewise the thickness of the beaker along the fracture and the *max* thickness in mm Any beaker having a min thickness less than ½ its max thickness along the fracture is rejected The results of 10 beakers whose max thickness is 0 9–1 9 mm. are averaged to obtain the thermal endurance of the glass according to the equation: thermal endurance = temp difference × $\sqrt{\text{thickness in mm}}$ H F. KRIEGE

**Calculation of the tensile strength of glass.** O KNAPP *Glashütte* 60, 364(1930), *J Soc Glass Tech* 14, 290–1A —I or the purpose of calcn of the tensile strength, it is assumed that this is an additive property dependent on the silicates present in the glass, and that when the $SiO_2$ content is 50–66 6 mols % the oxides are present as *monosilicates* and the excess $SiO_2$ is present as free oxide Similarly, when the $SiO_2$ content is 66 6–75 or 75–80 mols % the oxides are present as di- or tri silicates The tensile strength of such a glass is then readily calcd by use of factors, deduced from the data for tensile strength published by G Gehlhoff and M Thomas (*C. A* 22, 1448) A table shows the value for the tensile strength of 22 of Gehlhoff and Thomas's glasses as calcd (*a*) by A Winkelmann and O Schott's factors, (*b*) by Gehlhoff and Thomas' method and (*c*) by the above-mentioned factors The percentage deviation of each of these from the observed value is shown Methods (*b*) and (*c*) are fairly accurate but (*a*) gives rather high values G G

**Critical investigation of the methods for the determination of the resistance to**

**chemical attack of glasses** ERNST REXER. *Keram. Rundschau* 38, 387–90, 421–5, 464–5, 506–7, 546–8, 560–4, 590–3, 624–7(1930) —The methods now in use for testing the attack of water on glass were critically investigated Methods using crushed samples, the Mylius "surface samples" and autoclave samples were tried Relations between soly and size of sample, fineness of sample, character of surface and amt of strain were obtained H INSLEY

**Effect on the properties of a soda-lime-silica glass of repeated melting in platinum. The x-ray pattern.** W E S TURNER *J Soc Glass Tech* 14, 351–3T(1930), cf *C A.* 25, 788 —No change in phys properties was observed unless a chem change was produced by the repeated meltings in Pt H F K

**Development and trend of the mechanical production of white hollow glass ware.** A WENDLER. *J Soc Glass Tech* 14, 353–68T(1930) H F K

**The supposed diphasic nature of glass.** F W PRESTON *J Soc Glass Tech* 14, 349–50T(1930) —Double refraction has been noted in glass allowed to cool under pressure P suggests that this phenomenon may be due to the presence of ultramicroscopic crystals with some orientation H F K

**Use of borax in glass manufacture.** EDWARD MEIGH *J Soc Glass Tech* 14, 164–72 P(1930) —A general discussion by M and others H F KRIEGE

**The development of tank-block production.** HANS HIRSCH *Keram Rundschau* 38, 291–5, 312 5, 343–6(1930), cf *C A* 24, 5121 —A no of commercially made tank blocks were divided according to $Al_2O_3$ content into 2 classes Besides chem analyses, phys tests for sp gr, porosity, compressive strength, abrasive hardness (resistance to wear), resistance to thermal shock, resistance to molten glass attack and to $Na_2CO_3$ attack and refractoriness were made Although results show ambiguity due to differences in methods of manuf as well as compn, it is concluded that low porosity with only fine pores present, high d, uniformity in compn and structure and high strength give the best tank block and that, other things being equal, blocks high in $Al_2O_3$ give better resistance to glass attack than those low in $Al_2O_3$ H INSLEY

**The thermooptical properties of glasses rich in silica.** F RINNE *Keram Rundschau* 37, 772(1929), *J Soc Glass Tech* 13, 371A —The *n*s of glassy substances were detd for wave lengths of 735–440$\mu\mu$ for temps between —160° and 1000° The following substances were used (*a*) fused quartz, (*b*) hyalite ($SiO_2$, 3 4% $H_2O$), (*c*) hyalite ($SiO_2$, 4 84% $H_2O$), (*d*) opal ($SiO_2$, 8 5% $H_2O$), (*e*) opal ($SiO_2$, 9 73% $H_2O$) As the water content increased, the *n* was lowered The dispersion was const A max was detected in the *n* temp curve at 0° with glass (*e*) No sepn of water could be detected in an opal on cooling in liquid air G G

**Elimination of waste in the glass industry.** GEO. H MILES *J. Soc Glass Tech* 14, 185–95 P(1930) —General H F. KRIEGE

**Continuous kilns for the burning of clay products.** J WILLIAMSON *Trans Ceram. Soc* (England) 30, 21–32(1931), cf *C A* 25, 789 H. F KRIEGE

**Manufacture of bricks for road paving in the U. S. A. and Holland.** G A HODSON. *Trans Ceram Soc.* (England) 30, 37–45(1931) H. F KRIEGE

**Oil fuel and the brick industry.** I LUBBOCK *Trans Ceram Soc* (England) 30, 68–80(1931), cf *C A* 25, 1066 —To offset the higher cost of oil over coal 3 economies are claimed for oil fuel (*a*) reduction of time of burning, (*b*) elimination of under burned brick, (*c*) saving labor costs for coal and ash handling Various types of fuel-oil burners and oil-fired kilns are described H F KRIEGE

**Use of garbage slags for manufacture of slag bricks.** R GRUEN *Städtereinigung* 22, 71–8(1930) —A description of the new practice of refuse disposal at Cologne Chem analyses of garbage slags and their phys properties and the compn and test data on the phys properties of brick manufd from this slag are given E I. S

**Advances in the production of hollow tile.** ALFRED HIELSCHER *Tonind-Ztg* 55, 379–82, 420–3(1931) —*Modern machinery is described* B A SOULE

**Method for determining the workability of clay and ceramic masses with the ball plastimeter** WILLI M COHN *Tonind-Ztg* 55, 238–40(1931) —An app is described for measuring the workability of clay mixes It consists of a ball 20 mm in diam. attached to a plunger which is surmounted by a flat plate The ball is made to rest on the mud and weights are placed on the plate The depth of penetration of the clay into the mud is measured on an attached scale The depth of penetration depends on the water content of the mud, the pressure on the plunger and the time the pressure is applied Expts were made with one clay, by varying one of these factors and holding the others const The method is not claimed to be a measure of plasticity but rather a measure of the pressure component (yield value?) of the workability R F F

**Solid fuels in the fine ceramic industry.** A. JAESCHKE *Keram. Rundschau* 37,

541–5, 561–2 593 6, 631–4(1929).—Temps required for burning different kinds of ceramic ware are given and various fuels are evaluated E I S.

**The effects of various gases in the kiln on the burning of bright gold for gilded ceramic wares.** AKIRA NAKATSUCHI *J Soc Chem Ind, Japan* 34, Suppl binding, 67–9(1931).—$SO_2$, $H_2S$, CO, $CO_2$ and $H_2$ are found to be injurious, but not at low temps The best practice is to burn at 300°, sweep out the gases and heat to 750°. V F H

**Gas permeability of pyrometer tubes in relation to temperature.** W. MIEHR *Tonind -Ztg* 55, 149(1931).—Contrary to general belief, the permeability of ceramic pyrometer tubes to gases was found to decrease materially with increased temp This was explained by assuming that gases have a higher viscosity at high temp Detns of the viscosity of $CO_2$, $N_2$ and producer gas at 1220° confirmed this assumption R F FERGUSON

**Acceleration of the drying of ceramic products.** P P BUDNIKOV, G V. KUKOLEV AND L L MANDELCRÜN *Tonind Ztg* 55, 409–11(1931).—The drying time may be lowered 50% by addn of electrolytes, especially 0.5% $FeSO_4$ or 0.25% $Al_2(SO_4)_3$. B A SOULP

**Silicates high in alumina.** VLADIMÍR ŠKOLA *Chem Listy* 25, 30–4, 59–61(1931).—The phase diagram for the system $Al_2O_3$-$SiO_2$ is evolved and discussed in connection with the production of corundum, sillimanite, andalusite, etc FRANK MARPSH

**Some of the newer uses for silicon carbide.** CHARLES MCMULLEN *Trans Electrochem Soc* 59, preprint 6 pp (1931).—Important recent adaptations of SiC are recorded and discussed In recuperators cylindrical tubes are used In the "Carborradiant" combustion chamber a mixt of air and fuel is injected into a SiC box The Thornhill Anderson furnace has an arched overhead combustion chamber made of SiC Other applications include boiler furnace walls, heating elements, therapeutic lamps, resistors for radio equipment and lightning arresters The physical properties of SiC are tabulated C G F

**Grog.** C R F TURRELFALL. *Trans Ceram Soc* (England) 30, 1–18(1931); cf. *C A* 25, 783.—The best fireclay grog is made from raw lumps calcined at high temps and crushed to have a splintery shape To make low porosity brick it is best to use grog with high porosity H F KRIEGE

**Refractory materials Observations on the behavior of refractory materials in continuous vertical retorts.** A T GREEN *Inst Gas Eng* 1930, Communication No 22, Pt 3, 9–26, *Gas Eng* 47, 689 91(1930), *Gas J* 192, 720–4.—Most cases of "holing" were found to originate in the interior of the retort rather than in the combustion chamber Foreign substances such as Fe compds and alkali from coal, cause superficial disintegration or corrosion The reducing atm prevailing in the retort accentuates the slagging action of iron slags The viscosity or stickiness of the slag at the surface is important in its influence on the passage of the charge through the retort High-alkali slags cause augmented stickiness for alkali silicates are low melting Material in the zone 6 to 12 ft from the top of the retort often peels off in thin layers Examn of these flakes showed a very slight increase in Fe content. The alkali content increased from 0.52% to 0.73%, the sp gr decreased from 2.36 to 2.32 Flaking often takes place during the scurfing operation The surface in contact with the scurf has probably been weakened at definite planes by (*a*) depositions and impregnations, (*b*) constitutional changes in the $SiO_2$ in the surface layers resulting from previous high temp scurfings, (*c*) a general spalling tendency of a $SiO_2$ product. Joints and jointing cements are considered A H DIERKER

**Refractory materials for electric furnaces. II. Copper and its alloys, including bronze, gun metal, brass, copper-nickel and phosphor-bronze** ALFRED B SEARLE *Metal Ind* (London) 38, 333 5(1931) cf *C A* 25, 1650.—The most important types of elec furnace for melting copper, brass, bronze, etc., are the direct arc, the indirect arc, the induction and the granulir resistance The direct arc type furnaces are suitable only for bronzes and alloys contg less than 6% Zn, while the indirect arc types are applicable to all Cu alloys The Pb content of the alloy dets the type of lining—magnesite being preferable when Pb is present, though Zn may react with a MgO lining In the Ajax-Wyatt furnace for melting yellow brass, a lining consisting of a refractory cement of a compn corresponding to a mixt of fireclay, $SiO_2$ and asbestos fiber is often used Fireclay bricks are generally satisfactory Silica bricks are used for the roof and the parts of the sides not coming in contact with slag Pure magnesia bricks fully burned and enclosed in steel cases, show long life Zirconia bricks are highly refractory but very expensive The use of fritted linings has increased widely he range of metals for the linings of industrial furnaces of the Ajax Wyatt type and

has increased greatly the no of runs obtainable without relining the furnace W. H. BOYNTON

**Refractory clays in Calhoun and Pike counties, Illinois.** J E LAMAR. *Ill State Geol Survey, Rept Investigations* No 22, 43 pp (1931) R. F FERGUSON

**The determination of aluminum oxide in refractory clays.** R BIAZZO. *Ann. chim applicata* 21, 3–12(1931) —Where only the amt of $Al_2O_3$ is to be detd, time is saved by volatilizing the $SiO_2$ by means of $H_2SO_4$ HF, detg $Al_2O_3 + Fe_2O_3$ and then detg $Fe_2O_3$ in the ordinary ways and obtaining the amt of $Al_2O_3$ present by difference $Al_2O_3$ was detd with less than 0.25% error by this method A W CONTIERI

**The possibility of andalusite as a refractory.** FRANK H RIDDLE *Trans Electrochem Soc* 59, preprint 16 pp (1931) —The com development of $Al_2O_3$ $SiO_2$ refractories stimulated the search for deposits of a natural mineral of this so-called "sillimanite type" Regardless of the proportions in which the 2 oxides occur to begin with, after exposure to furnace temps mullite, $3Al_2O_3$ $2SiO_2$ is formed with one or the other oxide in excess Many expts have shown that andalusite of proper grain size and proportion, when held together with a min amt of a plastic aluminous bond such as clay, makes a very desirable refractory It is const in vol during calcining An extensive deposit of andalusite has been located in Mono County, Calif About 350 million spark plug cores have been made from this andalusite Important localities of cyanite, sillimanite and dumortierite are briefly described Tests on andalusite refractory are detailed, demonstrating its superiority over other refractories of this class C G F

**Works tests on refractories and service conditions.** R. J SARJANT *Trans Ceram Soc* (England) 30, 46–65(1931) —Load tests indicate serviceability Changes in porosity and d on firing to 1450° give useful indication as to probable service behavior Simulative slag resistance tests are valuable if classified according to type of refractory and use Reliable spalling tests are hard to get and to interpret in terms of service conditions Heat cond data have definite economic value For magnesite refractories, optical detn of the % periclase present and the d and porosity changes before and after firing to 1600° are important tests Chem analysis, particularly as regards $SiO_2$, MgO and CaO, provides the most essential information regarding dolomite refractories In silica refractories the degree of conversion and bond are most important characteristics, while in fireclay bodies bonding of the clay is very important Refractory cements should be examd by all available tests both alone and built up with refractory units H F KRIEGE

**Thermotechnical possibilities and requirements in the ceramic, especially in the refractory-materials industry.** W BRASS *Sprechsaal* 62, 445–7(1929) —Thermotechnical conditions in the ceramic industry and their causes are investigated Good results were obtained in tests carried out on an old chamber oven making use of gas-analytical app. E I. S

**The effect of smelter atmospheres on the quality of enamels for sheet steel** ANDREW I ANDREWS AND EMANUEL A HERTZELL Univ Ill Eng Expt Sta, *Bull* No 224, 15 pp (1931), cf *C A* 25, 1650 —The presence of $N_2$, $CO_2$ and reducing atms in the smelting furnace is not deleterious to sheet steel enamels, but $SO_2$ is extremely harmful H L OLIN

**Notes on the manufacture in New Zealand of electrical porcelain.** E. W. ACKLAND *Proc. New Zealand Soc Civil Eng* 16, 274–86, 287–302(1929–30) —This is a 98% local industry Methods of manuf are outlined E I S

**A study of the electrical strength of porcelain.** JOHN O KRAEHENBUEHL AND CULLEN W PARMELEE *Trans Electrochem Soc* 59, preprint 15 pp (1931) —The paper records some of the existing inconsistencies in the literature concerning solid dielectrics, particularly porcelain Observations show that the puncture track is largely a matter of chance and depends upon flaws A statistical study was made of a particular body, prepd under controlled conditions The paper does not try to define a test method or a specification, but shows the importance of a complete study of the test data C G F.

**The microstructure of some porcelain glazes.** CLYDE L THOMPSON Univ Ill Eng Expt. Sta., *Bull* 225, 24 pp (1931) —Glazes studied fell within the compn range of (0.3 $K_2O$, 0.7 CaO), 0.4 to 1.0 $Al_2O_3$, 2.0 to 8.0 $SiO_2$ A series of glazes was made from the usual potters' materials and examd microscopically A second series was made from pure chemicals and the primary crystalline phase sepg from each glass and its temp of equilibrium were detd Conclusions (1) Good mat glazes owe their matness to crystn (2) $Al_2O_3$ plays a double role in mat glazes, furnishing an essential constituent of the crystallizing mineral and also regulating the viscosity to prevent

under crystal growth. (3) Many of the bright pressed glasses are not all glass but contain undissolved quartz, and show traces of devitrification. (4) An excess of either $Al_2O_3$ or $SiO_2$ will cause devitrification, while a greater excess will cause immaturity. (5) The $Na_2O$ introduced by the feldspar has a definite effect on the compn. of the mineral sepn. from the melt upon crysts. H. L. Olin

Glass. Corning Glass Works. Fr. 667,570, June 17, 1929. Glass which has been frosted *e. g.*, elec. bulbs, is prevented from "aging" by washing it in an aq. soln. of $AlF_3$.

Glass making. Ernst Hagens. Fr. 667,418, June 14, 1929. App. for rolling plates of glass is described.

Melting glass. Gustav Keppeler. Fr. 667,544, June 24, 1929. In melting glass the mixt. contg. finely divided $SiO_2$, sweated in known manner, is submitted to a brisk elevation of temp. so that trapping of the fusion gas is not possible and the sweating material, before melting, remains as completely as possible in the action of the flame.

Paddle mechanism for circulating molten glass. John Mowcrity, Ltd., and Alexander F. McInnes. Ger. 522,470, Feb. 15, 1929. Brit. 290,623 (C. A. 24, 2556).

Apparatus for feeding molten glass. Thomas F. Pearson. Ger. 522,500, April 25, 1929. Corresponds to Brit. 221,145.

Mold for glassware. Wm. T. Barker, Jr. (to Hartford-Empire Co.). U. S. 1,728,126, March 31. Structural features of a mold with pipes in its walls for circulation of a temp.-controlling fluid.

Glass-forming apparatus suitable for manufacture of blow-molded ware. Edward H. Lorenz (to Hartford-Empire Co.). U. S. 1,728,191, April 7. Structural features.

Mold for forming glass articles such as bottles. Orrett C. Norris (to Tygart Valley Glass Co.). U. S. 1,728,217, March 31. Mech. features.

Apparatus for manufacture of stemmed and footed glassware. Virgil O. Conwell (to Federal Glass Co.). U. S. 1,728,278, March 31. Structural features.

Decorating and annealing lehr for glassware. Virgil Mumbollard (to Hartford-Empire Co.). U. S. 1,728,552, March 31. Structural features.

Electric furnace for glass manufacture. Harry F. Hitner (to Pittsburgh Plate Glass Co.). U. S. 1,729,271, April 7. Structural and elec. features.

Cooling furnace for sheets of glass. N. V. Mij. Tot Beheer en Exploitatie van Octrooien. Fr. 667,572, June 24, 1929.

Roll-conveyor lehr for intermittently prepared sheet glass. N. V. Maatschappij tot Beheer en Exploitatie van Octrooien. Ger. 520,255, June 26, 1929.

Roller apparatus for conveying intermittently prepared sheet glass to the lehr. S. C. Anon. des Manufactures des Glaces et Produits Chimiques de St. Gobain, Chauny & Cirey. Ger. 522,416, Oct. 14, 1927.

Method and plant for making sheet glass with wire insertions. Hermann Müller-Sievers. Ger. 522,687, July 19, 1928.

Sheet- and plate-glass manufacture. Wm. Wellenreuth (to Libbey-Owens-Ford Glass Co.). U. S. 1,729,232, April 7. Mech. features.

Method of making glass articles showing marbled or veined effects. Jenaer Glaswerk Schott & Gen. Ger. 522,417, Dec. 4, 1928.

Laminated glass. George B. Watkins (to Libbey-Owens-Ford Glass Co.). U. S. 1,729,075, March 31. Laminated products such as those comprising glass sheets with an intervening sheet of cellulose or the like are subjected to the action of a solvent bath such as triacetin for a sufficient time to cause a "flowing" of the intervening sheet material to form a seal at the edges. Cf. C. A. 24, 2556.

Kiln for firing ceramic ware. Robert H. Youngman and Robert H. H. Pierce. U. S. 1,728,297, March 31.

Kiln (with preheating, firing and cooling zones) for treating ceramic ware. Frank M. Hartford (to Harrop Ceramic Service Co.). U. S. 1,729,930, April 7.

Direct-fired tunnel kiln and heating system for ceramic articles. Isaac Hartzell, Anthony M. Kopler and Frederick H. Norton (to Babcock & Wilcox Co.). U. S. 1,729,256, April 7. Various details of construction and operation are described.

Channel ceramic furnace. F. A. Meynard. Russ. 12,519, Feb. 29, 1931.

Brick kiln. Bonnesser & Co. m. b. H. Ger. 516,970, Feb. 13, 1929. Details of fuel loading are given.

Insulating brick. Edwin B. Forse (to Carborundum Co.). U. S. 1,728,934,

March 31. An insulating brick suitable for lining furnaces is made with a dense facing, having a permeability of less than 100 units through the brick and facing and a permeability of over 300 units when the facing is removed. The facing may be formed of vitrified clay 4, unbaked clay 4 and Na silicate 2 parts

Refractory material. SANDFORD S COLE (to Koppers Co) U. S. 1,798,972, *March 31.* *A refractory material suitable for use in furnace or coke-oven construction* is formed from a silica body such as ganister mixed with a ferric salt such as $FeCl_3$, lime, an org acid such as lactic acid and with $Ca(CNS)_2$ and water, molded, dried and fired Cf *C A* 24, 3873

Abrasives. BAKELITE CORP Fr 698,090, June 26, 1930 A supple phenol resin such as that described in U S 1,590,079 (Byck, *C A* 20, 3090) is used for binding abrasives to supple supports

Enameling iron VEREINIGTE CHEM FAB KREIDL, HELLER & Co Ger 522,472, Nov. 4, 1923 Fe articles, particularly sheet Fe, are provided with a colorless ground-enamel coating, free from CoO or NiO by applying a suitable mixt of readily fusible and difficultly fusible substances in the form of a moist pulp and then heating the article for a short time, so that the difficultly fusible substances do not completely dissolve in the readily fusible substances with the result that a coarse-grained coating is produced A suitable mixt contains borax 36 3, feldspar 36 3, quartz 32, soda 6, $NaNO_3$ 6 $CaF_2$ 1.8 and kaolin 10 parts

## 20—CEMENT AND OTHER BUILDING MATERIALS

J C WITT

Chemical constitution of cements. FERRARI *Ind cemento* 25, 6(1928); *Ceram Abstracts* 9, 259—F reviews the literature dealing with the chem constitution of calcareous cements and cites references dating between 1785 and 1925 G G

White cements. L. NICOL *Baumarkt* 29, 451–2(1930), *Ceram Abstracts* 9, 1017–8—White cements are classified as portland, "marble," magnesia and special cements. White portland cements include all those which chemically are similar in compn. and in properties to the gray portland cement. The white portland cements examd had on the av the following compn: lime 51–2, $SiO_2$ 13–24, $Al_2O_3$ 6–13, $Fe_2O_3$ 0.2–0 6, $SO_3$ 0 4–1 5, MgO 0 2–0 4, potash salt 0 3–2 0, loss on ignition 2 3–6 0%. In every white portland cement the $Fe_2O_3$ was replaced by $Al_2O_3$ down to a small part; its properties are similar to those of the ordinary gray portland cement, except that the white cement sets more slowly because of the higher degree of gel formation From 10 to 25% of fine white quartz sand should be added to the white cement in making the concrete, and the mixing water must contain no Fe. A plant at Stettin made a good white Stern cement of the following av. compn: lime 58–60, $SiO_2$ 19–20, $Al_2O_3$ 12–14, $Fe_2O_3$ 0 3–0 6, $SO_3$ 1 0–1 5, loss on ignition 5–6, MgO 0 1–0 3, and potash soda 0.3–0 5% A good French white cement is the Le Noble cement, which has the following compn lime 62 75, $SiO_2$ 22 00, $Al_2O_3$ 5 90, $Fe_2O_3$ 0.25, MgO 0 60, $SO_3$ 0 55, alkalies 0 20, loss on ignition 9 15% "Marble" cements are, in general, not to be used for outside work, for they are not hydraulically hardening cements They comprise double-calcined gypsum with addns of alum A Luxemburgian marble cement has the following compn. lime 67 80, $SiO_2$ 20 20, $Al_2O_3$ 1.25, $Fe_2O_3$ 0 25, MgO 1 38, $CO_2$ 1.26, "sand" 1.30, loss on ignition 6 04, and $SO_3$ 0 40% Russia has a very light marble cement called La Glyptolithe A Swiss white marble cement has the following compn ignition loss 5, lime 39, $SiO_2$ 18, $Al_2O_3$ and $Fe_2O_3$ 28, $SO_3$ 7, alkalies 1.2, MgO 0 6, and barite 0 2% Of the white special cements, one is made from rock chalk, infusorial earth (kieselguhr) and soda soln, and the other from calcined lime (white lime) and ground colorless silicic acid which are mixed in the slaking drum. G. G.

Action of magnesium sulfate on cement. P KREMSER *Ind cemento* 26, 8 (1929); *Ceram Abstracts* 9, 258—K. describes the occurrence of $MgSO_4$ and its chem relation to cement CaO is subject to the disintegrating action of $MgSO_4$ according to the equation $Ca(OH)_2 + MgSO_4 \longrightarrow CaSO_4 + Mg(OH)_2$; the hydrate of magnesia being a white, gelatinous mass. The detrimental compd sulfatoaluminate of Ca is then formed according to the equation $3CaSO_4 + (3CaO\ Al_2O_3\ 12H_2O) + 18H_2O \longrightarrow 3CaO.Al_2O_3\ 3CaSO_4\ 30H_2O$. This action effects change of vol and disintegration of the cement K also describes results obtained by satg. the specimens with "Sika," a cement paint for reducing disintegration by $MgSO_4$ G. G

Material balance in the rotary-kiln cement plant. D STEINER *Tonind-Ztg*

55, 479–80(1931).—A 100-kg. charge yields 64.5 kg. of clinker and 5 kg. of flue dust. This latter is composed of 1 kg. unburnt charge, 2 kg. calcined, 1.3 kg. ash and 0.7 kg. coke. With 330 g. of coal per kg. of clinker and 15% excess air, 3.35 kg. of air per kg. of clinker is required. A flow sheet and analytical data are given. D. A. Soule

Specifications for the grading of sand, gravel and crushed aggregates. Anon. *Zement* 20, 37–8(1931).—A report is given of the 3rd Conference of the Comm. for the Standardization of Particle Sizes. H. F. K.

Chemical studies of rock used in the construction of old monuments in the city of Salamanca, of the patina of the same, and its artificial reproduction. I. Ribas and Petra de Prada. *Anales soc. españ. fis. quím.* 29, 211–20(1931).—The golden yellow color of the patina on the old stones in Salamanca is due to Fe hydroxide. Patination is caused by dehydration of the hydroxide on the surface. Suitable treatment of the stone with pptd. $Fe(OH)_3$ reproduces the patina. E. M. Symmes

Pulverized iron for waterproofing and hardening floors and walls. Charles Kew. *Creamery and Milk Plant Monthly* 20, No. 5, 90–1(1931).—Pulverized iron suspended in water is applied to concrete, brick or masonry and permanently waterproofs these materials. The water, soaking the walls, carries fine particles of iron with it which oxidize and swell up and thus seal the pores. A. H. Johnson

Colonial wood from Spanish Guiana. II. T. Bataecas. *Anales soc. españ. fis. quím.* 29, 184–8(1931); cf. *C. A.* 25, 189.—Detns. of water, ash, B. t. u., apparent d., and ultimate analysis were made on *Dyospiros ervila* (ebony), *Pterocarpus sovansii* (palo rojo or padouk), *Lovoa klaineana* (envero), *Isolana klaineana* (ogoa or n'fé), ebanan or m bebame (a species of *Chrysophylum*), and adeba or ondondú. E. M. Symmes

Walz, Kurt. Die heutigen Erkenntnisse über die Wasserdurchlässigkeit des Mörtels und des Betons. Berlin: Ernst. 92 pp. M. 9.

---

Cement. G. Polysius A.-G. Ger. 522,022, Dec. 4, 1925. A method of dewatering crude cement sludge in a horizontal centrifuge is described.

Cement. Bruno Bruhn. Fr. 697,673, June 19, 1930. The relative content of $SiO_2$ in normal portland cement is reduced by increasing the content of sesquioxides and the mass is fused. In the fusion of a mixt. of slag and lime the relative content of $SiO_2$ is reduced by increasing the content of sesquioxides. Other fluxes such as $CaCl_2$ or compds. of HF may also be added.

Cement. Caspard Winkler. Fr. 698,422, July 5, 1930. Cements of various kinds are protected against the action of corrosive waters by replacing a part of the sand by clinker of portland cement or other cements, the size of grain being between 0.15 and 2 mm. The clinker is preferably treated before use with solns. of alkali or alk. earth compds. or F compds. or solns. of oxalic acid or its salts.

Cement. Trefileries et laminoirs du Havre (Anciens établissements Lazare Weiller) and Soc. coöpérative de Rugles et la canalisation électrique réunis. Fr. 698,515, May 24, 1930. In making porous cements by decompn. of part of the mixing water under the action of Al powder, the formation of a protecting layer of $Al_2O_3$ on the Al is prevented by the addn. of certain chlorides such as $MgCl_2$ or HCl and calcined MgO. A soln. of $KMnO_4$ may also be used to prevent oxidation.

Cement. Arthur F. Fabre. Fr. 698,520, May 6, 1930. A special portland cement is made by substituting pozzolana for $CaSO_4$ in com. portland cement.

Fused cement. Stefan Kohut. Ger. 516,859, Nov. 23, 1928. See Fr. 685,027 (*C. A.* 24, 5456).

Porous cement. Soc. anon. Trépileries et laminoirs du Havre (Anciens établissements Lazare Weiller) and Soc. coöperativé de Rugles et lac analisation electrique réunis. Fr. 698,320, July 3, 1930. Porous cements are made by the action of a metal such as Al and a soln. of $KMnO_4$ or $MgCl_2$ or $MnCl_4$, CaO being added in suitable proportion to increase the action of the metal.

Dry mixing of cement-forming materials. Mikael Vogel-Jorgensen (to F. L. Smidth & Co.). U. S. 1,798,423, March 31. Various details of procedure and app. are described for obtaining a uniform mixt.

Waterproofing material for cement. Manziro Nakahara and Tokyo Industrial

LABORATORY Japan. 89,610, Dec. 10, 1930 A mixt. of resin and pitch is emulsified with aq soln of glue, and $H_2SiF_6$ and a substance contg sol silicic acid are added.

Concrete. BETONIT GES M B H and N V. HOLLANDSCHE BETONIT MAATSCHAPPIJ Fr 698,636, July 8, 1930 Articles such as pipes molded in concrete are placed in a closed space, which is then filled with liquid bitumen, asphalt or tar and submitted to pressure

Preparing and placing concrete. KARL P BILLNER (to Aerocrete Corp of America) U S 1,798,924, March 31 An intimate mixt is formed of cement, water and a gas-producing agent such as Al powder, and a counteracting pressure is applied to the mixt to prevent expansion of gas bubbles and to permit a pressure to develop within the mass while the chem reaction is in its incipient stages, the mass is then transported to the place of use, the counteracting pressure is relieved and it is deposited where desired App is described

Slate as a concrete aggregate. P N SHABLUIKIN and M I KOIFMAN Russ 19,510, Feb 28, 1931 Crushed slate, obtained as a waste product in slate production, is heated at 1100–1200° before being incorporated into concrete

Coating concrete vats. STANDFASSWERKE ROSTOCK & BAERLOCHER and GEORG WALTER Fr 698,562, June 25, 1930 Fermentation vats and reservoirs are coated internally by aq emulsions of bitumens, resins or lignite waxes to which oils and fats may be added Mortar may be added to increase the adherence

Road-making compositions. ROMAN GRENGG and ANNEMARIE SCHMÖLZER Austrian 121,773, Oct. 15, 1930 The binding of compns comprising rubble or the like and water glass, is improved by addn of powd sintered magnesite, or of powd wood charcoal that has been stored in $CO_2$ The sintered ferruginous waste obtained in working up magnesite may also be used

Road tar. THERMAL INDUSTRIAL & CHEMICAL (T I. C.) RESEARCH CO., LTD Fr. 697,824, June 23, 1930 A tar suitable for roads is made by adding a small proportion of acid, preferably $H_2SO_4$, to a crude tar free from wax, agitating the mixt at 55–83°, neutralizing the mixt and dehydrating it, and if necessary heating it to volatilize the light oils and obtain the desired consistency

Asphaltic and bituminous compositions. GENERAL TECHNICAL CO., LTD Fr 698,680, Oct. 7, 1929 Compns. of relatively high m p suitable for roads are made by heating residues from the distn of natural petroleum or coal tars to a temp of 360–430° at atm pressure, and eliminating the resulting liquid products from this partial dissocn as they are formed

Expansion joint for concrete pavements. ALBERT C. FISCHER (to Philip Carey Mfg Co.). U. S 1,800,193, April 7. Various details are described of the use of fibrous material and bituminous material together. U S 1,800,194 relates to products such as satd. paper or felt having an adhesive surface such as oil or asphaltic compn protected by a water-sol covering such as Na silicate. *Cf C A 24, 4008*

Building block. FRANCIS J STRAUB U S 1,798,505, March 31. The smaller particles and fines are sepd from an original mass of cellular coal-cinder aggregate and while dry these are mixed with a suitable binder such as portland cement. The remainder, composed of the larger pieces, is soaked in water and the materials are then mixed together for molding into blocks. An arrangement of app is described

Shaft furnace for burning gypsum. I. F FLORETZOV Russ 19,520, Feb 28, 1931. Structural details.

Artificial stones, etc. SOC ANON POUR L'IND DE LA MAGNÉSITE (SUCCURSALE DE HONGRIE). Fr 697,898, June 25, 1930 Very refractory stones resistant to rapid changes of temp are made by grinding magnesite (fritted or concreted) or overburnt MgO, removing the very fine particles—not more than 50%—and replacing them by an equal amt of finely ground substances rich in $Al_2O_3$. The mixt is used as mortar, fireclay lining or molded in the form of stones and baked.

Fireproof composition suitable for use in building construction. CARL MARCZINCZEK. U. S. 1,800,024, April 7 Volcanic cinders 45, cement 20, gypsum 5, hydrated lime 5 and finely ground pumice 25 parts are mixed with sufficient water to cause the mixt. to set.

Apparatus for making asbestos-cement tubes. RUDOLF HAYDEN Austrian 121,643, Oct 15, 1930.

Surface coloring of flat articles such as asbestos-cement shingles. CLEMENTS BATCHELLER (to Bemis Industries, Inc.) U. S 1,798,906, March 31. Flat objects having an alk. reaction are treated with a soln of a metallic salt such as Cu and Fe salts which will react with the alk substance to form an insol. compd and treated surfaces are juxtaposed to retard evapn. of the soln.

Surface coloring of articles such as asbestos-cement shingles. CLEMENTS BATCHELLER (to Bemis Industries, Inc.) U. S 1,798,097, March 31. In treating an article having an alk. reaction and having inorg coloring matter mechanically incorporated in its surface, to bind the coloring matter in the surface, the surface is treated with a soln of a metallic salt U. S 1,798,998 describes the similar surface coloration of shingles comprising cement and fibrous material U S 1,798,999 relates to coloring porous bodies such as asbestos-cement shingles by applying a soln of a metal salt such as $FeSO_4$ or $CoSO_4$ which is capable of oxidation and then applying a reacting substance such as a peroxide to form insol coloring material in the surface portion of the material. Various details and examples are given.

Plaster mixture. GEORGE H. A RUBY. U. S 1,799,324, April 7. A material capable of holding nails firmly without splitting or spalling is formed of cotton fibers with a plaster-of-Paris binder solidified through crystn after addn of water. U. S 1,799,325 also relates to similar material

Plaster-board. THEODORE E KNOWLTON (to Certain-Teed Products Corp) U S 1 798,609, March 31 Mech features

Drying wood, etc. AKTIEBOLAGET BANKFIRMAN ALFRED BERG Ger. 522,141, Sept. 24, 1929. The materials are treated in a closed container with warm air or other gas under pressure and the pressure is then reduced to zero as rapidly as possible. The treatment may be repeated App is described

Artificially drying wood. FRIEDRICH MOLL. Ger 516,064, Mar. 20, 1930 The drying chamber has an opening from which observations and samples can be taken during the process

Preserving wood. GRUBENHOLZIMPRAGNIERUNG G M B H Fr 698,624, July 7, 1930 Wood is preserved by a mixt of equal parts of $K_2CrO_7$ and NaF.

## 21—FUELS, GAS, TAR AND COKE

A C FIELDNER AND ALDEN H EMERY

Investigation of the aluminum apparatus for the testing of spontaneous combustion of anthracite coal and other materials. D J W KREULEN. *Brennstoff-Chem* 12, 107–11(1931); cf *C A* 25, 394.—By use of app previously described (*C A*. 25, 394) the influence of heating and $O_2$ flow rates, sample and particle size upon the results obtained has been detd The best results are obtained when $CO_2$ is passed through the coal at 5 l /hr until the app has reached 120° When the coal has reached 116°, $O_2$ is started through at 10 l /hr and the temp of the app raised to the kindling point of the coal Depending upon the shape of the plotted temp curves of the app and coal at the kindling temp , rates of 1° or 2° or 3°/min are used For each detn 5 cc of briquetted coal sized between 10 and 20 mesh/cm is used Anthracite, brown coal and wood charcoal have been used in showing graphically the effects of the variations F. W J.

New method for practical fuel examination and calculation. M. DOLCH. *Brennstoff und Wärmewirt* 12, 253–67(1930).—Review of the author's previous work (cf *C. A* 24, 221, 5969) A. HIRSCH

Ignition and combustion of fuels of low heating value. MARCARD *Die Wärme* 54, 208–13(1931).—Crit data concerning the ignition characteristics of fuels are tabulated and discussed The influence of the construction of the boiler on the ignition and combustion processes, and the importance of catalysis on ignition of fuels are discussed ALLEN S SMITH

Determination of the heating value by a simplified calorimeter. A. P SHAKHNO AND M D ZHUKOVSKII. *Investiya Teplotekh Inst.* (*Trans Thermo-Tech Inst.*) 1931, No 1, 34–42.—The heating values of various coals and wood were detd. in different calorimeters The Parr calorimeter is recommended provided that the $Na_2O$ contains not less than 92% of active $O_2$ and the proper amts of $Na_2O$ and tartaric acid are used, without the addn of $K_2S_2O_8$. Corrections for radiation must be made, and max deviations of 1 16% were observed in various detns A A BOEHTLINGK

Wood as a fuel for internal-combustion engines. G DUPONT. *Bull inst pin* 1931, 5–8, 31–6, 65–71.—An address describing the work carried out recently by D and co-workers at the Institut du Pin (cf *C A* 23, 2551, 24, 1490, 4914) A PAPINEAU COUTURE

Conversion tables for recalculating to various laboratory conditions results of fuel analysis and ash determinations V. ALEKSANDROVSKII *Izvestiya Teplotekh. Inst* (*Trans Thermo-Tech Inst*) 1931, No 1, 56–60.—Tables are given for recalcg the results of lab analysis to the as-received basis and to the dry basis. A. A. BOEHTLINGK

Determination of the ash content of coke and coal. H A J Pieters. *Het Gas* 51, 77–9(1931).—From comparative ash detns on coke and coal ground in a hammer mill, rolled on a steel plate or pulverized in a mortar it is shown that Fe particles can cause variations in ash content up to 0.4% (highest error for rolled coke). A particularly hard material needs to be used for the construction of grinders. A temp of 900° is advocated for ash detns., higher temps cause losses. Cooling of the samples for moisture or ash detns in air is equally as good as in a desiccator, as long as it does not take more than 10 min. Tables of check analyses are given. B J C. v d H.

Fuel technology and the classification of coal. Clarence A Seyler. *Proc. S. Wales Inst. Eng.* 47, 6–9(1931).—The properties of coal are divided into 2 categories: the concn. characteristics and the mobility or reactivity characteristics. The concn. characteristics are those which depend on the concn. of the combustible elements or the energy in the coal or its products of combustion. They include the compn. of the coal, its calorific value, vol. of air required for combustion, vol. and compn. of flue gases, flame temp. of gases and combustion efficiency. The relation between the vol. of flue gases or air and the net calorific value of the coal is a special case of a general relation which can be deduced from Dulong's law. The plotted lines of isocals therefore represent all other concn. characteristics. The mobility or reactivity characteristics depend on the freedom with which the colloidal particles or those of mol. dimensions can move and undergo rearrangement or enter into combination with external reagents. Coking properties belong in this category. Softening points detd. by the Charpy and Durand method show great regularity when plotted and lines of equal softening points may be drawn. The lowest line surrounds the best coking coals, the higher the line the poorer the coking properties. Alden H Emery

Petrography and coal classification. Clarence A Seyler. *Proc. S. Wales Inst. Eng.* 47, 4–6(1931).—S. briefly reviews 3 systems for the classification of coal: lithological (vitrain, clarain, durain and fusain), botanical (anthraxylon and attritus), and micropetrographical (humic material, resins, resistant plant remains and fusain). The latter are in the main proximate chem. components. Alden H Emery

The caking power according to Meurice as a basis for classification of coal. D Stavorinus. *Het Gas* 51, 79–82(1931), cf. M., *C. A.* 8, 1496.—The Meurice method of detg. caking power is reviewed. The "limiting agglutination index" is detd. by the no. of g. of sand which 1 g. of coal can bind without giving more than 1 g. loose powder. The sand passing a no. 40, and retained on a no. 50, sieve is heated with coal ground to pass a no. 80 sieve in a 25-cc. covered Meissner porcelain crucible, between 900 and 950° in a muffle until the flame between crucible and cover has disappeared. The loose powder remaining is weighed. A second significant figure, the "cokefaction index," is detd. from the compressive strength $K$ of the cake of 17 g. sand + 1 g. coal. If $D$ is the wt. of the loose powder after caking, the index is $17K/D$. The usual (European) classification of coal corresponds to limiting indexes as follows: flame coal (volatile matter more than 35%) 0 to 8, fat gas coal (volatile > 28%) at least 10, coking coal (volatile 18 to 32%) above 14, various fat coals (volatile 11 to 22%) from >10 to >2, lean coal (volatile 9 to 11%) 2, anthracite (volatile up to 8%) index 0. For 15 samples of Ruhr and Durham gas coals the cokefaction index is given. It varies for Ruhr coal from 40 to 425, $K$ between 3.5 and 14, $D$ from 0.30 to 1.5, for Durham coal the index is 196 to 1135, $K$ from 5 to 10, $D$ 0.30 to 0.52. For the detn. of compressive strength the Lechine app. was used. B J C. van der Horven

A note on the mineralogy of coal as suggested by x-ray examination. Henry Briggs. *Colliery Guardian* 138, 638–40(1929).—Mineral impurities in coal are classified under four heads: (1) those existing in the coal substance, and so finely disseminated through it that they cannot be extd. by any known phys. process, (2) those forming layers, streaks or flakes lying in the bedding planes, (3) those forming streaks, flats flakes or plates, usually at angles approaching the right angle, and (4) particles, crystals or irregular masses, large or small, scattered, apparently promiscuously through the coal. The first is discernible only in the radiograph of a coal band as a uniform and a featureless cloudiness of the clearest portions, while the other 3 varieties are sharply silhouetted in an x-ray photograph, and their manner of occurrence is still more clearly presented by the stereoscopic method of Kemp and Thomson. A review is made of characteristics of the mineral impurities, and the low ash content (compared to that estimated from the plant source of the coal) is explained. X-rays provide refined methods of qual. analysis not previously available and at the same time enable the manner of distribution of these foreign substances to be studied without destroying the sample. W. H. Boynton

Coal properties and their applications. T. Kidokoro and G. Shirane. *J. Fuel*

*Sci. Journ.* 0, 43–6 (1930).—A method is described for the identification of the geological rock of coals, lignites, etc., by their treatment with oxidizing agents followed by ppts. of the humic acids with NaOH. Expts. on the oxidation and spectroscopic examination of coals, with special reference to their rank, as detd. above, are also discussed. B. C. A.

The preparation of coal dust for and its analysis by projected microscope images. Erich Stach. *Fortschr. Geol. u. Pal.* 12, 147–80 (1931). cf. *C. A.* 23, 3029.—The procedure and apps. are described in detail for the examn. of coal particles, reduced to 0.25–0.88 mm. size. For mounting, a material prepd. from 3 parts dammar, 2 parts shellac and 1 part Venetian turpentine or other mastic or carnauba wax also is used. To 8 parts by vol. of this medium, 6 parts of the coal is added. The mixt. is then pressed into a 2 × 2 × 1 cm. mold. After the setting and removal, progressively finer grinding and wet polishing with the final use of alumina to produce relief, a surface of the block is prepd. for microscopic examn. at 150–200 diams. magnification. F. W. Jessup

Notes on occurrence of spontaneous heating [in coal mines]. E. H. Vallis. *Colliery Guardian* 141, 1971–2 (1930).—For the Seven Feet Barbery seam at the Barbeswood Colliery it appears that the $CO_2$ absorbed ratio of 1% is a critical figure. Having reached this point, it may recede, or after the ratio has remained stationary for several days, heating may develop with startling rapidity. It was found that the $CO_2$ absorbed ratio may increase from 1.1 to 2.9% in less than 10 hrs. and to a stage when the 1st change in smell is apparent in 5 hrs. V. emphasizes the importance of analyses every 24 hrs. in addn. to the frequent examn. of the working districts of such mines for any change in the smell of the return air. Such analyses should include air in the working places and the airways near the face to discover the development of heating in its early stages. H. C. Parish

Process of combustion of pulverized coal. A. Gaydt. *Compt. rend.* 192, 567–9 (1931).—Pulverized and dry (1% $H_2O$) coals (lignite or anthracite) ignite at characteristic temps. between 700° and 900°, temps. which correspond to the max. disengagement of $H_2$ during dry fractional distn. This leads to the conception that ignition of coal starts with inflammation of the $H_2$ disengaged, the carbonization continues along with the progressive and concomitant oxidation by air, first of the $H_2$, then of the transformed coals, and then of CO. The formed mass of incoherent coke reacts with the $H_2O$ present and the resultant $CO + H_2$ burns. This conception differs from the intermediate formation of the water-gas theory of d'Arsonval (Brennstoff und Verbrennung, Berlin, 1923), and is confirmed by recent analyses of Fick (Le Chauffage des Chaudières au Charbon Pulverisé, Paris, 1930, p. 57), the results of which are plotted to show that C is first oxidized to CO rather than to $CO_2$. Albert Thomas Fellows

Graphic examination of the combustion process. Alfons Nagel. *Die Wärme* 54, 201–3, 230–4 (1931).—A method of regulation, and estn. of combustion efficiency is described which eliminates the necessity of flue-gas analyses and reduces calcns., and which is simple and reliable. Ostwald flue-gas diagrams (*C. A.* 14, 257) are prepd. from equations representing complete and incomplete combustion of gaseous, liquid and solid fuels. From these diagrams the characteristics of the combustion may be detd. The influence of $CH_4$ and H on the accuracy of the diagrams is considered. Allen S. Smith

The specific heats of gases involved in combustion. A. Jaeschke. *Gasmasse* 59, 947 (1930). *J. Soc. Glass Tech.* 14, 144.—The sp. heats of individual gases, as well as those of typical mixts. of waste gases, are shown in tables and diagrams. The methods is given together with examples of the detns. of (1) the heat dissipated by gases while cooling and simultaneously decreasing in pressure, (2) the mean sp. heat of a gas between two specified temps., (3) the heat lost in the waste gases. G. G.

Saskatchewan Lignite. J. P. deWitt. *Can. Mining J.* 52, 420–3 (1931). cf. *C. A.* 25, 189.—Use is being materially extended within the province by adoption of suitable grates and stokers. W. H. Boynton

The gas plant at Ivry. Pouchelle. *J. usines gaz* 55, 69–74, 96–102 (1931).—Historical. Operation details are given with many drawings. B. J. C. v. d. H.

The modernization of the gas plant at Bressy. G. Dreux. *J. usines gaz* 55, 25–7 (1931).—A short description of the new installation of 7 vertical discontinuous chamber ovens, each of a capacity of 1500 kg. coal in 12 hrs. Steam is injected during the last 2 hrs. of carbonization. The plant has built-in-producers. B. J. C. v. d. H.

Gas production and its economics in Greece. Stergiades. *Gasverwertung Athen* 1, No. 1, 35–6 (1930).—An historical review of the gas production, its application for domestic and other purposes and the potential capacity of Greece oil fields are given. Statistical data on gasoline recovery from wet gases are tabulated. A. A. B.

Plant for preparation of coal and coke at the gas plant in Niederursel. J.

Andreeo *Schweiz Ver. Gas- u Wasserfach Monats Bull* 11, 78-82(1931).—A short description with drawings. B. J. C. van der Hoeven

Fundamental aspects of the natural-gas situation in Chicago. Samuel Insull, Jr. *J. Western Soc Eng* 36, 111-5(1931).—A brief résumé of the basic economics which shows that only those domestic consumers using large amts. of gas will benefit greatly by the use of natural gas. W. H. Boynton

*Heat loss of gas furnaces.* Fritz Schuster *Die Wärme* 54, 279-82(1931).—An essential part of the heat loss of all furnaces is contained in the sensible heat content of the waste gases. This may be estd. from the heat of combustion of the gases and a knowledge of the waste gases. The waste gas loss of the simple combustible gases, H, $CH_4$, ethylene, benzene, acetylene and CO, is computed for different conditions of temp., excess air and humidity. By means of these values the waste gas loss of com. gaseous fuels is obtained. Tables are given which show the heat content of the gases of combustion. An economical comparison is made of coal-, water-, and generator gas. Allen S. Smith

Metallic ions as catalysts for the removal of sulfur dioxide from boiler-furnace gases. H. F. Johnstone *Ind. Eng. Chem.* 23, 559-61(1931).—The catalytic effect of small concns. of $Fe^{+++}$ and Mn ions on the oxidation of dissolved $SO_2$ materially increases the capacity of water for absorbing $SO_2$ and thereby decreases the vol. required for washing flue gases. At a concn. of 300 p. p. m. Mn, 3500 cu. ft. of an air mixt. contg. 0.325% $SO_2$ was washed with 1 gal. of water at an av. efficiency of 95.5% removal of $SO_2$. The concn. of $H_2SO_4$ attained was 29.6%. $Fe^{+++}$ requires concns. about 100 times those of Mn. Cu ions act as a strong inhibitor to the catalysis by Mn but not by $Fe^{+++}$. Zn, Ni and Cr ions have no effect either as inhibitors or as catalysts. When lime water is used for washing, $CaSO_3$ rather than $Ca(HSO_3)_2$ is formed. Four thousand cu. ft. of flue gas contg. 5% $CO_2$ and 0.1% $SO_2$ was washed per gal. of water contg. 250 p. p. m. Mn. A rotary scrubber was used and the time of contact was approx. 1/20 sec. This is equiv. to 1¼ tons of water per ton of coal. The efficiency dropped from 40% at the beginning to 10% at the end when the acid concn. was 3.7% $H_2SO_4$. Further work on the application of catalysts to the scrubbing of flue gases is in progress. H. F. Johnstone

*Stoichiometry of the blow.* Lloyd Logan *Am. Gas J.* 134, 53-4(1931).—In the blow run of a water-gas set C is consumed by oxidation to CO or $CO_2$. There is a unique relation between CO, $CO_2$ and $N_2$ content of the blast gas, the compn. varying from 21% $CO_2$, 0% CO, 79% $N_2$ to 0% $CO_2$, 34.7% CO, 65.3% $N_2$. From the detn. of any one of the components the other 2 may be calcd., as well as the amt. of C consumed and the vol. of blast gas. Equations and charts are given for the calcn. of the unknown quantities from the analysis. Channing Wilson

Protection against fire hazards of gas appliances. F. G. Vandaveer *J. usines gaz* 55, 75-80(1931).—A review is given of results obtained in the Cleveland (O.) A. G. A. labs. B. J. C. van der Hoeven

Deformation of bells and lifts of gas holders under the influence of gas pressure. M. Petitpas *J. usines gaz* 55, 35-9(1931).—A review is given of the mechanics of water-gas holders. B. J. C. van der Hoeven

*The use of tar in the bell seals of gas holders.* W. J. A. Duynstee *Het Gas* 51, 73-7(1931).—From a no. of drawings and from a pressure chart of the gas trapped under the seal of the telescope ring of a 2 lift holder in bottom position it is shown that even if the ring seal is originally filled with tar to the top a water layer will replace it partly as soon as it has been down to the bottom once. Only by lowering the water level in the foundation basin can a sufficient tar seal be maintained in the ring permanently. B. J. C. van der Hoeven

The determination of sulfur in combustible liquids. I. F. Garelli and B. Saladini *Ann. chim. applicata* 21, 136-40(1931).—After reviewing the method of detg. S in illuminating oil by burning a weighed amt. and collecting the liberated $SO_2$ in alkali soln., a more general method is described suitable for crude as well as refined oils. This method is the common one using an $O_2$ bomb. A. W. Contieri

The plasticity of coal and the theory of coking. Clarence A. Seyler *Proc. S. Wales Inst. Eng.* 47, 9-14(1931).—When heated, coal deforms under const. pressure at a rate which diminishes as the contraction proceeds until it finally ceases, as a result, not of loss of the property of flow under pressure, but of the development of a resistance probably of the nature of a back pressure produced by the gases of decompn. The rate of deformation increases with pressure. With no pressure there is no flow. The phenomenon is one of plastic flow, not fusion. Plasticity involves 2 quantities, mobility (const. at a given temp.) and resistance (only conditionally const.). A plastometer

which permits calcn of the consts in c. g. s. units has been developed. In the coals investigated, when the rate of flow and temp. are not too high, coal follows the laws of plastic flow. Softening point is the temp. at which a min. rate of flow is produced at a given pressure, such that a very small further contraction causes the resistance to equal the external pressure. The plasticity temp. relation is hyperbolic with 2 asymptotes, 1 approaching the temp. axis and the other inclined to it. The plasticity of coal at the softening point is inversely proportional to the pressure. The plasticity does not increase indefinitely but reaches a max. detd. by the thermal stability of the coal. This max. decreases as the softening point of the coal increases and its thermal stability decreases. Preheating has a marked effect on plasticity. Coking is due to the plastic flow of the coal particles as a whole. The necessary pressure comes from the gases evolved. ALDEN H. EMERY

Results of compressive strength, tumbler and shatter tests of foundry coke. H. A. J. PIETERS. *Het Gas* 51, 84–5(1931).—The compressive strength was detd. on 10 cubical coke bodies sawed out and polished to 1 cc. For the tumbler tests 50 kg. coke was revolved for 4 min. in a drum, 1 m. long, 1 m. diam., 25 revolutions per min., then screened on 40 mm. round openings and the retained coke weighed. For the shatter test 25 kg. coke was dropped out of an Fe box with doubly hinged bottom halves on to a steel plate 1.80 m. lower. This test is repeated 4 times, the coke then screened on 80 mm. round holes and the retained coke weighed. From tabulated data of 52 expts. with 2 types of foundry coke it appears that the tumbler test gives the most consistent figures, the shatter test is more sensitive and less const., max. deviation for the former is about 3% of the average, for the latter around 10%. The compressive strength detn. has no practical significance for the valuation of the quality of the coke. B. J. C. v. d. H.

Heating inclined retorts with high B. t. u. gas. H. MÜLLER AND STIEF. *Gas u. Wasserfach* 73, 1177–80(1930).—Inclined retorts have been heated with mixts. of coke-oven gas with water gas, producer gas and flue gas, resp., as well as with coke-oven gas alone, which requires special burner provisions. The optional use of coke-oven gas increases the flexibility of gas manuf. and permits a higher coke gas ratio when this is desirable. The authors state that all coal-carbonizing equipment should be designed to operate with high or low B. t. u. gas. R. W. RYAN

Fuel. MASCHINELLE DRUCKENTWASSERUNG M. B. H. Ger. 516,761, Apr. 19, 1929. Crude peat is dehydrated by pressing with fully dried peat dust. The mass is heated during pressing and cooled by water-cooled plates.

Liquid fuels. SOCIÉTÉ NEUTRAL MOTOR FUEL, INC. Fr. 697,439, June 14, 1930. Motor fuels are improved by bringing them in intimate contact with a mixt. of an oxidizing agent sol. in water such as $H_2O_2$ and a compd. contg. Cl sol. in water such as $AlCl_3$, in the presence of water. A suitable app. is described.

Motor fuel. I. G. FARBENIND. A.-G. Fr. 698,641, July 8, 1930. A valuable motor fuel is made by the thermal decompn. of mineral and tar oils in the state of vapor and preferably in the presence of catalysts at temps. above 600°. The decompn. takes place under conditions which cause the formation of large amts. of gaseous products, particularly unsatd. hydrocarbons, the appropriate fractions of which are sepd. from the non-gaseous products.

Composition for treating fuel. FRED L. MENNIE. U. S. 1,799,631, April 7. A compn. for treating fuel such as coal-dust briquets in order to improve its burning properties comprises $KMnO_4$ 6, $KClO_3$ 12, "table salt" 32, crushed rock salt 50 parts, mixed with water.

Utilizing carbon saturated with oxygen. MAX PLATSCH. Ger. 506,274, Nov. 13, 1927. C satd. with O may be used, *e. g.*, for the manuf. of CO relatively free from N as a motor fuel, for the direct internal heating of metallurgical, etc., furnaces, or for the

heating of closed pressure vessels used for cracking oils, etc. Few or no details of these applications are given

Destructive distillation of suspended fuel particles. Friedrich Bartling U S 1,798,995, March 31 Various details of app suitable for use in the destructive distn of powd bituminous material are described

Rotary kiln suitable for low-temperature coal distillation, etc. Edmund Roser (to C H Ellsworth) U S 1,799,500, March 31

Low-temperature carbonization apparatus. Frederick L Duffield Fr 698,606, July 4, 1930

Carbonizing retorts and furnaces. Woodall Duckham (1920), Ltd, and Arthur McD Duckham Fr 698,584, June 30, 1930

Hydrogenation reactions. I G Farbenind A-G Fr 697,539, June 17, 1930 In reactions using H at a high temp particularly in the hydrogenation of coal, tars, oils, etc., the reaction vessels are protected against the destructive action of the H by covering their surfaces with an alloy of Cu and Zn Other metals such as Mn, Ni, Fe, Co, Al or Ag may be incorporated to increase the mech resistance

Hydrogenating coal, etc. I G Farbenind A G Fr 698,425, July 5, 1930 The mixt of oily and solid substances obtained by the hydrogenation under pressure of coals, oils, etc, is heated to a temp higher than that used in the treatment until the solids are agglomerated into larger particles and sepd Cf C A 25, 2549

Hydrocarbons I G Farbenind A-G (Rudolf Wietzel and Bruno Engel, inventors) Ger 522,463, June 19, 1927 In the manuf of hydrocarbons, principally liquid, from coal, tars, mineral oils, etc., by destructive hydrogenation, cracking, or extn with org solvents under pressure, a small quantity of an org substance capable of lowering the surface tension of the products is present, *e g*, an emulsifying agent such as Na isopropylnaphthalene sulfonate Cf C A 25, 1068.

Hydrocarbons. I G Farbenind A G Fr 698,244, July 1, 1930 Valuable hydrocarbons are prepd. from coal, tars, mineral oils, etc., by treatment with H or gases contg it The finely divided starting material is allowed to fall freely through a vessel contg heating elements and filled with H under pressure

Recovery of phenols. F Raschig G m b H Fr 698,390, July 4, 1930. Residual waters from coking plants, fuel-distn app, etc, are obtained free from phenols by washing the distn gases with solvents for the phenols at a temp above the dew pt of the mixt of gases.

Acetylene cylinder filled with plastic material. Bruce Miller (to Air Reduction Co). U. S 1,799,803, April 7. Structural features.

Gas. The Power Gas Corp, Ltd and Nebls E. Rambush. Fr. 697,788, June 23, 1930 An app is described for making a mixt. of water gas and producer gas.

Fuel gas. Julius Pintsch A-G Ger. 522,493, Mar. 27, 1929. The gaseous by-products (consisting mainly of CO) from the synthesis of $NH_3$ from water gas are mixed with water gas and waste gas, *e g*, flue gas, in such amts. that a mixt. of the approx compn of generator gas is obtained

Fuel gas for automobiles. Jegor I. Bronn and Concordia-Bergbau A-G Ger. 516,850, July 28, 1926. The gas consists of $CH_4$ mixed with gaseous hydrocarbons from the low-temp distn of coal or lignite, or from the cracking of raw oils, etc.

Producer gas. Louis Chavanne. U S. 1,799,885 April 7 In utilizing solid fuels in a slagging gas producer, the lower portion of the fuel bed is blasted with a gaseous mixt. of a free O content regulated for melting the fuel ashes in a fusion zone extending above the blasting level and maintained to a thickness not exceeding one-fourth of the total height of the fuel column, and for maintaining above this an extended zone of low-temp distn. An aq fluid is added near the top of the fusion zone, gases and entrained by-products are withdrawn, and molten products are removed from the base of the column U. S. 1,799,886 relates to a generally similar process in which fuel dust is introduced in the zone of fusion and fuel in lump form at the top of the fuel column App is described.

Water gas. Wm J Edmonds (to Commercial Solvents Corp). U. S 1,799,359, April 7. In a cyclic process for the production of substantially S-free water gas, fuel is subjected to alternate air and steam blows, the water gas resulting from the steam blows is desulfurized by contact with solid desulfurizing material such as iron or Fe oxide and the desulfurizing material is revivified at intervals, during air blows, by contact with gases comprising, at least in part, the gaseous products of the air blows. App. is described

Water gas. Oesterreichisch Amerikanische Magnesit A.-G. Fr. 697,489,

June 16, 1930 Water gas poor, in or free from, CO is made by the action of steam on a mixt of carbonaceous material and the oxide, hydroxide or carbonate of Mg at a temp above the dissoen temp of $MgCO_3$ but not appreciably passing 750°. CO may be eliminated from a gas contg it by passing the gas over the above mixt. at a temp not appreciably above 500°.

Oil gas. Edward A. Dieterle U S 1,798,372, March 31 Hot combustion gases are supplied upwardly to and through vertically spaced banks of heating tubes stacked in a chamber, and oil is simultaneously sprayed on the outside surfaces of the heating tubes for generation of oil gas, and the oil gas thus formed is withdrawn from the bottom of the chamber App is described

Desulfurizing gases István Hunyady and Karl Koller Fr 698,327, July 3, 1930 Industrial gases are desulfurized with recovery of S, by bringing the gases to be purified into intimate contact with an aq soln of finely ground $MnO_2$ The mixt. of S and sulfide formed is sepd by filtration and the sulfide is transformed in known manner to hydrate and thence by the action of dry air to $MnO_2$ The mass is dried and the S dissolved out Cf *C A* 25, 2550

Removing hydrogen sulfide from gases. Wintershall A.-G Ger 516,851, Sept. 17, 1927. The gases are passed into a suspension of basic ferric salt in a ferric salt soln., prepd by oxidizing the corresponding ferrous salt with $HNO_3$. Thus, a soln of $FeCl_3$ in neutral or weakly acid soln is oxidized by $HNO_3$ Part of the $FeCl_3$ is pptd. as $FeCl_3.6Fe(OH)_3$, the rest forming $FeCl_3$ which remains in soln. This liquid absorbs the $H_2S$ in gases with disposition of S, which can be recovered by filtration and centrifuge

Treating slurry from gas-purification products. Frederick W. Sperr, Jr. (to Koppers Co.) U S 1,798,912, March 31. Slurry produced in the purification liquid is submitted to a flotation operation and S is removed as a froth concentrate, and metallic compds are removed as tailings. An arrangement of app is described. Cf. *C A*. 24, 4922

Oil-gas generator. Enoch Rector (to Rector Gasifier Co.). U S 1,799,247, April 7 Various structural details are described

Gas producers. Charles Whitfield Fr 698,590, July 2, 1930 Means for regulating the combustion of the fuel is described

Vertical gas-producer. John U McDonald U S. 1,798 617, March 31.

Distillation column for gas producers. Carl Bleyer. Fr 698,042, June 13, 1930

Means for recovering heat from flue gases Harry Fahrbach Fr 697,846, June 24, 1930

Purifying tar acid-bearing oils. Solomon Caplan (to Combustion Utilities Corp.). U S 1,799,780, April 7 In removing color producing substances from tar acid bearing oils, the oil is distd., with refluxing and condensation, and, during one of the steps prior to condensation, is brought into contact with a non acid ferric compd. such as ferric stearate

Coke ovens. August Koppers Fr. 697,625, June 18, 1930 The drawing mechanism and control are described

Coke ovens. Firma Carl Still. Fr 697,618, June 18, 1930. The loading mechanism is described

Regenerative coke ovens. Heinrich Koppers A.-G Fr. 697,472, June 16, 1930 Constructional details are given.

Horizontal regenerative coke oven, with vertical heating flues. Koksofenbau und Gasverwertung A.-G Ger 504,113, Aug 7, 1926

Coke ovens with vertical chambers. N. V. Silica en Ovenbouw Mij Fr. 697,680, June 19, 1930

Coke-oven battery. The Koppers Co Ger 522,388, Oct. 16, 1928.

Coking-retort oven. Joseph Becker (to Koppers Co.) U. S 1,799 670, April 7.

Coke-oven smoke-discharge system. Joseph Becker (to Koppers Co.). U. S 1,798,517, March 31 Structural features.

Fastening device for coke-oven door. James H Gleason (to Gas Machinery Co.) U S 1,798,599, March 31

Plant for cooling glowing coke Gebrüder Sulzer A.-G Ger. 516,870, May 22, 1928 Details are given.

# 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

Methods of utilizing for power purposes the various petroleum residuals and by-products. A. E. DUNSTAN *J. Inst. Petroleum Tech.* 16, 701–22(1930).—The practices of the petroleum industry in burning its acid sludge, coke, asphalt and refinery gases are reviewed. EMMA E. CRANDAL

Refrigerating requirements for oil refining. HARRIS PRUIT *Refrigerating Eng.* 21, 311–3(1931).—The application of refrigeration to the removal of wax from paraffin-base lubricating oils is described. A. H. JOHNSON

Refrigeration in oil refining. J. M. WADSWORTH *Refrigerating Eng.* 21, 95–100 (1931).—The operation of an oil refinery using paraffin base crude oil is described. Wax is removed by gravity by filtration or by centrifuging. A. H. JOHNSON

The action of ferric oxide and ferric chloride as catalysts in the cracking and hydrogenation of oil from Ragusa. L. SALMOIRAGHI *Ann. chim. applicata* 21, 27–37 (1931).—Samples of oil from Ragusa contg. about 2.85% S and having a sp. gr. of 0.9667 were submitted to simple cracking by heating to 490° and also to cracking with hydrogenation *in the presence of* $Fe_2O_3$ *and* $FeCl_3$. *The amts. of the chloride were varied from* 5.07 to 11.07%. No gas is formed by simple cracking. With $Fe_2O_3$ 17.3% was formed (mainly $CH_4$, $C_2H_4$ with 80% $H_2$), while with $FeCl_3$, 7.4 to 13.6% of gas was made. In the simple cracking, only 4.5% of the product distd. under 250°, and 41% of residue was obtained. With $Fe_2O_3$ 37% distd. under 150°, 40% up to 250°, and the residue was 3.6%. With $FeCl_3$, 22% distd. below 150°, 53% below 250°, and there was no residue. With $Fe_2O_3$ the S was about evenly divided between the distillates and the residue, whereas with increasing amts. of $FeCl_3$, up to 75.5% of it was retained in the residue. A. W. C.

Crude oil emulsions. A. TZATUR'YAN *Groznenskii Neftyanik* 1, No. 2–3, 39–43 (1930–31).—The following methods for breaking up crude oil emulsions are described: (1) heating in open containers, (2) heating in closed containers, (3) elec. method (*with a potential of 1000 v.*), (4) *the Tret O-Lite method*, (5) *centrifuging method*, (6) combined methods, *i. e.*, a combination of two of the methods mentioned above. A. A. BOEHTLINGK

Fractional distillation of crude oil. E. O. SLATER. *Oil Bull.* 17, 272–4(1931).—The 4 point distn. method for evaluating crude oils is described in detail. It consists in a preliminary distn. (topping to a vapor temp. of 500°) under specified conditions of a weighed sample of the crude oil. Above 250° F. the distn. rate is not to exceed 10 ml. per min. A 300 ml. sample of the tops (contg. the gasoline and kerosene) from this distn. is rerun in the app. described in A. S. T. M. specification D-285–30-T, the condenser tube being packed in cracked ice and a dry graduate cylinder covered by blotting paper and immersed in water at 60° F. being the receiver. The distn. rate is 2–3 ml. per *min. for the 1st 5 ml. distd. and 4–5 ml. thereafter. The vols. of distillate in ml. are* detd. when the vapor temp. reaches the following points 221°F., 284°F., 392°F. and 437°F. From these vols. the percentage of gasoline recovered at each of these temps. and the percentage of gasoline in the crude oil are calcd. as follows. The percentage of gasoline recovered at each distn. point is the vol. recovered divided by the vol. of tops distd. times 100, this is the percentage of tops. The percentage of tops is multiplied by the percentage of net tops calcd. from the crude distn. (from the net vol. of crude oil and the net tops or total tops minus water), and the resulting figure is multiplied by a different factor for each temp. 5, 2, 1.11 and 1, resp., for the 4 distn. points to give the percentage of gasoline in the crude oil. D. F. BROWN

The detonation in internal-combustion engines. K. SCHNAUFFER. *Z. Ver. deut. Ing.* 75, 455–6(1931).—S. *uses a single cylinder engine in which the firing spark plug* is located at one end of the cylinder head. Three other spark plugs are located along the direction of flame travel. These are connected to a source of high frequency current and to an oscillograph. The passage of the flame front ionizes the gases between the electrodes, thus allowing the passage of the current and giving a record on the oscillograph. The firing is also recorded, as well as the pressure-time curve, and the oscillations of a timing fork. In the absence of detonation, the flame travels at an increasing speed, covering the 13 cm. of travel in 0.005 to 0.01 sec. When the engine is made to detonate, the flame reaches the last 2 indicators practically simultaneously. This shows the detonation consists in the spontaneous ignition of the whole mass of unburned gas compressed in front of the flame. G. CALINGAERT

*Detonation characteristics of some aliphatic olefin hydrocarbons.* WHEELER G.

LOVELL, JOHN M CAMPBELL AND T. A BOYD *Ind Eng Chem* 23, 855–8(1931) — The relative knock ratings of 25 aliphatic olefin hydrocarbons in admixt with gasoline have been detd With the $C_6H_{14}NH_2$ equiv as a basis of comparison, the straight-chain olefins showed that (1) in homologous series there is increased knock tendency with increased length of chain; (2) there is a progressive decrease in knock tendency in isomeric series, with centralization of the double bond and (3) tendency to knock is roughly detd by length of the longest satd C chain In branched-chain olefins the tendency to knock decreases upon the introduction of a double bond, both the position of the bond and the branched structure of the mol are important Cf. *C. A* 25, 1367. J L Issex

The behavior of antiknocks. A EGERTON AND L M PIDGEON *Nature* 127, 591(1931) —$PbEt_4$ is introduced into an evacuated vessel which is then heated to 295°. A charge of $C_6H_{14}$ and air is then introduced and exploded The $PbEt_4$ does not slow down the explosion and may even accelerate it. If the expt is repeated in the presence of a small quantity of air, the well-known retarding effect of Pb is observed, showing that Pb must be oxidized before it becomes an effective inhibitor G CALINGAERT

A study of the knock in internal-combustion engines. L AUER *Forsch Geb Ingenieurw*, Ausgabe B 2, *Forschungheft* 340, 18 pp (1931) —After a review of the literature, A describes his own expts The engine used is a single-cylinder, 4-cycle, water-cooled, valve in-head Baumann-Muenchen engine, 6 h p, 165 mm bore, 180 mm stroke and 320 r p m The compression ratio is varied from 3 6 to 10 1 by varying the length of the connecting rod Two types of knock indicator are used The 1st is derived from that described by Polster (*Forsch Arb Geb Ingenieurw* 172(1915)). This instrument, which is bolted to the underside of the piston, functions through the acceleration imparted to the piston by the knock. It comprises an "accelerometer," which is held in position by a spring, and an adjustable electromagnet By varying the exciting current of the magnet, it is possible to balance the force so that the mass is just deflected from its normal position by each detonation This slight deflection is detected by the breaking of an elec. contact The actual intensity of the knock, expressed in kg /sq cm, is calcd from the mass of the piston and the accelerometer and the force of the spring and the magnet The time of its occurrence is detd by recording the time of breaking of the contact The 2nd knock indicator has a small piston, the head of which is brought flush with the wall of the combustion chamber The piston is held in position by a strong spring The tension on the spring is adjusted to balance the pressure of the knock, thereby preventing a deflection of the piston The pressure is calcd from the known balancing pressure which holds the piston in position The fuel used is "Dapolin" gasoline of d. 0 711 The curves of "intensity of knock" and of "time of occurrence of knock" versus air-fuel ratio pass through a max and a min, resp, around the point corresponding to the theoretical air-fuel ratio With a compression ratio of 6 1, 10° spark advance and 310 r p m., the following typical data give successively the air-fuel ratio (by wt.), the intensity of knock (kg /sq cm), the time of knock (degrees of revolution after the top dead center) 10.8, 2 66, 33 5, 14 4, 7 46, 19 9, 15 7, 2 63, 46 0 At 6 1 compression and 310 r p m, advancing the spark from 0 to 20° increases the intensity of the knock from 0 75 to 6 74 kg /sq cm, while the time of the knock advances from 69 8 to 17.3° after the top dead center. At 6 1 compression and 10° spark advance, varying the speed from 205 to 336 r p m. decreases the knock from 8 61 to 2 86, while the time of knock is retarded from 21 6 to 34 6° after the top dead center Recalcd in sec. instead of r p m, the latter data show a practically const lapse of 0 022 sec. between ignition and detonation, irrespective of the speed The greatest effect on detonation is shown by the variation of the compression ratio At 296 r p m. and 15° advance, ratios of 5, 6 and 7 to 1 give intensities of 5 12, 7 19 and 24 08, resp, with corresponding times of 34.3, 21 2 and 14.2° after the top dead center At 6 1 compression, 10° advance, 310 r p m, air intake temps of 23, 49 and 74° give intensities of knock of 1 69, 2 56 and 6 50, resp, with corresponding timings of 45 9, 26 3 and 24 6° after the top dead center Finally, the knock was found to be unaffected in intensity and timing by variations in intake manifold pressure from 44 to 58 cm of water A comparison of these results with published data on the rate of flame propagation in explosive mixts led A to believe that detonation is caused either by an explosion wave or by the spontaneous explosion of the unburned gases compressed adiabatically by the flame front G. CALINGAERT

Improved bearing lubrication. HENRI BRILLIÉ *Bull soc encour. ind nat.* 130, 95–108(1931) —Lubrication of bearings by oil under pressure results in decreased power consumption and metal wear L. W. T. CUMMINGS

Extracts obtained in the manufacture of ethereal oils from conifers. P. A BOBROV. *Trudui Vyatskii Nauch Issledovatelskii Inst Kraevedeniya* 4, 76–86(1928) —The mixt.

under investigation is a by-product in the manuf of fir-tree oil obtained by treatment of conifers with steam It is sol in water and has marked tanning qualities After hydrolysis continued for 80 hrs ether extd from this soln. phenols, catechol and a solid of sweet taste The rest of the aq soln gave reactions of aldehydes, reacted with phenylhydrazine, reduced Ag and Cu salts, was optically active and was sweet in taste. It is regarded as a carbohydrate. From results of detns of carbohydrates with Fehling soln it was concluded that its liberation from a higher complex is due to hydrolysis Another product of hydrolysis was a ppt from which ether extd. phenols (catechol and resorcinol), acids (protocatechuic and gallic) and a neutral substance The tanning qualities of the exts were tested by reactions with lead acetate, gelatin and glue and powd hide As the results showed tanning qualities of the catechol group, actual tanning of pieces of hide was undertaken by shaking them with 0 2–4% solns of the tanning substances, treatments with hot water and 5% AcOH showed successful tanning J G TOLPIN

Recovery of organic nitrogen by dry distillation of agricultural waste. V. DIEGO. *Afinidad* 10, 97–101(1930) —$NH_3$ was obtained in 2 7% yield, together with tar, charcoal, AcOH and MeOH B C A

Excoecaria agallocha as a source of power alcohol. HIRENDRA KUMAR SEN, SINDHU BHUSAN GHOSH AND PATIT PABAN PAL *Proc 15th Indian Sci Cong.* 1928, 163 —*The sawdust from Excoecaria agallocha, which grows abundantly in Sundarban* tracts and is now being used plentifully for the match industry and for making cheap packing cases, was investigated While with most species previously examd 22 24% of reducing sugar was the max production after hydrolysis by Simonsen's process, namely, digestion with very dil $H_2SO_4$ under 9 atm pressure, the yield of sugar was about 40% of the wt of dry sawdust with *Excoecaria agallocha* Of this about 70% was readily fermentable, giving approx 30 gal of abs alc , a figure practically double that which was obtained in the past. With appropriate figures of cost, a gal of abs alcohol from *Excoecaria agallocha* would work out at 6 05 annas Given a continued supply of this wood, there is thus an excellent prospect of a power alc industry in the province of Bengal. E J C.

Tank and breather to prevent loss of vapors from volatile liquids such as petroleum fractions during storage. HAROLD V ATWELL (*to Standard Oil Co of Ind*) U. S. 1,800,043, April 7

"Tube bundle" heat-exchange apparatus for use in refining petroleum oils. CHARLES H LEACH U S 1,709,471, April 7 Structural features

Treating petroleum residues. PIERCE M TRAVIS (to Travis Process Corp) U. S 1,798,341, March 31 For removing solid and semi solid materials from petroleum residues, the residual oil is heated to about 50–55° and centrifuged at this temp and the thus-sepd solid material is conveyed axially in one direction in the sepg zone while the liquid moves in the opposite direction, and the materials are continuously discharged Various details of app and operation are described Cf *C A* 24, 234

Composition for increasing the conductivity of hydrocarbons. WOLF KRITCHEVSKY and ELLIOTT MORRILL Can 309,080, Mar 31, 1931 A compn for increasing the cond. of light petroleum distillate consists of a partially or completely substituted ammonium salt of an aliphatic acid, *e g*, triethanolamine oleate and a solvent. The solvent is not necessarily a petroleum hydrocarbon, it may be propyl alc , ethyl acetate, acetone, etc.

Catalytic cracking of petroleum oils. Ernest B Miller (to Silica Gel Corp). U. S. 1,799,858, April 7. Oil to be cracked is vaporized and there is fed into a stream of the vapor a pulverized catalyst consisting of silica gel and an active material such as one contg Fe and the vapor with the catalyst in suspension is passed through a zone of suitable temp and the catalyst is then sepd. for further use App is described. A similar procedure may be used in catalyzing various other reactions.

Cracking hydrocarbon oil. Carbon P. Dubbs (to Universal Oil Products Co) U. S 1,799,218, April 7. Fresh untreated oil is introduced to one end of a series of externally unheated zones, and is caused to pass successively through this series of unheated zones Progressively higher pressure is maintained on the succeeding zones of the series, and unvaporized oil is taken off from the last zone of the series, and the oil is subjected to cracking conditions of heat and pressure and the heat for this purpose is supplied exteriorly of the zones mentioned After removal of heavier constituents, the heated conversion products are introduced into the zone of the series from which the unvaporized oil is taken off and vapors released from the oil are caused to move through the series of zones countercurrent to the movement of the oil, and a phys commingling of the vapors and oil in each of the zones is effected and vapors which have escaped condensation are removed from the zones of the series into which the fresh oil is introduced and are subjected to a final condensation, and the resulting distillate is collected as the ultimate product of the process App is described Cf *C A*. 25, 587.

Cracking hydrocarbon oils. Gasoline Products Co., Inc. Fr 697,397, May 30, 1930 In cracking hydrocarbons a cold hydrocarbon is injected into the final and hot test portion of the cracking worm to prevent supercracking and an excessive deposition of C, while the injected oil is cracked to a certain degree The injected oil may be of the same characteristic as the oil to be cracked A suitable app is described

Cracking oils. Robert T Pollock (to Universal Oil Products Co). U S 1,799 530, April 7 Oil is passed through a heating zone such as a pipe coil and thence to an expansion chamber vapors are taken from the expansion chamber to a reflux dephlegmator in which they are cooled by a regulatable supply of cool liquid such as water and the remaining vapors are led to a condenser Raw oil is supplied to the condenser to condense the vapors and preheat the raw oil and the preheated raw oil is mixed with the reflux condensate from the dephlegmator and the mixt., free from unvaporized residue, is led under pump pressure to the heating zone (the latter being maintained under substantial superatm. pressure and the expansion zone being under less pressure, as are also the dephlegmator and condenser) Cf *C A* 25, 2279

Cracking oils. Petroleum Conversion Corp. Fr 697,817, June 23, 1930. Petroleum oils are transformed into oils suitable for motor fuel by heating a gaseous vehicle to a temp at least equal to the temp of transformation, passing it into a reaction zone, submitting the petroleum oil to such conditions that it vaporizes without any appreciable cracking and mixing the gas and vapor in the reaction zone to provoke cracking of the vapor An app is described Cf *C A* 25, 2844

Oil-cracking apparatus. Lyman C Huff (to Universal Oil Products Co) U. S. 1,799,234, April 7 Metal walls of oil-cracking app are provided with a metal lining which is made in a plurality of sections, each anchored to the wall at a central point of the section, so that the sections expand from their centrally anchored points Expansion folds formed from a different metal are interposed between and at all sides of the sections

Plant for cracking hydrocarbon oils. Edward E Stewart U S. 1,798,338, March 31 Numerous structural features are described

Hydrocarbon oil purification and refining. Jacque C Morrell (to Universal Oil Products Co) U S 1,799,431, April 7 Oils such as S-contg "cracked distillates" are heated with added metal such as Zn and with glacial HOAc, simultaneously, to convert refractory S compds in the oil

Tube-bundle heat-exchange apparatus suitable for heating hydrocarbon oils. Kenneth B Rus (to Griscom Russell Co) U S 1,798 354, March 31 Structural features

Treating hydrocarbon oils to effect distillation. Jacob B. Heid (to Universal Oil Products Co) U S 1,799,231, April 7. Oil is fed into the portion of an enlarged chamber where vapor sepn takes place, and the unvaporized portion of the oil is caused to have a back and forth cascading descent in the chamber by which the oil is broken up and vapors are evolved Unvaporized portions of the oil are collected as a body in the lower portion of the chamber, and the ascent of released vapors is accelerated by causing them to ascend through passages of successively increased cross-sectional area App is described.

**Use of mercury in distilling hydrocarbon oils.** ARTHUR E PEW, JR. (to Sun Oil Co) U S 1,709,640, April 7. A stream of Hg vapor and a stream of relatively cold liquid oil are flowed into a confined path where they intimately mix and the mixt is passed into a relatively less confined space, the temp of the Hg vapor being sufficiently higher than that of the oil that, by heat exchange and condensation of Hg vapor, a portion of the oil will be vaporized, and the condensed Hg is sepd from the unvaporized oil App is described

**Distillation of hydrocarbon oil.** JOHN S WALLIS (to Foster Wheeler Corp) Can 310,658, Apr 21, 1931 Hydrocarbon oil having a high b p is blended with oil having a lower b p and the mixt heated to a temp to vaporize the lower boiling constituent the partial pressure effect of the vapor so formed is utilized to cause vaporization of the higher boiling constituent, and the vapors are introduced into a fractionating tower and the fractions sepd

**Distilling heavy hydrocarbons.** SOC DES ÉTABLISSEMENTS BARBET Fr. 698,744, Oct 14, 1929 An app is described for distg or cracking very heavy hydrocarbons by bubbling them through molten Pb

**Device for measuring and sampling fluids such as oils in oil fields.** HOLMES H. DYER. U S 1,798,788, March 31 Structural features.

**Oil-shale distillation retort.** CLAYTON O WHITE U S 1,799,268, April 7 Various structural details are described of a retort formed with sections having inclined bottoms over which powd oil shale will pass by gravity

**Converting oils into products of lower boiling point.** CARBON P DUBBS (to Universal Oil Products Co) U S 1,799,413, April 7 An app is described comprising a heating zone such as a pipe system through which the oil is passed and which is connected with inclined vaporizing tubes which in turn are connected to collecting tanks adapted to permit settling of the cracked oil, and connections are provided for drawing off the residual product and for returning the lighter ends to the heating zone for retreatment, and for controlling the relative temps of the heating and vaporizing zones

**Fractionating mineral oils.** ALFRED R EARL and THOMAS W REEVES. U S 1,799,414, April 7 A series of interconnected units such as stills is maintained under progressively varying pressures (some above atm pressure), and an intermediate unit of the series is at atm pressures and some other units are below atm pressure Oils are introduced into the system by means of the sub-atm pressures in one portion of the series of units and superheated steam under pressure is permitted to flow through the first mentioned series of units and to expand in the units under sub-atm pressure, and the pressures of the steam in the different units are utilized to maintain levels of oil at varient altitudes in the unit system, certain fractions are removed from the unit of greatest vacuum Numerous details of app and operation are described

**Colored mineral oils.** PATENT FUELS & COLOR CORP. Fr 698,152, June 27, 1930 Mineral oil (gasoline) or other petroleum distillates are colored in a stable manner by dyes and a stabilizing agent of a colloidal nature which may be a metal compd of a higher fatty acid, *e g*, Al palmitate, Mg oleate, Zn stearate The dyes may be arylated rosanilines, basic triphenylmethanes, indulines, indazines, rhodamines, etc If the dye has a strongly basic nature, an org acid such as stearic acid or benzoic is added if necessary

**Recovery of volatile substances such as gasoline from gases.** HENRY J NICHOLS, JR and ERIC W LUSTER (to Standard Oil Development Co) U S 1,799,619, April 7 A low-pressure still gas or the like is compressed by the expansion of a high pressure gas such as a pressure-still gas and the compressed gas is cooled The gases are mixed at an intermediate pressure, and volatile substances are recovered from the mixed gases App is described

**"Sweetening" gasoline.** HUGH H CANNON (to Cannon-Pritzman Treating Processes, Ltd) U S 1,798,784, March 31 Sulfurous petroleum products are "sweetened" by use of a dry powd reagent comprising PbO, an alk earth metal hydroxide, an alkali metal hydroxide and a porous earth such as diatomaceous earth Cf *C A* 25, 1067

**Working up oxidation products from paraffin, etc.** I G FARBENIND A G (Christoph Beck and Franz Kremp, inventors) Ger 522,055, May 27, 1928 To isolate the acids from the oxidation products of solid hydrocarbons such as paraffin and montan wax, the products are treated with $NH_3$ at atm or raised pressure and with or without simultaneous or subsequent addn of water The acids are thus converted, according to the conditions, into amides or $NH_4$ salts The amides may be freed from unchanged products by extg the latter with petroleum ether The $NH_4$ salts sep out during the

reaction The amides or $NH_4$ salts are converted into acids in known manner Examples are given Cf *C A* 24, 4792

**Treating gas-washing oils.** FRITZ SEIDENSCHNUR. Ger 522,032, June 30, 1925. To sep benzine from heavy oil that has been used to wash the distn. gases of lignite, the heavy oil contg benzine is run on to the surface of a body of benzine free heavy oil heated to 150–200° in a gas heated vessel fitted with a dephlegmator Benzine-free heavy oil is continuously withdrawn from the vessel

**Oil filter.** CHARLES W McKINLEY (to A C Spark Plug Co.) U. S. 1,798,947, March 31.

**"Self-washing" oil filter.** JOE W MORRISON (to General Motors Corp.). U S. 1,798,950, March 31.

**Lubricating oils.** MARTIAL BEGUIER. Fr 698,737, Oct. 14, 1929 Lubricating oils are regenerated during use by adding a small quantity of a homogeneous mixt. of a fixed oil, a fatty acid and a mineral oil

**Lubricating oils.** F HAUSZ. Hung 102,189, May 14, 1930 Addn. to Hung 99,915. Previously neutralized S or S-contg material is added to vegetable or mineral oils by chem or mechanical methods.

**Hydrocarbons of high boiling point range suitable for use as lubricating oils.** RUDOLF WIETZEL, WALTER SPEER and HANS KAEHLER (to I G Farbenind A.-G.) U S 1,798,288, March 31 A mixt of oxides of C and H is subjected to a treatment with a catalyst contg in addn to a metal of group 8 of the periodic system such as Fe and Co, a quantity of an alkali metal compd such as Na having an alky not substantially greater than that of $Na_2CO_3$ and comprising less than 0.5 part (calcd as alkali metal) per 100 parts of the group 8 metal the treatment is effected at temps. of 270–350° and the resulting hydrocarbons of low b. p range are subjected to a treatment under pressure at temps. below 250° in the presence of an inorg anhyd halide having a condensing action such as $AlCl_3$ which when treated with water causes strong evolution of heat

**Purifying mineral insulating and lubricating oil.** FRANK M CLARK and ARTHUR T HARDING (to General Elec. Co.) U S 1,798,968, March 31 Oil contg dissolved impurities such as that used in elec transformers is extd with tricresyl phosphate to remove the impurities Cf *C A* 24, 5477

**Lubricating greases.** JOSÉ DOBÓN Fr 697,770, June 21, 1930. Olive oil residues from olives, etc., are neutralized by means of a virgin rosin and a carbonate or lime.

**Hydrogenating oils.** STANDARD OIL DEVELOPMENT CO Fr 697,524, June 16, 1930 Lubricating oils are prepd by submitting a heavy hydrocarbon oil to a treatment with H under a pressure above 25 kg and at a temp above 371°, the formation of oil boiling below 204° being limited to below 20% of the amt of oil charged, so that the impurities of the oil are eliminated or rendered inoffensive. An app is described Cf *C A* 25, 808

**Hydrogenating oils.** STANDARD OIL DEVELOPMENT CO Fr 697,724, June 20, 1930 Lubricating and other oils are prepd by submitting heavy hydrocarbon oil to the action of a gas rich in free H, at a high temp (371–454°) and under high pressure A part of the oil in the liquid state is withdrawn and the pressure of the withdrawn part reduced so that a large proportion is vaporized The vapor is separately condensed An app is described

**Condensation products.** I G FARBENIND A.-G Fr 697,700, June 20, 1930. Condensation products, which are either *lubricating oils* or *resins* are made by condensing satd or unsatd fatty oils or waxes contg OH groups with colophony or other resin acids.

**Bitumen.** SIEGFRIED HAMBURGER. Fr 698,081, June 26, 1930 Bitumen is produced from the acid and resinous by-products obtained in the refining of crude oil and oil residues by heating them to 80–100° and allowing them to stand until 3 layers are formed, the lower being $H_2SO_4$ the next bitumen and the top oil

**Emulsion of tar or asphalt.** HUGO NOVÁK. Fr 698,554, June 30, 1930 In emulsifying tar or asphalt, org compds contg one or more atoms of Cl in the mol such as $CCl_4$, $C_6HCl_5$, chloronaphthalene or Cl derivs of oils are used as emulsifying agents in addn to the usual stabilizing and emulsifying agents such as glue, casein, resin and naphthenic acids.

**Deodorizing and decolorizing wood-distillation oils.** DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM ROESSLER (Wilhelm Querfurth inventor) Ger 522,254, Mar 4, 1927 The oils are vaporized and passed with H, at a temp. above

conclusion drawn by Bréguet from the study of fractional pptn. of such solns (Thesis, Lyon, 1924, p 93) Other investigators who studied the fractionation of cellulose esters by ultrafiltration do not mention the $H_2SO_4$ contents of the products with which they worked Specifications of max limits for total sulfate and ash are entirely inadequate to insure proper quality of cellulose acetate, it is essential to specify a min. decompn. point (*C A* 19, 171), which should preferably be not below 195°. When the decompn point is specified, total and neutralized sulfate are of secondary importance, as the decompn point depends directly on these 2 values. The max total $H_2SO_4$ content of 0.6% in cellulose acetate specified by the Fr aeronautical service is practically meaningless, as cellulose acetate with this $H_2SO_4$ content can be highly unstable, and moreover cellulose acetates are being produced commercially which contain as little as 0.05% $H_2SO_4$ and 0.2% ash The normal water content of cellulose acetate at 15° at a relative humidity of 50% is about 6% In the detn of Ac by sapon with excess alkali and back titration with acid, the error introduced by the presence of $H_2SO_4$ is negligible in finished acetates, in the investigation of the mfg and aging processes, in which total combined $H_2SO_4$ frequently reaches 2–3% and even more, the error is quite large and would lead to the conclusion that the Ac content decreases, contrary to C 's results (*C. A* 19, 171) Previous results have shown that nitrocellulose and cellulose acetate are easily washed free from acid, and the apparent difficulty reported by various authors is due to slow hydrolysis of the sulfocellulose esters in the presence of water, with liberation of free $H_2SO_4$. A sample of com. nitrocellulose taken immediately after nitration was divided into 2 portions, one was stabilized by washing 8 days in hard water (Rouen city water) (*C A* 18, 3715) and contained 1.113% $H_2SO_4$, the other was stabilized by prolonged boiling in $H_2O$ contg a trace of HCl and contained 0.17% $H_2SO_4$ They were subjected to the same fractional pptn. treatment, 400 cc. of a 5% $Me_2CO$ soln was used with the following results

| | Nitro contg 1.113% $H_2SO_4$ | | Nitro contg 0.17% $H_2SO_4$ |
|---|---|---|---|
| | Wt. of ppt | $H_2SO_4$% | Wt. of ppt. |
| Addn of 140 cc. of 50% $Me_2CO$ | 4.8 g | 0.503 | 14.0 g |
| Addn of 30 cc. distd $H_2O$ | 7.4 | | 5.4 |
| Addn. of 20 cc distd. $H_2O$ | 2.7 | 1.114 | 0 |
| Addn of 50 cc. distd $H_2O$ | 0 | | 0 |
| Residue on evapn | 5.1 | 1.536 | 0.6 |

These results show conclusively that, if the combined $H_2SO_4$ is not the controlling factor in the fractional pptn of nitrocellulose, it plays a very important part. Though these results are the reverse of those obtained by Bréguet (Thesis) they do not necessarily contradict them, as B used $C_6H_6$ to ppt. $Me_2CO$ solns of celluloid. A P C

Cellulose acetate and its production in Russia. Carl Peters. *Kunststoffe* 21, 85–9(1931).—Although the production of cellulose acetate elsewhere amounts to thousands of tons annually, the Russian industry is still in the early exptl. stages J. W. Perry

Effect of neutral salts on the rate of hydrolysis of cellulose acetate in acetic acid solutions. J. T. Fuess and C. J. Staud *J. Am Chem Soc* 53, 1934–41(1931).—The Na and K nitrates, sulfates and chlorides appear to exert a retarding influence on the rate of sapon of cellulose acetate dispersed in AcOH A greater effect was observed when nitrates and sulfates were used than when chlorides were employed Addn of neutral salts after the reaction had proceeded for 42 hrs showed an effect similar to that noted when they were present at the beginning of the sapon C. J. West

Cellulose furoate. Kenneth A. Kobe and Ralph E. Montonna. *J. Am Chem Soc* 53, 1889–91(1931).—Cellulose di and tri furoates have been prepd by treating standard cellulose with furoyl chloride in the presence of $C_5H_5N$ The esters were fibrous, dark colored and insol in the usual solvents for cellulose esters A considerable degradation of cellulose takes place during the reaction with the production of furoylated degradation products of cellulose which are black amorphous substances. The analysis of cellulose trifuroate by sapon. shows very clearly the fundamental difference of 2 of the alc. HO groups in the hexose residue from the third or primary HO and thus confirms the present accepted structure of the hexose residue. C. J. West

Note on the cellulose amyloid. Justin Mueller *Bull soc. chim.* 47, 1400–4(1930).—When cellulose is treated with $H_2SO_4$ (sp gr 1.58) and the resulting soln. dild., an amyloid seps in finely divided form. This amyloid gives a blue color with I, is sol in alkali, coagulates on drying, and does not reduce Fehling's soln. When dry it is less reactive than when wet On these grounds it must be differentiated from hydro-cellulose and starch R. H. Doughty

**The highest degree of nitration of cellulose.** G DE BRUIN *Z. ges Schiess-Sprengstoffw* 26, 81(1931), cf *C A* 25, 1671 By means of a process which he is not yet willing to describe, de B has prepd nitrocellulose of any desired degree of nitration from 2 to 14% N He believes the highest nitration product to be a homogeneous product It is not decompd by boiling water nor by very dil acid or alk solns Its soly in $Et_2O$ + EtOH is less than 2% C G STORM

**The structure of nitrated cellulose. I. The swelling and disintegration of ramie cellulose in nitrating acids.** FRANK D MILES AND MAURICE MURPHY *J. Phys Chem* 34, 2588-2600(1930) Ramie fibers were nitrated to N contents ranging from 2 to 12% with various mixts of $H_2SO_4$ and $HNO_3$, the latter at various dilns Phys changes occurred at a N content of 7.5% which were probably assocd with some structural change of the nitrated cellulose The phys changes appear to depend on N content rather than the acid compn II **The x-ray examination of nitroramie.** FRANK D MILES AND JAMES CRAIK *Ibid* 2607-20 The x-ray diagrams of nitroramie contg up to 7.5% N were identical with that of cellulose, which is possibly due to intermicellar nitration A N content of 7.5 to 10.4% resulted in phys disintegration of the fibers and indefinite diffraction but the parallel arrangement of the chains in the nitrated structure was thought to persist since the regenerated cellulose was of an ordered form At 10.3% N the stage of internal disorganization is passed at 12.7 or 12.8% N there is a discontinuity and after this the comparatively definite trinitrate is reached I A S

**The structure of nitrocelluloses.** DESMAROUX AND MATHIEU *Compt rend* 192, 231-6(1931) X-ray diagrams of cotton cellulose nitrates contg 11.35-13.9% N all showed distinct circles of diams indicating reticular distances of 6.6 to 7.5 A U, the increase being regular The trinitrate showed 2 intense circles corresponding to reticular distances of 4.5 and 4.0 A U resp The product with less than 13.0% N showed 2 larger circles of lesser intensity, the one contg 12.10% N having 2 concentric uniform regions which met An examn of the products by means of the polarizing microscope showed that the coloration of the fiber surfaces was that of a trinitrate whereas the interior was characteristic of a lower nitrate, indicating heterogeneity *Ibid* 354-5 —When Müller diagrams of long chain paraffins, indicating that the different reticular planes admit of considerable variation in arrangement in respect to variation in temp, were compared with those of D and M, evidence of an anisotropic structure of nitrocellulose was observed The interior circle of the Debye Scherrer diagram of nitrocotton of 13.0% N corresponds to the intense equatorial spots near the center of nitroramie, such spots caused by reticular planes not coinciding with the periodicity in the fiber It is such a family of planes whose distribution remains periodic when the % of N is varied and which suddenly disappears when the nitrocellulose passes to the amorphous state. P. A SIMMONDS

**Effect of mild heat treatments on the chemical composition of wood.** L. F HAWLEY AND JAN WIERTELAK *Ind Eng Chem* 23, 181-6(1931) The chem characteristics of samples of white ash and Sitka spruce wood were detd before and after heating in closed tubes at 138° for 2, 4 and 8 days Losses of pentosans and AcOH occurred in the ash wood whereas in the Sitka spruce the losses were hexosans and stable cellulose The methoxyl content of both woods was practically unchanged Indications of a change of carbohydrates to a lignin like substance were observed P. A. SIMMONDS

**The utilization of waste wood.** W SCHMID *Papier-Fabr.* 29, Tech.-Wiss. Teil

84–5(1931).—The combination of chem. softening and mech. disintegration, for making coarse pulps, is considered. R. H. Doughty

Purified wood fiber. I. Physical and chemical properties. Geo. A. Richter *Ind. Eng. Chem.* 23, 131–9(1931).—Various tests used to characterize paper pulps are described and interpreted. Certain chem. constants of 51 samples representing 11 kinds of pulp are reported. II. Paper-making characteristics of wood fiber high in α-cellulose. *Ibid* 206–72.—The nature of the hydrate gel formed when cellulosic material is mechanically processed in the presence of water depends on the chem. characteristics of the unprocessed material. A wood pulp of high α-cellulose content hydrates slower than ordinary sulfite pulp and yields a paper of higher resistance to tearing and folding. The strength of a sheet is ascribed to an interfelting of the fibers plus the cementing effect of the hydrate gel. Hydrated wood pulp of high α-cellulose content produces paper of quality about equal to paper made from the better grades of rag stock. F. A. Simmonds

A contribution to the technic of fiber measurement. Bruno Schiller *Paper Fabr.* 29, Tech.-Wiss. Teil 4–5(1931).—A simple projection microscope and a method of sampling for making slides are described. The prepd. fibers are collected on an 80-mesh or finer wire cloth, and a small portion is transferred to the slide with a needle. Lifting fibers directly from dil. suspension with a needle results in loss of fines, while if a pipet is used the sample is unduly enriched in short fibers. R. H. Doughty

Chemistry of Australian timbers. W. E. Cohen and H. E. Dadswell. *J. Council Sci. Ind. Research* 4, No. 1, 45–8(1931).—A research project is outlined. For eucalypt Australian woods, the usual methods of wood analysis had to be modified because of their resistance to the action of Cl used in sepg. cellulose. These woods need a much longer treatment than usual and the cellulose appears to be greatly disintegrated. The repeated chlorinations cause the cellulose to become gelatinized by the subsequent alkali treatment and it cannot be filtered. The α-cellulose detn. is of value in detg. the suitability of the cellulose for the manuf. of rayon and cellulose lacquers. Chem. analysis is the only means of positively differentiating jarrah and karri. The former shows 38.8–52% cellulose while the latter yields 55.7–63.7%. It is hoped similarly to differentiate hoop pine and bunyah pine. Lignin results are often high because the $C_6H_6$-alc. mixt. which is used for extn. leaves behind some of the extraneous materials frequently present in woods. These substances contaminate the lignin and vitiate the results. C. R. Fellers

The penetration of water vapor into wood. L. M. Pidgeon and O. Maass. *Research Notes* 3, 47–50(1930); *Pulp Paper Mag. Can.* 31, 530–3(1931).—See *C. A.* 24, 4155. A. Papineau-Couture

Wood-pulp evaluation for soda pulp manufacture. II. W. Morgan. *Paper Trade J.* 92, No. 15, 51–2(1931).—*The importance of careful control of the quality of soda pulpwood and the present methods of grading are briefly discussed. The technic of the 1% alkali soly. test has been modified to give more uniform heating (resulting in slightly higher temp.), which gives more reproducible, though somewhat higher, results. From the results of evaluation of aspen wood by phys. and chem. methods, the relation of the yield to the 1% alkali sol. material was expressed graphically. It is estd. that an increase of 1% in alkali sol. material is accompanied by a decrease of 3% by wt. in the pulp yield.* The effects of decay on the compn. of wood are discussed and the relation of these effects to the pulp yield is pointed out. A. Papineau Couture

The growth of molds on sulfite pulp, the consequent fiber degradation and cellulose decomposition. Walter Drechsel. *Papier-Fabr.* 28, Tech.-Wiss. Teil 709–13, 739–46, 848–54(1930); 29, 5–9(1931).—The method generally used in studying this problem is to follow the wt. changes on decompn., which fails to show the mechanism of fungus attack. The presence of nutrient media may also lead to incorrect conclusions. D. followed the decompn. microscopically, and later by the rate of evolution of $CO_2$. The behavior of 15 molds toward sterile bleached and unbleached sulfite pulp was studied, at 650 magnification, special technic being used. The results, which are copiously illustrated, showed that all the molds tried attacked both pulps, but in different ways. In certain cases, and at certain stages of decompn., the fibers appeared as if swelled in peptizing media, the end result in all cases was a structureless mass. Lignin and other impurities in unbleached pulps seemed to serve as nutrients. Humin substances were formed, especially from the more lignified pulps. It was found that the molds are not anaerobic, and cannot exist solely on the O content of the cellulose. It was possible to control conditions in the lab. so that the lignin decompn. was greater than the cellulose decompn., but the results hold no promise of a successful process for *isolating pure and strong fibers* by biological decompn. of lignocellulose. While most

pulp in storage may be attacked by molds if special care is not taken to prevent infection, the attack will be localized since in the absence of special nutrient media the molds cannot propagate greatly Though the weight loss is small, the strength loss may be large, because of the nature of the attack on the fibers A bibliography of 60 items is appended R. H Doughty

**Description and historical development of the manufacture of sulfite spirit from waste pulp liquors in Germany during the war period 1914-18.** Walter Sembritzki. *Papier-Fabr* 29, Tech -Wiss Teil 69–74, 85–92(1931).—Methods, operation and costs are reviewed R. H. Doughty

***Review of patents on the use of waste liquors and gases of the pulp industry, for the period 1925-30.*** W Schmid *Papier-Fabr* 28, Tech -Wiss. Teil 573–5, 587–90, 620–3, 636–9 671–2, 727–9, 744–6, 875–7(1930), 29, Tech -Wiss Teil 10–4(1931) R. H Doughty

**The galvanic behavior of a chromium-nickel-iron alloy in sulfite liquors.** W Andrew Wesley and F L LaQue *Paper Trade J* 92, No 16, 56–61(1931) —Cr-Ni Fe alloy can function as cathode in galvanic couples in neutral and in acid solns without destruction of the surface film which renders it passive in these electrolytes Mech and other disturbances of the surface of this alloy rendered it active, at least temporarily in which condition it behaved more nearly like Fe than like a noble metal Fe coupled with Cr Ni Fe in $Na_2SO_4$ soln suffered just the same amt of galvanic corrosion as it did when coupled with Pt In sulfite liquors, freshly surfaced Cr-Ni Fe behaved erratically for a time, but always tended to become passive, to behave like a noble metal and to remain in that condition until its surface was again abraded The behavior of couples in which a valve bronze was connected with the alloy or with Pt *indicated that the corrosion process was different in tower acid from that in reclaimed* acid The test conditions were somewhat different from plant conditions in that these solns were satd with $SO_2$ at 50° and atm pressure In reclaimed acid the corrosion of valve bronze was accelerated to the same degree when it was coupled with Cr Ni-Fe as with Pt, indicating that the corrosion process involved to a predominating extent the reaction of some depolarizing agent active in this soln In tower acid the corrosion of valve bronze was accelerated much less by coupling it with Fe alloy than by coupling it with Pt A similar result was obtained in pure dil $H_2SO_4$ soln The discrepancy is thought to be the result of a difference between the H overvoltages of the 2 cathode surfaces A Papineau Couture

**"Liquid rosin" and its possible uses.** W. Schmid. *Papier-Fabr.* 29, Tech -Wiss Teil 1–4(1931) —Quality and compn of the liquid rosin that separates from alk pulp waste liquors varies with the process and the wood used An av yield is 30 kg. per ton of pulp made Purification and uses of this material are described The phytosterol, present up to about 2%, is of increasing importance R H Doughty

***Process water in the pulp and paper industry.*** A. Splittgerber *Papier-Fabr.* 29, Tech -Wiss Teil 81–4(1931) —The impurities of water and their removal from boiler feed, washing and cooling water are described R H Doughty

**White water in paper and pulp mills and its utilization.** R. J. Marx *Trans Inst Chem Eng*, Advance copy, Dec., 1930, 24–9 —White water is the effluent from the passage of the aq suspension of fiber over a close meshed wire in a paper machine. Settling methods for fiber removal were used first, but these are mostly of low efficiency An early power driven machine employed an endless belt traveling over a wire-covered drum The Dorr save-all consists of a vertical tank with horizontal trays connected close to the vertical shaft, which carries one scraper in each chamber The Oliver save-all is a horizontal revolving cylinder with a wire screen in which the deposited fiber forms a filtering medium It has oscillating rakes and works under suction M prefers a gravity settler, in which the water is allowed to fall as drops on to a distributing surface The impacts cause the sepn of entrained air from the fiber, which thereafter settles readily in a large conical tank with bottom discharge for solids B C A

***History of paper-products manufacture.*** H Raff. *Kunststoffe 20*, 272–5(1930) E J. C.

**Chemistry and paper making.** M. Brot. *Chimie & industrie* 25, 480–7(1931).—A general discussion of the importance of chemistry in the various pulp- and paper-making processes A Papineau Couture

**Copper-pipe advantages in the paper industry.** Charles A. Hill and Leland T. Summers *Paper Trade J* 95, No 16, 61–2(1931) —A brief discussion is given of the advantages of Cu over other metals for piping in pulp and paper mills Its use has been rendered quite practical and economical by the development of stream line hard Cu

pipe and fittings which is made threadless and designed to make a conveniently soldered connection to thin wall Cu pipe A. PAPINEAU COUTURE

**Preparation of paper-making materials. I. Rags, esparto, wood pulp.** J. P. BARBOUR. *World's Paper Trade Rev* 95, 1115, 1120, 1129(1931).—A brief discussion, based on 60 yrs.' practical experience, of the prepn of rags, esparto, straw and wood pulp, more particularly as regards boiling A. PAPINEAU-COUTURE

**Methods of determining acidity in paper.** P. F. WEIMER, *et al.* *Paper Trade J.* 92, No. 16, 63–4(1931).—Report of the Technical Assoc. of the Pulp and Paper Ind. subcommittee on paper testing chem. methods. Thirteen labs. have agreed to coöperate in an investigation carried out on 6 different grades of paper by 5 different methods (which are described) including 2 $p_H$ methods (electrometric and colorimetric) A. P.-C.

**The use of liquid chlorine in the preparation of bleach liquors.** H. R. J. FEENY *World's Paper Trade Rev* 95, *1092–6, 1154, 1156(1931).*—*After a brief outline of the* advantages of liquid Cl its use for the chlorination of bleaching powder and of milk of lime in paper mills is briefly outlined. A. PAPINEAU-COUTURE

**The volumetric composition of paper. I. Permeability of paper to air.** T. TREVOR POTTS. *World's Paper Trade Rev* 96, 1257–60, 1330(1931).—After a brief discussion of the primary requisites for permeability measurements, the effect of changing conditions of testing on the rate of flow of air through paper was studied. The rate of flow is proportional to the area of the sample, provided that it is not so great that, in papers of low permeability, it will be slightly modified at the pressure required to obtain flow of air through the paper. For all practical purposes, the flow is practically proportional to the pressure difference between the 2 sides of the sample. No change in rate of flow occurs with time. The rate of flow is proportional to some power of the thickness, the numerical value of the power varying according to the sample of paper tested. This is taken as exptl. proof that the inter fiber spaces of paper are not simple capillaries, and that the thickness of the sample should not enter into the expression of permeability until more is known about its meaning. A. PAPINEAU COUTURE

**Can the bursting pressure for a [paper] test area of any size be calculated if it is known for one area?** G. BIERETT AND BRUNO SCHEELER. *Wochbl. Papierfabr.* 61, 1652–5(1930). *Papier Fabr.* 29, Tech.-Wiss. Teil 231–5(1931).—The relation $p/P = (f/F)^{1/x}$ was found to hold, the value of $x$ lying between 1.6 and 1.8, with the value 1.7 giving satisfactory approx. results in all cases. In the formula, $p$ and $P$ are the bursting pressures for the areas $f$ and $F$. In a perfect homogeneous material, $x$ should equal 2. The formula fails for very weak papers because of the exptl. error in detg. small pressures. R. H. DOUGHTY

**Grease resistance of paper.** ROGER C. GRIFFIN. *Paper Trade J.* 92, No. 15, 44–51(1931).—Results of a collaborative study of the turpentine penetration test and the red oil penetration test, applied to greaseproof paper and vegetable parchment, are reported. It is recommended that paper be first tested in a preliminary way by the turpentine penetration method using 4 sep. pieces, and that, if the av. result of this test is less than 5 min., the paper be tested by the red oil penetration method. Adoption of both methods (the technic of which is described in detail) as tentative standard methods by the Technical Assoc. of the Pulp and Paper Industry is recommended. A method proposed by Ernest Scheller, which is based on the no. of transudations per unit there are in a definite period of time and the technic of which is described, will be studied. A. PAPINEAU COUTURE

**Newsprint: control and tests.** RAYMOND FOURNIER. *Papeterie* 53, 350–61 (1931).—A discussion is given of the advantages to be derived by newsprint users, particularly large dailies, from the control of the paper purchased with an outline of the principal tests and the instruments required. A. PAPINEAU COUTURE

***Manufacture of insulating board from cornstalks.*** O. R. SWEENEY AND W. E. EMLEY. *U. S. Bur. Standards, Miscellaneous Pub.* No. 112, 27 pp. (1930).—A description is given of the exptl. work at Iowa State College on the manuf. of cornstalk insulating boards, including lab. scale and semicom. expts. Both chem. and mech. methods were used. The boards produced appeared to have the same properties as boards from other sources. A statistical survey of the quantity, distribution, value, etc., of cornstalks is given and cost data are presented in pointing out the possibilities of cornstalks in board production. M. HEINIG

X ray study of the gelatinization of nitrocellulose (DESMAROUX, MATHIEU) 2. Plastic materials (Fr. pat. 698,321) 18.

Hess, Walter F.: Die Praxis der Papier-verarbeitung. Berlin: M. Krayn. 256 pp

---

**Cellulose.** Aktieselskapet Raoul Pictet & F. Tharaldsen. Fr. 698,338, July 3, 1930 Cellulose is obtained by treating wood, etc., with a lye contg a much larger amt of free $SO_2$ than in the usual "bisulfite" process, less lye being used than is necessary to recover entirely the primary material treated

**Cellulose derivatives.** I G Farbenind. A.-G. (Max Hagedorn and Eugen Gühring, inventors). Ger 516,882, Apr. 18, 1929 The derivs are recovered from their solns by pptn with steam or vapor Thus, a soln of cellulose laurate, in PhCl, pyridine and pyridine-HCl is treated with steam at 120° The cellulose laurate is pptd as a fine powder and can be sepd by centrifuge or filtration A soln of cellulose nitrate in MeOH is treated with $C_6H_6$ vapor to ppt the cellulose nitrate Further examples are given

**Alkylcellulose masses.** I G Farbenind A.-G (Gerhard Balle and Kurt Sponsel, inventors) Ger 516,751, Aug 14, 1925 Masses or objects are prepd partly or wholly of aq sol alkylcellulose by pressing layers or plates of this substance on one another with simultaneous treatment with water, moisture or aq solns

**Benzylcellulose.** I G Farbenind A.-G (Eduard Dörr, inventor). Ger. 522,170, Aug 18, 1925 See U. S. 1,771,529 (*C. A.* 24, 4631)

**Cellulose acetates.** I G Farbenind A.-G. Fr 698,392, July 4, 1930 Primary acetates of cellulose sol in acetone are prepd by acetylating monohydroxyalkyl ethers of cellulose with $Ac_2O$, AcOH and a catalyst at a temp below that at which hydrolysis takes place

**Cellulose esters.** Kodak Pathé Fr 698,689, Oct. 7, 1929 In making cellulosic esters the diluting reaction acid is replaced wholly or in part by a solvent for primary esters of cellulose, particularly $CH_2Cl_2$ A reflux app is used

**Treatment of cellulose esters.** Camille Dreyfus and Clifford I Haney (to Camille Dreyfus) Can 309,756, Mar 24, 1931 Cellulose acetate that has been prepd by the reaction of cellulose with $Ac_2O$ in the presence of $H_2SO_4$ is purified by sepg it from the primary soln. in which it is formed, dissolving in AcOH and then adding $Ba(OAc)_2$

**Cellulose ethers.** I. G Farbenind A.-G (Gerhard Balle and Karl Ost, inventors) Ger. 522,054 Feb 11, 1928 Cellulose ethers insensitive to water are prepd by treating metal compds of cellulose with an excess of an alkylating agent contg up to 2 mols of an aralkyl halide for each 10–30 mols of alkylating agent The reaction is effected under such conditions of temp and pressure that sapon of the excess of alkylating agent is avoided Thus, an alkali cellulose prepd from 1 mol of cellulose ($C_6H_{10}O_5$) may be heated with EtCl 14 and $PhCH_2Cl$ 1 mol to 110–120° in a pressure vessel Cf *C. A.* 25, 1379

**Carbohydrate ethers.** I G Farbenind A.-G (Otto Leuchs and Eduard Dörr, inventors). Ger. 522,171, Nov. 7, 1923. See Fr 684,330 (*C. A.* 24, 5496)

**Nitrocellulose.** Fredrich Olsen. U. S 1,798,270, March 31. Cellulose is nitrated, pulped and then alternately boiled and washed in water, in order to effect purification.

**Dissolving and dispersing nitrocellulose.** William B. Pratt and Ralph T. Halstead (to Dispersions Process Inc) Can 311,079, May 5, 1931 Cellulose is dissolved in wood creosote and a hydrophilic colloid incorporated therein and water is gradually added until a change of phase takes place and the nitrocellulose soln disperses as minute particles in the aq medium

**Use of cellulose compounds such as celluloid solutions for sealing joints between watch crystals and bezels.** Warren F. Bleecker. U. S 1,799,146, April 7.

**Films.** Kodak-Pathé Fr 698,727, Oct. 12, 1929 In making films from cellulose derivs the sheet of collodion is submitted, during the formation of the film, and particularly before solidification, to a drawing in the direction of its breadth to avoid the formation of wrinkles or creases The drawing may be by bands of fabric on the edges of the sheet which they accompany into the bath guiding it to the roller

**Artificial silk.** Hölkenseide G m b H Ger 522,469, Nov. 17, 1928 See Fr 684,658 (*C. A.* 24, 5497).

**Artificial silk.** Henry Dreyfus. Fr. 697,427, June 14, 1930. Artificial threads or filaments are made by extruding a spinning soln of cellulose acetate or other cellulose deriv. into an evaporative medium in which an external skin-like layer is formed on the threads The threads are passed into an atm of solvent vapor in which the external

layer is softened, and then drawn The drawing is limited to the part of the filaments which have been submitted to the softening An app is described

Artificial silk. HENRY DREYFUS Fr 697,725, June 20 1930. A soln of cellulose or its deriv is extruded and the threads are wound or twisted in a centrifugal box of relatively small diam and at a very high speed, *e g*, 12 000 to 20 000 r p m

Artificial silk. CAMILLE DREYFUS. Fr 697,814, June 23 1930 A soln of an org or inorg deriv of cellulose such as cellulose acetate in a solvent is extruded through orifices at the outlet of which the soln is received into a coagulating bath, the nature of the solvent being such or the coagulation being carried out in such a way that a certain amt of the solvent remains The threads are then heated and are obtained in a transparent brilliant state Thus, threads made from a soln of cellulose acetate in ethylene dichloride, MeOH and triacetin are passed into a coagulating bath contg water and then over a heated roller Other examples are given

Artificial silk. CARL HAMEL A -G and EDMUND HAMEL. Fr. 697,717, June 20, 1930 App for regulating the course of the guide thread is described

Artificial silk. JACQUES DELPECH and CONSTANTIN HEINRICH Fr 698,423, July 5, 1930 An artificial silk of very fine strand is made by partially dehydrating the nitrocellulose by means of 70° MeOH, dissolving the partially dehydrated nitrocellulose in MeOH, and spinning this collodion into 10–40° MeOH at a temp not below 25°.

Artificial silk. COMPTOIR DES TEXTILES ARTIFICIELS (SOC. ANON) Fr 697,853, June 24, 1930 In making artificial silk, the thread after passing through the coagulating bath is passed through a narrow tube traversed by a liquid The liquid is caused to flow in the opposite direction to the movement of the thread to increase the tension or with the thread for the reverse effect. The liquid may be the same as that in the bath or may be a washing liquid

Artificial silk. COMPTOIR DES TEXTILES ARTIFICIELS (SOC. ANON) Fr 698,660, July 8 1930 A brilliant pearly artificial silk is made by transforming a cellulose rich in α-cellulose into a viscose rich in cellulose, preferably more than 7 5%, and, after a short ripening spinning the viscose in a bath of $H_2SO_4$ and $Na_2SO_4$, the content of $Na_2SO_4$ being more than double that of $H_2SO_4$ and the latter being 100–150 g per l

Artificial silk. I G FARBENIND A G Fr 697,329, June 13, 1930 Hollow threads of artificial silk are made by dissolving cellulose derivs such as cellulose acetate in one or more solvents adding one or more non solvents, the b p of which is higher than that of the solvents, heating the spinning soln and spinning into a gaseous medium, the temp of which is lower than the b p of the non solvents Examples are given in which cellulose acetate is used in a mixt of acetone and toluene or $C_6H_6$.

Artificial silk from viscose. I G FARBENIND A -G Fr. 697,997, Mar. 24, 1930 Uniform solns of viscose are prepd, the use of compressed air or other gas being completely avoided The filtration, elimination of air and the final mixing of the distinct contents of the dissolving reservoirs are effected without any interruption The crude soln to be spun coming from the reservoirs is driven back by a common pump to the filter presses connected to a common distributing pipe, then the filtrates from all the filter presses working simultaneously are collected in a common conduit

Artificial silk and films. I G FARBENIND A -G Fr 698,100, June 26, 1930 The reaction mixt of cellulose esters obtained in liquid $SO_2$ by Fr 664,459 (*C A* 24, 961) is used, without isolation of the dissolved cellulose esters, for making threads or films by dry spinning or flowing the liquid into a pptg liquid

Artificial silk, films, etc. WOLFF ET CO KOMMANDIT GES. AUF AKTIEN, EMIL CZAPEK and RICHARD WEINGAND Fr 698,307, July 2, 1930 In the manuf of threads sheets etc, from aq solns of cellulose and a coagulating bath, the mutual soln. of cellulose is heated to about 50°

Artificial silk, films, etc., of reduced luster. HENRY DREYFUS Fr. 698,093, June 26, 1930 $TiO_2$, preferably in a finely divided form, is incorporated in the solns of org derivs of cellulose used for making silk, films, etc The size of the particles of $TiO_2$ is preferably 0 0001–0 00035 mm and dispersing agents for the particles may be used

Artificial silk, plastic materials, etc. OSCAR KOHORN & CO and HELLMUTH SCHUPP Fr 697,471, June 16, 1930 Solns, lacquers, films, artificial silk, etc., are prepd by treating cellulose acetobutyrate with mixts of liquids which have not marked solvent properties for this substance, *e g*, mixts of alcs with hydrocarbons or with their derivs Examples are given using mixts of EtOH and $C_6H_6$ in equal amts

Artificial silk threads, etc. CAMILLE DREYFUS Fr 697,573, June 17, 1930 In dry spinning artificial threads, etc, in an upward direction, the operation is started by surrounding the nozzles with a coagulating liquid such as water, $C_6H_6$, MeOH, EtOH or $CCl_4$, which is run off once the threads have begun to form.

Artificial fibers. I G Farbenind A.-G (Adolf Kämpf, inventor). Ger 522,308, May 1, 1929 A method of stretching dry-spun artificial fibers is described. The fibers are treated, in the course of the process, with swelling agents.

Preparing artificial silk fiber for spinning. Meinrad F Thoma U. S 1,799,399, April 7 The fiber is treated at a moderately warm temp in a bath of water contg an oil soap with a trace of $H_2SO_4$, glycerol, NaOH and pinol

Spinning and stretching artificial silk. Fr. Küttner A.-G. Ger. 516,789, May 27, 1928.

Spinning apparatus for artificial silk. Martin Hölken G m b H Ger. 516,788, July 31, 1929 Details of supplying the soln. to be spun to the spinning heads are given.

Nozzle for spinning artificial silk in acid spinning baths. Erste Österreichische Glanzstoff Fabrik A G Austrian 121 970, Nov 15, 1930

Cellulose acetate yarn. William Whitehead and Camille Dreyfus (to Camille Dreyfus) Can 310,732, Apr 21, 1931 An acetone-sol cellulose acetate having an acetyl value of 52.5–56% is dried until it contains less than 1% of water, dissolved in substantially pure acetone, filtered and dry spun at a temp of 50–55°, whereby yarns are formed that are highly resistant to the delustering action of boiling water, and which have a strength that is 15–25% greater than that of yarn produced from a cellulose acetate soln in 95% acetone

Cooking fibrous material. Thomas L. Dunbar. U S. 1,798,525, March 31. In a process such as digestion with acid liquor, gases and vapors from a digester are discharged through a conduit into an enlarged mixing chamber, and cold acid liquor is constantly fed into the chamber and the gases and vapors are thus utilized to preheat and pre-condition the liquor, thus operation is conducted and the liquor is withdrawn from the chamber under substantially atm. pressure and the liquor is then forced into an accumulator maintained at superatm pressure An arrangement of app is described.

Sulfite liquor. Thomas L. Dunbar (to Chemipulp Process, Inc.). Can. 309,887, Mar 31, 1931 A process and an app are disclosed for absorbing $SO_2$ gas in aq solns. to obtain a sulfite liquor Hot, strong $H_2SO_3$ soln is mixed with cooler, dil. $H_2SO_3$ soln. in the presence of solid lime-contg material. The resulting soln is cooled, $SO_2$ gas is absorbed therein, in the presence of solid lime-contg material, and unabsorbed $SO_2$ is passed from the last-mentioned absorption into contact with water in the presence of solid lime-contg material to prepare a dil. soln to be mixed with further quantities of hot strong $H_2SO_3$.

Washing sulfite pulp. Syosiy Okuda. Japan. 90,207, Feb. 9, 1931. Stuff from the pulp separator in the manuf. of ordinary sulfite pulp sometimes contains acid, which lowers the quality of the pulp. In this process the stuff is mixed with milk of lime in a flow-box; by this means the acid in the stuff is neutralized and the quality of the pulp is improved

Cellulose pulp. George A Richter (to The Brown Co.). Can. 309,868, Mar. 31, 1931. Wood pulp, previously liberated by the action of an alk. liquor, is digested in an acid sulfite liquor to remove components other than α-cellulose, including ligneous matter and pentosans; then the pulp is digested in an alk. liquor to remove more non-cellulose components, and finally bleached.

Chemical wood pulp. George A. Richter (to The Brown Co.). Can. 309,867, Mar. 31, 1931. Raw cellulosic material is cooked in ammoniated water to dissolve a portion of its cementitious content and then cooked in a liquor contg. both NaOH and $Na_2S$ to effect fiber liberation.

Pulp for paper making. John D. Rue (to Champion Fibre Co.). U. S. 1,798,987, March 31. An unbleached and impure chem wood pulp is partially bleached and washed, thickened, admixed with an alk. treating soln. such as caustic alkali and digested. Treating pulp is sepd., a portion of the sepd. soln. is coned., and the remainder of the sepd. soln is combined with a portion of the so-coned. soln. The resulting alk. soln. is reused with addnl caustic alkali as alk. treating soln., and the remainder of the so-coned. soln. is used in alk. digestion of wood.

Bleaching paper pulp. John Neumann. U. S. 1,799,601, April 7. The pulp is bleached in a bath contg salt and oxalic acid and is then washed.

Paper. Charles J. Barnes. U. S. 1,799,350, April 7. Mech. features.

Paper containing rubber. General Rubber Co Fr. 697,683, June 19, 1930. A protective colloid such as starch esters known as "feculoid" or "feculose" or a protein is mixed with paper pulp. The mixt. is rendered alk. and a dispersion of rubber added. The pulp obtained is then treated in the usual manner for making paper. Cf. C. A. 24, 5159

**Paper-making apparatus.** HERMAN L KUTTER (to Black Clawson Co) U S 1,798,887, March 31 Structural features

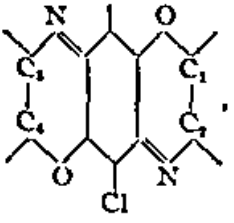
**Apparatus for dewatering paper pulp, etc.** RICHARD KASTNER and HERBERT SCHMOLKA Austrian 121,799, Nov 15, 1930 Addn to 115,901 (*C A* 24, 2295) and 120,690 (*C A*, 25, 1996)

**Apparatus for dewatering cardboard, etc, by compression.** CARL WEISHAN Austrian 121,801, Nov 15, 1930

***Sizing paper.*** JUDSON A DECEW (to Process Engineers, Inc). U S 1,799,216, April 7 A stream of sizing soln is mixed with a stream of alum and the mixed materials are then mixed with a stream of pulp stock U S 1,799,217 describes incorporating emulsified rubber particles into cellulose paper stock by mixing the rubber emulsion with the paper stock after the stock has been discharged from the beater, and adding and mixing a coagulant such as $Al_2(SO_4)_3$ to fix the rubber on the cellulose fibers, then forming the latter into paper Cf *C A* 24, 2604



**Safety paper.** RAYMOND E BOITER (to Todd Co, Inc) U. S 1,799,499, April 7. A plurality of max valuation legends are printed in a concealed manner on documents such as bank checks, by use of substances such as colorless inks" which are altered by chemical reagents such as ink eradicators" so as to render the legends visible

**Packing, etc., paper.** FELIX THUNERT. Ger 519,867, Aug 20, 1925 Addn to 518,099 (*C A* 25, 2568) In the method of Ger 518,099, ornamental effects are obtained by spraying colored or uncolored adhesives on to the cellulose wadding

**Wallboard and pressboard, etc.** FERNANDO S VIVAS. U S 1,800,121, April 7 In producing a sheet of felted cellulosic fibers, the pulp used is beaten with a soln of dextrin

**Carbon paper.** FIRMA GÜNTHER WAGNER Ger 516,975, Mar 8, 1928 Carbon paper is prepd by giving the paper a layer of natural or artificial rubber, gutta percha, *balata, dye and optionally a softening agent such as tricresyl phosphate, oil, fat, fatty* acid etc, and drying Vulcanizing agents may also be added Examples are given Cf *C A* 24, 3903

**Paper colored with sulfonic acid compounds of dyes obtainable from higher molecular diarylaminobenzoquinones.** GEORG KRÄNZLEIN, HEINRICH GREUNE, MAX THIELE AND KARL HAGER (to General Aniline Works) U S 1,798,544, March 31 Dyeings of good fastness to water and to light are effected by coloring paper with a salt of a sulfonic acid of a compd of the probable general formula

wherein $C_1$ and $C_2$, on the one hand, and $C_3$ and $C_4$, on the other hand, represent C atoms belonging *to a naphthalene or carbazole nucleus*, or to a benzene nucleus which is substituted by at least one substituent of the group consisting of PhO, PhNH, BzNH, alkylamino, alkyl and halogen Examples with details of procedure are given, involving the use of the Na sulfonate salts of the dyes produced from (1) 2,5-di(*N*-ethylcarbazolyl-3' amino) 3,6 dichloro-1,4 benzoquinone, (2) di (*β* naphthylamino)dichlorobenzoquinone, (3) 2,5-di (*o* aminodiphenoxy)-3,6-dichloro-1,4 benzoquinone, and, (4) 2,5-di (*p* aminodiphenylamino) 3,6 dichloro-1,4 benzoquinone *Blue, violet, red and bluish* gray tints may be obtained

# 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E MUNROE AND C G STORM

**Recovery of ammonium nitrate from amatol. Explosion at ammonium nitrate plant of Ammonite Company.** R NORRIS SHREVE *Ind Eng Chem* 23, 566–73(1931).—S. describes in detail the process and equipment used in the Ammonite Co's plant for recovery of $NH_4NO_3$ from water soln obtained from amatol (TNT $NH_4NO_3$ mixt) salvaged from loaded shell. He also discusses the effects and probable causes of an explosion which destroyed the plant and killed 16 persons on March 1, 1924.

C G STORM

**Effect of impurities on the freezing point of nitroglycerin.** A SAPOZHNIKOV AND K SNITKO *Zhur Prikladnoĭ Khim* 3, 1077–85(1930).—F. ps of the 2 isomers of nitroglycerin are 12.2° 12.3° and 13.15°, resp. The use of $NaNO_3$ yields the high f. p., and the use of $KNO_3$ the low f. p. isomer. Addn of dinitroglycol for lowering the f. p. is practical while addn of dinitrochlorohydrin or tetranitrodiglycerin has only a small effect. F. ps of these mixts contg. 60–100% nitroglycerin are given. V. K.

**Apparatus for determination of flame propagation.** J. IZART *J. usines gaz* 55, 57–8(1931).—The principle of the app. described is variation of height of combustion cone in a calibrated Bunsen burner. Curves and numerical examples of detns. are given.

B. J. C. VAN DER HOEVEN

**Flame speeds in the "inflammation" and "detonation" of moist carbon monoxide-oxygen mixtures.** WILLIAM A. BONE AND REGINALD P. FRASER *Proc. Roy. Soc.* (London) A130, 542–51(1931).—The "detonation range" of moist satd. CO–O mixts. at about 18° and atm. pressure lies between about 40 and 80% CO contents, as compared with about 15.4 and 94.0% for their "inflammation range." Within the said range the observed rates of detonation in a tube 1.3 cm. in internal diam. all lie between 1700 and 1800 m. per sec. There was a well marked max. rate of detonation at the $75CO/25O_2$ mixt. compn.

H. C. PARISH

**Application of the antioxygenic effect to the problem of extinguishing fires. Negative catalysis of the ignition of carbon.** CHARLES DUFRAISSE AND RAYMOND HORCLOIS. *Compt. rend.* 192, 564–6(1931).—Ignition, like oxidation at low temps., may be hindered by neg. catalysts, and there is thus no theoretical reason why fires may not be extinguished by applying this principle. $CCl_4$, added to air so as to form 5% by vol., exerts this antioxygenic catalytic effect, extinguishing a wood charcoal fire in an exptl. stove very quickly. That the extinguishing is not due to the massive action of the $CCl_4$ or to rarefaction of $O_2$ by dilu. is shown by similar expts. in which the diluent is $N_2$ (scarcely any extinguishing effect) or where the air and $CCl_4$ are enriched with up to 31% $O_2$ (marked extinguishing effect). For $CCl_4$, the threshold of activity is at $^1/_{10}$ of satn. or $^1/_{100}$ of vol. $CO_2$ behaves similarly but not so markedly. Other substances acting like $CCl_4$ are $CHCl_3$, $C_2H_4Cl_2$, $C_2H_2Cl_2$, $C_2HCl_3$, EtBr, ethyl chloroformate, sulfur chloride, thionyl chloride, sulfuryl chloride, $PCl_3$, $PBr_3$, As chloride, $SiCl_4$, $TiCl_4$, $SnCl_4$, $BCl_3$, $Et_3NH$, $SO_2$, etc. $POCl_3$ is very active, its threshold being $^1/_{20}$ of satn. or $^1/_{2000}$ of vol.

ALBERT THOMAS FELLOWS

**Prevention of mine explosions by means of water sprays.** WM. KOHLSCHEIN. *Z. ges. Schiess Sprengstoffw.* 26, 77–81(1931).—A method is described for extinguishing an explosion flame by means of an atomized spray of water, automatically released by means of compressed air from 45 l. of water in a cylinder placed in the mine gallery about 20 ft. from the shot. The release is effected electrically by the current which fires the shot. Tests in a steel gallery at Freiberg, Saxony, in which 200-g. charges of dynamite were fired from a mortar, showed a length of flame of 25–30 m. without the water spray, and only 0.5–1.5 m. when the spray was used. To be effective, the spray must be released 2.5–3 sec. before the shot is fired, the delay of the shot being obtained by "delay detonators."

C G STORM

**Prevention of explosions in mirror-silvering materials.** MAX ERMES *Diamant* 51, 62–3(1929), *Ceram. Abstracts* 9, 24.—In the prepn. of a silvering mixt. there is a possibility of the formation of CNOAg on the addn. of alc. to a concd. soln. of $Ag_2O$ in $NH_3$. Two kinds of silver fulminate, Howard's and Berthelot's, are formed and they are both more explosive than the best gunpowders. Precautions to be taken to prevent accidental explosions while prepg. and working with silvering solns. in mirror manuf. are discussed.

G. G.

**Danger of explosion in silvering solutions.** MAX ERMES *Diamant* 51, 587 (1929), *Ceram. Abstracts* 9, 725.—The statements of E. Lohmann (cf. following ab-

stract) in regard [redacted] ty from danger of explosions in the Rochelle salt process are confirmed by l[redacted] ns of mirrors prepd by this process that are still sound though they were prepd 20 yrs. ago Experience with a soln that had been stored for a year confirmed the fact that the Brashear process is also safe if the solutions are properly dild G G

**Source of danger of explosion in chemical silvering of glass.** Eduard Loidmann. *Diamant* 51, 526–30(1929), *Ceram. Abstracts* 9, 725.—The danger of explosion is said to lie in the prepn. of the ammoniacal soln of Ag for the Brashear process, when soln "A" is made alk with KOH or NaOH In certain concns the compd $Ag(NH_2)_2OH$ is formed, which breaks down to give $AgNH_2$ and $Ag_2N$. This does not happen in dil solns contg less than 0.35 g.-atoms of Ag per l The mixt. of $AgNH_2$ and $Ag_2N$, the "Knallsilber" of Berthelot, detonates violently on the slightest disturbance of the soln In the Rochelle-salt process, where addns of KOH are unnecessary, there is very little danger of the formation of this explosive compd., and the danger in the Brashear process can be minimized to a large extent by avoiding too concd solns of Ag, by using dil caustic alkali and by mixing the soln only just before use It is also good practice to keep the flasks which contain such solns away from direct exposure to sunlight. G G

**Explosions in production of mirror coatings.** Werner Mylius. *Diamant* 51, 42–4(1929), *Ceram Abstracts* 9, 24.—The chemistry of prepg silvering solns for mirror silvering is discussed, and it is pointed out that there is a possibility of formation of such explosive compds as $AgNH_2$ by the combination of Ag and part of the $NH_4$, or in case other ingredients are used in prepg the solns, other explosive compds. may be formed G G

**Explosion studies of ammonia-air and ammonia-oxygen mixtures (with regard to high pressures).** H Heinrich Franck and Gerhard Döring *Z. angew Chem* 44, 273–7(1931).—An investigation of the lower explosion limits of mixts. of $NH_3$ with air and O was carried out in a 50-l bomb at an initial pressure of 1–20 atm., with various means of ignition Independent of the nature of the means of ignition, there is a sharply defined explosive limit above which explosion is propagated without interruption in all directions With less efficient ignition (elec sparks or small quantities of combustible mixts.), complete reaction results only with increased concn of $NH_3$ in the gas mixt With more efficient ignition (*e. g.*, 0.5–1 g $KClO_3$ C mixt.), the explosion limits were, for 1 atm., 15.5% $NH_3$ with air, and 13.5% $NH_3$ with O, for 20 atm., the limit fell to 10% $NH_3$ with O C. G. Storm

**Explosions in mixtures of acetylene and electrolytic gas.** W. A. Bone, R. P. Fraser and F Lake *Proc Roy Soc* (London) A131, 1–17(1931), cf *C. A.* 21, 2064.—Explosions of mixts of $x(C_2H_2) + (100-x)(O_2 + 2H_2)$ were studied by the open tube and the closed tube methods The flame speeds, $S$, were measured and the flames photographed Initial $S$ is reduced on addn of 1% $C_2H_2$, further addns. up to 11.8% $C_2H_2$ greatly increase $S$ which reaches a max at $C_2H_2 + 5O_2 + 10H_2$ when the $O_2$ is sufficient to burn $C_2H_2$ to $CO_2 + H_2O$, increasing the $C_2H_2$ content above 11.8% causes a rapid decrease in initial and general $S$ until a 40 $C_2H_2$/60($O_2 + H_2$) mixt is reached No C is deposited in mixts contg 25% or less $C_2H_2$, *i. e.*, in mixts. with $C_2H_2$ less than $C_2H_2 + O_2 + 2H_2$, the combustion is given by $C_2H_2 + O_2 + 2H_2 = 2CO + 3H_2$ Diln with A has no effect, while diln with $N_2$ causes C sepn and steam formation In no expts with explosions of $x(C_2H_2) + (100-x)(O_2 + 2H_2)$ or $x(C_2H_2) + (100-x)(O_2 + 2CO)$ was there any sepn of C or survival of $C_2H_2$ until $x$ was greater than 25 With low $C_2H_2$ content the "water-gas" equil was not attained during cooling behind the flame front. S Lenher

**Ballistic powders.** E I du Pont de Nemours & Co Fr 698,308, July 2, 1930 A ballistic powder which may be dried contains nitrocellulose in combination with a polynitrotoluene and an ester of an org acid, each of which has in the liquid state a marked solvent action on nitrocellulose and each of which is non-volatile, non hygroscopic and insol in water, *e. g.*, nitrocellulose 85, dinitrotoluene 10, dibutyl phthalate 7 and diphenylamine 1 part.

# 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Recent developments in dyes and dyeing.** CHAS E. MULLIN AND ALFRED R. MACORMAC *Textile Colorist* 52, 739–43, 815–8, 849(1930).—A review of the present trends in dyeing and latest color cards, with a discussion of the properties of the recently announced dyestuffs CHAS. E MULLIN

**Action of light on some vat colors.** W F A ERMEN AND E. H. GOODYEAR. *Textile Manufacturer* 55, 437–8(1929).—Some abnormal effects in the fading of vat colors by light. CHAS. E. MULLIN

**Dyeing and finishing costume cloths.** H. JENNISON *Textile Manufacturer* 57, 69(1931).—A general address on the dyeing and finishing of wool materials C E M.

**Notes on the dyeing of union fabrics containing acetate rayon.** ENCO *Russa* 6, 489, 491(1931).—Brief practical notes are given on the production of various effects on such fabrics A PAPINEAU-COUTURE

**Effect of valences of electrolytes in mordant dyeing.** P P VIKTOROV AND A. A LEBEDEV *Zhur Prikladnoi Khim* 3, 1175–88(1930). cf *C A* 25, 1386.—For coagulating Benzo pure blue the effectiveness of electrolytes is as follows $NH_4 < Na < K < Mg < Ni < Mn < Zn < Cd < Al$ V KALICHEVSKY

**The resistance of coloring substances to ultra-violet light.** III. GIUSEPPE A BRAVO. *Boll ufficiale staz sper ind pelli mat conciantì* 8, 292–8(1930). cf *C A* 24, 2888, 25, 2295.—Earlier investigations were continued The dyes examd in this study belonged to the following classes azo, pyrazolone, diphenylmethane, triphenylmethane, xanthene, acridine, quinoline, azine, oxazine and thiazine dyes. G S

**Chemical control in the textile industry.** W. F A ERMEN AND S. H. JENKINS. *Textile Manufacturer* 55, 279–81, 316–7, 352–3, 402–3, 439–40(1929), 56, 28–9, 71–2, 225–6, 261–2, 377(1930), 57, 70–1(1931).—A discussion of lab layout, the testing of coal and lubricants, the identification of synthetic yarns and starches, and the chem analysis of flue gas, water, fabrics, sizing, finishing and weighting materials. CHAS. E MULLIN

**Use of the microscope in the textile industry.** J M. PRESTON. *Textile Manufacturer* 55, 293, 335–6, 379–80(1929), 56, 12–3, 130–1, 244–6, 284–6, 358–9, 395–6 (1930); 57, 6–7(1931).—Many excellent details of technic are given. C E M

**Some chemical differences between abaca and Canton fibers.** HARTLEY E SHERMAN. *Philippine J. Agr.* 1, 123–34(1930).—Color of the ash is of no value in differentiating abaca from Canton. Since both fibers are colored by $K_2CrO_4$ soln this test is of no value in classifying Canton and abaca Canton fibers were lighter in wt., showed lower tensile strength, lower elasticity, higher natural acidity, 2–3 times greater fat content and higher ash than abaca fibers of similar stripping The "Mercerization Curl" produced by hanging the fiber in a tall tube of 20% NaOH gave tighter, kinkier curls and greater contraction with Canton than with abaca fiber of similar stripping Loss in wt due to boiling the fiber for 1 hr. in 1% KOH soln was 6% higher for Canton than for abaca fiber, indicating a larger amt. of saponifiable matter and pectocelluloses in the Canton JOHN O HARDESTY

**Relation between reeling process of the cocoon and physicochemical properties of the aqueous colloidal solution of sericin.** H. KANEKO AND M MIYASAKA. *Bull Sericulture and Silk Ind* (Japan) 3, 2–3(1930).—The sericin of silk cocoons has been examd as to its soly. in hot water and the stability, viscosity, surface tension, osmotic pressure, sp elec cond and degree of turbidity of its colloidal solns. Increased ease of reeling appears to be correlated with lower soly in hot water, higher stability of colloidal solns, lower surface tension, greater cond., greater osmotic pressure and greater turbidity B C A

**Acetate silk developments.** CHAS. E MULLIN. *Textile World* 78, 1519, 1578 (1930).—A general review of the developments in the use, dyeing, printing and processing of the acetate silks. CHAS E MULLIN

**Recent developments in the delustering of rayon materials.** A J HALL. *Textile Exporter* 6, No 49, 14–5(1931).—A review of the recent patents CHAS. E MULLIN

**What are the future trends in the American synthetic yarn industry?** CHARLES E MULLIN. *Chem Markets* 28, 363–7, 492–6(1931). E H

**Immunized cotton.** GIOVANNI TAGLIANI. *Bull soc. ind Rouen* 58, 418–26 (1930).—An address on the Zimmerman process of rendering cotton immune to the action of substantive dyes by treatment with toluenesulfonyl chlorides (cf. Ger Pat. 396,926 (1922)) The chem and phys factors affecting the process are discussed

in general terms Among the properties of cotton so treated are the following larger, stiffer, and more transparent fibers, maintenance of immunization against the action of dil acids, alkalies and bleaching liquors, also to the mercerization process if carried out rapidly, resistance to drying storage and molds The product is immune to most substantive dyes It can be dyed with properly chosen S and vat dyes in which case certain phenolic materials and colloids are desirable addns to the bath It also absorbs basic dyes, some azo dyes and several other classes A list of patents on this type of process is given I H Odell

Woolen and worsted cloth finishing. B H *Textile Manufacturer* 55, 314-5, 350-1, 442-3(1929).—Carbonizing piece goods by the $MgCl_2$, $AlCl_3$, $H_2SO_4$ and HCl processes, filling and weighting are considered Chas E Mullin

Sizing of worsted and woolen yarns. B R D Sharp *Textile Manufacturer* 56, 240-1(1930).—General. Chas E Mullin

Treatment and disposal of wool-washing effluent. Basil A Smith *Textile Manufacturer* 56, 452, 458(1930) *Trans Inst Chem Eng*, Advance copy, Dec 1930, 16-23.—The acid-cracking solvent extn, and centrifugal processes of grease recovery, the recovery of scouring liquors by purification and the disposal of the final liquors are discussed Chas E Mullin

Treatment of suint liquors from wool-scouring A T King *Textile Manufacturer* 56, 458-60(1930). *Trans Inst Chem Eng*, Advance copy, Dec 1930, 9-15.—The Duhamel and other systems are discussed Chas F Mullin

The Marwa washing process. M Dittmer. *Seifensieder Ztg* 58, 235-7(1931).—The Marwa process saponifies fatty acids with $Na_2CO_3$ in the washing machine in the presence of the wash goods. The evolution of $CO_2$ may aid cleansing but the odor of the fatty acids, the usual presence of neutral fat and traces of metals in the fatty acids are decided disadvantages and do not avoid the formation of Ca and Mg soaps as a result of water hardness F Eschen

Dyes. Ostro Research Laboratories, Inc. Fr 698,076, June 24, 1930 4 (*p*-Alkoxyphenyl)azo-*m* phenylenediamines in which 1, 2 or 3 alkyl groups may be substituted in each benzene ring are prepd by diazotizing an alkoxyaniline and coupling with a diaminobenzene Thus *p*-phenetidine is diazotized and coupled with *m* phenylenediamine The products may be used as direct dyes for silk and wool and for cotton mordanted with tannin They may also be used for *coloring bacteria* and for *preserving foods from fermentation*

Azo dyes. I G Farbenind A -G (Winfrid Hentrich and Rudolf Knoche, inventors) Ger 522,201 May 15 1928 The diazo compd from 4 nitraniline-2 sulfonic acid is coupled with 2 alkylaminonaphthalenesulfonic acids in which the alkyl residue contains more than 2 C atoms An example is given Cf *C A* 25, 2299

Azo dyes. I G Farbenind A G (Leopold Laska and Arthur Zitscher, inventors) Ger 522,295, July 26, 1928 Diazo tetrazo or diazoazo compds not contg the COOH or $SO_3H$ group, are coupled with a 2,3 hydroxynaphthoyl-4-amino-1 alkoxytoluene The dyes are insol in water, and are useful as pigments as well as for dyeing or printing vegetable fibers Numerous examples are given Cf *C A* 25, 2855

Azo dyes. I G Farbenind A G Fr 698,219, June 30, 1930 Diazotized

aromatic amines are coupled with ω haloacylaminonaphtholsulfonic acid and their derivs Thus, a dye which dyes wool red shades is obtained by coupling diazobenzene with ω-chloroacetyl 1 amino-8 naphthol-3 6 disulfonic acid Other examples are given

**Azo dyes.** I G Farbenind A G Fr 697,540, June 17, 1930 Dialkyl ethers of aminohydroquinone or their derivs are diazotized and coupled with 1-benzoylamino-8-naphthol-4 6 disulfonic acid or its derivs substituted in the $C_6H_4$ ring Examples are given

**Azo dyes.** I G Farbenind A G Fr 698,007, July 5, 1930 Azo dyes are prepd in substance or on the fiber by coupling diazo compds of esters of aminoterephthalic acid with arylamides of 2 hydroxynaphthalene-3 carboxylic acid Thus the dimethyl ester of aminoterephthalic acid is diazotized and coupled with the 2'-methoxy 1' anilide of 2 hydroxynaphthalene-3-carboxylic acid Other examples are given

**Azo dyes.** Soc anon pour l'ind chim à Bâle Fr 697,742, June 21, 1930 Aminodiarylsulfones of the general formula $R'R''N(H_2N)C_6H_3SO_2R$, in which the amino groups are *p* to each other and R' represents H, alkyl, aralkyl or aryl, R'' is alkyl, aralkyl or aryl, and R is aryl, or ring substituents thereof, are treated with $HNO_2$ and coupled with arylides of β hydroxynaphthoic acid in which the $C_{10}H_6$ nucleus may contain substituents such as halogen or OH and in which the aryl group may also be substituted

**Chromium compounds of azo dyes** I G Farbenind A G Fr 698,526, June 4, 1930 Azo dyes prepd by coupling diazotized aromatic amines contg neither a OH nor COOH group *o* to the amino group with 1 phenyl 3 methyl 5-pyrazolones contg in the phenyl group a OH and COOH *o* to one another are treated with Cr compds *Thus, the dye obtained by diazotizing m aminobenzoic acid and coupling* with (2 hydroxy 3'-carboxy 5 sulfo) 1 phenyl 3 methyl 5-pyrazolone is treated with a paste contg $Cr_2O_3$ and HCOOH Other examples are given

**Vat dyes.** Felice Bensa Fr 697,640, June 18, 1930 Perylenediketones dissolved *in an appropriate solvent are electrolyzed An example is given of the electrolytic* treatment of dibenzoylperylene dissolved in concd $H_2SO_4$ The product dyes cotton in a blue shade which turns purple on exposure to the air

**Vat dyes.** I G Farbenind A G Fr 697,875, June 25, 1930 Vat dyes of the *N* dihydro-1,2,2',1' *anthraquinoneazine* series are prepd *by* treating *the* dyes prepd by the process of Fr 693,919 (*C A* 25, 2004) with halogens or substances yielding halogens Several examples are given

**Vat dyes.** I G Farbenind A-G Fr 698,345, July 3, 1930 The $H_2SO_4$ ester obtained by treating the leuco compd of 4,6 dichloro 6' methoxy bisthionaphthene-indigo (by condensing a 2 anil of 2,3 diketodihydro-6 methoxy thionaphthene with 4 6 dichloro-3 hydroxy thionaphthene) in the presence of a tertiary base with $SO_3$ or substances liberating it gives fast scarlet red shades on animal or vegetable fiber when used for dyeing or printing

**Vat dyes.** I G Farbenind A G Fr 698,407, July 4, 1930 Two active derivs of 4 alkyl 5,7 dihalo 2,3 diketodihydrothionaphthenequinones are condensed with hydroxy thionaphthenes with the exception of 4 methyl 5,7 dichloro-3-hydroxy thionaphthenequinone Thus, 4 methyl 5,7 dichloro-2,3 diketodihydrothionaphthenequinone 2 (*p*-dimethylamino)anil is condensed with 4 methyl-6-chloro-3 hydroxythionaphthene in glacial AcOH to give a product which dyes cotton in fast rose shades Other examples are given

**Vat dyes.** I G Farbenind A G Fr 698,638, July 8, 1930 Vat dyes of the *N* dihydro-1,2 2',1' anthraquinoneazine series are prepd by treating the products obtained by Fr 346,398, with halogens or agents liberating halogens Examples are given

**Blue vat dyes.** I G Farbenind A G (Karl Thiess, Theodor Meissner and Werner Zerweck, inventors) Ger 522,206, Aug 28, 1928 Reactive α compds of 4 methyl 5 halo-7-alkoxyisatins are condensed with 4 halo-1 naphthols The reaction may be effected by warming the reagents together in PhCl soln Examples are given Cf *C A* 25, 2301

**Dye preparation.** Mary B Parrish Can 310,316, April 14, 1931 A dye compn consists of commercial aniline dyes, panercatin, pancreas, acetic acid, citric acid, acetone, gelatin, tinctures of camomile flowers, hyssop, ground cedar wood, and myrrh and dextrin

**Sulfuretted dyes.** Chemische Fabrik. vorm Sandoz Fr 698,583, June 30, 1930 See Brit 335,297 (*C A* 25, 1394)

**Dibenzanthrone dyes.** Scottish Dyes, Ltd Ger 522,406, Aug 27, 1927 See Brit 286,323 (*C A* 23, 285)

**Xanthene dyes.** Imperial Chemical Industries, Ltd Ger 516,785, Mar 3, 1929 See Brit 314,825 (*C A* 24, 1518).

**Acid dyes of the anthraquinone series.** Fabrique de produits chim ci devant Sandoz Fr 698,306, July 2, 1930 Anthraquinone derivs having at least one replaceable group are condensed with halogenated aromatic amines, contg at least one halogen *m*- with respect to the amino group, and their substitution derivs and sulfonating the products thus obtained Thus, 1-amino-2 methyl-4 bromoanthraquinone is heated to 160° with *m*-chloroaniline and a small quantity of AcOK and crystd $CuSO_4$ The product is sulfonated Other examples are given Wool is dyed violet red, violet and violet blue shades.

**Acid wool dyes.** I G Farbenind A.-G (Walter Mieg and Kurt Bamberger, inventors) Ger 522 082, June 8, 1929 Amino- or alkylamino-1,1'-dianthraquinonyl amines are sulfonated with oleum in the presence of $H_3BO_3$ and Hg or its oxides or salts at 120–50° Examples are given Cf *C. A.* 25, 2574

**Alkylolamine salts of aliphatic acids and sulfonated fatty acids (dye assistants).** Jean G Kern and Charles J Sala (to E I du Pont de Nemours & Co) U S 1,799,821, April 7. Dyeing is facilitated by mixing the dye with a product resulting from saponifying a higher fatty acid and glyceride with an alkylolamine such as mono-, di- or tri ethanolamine, U S 1,799,822 relates particularly to the use of the product derived from oleic acid and an alkylolamine such as mixed ethanolamines U S 1,799 823 relates to the similar use of similarly formed derivs from stearic acid U. S 1,799,824 relates to products formed from an alkylolamine such as ethanolamines and sulfonicinoleic acid or the product of sulfonation of castor oil U S 1,799,825 relates to the use in dyeing of these products U. S 1,799,826 relates to printing pastes contg a lake of a basic color and an alkylolamine salt of a higher fatty acid

**1-Amino-2-chloro-4-hydroxyanthraquinone.** Ivan Gubelmann, Henry J. Weiland and Otto Stallmann (to Newport Chemical Corp) U S 1,798,156, March 31 This compd., a *dye intermediate*, forming dark red shining needles when recrystd from glacial HOAc, may be made by further heating a reaction mass resulting from the heating of 3' amino-4',6' dichloro-*o*-benzoylbenzoic acid with concd $H_2SO_4$ and contg 1 amino-2 4 dichloroanthraquinone to a temp of 140–200° and maintaining the mass within that temp range until evolution of HCl has practically ceased

**Condensation products.** I. G. Farbenind A.-G Fr. 698,525, June 3, 1930 Org polycyclic N compds having at least 4 rings, particularly $NO_2$ or $NH_2$ derivs., are treated with org compds having an open chain of at least 3 C atoms, in the presence of dehydrating agents, preferably in the presence of oxidizing substances favoring the reaction and finally substituting or condensing or both the reaction products thus obtained Thus, 6-aminobenzanthrone is condensed with glycerol in $H_2SO_4$ The product, 6 (*N*), 5 pyridinobenzanthrone, m 270°, dyes acetate silk in green yellow shades, and by alkali fusion gives a product which dyes vegetable fiber a violet blue from the vat Many examples are given, including the prepn of pyridino-*allo meso* naphthodianthrone, m 350–352°, a pyridinopyranthrone, m above 300°, pyridino-3,4 8,9 dibenzopyrene 5,10 quinone, 4,3-pyridino-*Bz*-dichloroanthraquinone 2,1-benzacridone and their derivs and condensation products The *products have application in dyeing, printing and pharmacy*

**Aniline black dyeing.** Hikozo Sato Japan 89,540, Dec. 12, 1930 Fibers are treated first with a dil soln of persimmon tannin, dried and then dyed with one of the following mixts (1) aniline salt 140, $K_2Cr_2O_7$ 150 and HCl 30 parts, (2) aniline salt 200, $KClO_3$ 40, $CuSO_4$ 80 parts, (3) white paste 1000, aniline salt 80, $KClO_3$ 40 and CuS 80 parts

**Dyeing textiles.** Camille Dreyfus. Fr 698,269, July 1, 1930. Textiles of or contg cellulose esters or ethers are dyed with vat dyes by applying the leuco compds by means of a medium of relatively low alky., *e. g.*, 2–8 parts of alkali for 5 of dye Examples are given

**Dyeing piece goods.** August Römer, Färberei, Bleicherei und Appreturanstalt (Alfred Linke and Walther Schramek, inventors) Ger 516 983, Feb 10, 1927 A method of producing white or colored effects on piece goods during the slop-padded aniline black process is described Wool yarn is soaked with an ammoniacal or other alk casein soln to which oxidation retarding agents have been added, and is optionally after treated with $CH_2O$ or acid Finally it is dried in moderate heat Thus, wool yarn is soaked in an aq soln of casein and $NH_4OH$ and squeezed out It is then immersed in a bath of 1% AcOH, dried and woven It remains unchanged in oxidation processes A further example is given

**Dyeing acetate silk.** Soc anon. pour l'ind chim à Bâle Fr 697,541, June 17, 1930 Fast shades are obtained on cellulose esters and ethers by means of 1 alkyl-

amino-4 anilinoanthraquinones Thus, the Me compd gives a light greenish blue shade on acetate silk

**Dyeing and waterproofing of cloth and fibers.** YONETARO WASINO Japan 89,546, Dec. 13, 1930 The dyeing and waterproofing are effected by one treatment with a mixt. of emulsified wax, paraffin, fatty acid, rubber or like substances in the presence of protective colloid, dyestuff and hydroxides of metals or their double salts.

**Dyeing animal fibers.** SOC. ANON. POUR L'IND CHIM A BÂLE Ger. 516,878, Dec 28, 1929 The fastness of chromed azo dyes on animal fiber is improved by adding tannin and an aromatic hydroxycarboxylic acid to the dye bath, or by after-treatment with these substances In the example, wool dyed with a chromed *o*-hydroxyazo dye is made fast to acid dressing and fulling by addn of tannin and salicylic acid

**Dyeing furs with "ursols."** GOSUDARSTVENNAYA SUIREINO KRASILNAYA FABRIKA GOSUDARSTVENNAGO TRESTA LENINGRADSKOI SHVEINOI PROMYSHLENNOSTI "LENINGRADODEZHDA" Russ appl 37,262, Dec 19, 1928 Furs after being dyed with "ursols" by usual methods are first treated at ordinary temp with dil solns. of $Ca(ClO_3)_2$ followed by a dil sol of $H_2O_2$ before their final finishing, whereby they are rendered harmless

**Coloring textiles.** HENRY DREYFUS. Fr 697,523, June 16, 1930. Textiles are colored by aq suspensions or dispersions of free leuco compds of dyes Several examples are given Cf *C A* 25, 2007

**Machine for dyeing cloth.** MASCHINENFABRIK BENNINGER A.-G. Fr. 698,177, June 28, 1930

**Machine for dyeing cloth.** MASCHINENFABRIK BENNINGER A.-G. Fr. 698,416, July 5, 1930

**Controlling means for dyeing machines.** SIEMENS-SCHUCKERTWERKE A.-G Fr 698,252, July 1, 1930

**Beam-dyeing apparatus.** WM P HORNBUCKLE and ROBERT F CRAIG U S 1,709,421, April 7 Structural features

**Apparatus for oxidizing mordanted cloth.** TEINTURERIE CLÉMENT MAROT. Fr. 697,955, Sept 30, 1929

**Textiles.** HENRY DREYFUS. Fr 698,418, July 5, 1930 Cotton or other cellulosic fiber is eliminated from mixed fibers contg animal fibers and (or) cellulose acetate or other esters or ethers of cellulose by heating the fibers in a soln of a mineral acid or a salt having an acid reaction such as $FeCl_3$ and washing, etc.

**Textile materials of organic cellulose derivatives.** CAMILLE DREYFUS and HERBERT PLATT (to Celanese Corp. of Am.) U S 1,798,536, March 31. Org. cellulose derivs such as cellulose acetate are prepd contg a substance such as a Sn compd which acts as a weighting and swelling agent and gives increased resistance to heat

**Metallized fabrics.** OSCAR TREBITSCH Austrian 121,965, Nov. 15, 1930. Fabrics are treated with a metal salt soln and then with a reagent capable of reducing the salt to the metal. After washing and drying, the metallic appearance is developed by mech. treatment with steel rolls or brushes in a lustering or beetling machine or the like. Cf *C A* 25, 1392

**Treating cloth.** HENRY DREYFUS Fr 698,181, June 28, 1930 Metallic radicals are incorporated in textile materials for mordanting, charging or dyeing by treating the materials with a current of particles of metal or oxide moving at a high speed, and oxidizing if necessary

**Vegetable fibers.** HEBERLEIN & CO., A.-G Ger 516,877, Nov 29, 1927. In working up vegetable fibers by CuO-$NH_3$ soln and NaOH, the fiber is treated first with CuO-$NH_3$ soln and then directly with NaOH soln. The excess of the first soln may be removed mechanically, *e. g.*, by pressing, before the application of the second soln The fiber is washed, dried, stretched, etc. The NaOH bath imparts a mercerized finish

**Threads for spinning.** GIOVANNI MOSSO Fr 697,629, June 18, 1930 Fibers which may be spun are obtained by softening crude vegetable in water, treating them in an autoclave at above 130° in a bath contg $Na_2CO_3$ 1, NaOH 2–3 and olein or soap 0.5% The fibers are afterward submitted to an energetic washing with water under pressure and afterward in a bath contg soap and olein or Na sulforicinate and dried

**Apparatus for sizing textile threads.** JOSEPH ANNICQ Fr 698,547, June 11, 1930

**Weavers' shuttles.** I G FARBENIND A.-G Fr 697,496, June 16, 1930 Weavers' shuttles are made of wood impregnated with org Cl compds such as chlorinated $C_{10}H_8$ or wax

**Scouring silk.** I G FARBENIND A.-G. (Anne Nies-Harteneck and Roland Rüsch, inventors) Ger 520,092, Mar 6, 1928 Addn to 513,373 (*C A* 25, 2578)

The method of Ger 513,373 is applied to undegummed crude silk in mixed fabrics or to hardened or colored but still undegummed silk. Examples are given.

Regeneration of natural silk. Gen'itu Kita, Genzo Yamanouti, Syuzo Masuda and Institute of Physical and Chemical Research Japan 89,557, Dec. 15, 1930 $Ca(NO_3)_2$ soln of natural silk is coagulated by passing through 70% $Na_2S_2O_3 \cdot 5H_2O$ soln The regenerated fiber is further treated with AcONa soln or AcOH (1:2)

Preparing spinnable solutions from natural silk. I G Farbenind A.-G (Wilhelm Irion, inventor) Ger 522,086, Nov. 2, 1929 Degummed silk is dissolved in a concd strong mineral acid, *e. g.*, 89% $H_3PO_4$ at a low temp., preferably below 0°, and the soln is treated with a salt soln., *e. g.*, NaCl or HCOONa soln. The fibroin is thus pptd in a form readily sol at atm temp in solns of suitable alkali or alk earth metal salts, *e. g.*, in 50% NaSCN soln., giving solns suitable for the manuf of fibers by spinning into baths of coagulating salts

Preparing spinnable solutions from natural silk. I G Farbenind A.-G (Heinrich Fink and Ernst Rossner, inventors) Ger 522,408, Sept 1, 1929 Addn to 510,489 (*C. A.* 25, 1103). In the method of Ger 510,489, about 0.02–0.1% of an ethereal oil is added to the acid spinning soln The tendency of the spun fibers to stick together is thus reduced

Twisting effect in cottonized fiber. A V Talanov Russ 19,498, Feb 28, 1931. Fiber after having been cottonized by usual methods and after plucking and mellowing, is steamed in chambers with vapors of $H_2SO_4$ soln (8–10° Be.) or HCl (12–15° Be.) and then dried

Preparing cotton goods for roughening. Eduard Tschörner and Heinrich Ries. Ger 516,876, Sept 10, 1929 The cotton fabric to be roughened is treated with an alk soap soln or with a sulfonated oil in alk soln to which an oxidizing agent has been added An example of the latter agent is Turkey red oil and $H_2O_2$

Dulling cellulose esters and ethers. I G Farbenind A G (August Baumert and Richard Fischer, inventors) Ger 519,983, Nov 12, 1929 Addn to 512,390 (*C. A.* 25, 1393) Cellulose ester or ether yarns or fabrics are uniformly dulled by impregnating with an aq soln of urea, and then steaming The action of the urea soln may be enhanced by addn thereto of water-sol., aliphatic, hydroxy carboxylic acids, *e. g.*, glycolic or lactic acid, or their salts A dye may also be added to the urea soln Examples are given

Size-impregnated yarn package for use in knitting machines. Joseph A. Harron, James J Diamond and Gustav Bley. U. S 1,799,230, April 7 Yarn packages are formed with convolutions of yarn of a type having an inherent tendency to snarl or loop in untensioned state, with the convolutions adhering to each other by the action of the size employed so as to resist being too readily unwound from the package

Apparatus for the wet treatment of hank yarns. Maschinenfabrik Tillm Gerber Söhne & Gebr Wansleben Ger 522,382, Feb 5, 1930

Paste for textiles. Hikuzo Kato Japan 90,201, Feb 9, 1931 The paste is prepd by treating cherry-tree gum with NH$_4$OH, $Na_2CO_3$ or $K_2CO_3$ for 24 hrs and then mixing with boric acid

Apparatus for continuous steaming of material carried by looping bars. Stanley H Franklin (to Textile Finishing Machinery Co.) U. S 1,799,978, April 7. Structural features

Washing liquid for fibers. Hans Schwarzkopf Fr 698,101, June 26, 1930 A powd prepn suitable for making a washing or sprinkling liquid for treating wool or silk is made by mixing citric or tartaric acid with a non hygroscopic acid not acting on the citric or tartaric acid, such as boric acid or salicylic acid

Waterproofing fibers. Dunlop Rubber Co., Ltd., and The Anode Rubber Co., Ltd Fr 697,730, June 20, 1930 Fibrous or cellulosic materials are waterproofed by the application of rubber or vegetable resins in the form of an emulsion or aq dispersion with the addn of a wax or mixt of waxes

Waterproofing cloth. Edmond Decoclois. Fr 698,691, Oct. 7, 1929 A coating of latex which may contain appropriate ingredients to give designs is used.

Treating textile fabrics with substances for waterproofing, mothproofing, etc. Hilton I Jones. U S 1,799,047, March 31 Textile materials such as canvas are wetted with an emulsion contg petrolatum kept in suspension by the joint action of bentonite and an auxiliary emulsifying agent such as soap, casein and carrageen and the material is subsequently treated with a soln of a rare earth chloride such as Ce chloride so that a salt of the rare earth chloride is pptd in the material

Apparatus for bleaching, washing or other wet treatments of fibers. Emil Grimmer U S 1,799,685, April 7. Various details are described of an app comprising

a treating drum of "frustroconical" form, having an inclined axis, with its lower side substantially horizontal, fibers and water, Cl soln., oil, acid, benzene or other treating liquid being delivered to the larger end of the drum and withdrawn from its smaller end

Apparatus for treating fiber packages under pressure with fluids such as bleaching, dyeing or washing liquids. OTTO J OBERMAIER U S 1,708,623, March 31. Structural features

Drying apparatus for continuous strip material such as rubber-coated fabric. ROBERT R JONES (to Firestone Tire and Rubber Co.) U S 1,709,375, April 7. Leakage of vapors at the inlet or outlet passageways is prevented by maintaining a body of inert gas about the passageway at a pressure greater than that within the app. and greater than atm. pressure. Various details of app. are described.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Irregular results of accelerated [paint] tests. P. NETTMANN. *Farben-Chem.* 1, 103–4(1930). cf. *C. A.* 25, 2009.—The composite nature of paint films is indicated, and an attempt is made to illustrate this by means of an equation. Surface forces and thickness of coat, and the effects of temp. on these, are further influences acting against the possibility of obtaining uniform results from accelerated tests, even if such factors as vol., shape, wettability and degree of grinding of pigment could be standardized. B. C. A.

Protecting paints of aluminum. H. BUSCHLINGER. *Hauszeit. f. Anstrich u. Erfinderwerk. Z. Aluminium* 1, 237–43(1929). *J. Inst. Metals* 43, 517.—The properties are described of Al paints which consist of a mixt. of Al powder with a binding agent (linseed oil, varnish, cellulose lacquer, bituminous colors). Some examples of their application for rust prevention are given. G. G.

Protective coatings of aluminum paint. H. BUSCHLINGER. *Vortrage geh. Jahresversammlung 1929 zu Wien* (Suppl. to *Korrosion u. Metallschutz*) 1929, 49–53. *J. Inst. Metals* 43, 517.—The value of Al paint as a protection against corrosion is discussed, it is particularly resistant to the action of moisture and $SO_2$ and, if desired, may be colored by the addn. of pigments. The manuf., properties and uses of the paint are described. It reflects 70% of the incident light and heat waves, and its radiation power is only 30% of that of a perfect black body. One kg. of the paint will cover about 15–20 sq. m. of surface satisfactorily. G. G.

Chalking of paints. IV. Practical studies of the chalking of oil paints. RICHARD KEMPF. *Farben-Ztg.* 36, 1173–6, 1216–7, 1256–9(1931). cf. *C. A.* 25, 1104.—The chalking of paints made up with one or more of the pigments, (1) red seal lithopone, (2) bronze seal lithopone, (3) low oil-absorption lithopone, (4) carbonate white lead, (5) sublimed white lead, (6) Kronos A titanium pigment, (7) $TiO_2$, (8) ZnO, (9) lead chromate, in vehicles contg. one or more of the oils, tung, boiled linseed, linseed and tung standoils, was studied. The area under the time-degree of chalking curve was taken as the amt. of chalking. The type of vehicle proved to be unimportant. The chalking of the single pigment paints was 4 least, 1, 7 and 6 increasing in the order named. The chalking of paints contg. lithopone in combination with 9, 8, 4 or 5 was 9 least, followed by 8, 4 and 5. Cracking sometimes accompanied pronounced chalking, *e. g.*, lithopone paints, but slight chalking was not always accompanied by cracking, *e. g.*, white lead paints. G. G. SWARD

*Analysis of an oil color.* A. GARCÍA BANÚS. *Anales soc. espan. fis. quim.* 29, 182–3 (1931).—A violet oil paste defied sepn. because the dyestuff dissolved in all known org. solvents and was insol. in water. Sapon. of the oil gave hopeless emulsions. Since such dyestuffs have usually a base of triphenylmethane, HCl was passed in, pptg. the dyestuff completely. The oil was dolphin or whale oil. E. M. SYMMES

Human factors in color judgment. W. O'D. PIERCE. *J. Oil & Colour Chem. Assoc.* 14, 90–109(1931).—A review of the psycho-phys. aspect of color matching indicates that individuals vary widely in the 3 fundamental attributes of color. Normality in one respect does not guarantee normality in all others. Results on pigments do not necessarily parallel those on lights. There are probably as many supernormals as subnormals. It is further emphasized that color judgment depends upon the human factor and that color has no existence apart from the presence of the observer. It is shown that experience is a large factor in matching color. G. G. SWARD

A simple device for measuring gloss. G. G. SWARD AND S. A. LEVY. *Am. Paint*

*& Varnish Mfrs'. Assoc.*, Circ. No 380, 162-4(1931).—A low cost device for viewing the reflection of an illuminated slit 1 × 20 mm at an angle of incidence and reflection of 45 is described and illustrated. Illumination is by an ordinary flashlight. The reflection from a sample is merely compared with that from standards of known gloss. The range of gloss from that of polished plate glass (= 100%) to 0% is divided into 5 steps: above 90, excellent, from 50 to 90, good, from 25 to 50, fair, from 10 to 25, fair, below 10, none. G. G. SWARD

Gloss and its quantitative measurement. L. D. RIES AND C. B. GILBERT. *Proc. Am. Soc. Testing Materials* 30, Pt. II, 911-23(1930).—An app. is described for measuring gloss by photometric detn. of the intensity of specularly reflected light. The reflected light goes through a sharp max. when the angle of incidence of the rotating panel board equals the angle of reflection. Flat surfaces show no max. The amt. of specularly reflected light increases with the angle of reflection and approaches 60% for some polished panels. Gloss changes markedly with the angle of incidence except in very glossy panels. Diffuse reflection from darkly pigmented lacquered surfaces has been shown to be of the same order of magnitude as that from light ones. H. M. S.

Application of microchemical methods to investigation of the pigments in paintings. H. HETTERICH. *Mikrochem., Emich Festschr.* 1930, 152-62.—Particles of pigments may easily be removed from oil paintings by means of a fine needle moistened with glycerol, without causing any visible injury; details are given of microanalytical methods suitable for the examn. of the pigments. B. C. A.

Report of coöperative work on the determination of hiding power of paints and pigments and the tinting strength of pigments. ANON. *Proc. Am. Soc. Testing Materials* 30, Pt. I, 748-52(1930).—A series of pigment samples and pigment-in-oil mixts. was sent out by Am. Soc. Testing Materials, subcommittee VIII on Methods of Analysis of Paint Materials, to coöperating institutions who were requested to make tinting strength and cryptometer tests. The results led to the conclusions: (1) that the former Tentative Method D282-28T for tinting strength did not give consistent results, (2) that tinting strength should be studied further by the committee; and (3) that hiding power can be measured satisfactorily by the cryptometer, reproducible results being obtained by the several laboratories reporting on the pigment-oil mixtures. H. M. STARK

A discussion of hiding power and its measurement. G. P. A. STUTZ, JR., AND G. S. HASLAM. *Proc. Am. Soc. Testing Materials* 30, Pt. II, 884-90(1930).—Indirect measurement of hiding power by measuring related properties such as tinting strength is not satisfactory. The paint-out test for hiding power is correct in principle but is time-consuming in application. Improvements necessary in the test before it will meet the definition of Subcommittee VIII on Methods of Analysis of Paint Materials include more uniform application, possibility of increasing the film thickness by an amount less than a normal coat, etc. The Pfund cryptometer measures hiding power simply and accurately but is applicable only to wet paints and to paints of over 70% brightness. The Pfund black-and-white cryptometer gives an accurate measure of the wet hiding power of a paint of any brightness. The Haslam spinning-film method measures hiding power accurately but requires expensive app. The modified paint-out test of Gardner is less accurate but simple and inexpensive. H. M. STARK

Hiding power and tinting strength of white pigments. R. L. HALLETT. *Proc. Am. Soc. Testing Materials* 30, Pt. II, 895-910(1930).—This paper describes a method for detg. hiding power and tinting strength for white pigments. The hiding power test consists of a brush out of several coats on a white board with a black stripe down the center. Tinting strength was detd. by detn. of the amount of carbon black necessary to dil. the white color of the unknown to that of a standard white contg. a fixed amount of black. It is important in measurement of tinting strength that the pastes all have the same consistency and the same brightness. Hiding power and tinting-strength values for 20 white pigments obtained by the methods described showed a straight line relationship to each other. The hiding power in sq. ft. per lb. was equal to its tinting strength (carbonate white lead = 100%) multiplied by 0.10 + 3. H. M. STARK

Manufacture of titanium white. HANS J. BRAUN. *Metallbörse* 21, 507-8(1931).—Ilmenite is treated with 90% $H_2SO_4$ at about 80° or with 80% acid at 180-250°. $Ti(SO_4)_2$ and $FeSO_4 + Fe_2(SO_4)_3$ are leached from the brown mass resulting from the attack. Ti is pptd. as $Ti(OH)_4$ by hydrolysis of the soln. Hydrolysis is influenced by concn., temp., H ion concn., manner of agitation and the presence of foreign substances, both org. and inorg. The product of hydrolysis is amorphous and contains some $SO_4$ not removed by washing. The $H_2SO_4$ is neutralized by $BaCO_3$ or $CaCO_3$. Calcination

produces $TiO_2$ of microcrystalline form Other white pigments are mixed with $TiO_2$ to give the product special properties. $TiO_2$ pigments are superior in tinting strength and covering power and are chemically inert. H M. STARK

The inexhaustible red lead problem. HANS HENRIKLING *Farben-Ztg* 36, 1129-30(1931) —The value of red lead as a pigment is undoubtedly due to its ability to form so-called metallic glyceride systems, a property not possessed by iron oxides. Basicity or ability to form metallic soaps is not related to the durability of films. G G S.

Reaction of litharge with linseed oil at room temperature. K. CHARISIUS AND E. KINDSCHER *Farben-Ztg* 36, 1297-1300(1931) —A mixt of raw linseed oil 500 g and litharge 750 g was placed in a completely filled, closed flask and shaken daily for 7 weeks. At the end of that time there was obtained, (1) 316 g of a clear acetone sol oil contg 2.6% Pb The residue yielded an ether ext., (2) an org compd contg 46% Pb The residue from 2 was extd with a mixt 9 1 of benzene and alc. and yielded 47 g of a solid dark brown compd contg 30 4% Pb The residue from 3 contained no org material The principal change accompanying the reaction was a slight increase in the acid no. of the clear oil (1) from 5 6 to 7 1, and the oxidation (by the litharge) of the org portion of (2) The compn of the lead compd. in (1) is unknown but upon standing a white compd., apparently a neutral Pb soap of satd fatty acids, is deposited. G G SWARD

Lithopone. MASAO UCHINO AND K. KAMITANI *Repts Osaka Imp Ind. Research Lab Japan* 11, No 3(1931) —A general review is given on the methods of prepn., properties and the methods of analysis. F. I. NAKAMURA

The preparation of ultramarine blue and health. G ISSOGLIO *Industria chimica* 6, 27-30(1931) —The manuf of ultramarine blue, because it uses as raw materials silica, kaolin and S, developed a great deal of dust, which is found to induce pulmonary diseases. This industry is, therefore, classed as hazardous, and it is recommended that the dust be kept under control A. W CONTIERI

The preparation of an antimony yellow. JAROSLAV MILBAUER. *Chem.-Ztg.* 55, 222(1931) —A bright yellow product is obtained by grinding together $Sb_2S_3$ and 25% NaOH (1 6) in a ball mill for 3 hrs. The product is a solid soln of $Sb_2S_3$ and Sb oxides. This pigment is stable to 200°, has good covering power, but may not be mixed with colors that react with sulfides. W GORDON ROSE

Manufacture and evaluation of Schweinfurtgreen. A TIETZMER. *Farben-Chem* 1, 114-6(1930) —The prepn and properties of Schweinfurtgreen (Cu arsenoacetate) are described The characteristics of this pigment depend on purity and regularity of particle size, and details of its evaluation by chem analysis and by sieving and settling tests are given. B C. A.

Precipitating agents used in color-lake manufacture. A. W C. HARRISON *Farben-Chem.* 1, 105-8(1930) —An account is given of insol agents and mordants functioning by occlusion, *e. g.*, green earth, artificial Fe silicate, $Al_2O_3$, of sol. metal salts (true precipitants), *e. g.*, $Ca(OAc)_2$, $Pb(NO_3)_2$, $BaCl_2$, and of special synthetic agents, *e. g.*, Tamol NN and Katanol G. G.

Wood stains. A C. HEINEMANN *Farben-Ztg.* 36, 1259-60(1931).—Acid dyes have but little affinity for cellulose and when used for dyeing wood their effectiveness is due to the presence of lignin This fact was demonstrated by being able to dye newsprint paper slightly but filter paper not at all with Orange G Basic dyes are more suitable for wood The staining of wood with particular emphasis on wax emulsion stains is briefly discussed G G SWARD

Requirements of pigments for the linoleum industry. H. G. BODENBINDER. *Farben-Chem* 2, 58-61(1930) —The desirable qualities of linoleum pigments are fastness to light, resistance to cleaning agents, heat and acid; freedom from oxidation catalysts and from sol Fe salts. Each of these is discussed, and a general description of linoleum manuf is given B. C. A.

Notes on the oxidation of metallic keels and the means of protecting them from rust. H MASSEILLE *Peintures pigments vernis* 7, 1372-5(1930), 8, 1401-4, 1430-3(1931).—Devices for grinding and mixing paints are discussed. J W PERRY

Manganese soaps. II. HANS WAGNER AND G HOFFMANN. *Farben-Ztg.* 36, 1214-6(1931), cf. *C. A.* 25, 1695 —The degree of swelling of linseed oil films in water is proportional to the amt of Mn soaps present. Films contg Mn hydroxide, umbers, Mars yellow and Mars yellow plus 5 and 10% Mn soaps were prepd. Only the film contg pure Mars yellow was satisfactory from the standpoint of swelling in water. G. G. SWARD

Cooling produced by evaporation. HERBERT DABISCH. *Farben-Ztg.* 36, 1300 (1931) —A Lambrecht psychrometer was used to obtain the lowering of temp. pro-

duced by the evapn of some 21 solvents used in the print industry The wet bulb was unventilated and the detns were made at 27° and 10°, with relative humidities of 63% and 93%, resp With hygroscopic liquids, instead of a lowering, a rise in temp took place This was due to the heat of soln exceeding the heat of evapn G G S

**The formation of films of drying oils. A problem in organic colloidal chemistry.** C P A Kappelmeier *Chem Weekblad* 28, 174-83(1931).—A lecture, reviewing the various theories which have attempted to explain the mechanism of the drying of oils Stress is laid upon the fact that the problem must be considered not simply as one in org chemistry, but rather as one in org colloid chemistry G. Calingaert

**Ursolic acid and other plant products (in lacquer and varnish).** H A Gardner, G G Sward and A W Van Heuckeroth *Am Paint & Varnish Mfrs' Assoc*, Circ No 379, 154-60(1931).—The drying times of varnish or nitrocellulose lacquers in which ursolic or oleanolic acids have been added are greatly extended The acids dissolved in warm varnish are pptd when the varnish is cooled and act as flatting agents The tensile strength and elongation of lacquers are slightly reduced but the gloss is greatly increased by the presence of the acids The possibilities of derivs, such as esters and salts as plasticizers are suggested G G Sward

**Mirror-surface lacquers.** Max Ermes. *Diamant* 51, 286-8(1929), *Ceram Abstracts* 9, 208.—The properties of some of the varnishes or lacquers used in the mirror industry are discussed Varnishes contg alc are not used for silver mirrors as the residual alc causes them to be hygroscopic to some extent, while benzene varnishes are not good in cold weather, since the resin is decomposed and drying is held up No alternative solvents are suggested G G

**Thinners for cellulose lacquers.** P S Symons. *Brit Plastics* 2, No 23, *Synthetic and Applied Finishes* 2, 5-7, 12(1931).—The methodical blending of thinners for nitrocellulose lacquers are outlined with particular respect to such points as "flow," blushing pinholing and winkling' of the lacquer films Tables are given showing the diln ratio for nitrocellulose in various solvents using benzene, xylene, solvent naphtha and kerosine, resp as diluents and the evaporative rates for a no of solvents, also formulas for a general high flash point thinner, a general low flash point thinner and a cheap thinner S warns against the use of 'universal thinners" D Thuesen

**Butyl and amyl lactates as solvents for cellulose lacquers.** Otto Gerhardt *Chem Ztg* 55, 222(1931).—A brief discussion of the properties that characterize butyl and amyl lactates as desirable cellulose solvents W Gordon Rose

**Plasticizers for nitrocellulose lacquers.** P S Symons *Brit Plastics* 2, No 22, *Synthetic and Applied Finishes* 1, 169-71(1931).—The proper choice of plasticizers is discussed with consideration of the various purposes for which the lacquers are to be used The main characteristics of the following principal plasticizers are described diamyl phthalate, dibutyl phthalate, methylcyclohexanol oxalate, tricresyl phosphate, triphenyl phosphate *Sipalin ADM* (methylhexalin ester of adipic acid), *Sipalin MOM* (methylhexalin ester of methyladipic acid), camphor Bu stearate, castor oil, linseed oil tung oil and rapeseed oil D Thuesen

**New resins for the cellulose-lacquer industry.** F Harriss Cotton *Brit. Plastics* 2, No 21 No 22, *Synthetic and Applied Finishes* 1, 157-8 165-8(1931), cf *C A* 24, 525.—The manuf of nitrocellulose lacquers and enamels is broadly described Marked improvements in the properties of these have been obtained with the use of gutta percha and balata resins D Thuesen

**Resin studies. I. Preparation and autoxidation of precipitated lead rosinate.** W A La Lande Jr *J Am Chem Soc* 53, 1858-68(1931).—An app is described in which all the steps of the prepn of Pb rosinate (I) may be carried out in an inert atm. 2% solns of $Pb(OAc)_2$ and Na rosinate were found most practical for the pptn, the compn of the ppt was also found to vary with the rate of addn. of the $Pb(OAc)_2$ to the Na rosinate and with the time and rate of agitation of the reaction mixt Details are given of the prepn and a method is proposed for the analysis of the metal content of rosinates The rate and degree of O absorption by I depend, for a given pressure, on the temp The amt of O absorbed at equil corresponds to 3 atoms of O, the reaction product at this point is probably a combination of reaction products, rather than a definite compd. of 3 atoms of O with 1 mol of Pb abietate The mixt slowly liberates I from aq KI quickly from acidified iodide The product obtained at 60 atm pressure also liberated I from aq and acidified iodide. The dissocn of the end (or equil) product in the autoxidation of I evidently proceeds progressively as the temp is raised, there is an indication that this dissocn is never complete, and that a max dissocn is reached when 1 at equiv of O remains fixed by the rosinate The amt. of O absorbed in each case is thus an index of the stability (and the concn) of the end product at a

given temp for a const pressure The results are discussed from the viewpoint of the theory suggested by Dupont and Lévy (*C A* 24, 855, 1386, 1629, 2945, 5240) for the autoxidation of abietic acid C J West

**Resin studies. VIII. The Donath resin test.** Erich Stock. *Farben-Ztg* 36, 1176-7(1931). cf *C A* 25, 222.—The Donath test (*C A* 24, 5515) was carried out on a no of natural and synthetic resins and varnishes with and without rosin One g *of powder (in the case of resins)* was *cooked* with 5 cc $HNO_3$ (sp gr 1.32-3), cooled, diluted with an equal amt of water and finally neutralized with a large excess of $NH_4$ In many cases the test is useful, but it does not definitely identify rosin G G S

**Gum resin production and dry distillation.** P Bonnov *Trudui Vyatskii Nauch Issledovatelskn Inst Krasvedeniya* 5, 74-80(1929).—A number of processes resulting in change of products take place in gum resin production *The construction of app* permitting the primary products to escape before further decompn is of great importance B does not agree with the theory of Clason that the primary products are volatile in high vacuum The retort used for gum resin production in the Viatka region has always an exit for non volatile but fusible products before they are decompd by heat These are not obtainable in ordinary dry distn of wood and B therefore differentiates the latter from thermal decompn of wood, which is the process used by him A number of expts with cellulose lignin, sawdust, combustible slate, and peat were carried out in which the material was heated to 215-75° Lignin gave mostly products non volatile in a high vacuum half of them are sol in $H_2O$, the rest insol in the usual org solvents sol in NaOH less sol in soda As to the ether sol products it is known only that they are a mixt of weak acids and phenols Cellulose gave water sol products *(except charcoal) of sweet-caustic taste, 42-15% of the cellulose products were non* volatile They reduced an ammoniacal soln of silver oxide, gave a cuprous ppt with Fehling soln and showed reaction for carbohydrates with alkalies and with phenyl hydrazine First they could not be fermented but after treatment with dil acids they did The volatile matter contained considerable quantities of furfural and hydroxy *methylfurfural Wood and peat gave similar products The process is not changed* by application of steam and vacuum but the yields are increased Extn would probably give also solid infusible products, but for technical reasons this was not tried J G Tolpin

**The artificial synthetic resins.** René Chesneau *Bull soc ind Rouen* 58, 392 (1930).—A review is given of the methods of production, properties, and uses of synthetic resins, classified as phenol formaldehyde, urea formaldehyde, glycero-phthalic (glyptal) and coumarone I H Opfell

**Phenol- and cresol-formaldehyde resins.** Hans Stäger. *Helv Chim Acta* 14, 285-304(1931).—Resins were prepd by condensation of HCHO and PhOH (I) or $MeC_6H_4OH$ (II) and mixts of the 2 The II used contained varying quantities of *p* and *m* isomers The properties of these resins were compared The sp cond and *loss in dielectric rise while the dielectric const falls with increase in I content To a* smaller extent, the reverse is true for the II resins with rise in the *m* compd These facts show that polymerization takes place to a higher degree with II. A fall in the dielectric const, etc, is obtained by heating the resins The solubilities in alc and NaOH also drop with increase in duration of heating The force of cohesion (cementing force) *drops to a min upon heating and then rises steadily as the heating is continued, with* increase in I the min is lower and a longer time is required to attain it I M L

**Titanium white.** Alexandre Follift and Nicolas Saindfrichin. Fr 698,516, May 26, 1930 Titanium white is prepd by sepn of the metal from its ores, *e g*,

ilmenite by concomitant reduction and oxidizing volatilization under the action of an air blast heated from 750° to 850° acting on a thin layer of a mixt of powd ore and reducing fuel moving forward under the action of air jets

Zinc oxide. Manufactures de produits chimiques de Jouy-en-Josas (Anciens Établissements Louis Descamps) Fr 697,760, June 21, 1930 ZnO free from impurities is made by transforming the Zn starting materials into $Zn(AcO)_2$ either by soln in AcOH or by double decompn., eliminating the impurities and submitting the solns or crystals of $Zn(AcO)_2$ to pressure and temp to allow the dissocn of acetate with recovery of AcOH

Destructively distilled castor-oil condensation product suitable for use in paints, varnishes and lacquers. Edward C. Holton (to Sherwin Williams Co) U S 1,799,420, April 7 Castor oil is subjected to destructive distn until the residue is 60–80% the wt of the original oil, and the residue is heated with 0.5–3.0 times its wt. of glycerol until the esterifiable constituents are substantially esterified, and the product thus obtained is then heated with 0.75–5.0 times the wt., of the residue, of phthalic anhydride until condensation is effected and a clear homogeneous product is obtained

Printing inks. Johannes Scheiber Ger. 522,277, Nov 6, 1928. For the prepn of odorless printing inks, a vehicle is used consisting of, or comprising, the viscous residues from the vacuum distn of castor-oil acids

Printing inks. Johannes Scheiber Ger 522,480, Nov. 6, 1928. For the prepn of odorless printing inks, a vehicle is used consisting of, or containing, an ester of a polyhydric alc with 9,11-octadekadiene-1-carboxylic acid This acid is prepd by the vacuum distn of castor-oil acids The esters may be boiled to a suitable consistency before use Cf preceding abstr.

Printing ink. I G Farbenind A.-G Fr. 698,639, July 8, 1930 Varnishes, which have a basis of cellulose derivs obtained by using only hydrophobe constituents, are used in flat printing machines Examples are given of the use of a varnish made by mixing nitrocellulose of low viscosity with castor oil, phthalic acid ester, benzoic acid ester, dammar resin or an esterified resin and lamp black or ZnO

Printing ink. Goro Nakao. Japan. 90,225, Feb 10, 1931. The ink contains KI or $NH_4I$ and starch.

Coating composition. Edward F Arnold (to Canadian Industries, Ltd.). Can 310,845, Apr 28, 1931 A striping enamel comprises nitrocellulose of low viscosity, a pigment and a polyhydric alcohol polybasic acid resin modified by more than 50% of drying-oil component Cf *C. A.* 25, 834

Nitrocellulose solvent and coating composition. David Carnegie, Jr. (to The Atlas Powder Co) Can 309,861, Mar 31, 1931 A coating compn. comprises 20 oz of cellulose nitrate per gallon of soln The solvent comprises by vol 30 parts of AcOEt, 35 parts of EtOH and 35 parts of a non toxic hydrocarbon oil fraction corresponding to a naphtha having an initial b. p of about 20°, with 50% passing over at about 90° to 95°, and 90% at about 105° with a dry point at about 115°.

Synthetic-resin coating composition. Horace H. Hopkins (to The Canadian Industries, Ltd) Can 310,124, Apr 7, 1931. A coating compn for a *linoleum base* contains an ester of glycerol, a polybasic acid, acids formed by the hydrolysis of linseed oil and acids formed by the hydrolysis of China wood oil, and a pigment.

Pyroxylin solutions. Hammermill Paper Co. Fr 697,780, June 23, 1930. See U. S. 1,768,253 (*C. A.* 24, 4391)

Varnish. "Cirine-Werke" Josef Lorenz & Co Austrian 121,984, Nov 15, 1930 Varnishes comprising wax, fatty oils, a Co siccative and benzine or turpentine are prepd by emulsifying a part of the wax, after preliminary comminution, with the fatty oil in the cold, and adding to the emulsion a cooled soln of the siccative in the fatty oil and a soln of the rest of the wax in benzine or turpentine. The wax may be paraffin, ceresin or beeswax, and the fatty oil may be wood oil, linseed oil or thickened linseed oil (stand oil) An example is given Cf *C. A.* 25, 2311.

Varnishes. Bakelite Corp Fr 698,091, June 26, 1930 A resin soln. contains a non hardening resin having a basis of thiourea, an anhyd hardening agent contg $CH_2$ in amt sufficient to harden the resin and a solvent for the resin and hardening agent. The soln is used as a varnish Cf *C. A.* 25, 2866.

Varnishes. Maurice Percot. Fr 698,712, Oct. 9, 1929 AcOH is added to cellulosic varnishes to increase the stability of the colors obtained by incorporating artificial dyes therewith

Crystallizing varnish. William O Stauffer (to Canadian Industries, Ltd.) Can 310,846, Apr 28, 1931 A crystg varnish contains 19 parts by wt of a resin made from glycerol phthalic anhydride and China wood-oil acids, 38 parts of blown

China wood oil, 5 5 parts of Co drier soln , 9 5 parts of solvent naphtha and 28 parts of high boiling gasoline

Plant for making varnish from wood oil. Wilhelm Schmidding Ger. 422,407, Feb. 14, 1925.

Recovery of values from fumes in varnish making. Robert S. Perry. U. S 1,799,177, April 7 The fumes are passed through a treatment conduit having an open end, and an alk. liquid is sprayed within the conduit and toward its open end, condensates formed are collected with the alk liquid, and after sepn the alk. liquid is further used for spraying App is described.

Lacquers, etc. I G Farbenind A.-G. Fr. 697,348, June 13, 1930. Lacquers and plastic materials having a nitrocellulose basis are colored an intense greenish blue, fast to light by the dyes obtained by condensing the hydrochloride of a dialkyl nitrosoaniline with a dialkyl *m* aminocresol or a monoalkyl *m* aminophenol. Thus, 2 dimethylamino-2'-diethylamino-3' methyloxazine may be used Other examples are given Cf *C A* 25, 2866

Pigmented lacquer base. Henry J Hemingway and Wm A Weidlich. U S 1,798,840, March 31 A non aq mixt of nitrocellulose and unground pigment such as "titanox" is subjected (without grinding or rolling pressure) solely to the kneading action of a mixing machine in the presence of a relatively small quantity of a liquid volatile solvent such as alc , EtOAc and $C_6H_6$ to initiate the dissolving of the nitrocellulose simultaneously with the pulverization of the pigment and its dispersion throughout the batch (the amount of the solvent being insufficient to dissolve all the nitrocellulose but sufficient to produce a high viscosity during the kneading), and addnl solvent is added after the pigment is broken down and dispersed

Fire-resisting lacquer. Fernando S. Vivas (to International Fireproof Products Corp ) U S 1,800,120, April 7 Gum dammar, "soluble cotton," oil such as castor oil, $CaCl_2$, $H_3BO_3$, alc., BuOAc, EtOAc, toluene and perchloromethane are used together

Condensation products of phenols and aldehydes. Wilfred S. Rothera, Stanley Blythen and H R Gillespie (Alphous Ostersetzer and Franz Riesenfeld, inventors) Ger 516,677, Mar 13, 1928 To produce the condensation product as a powdery ppt., a basic condensing agent contg less than 10% of a dispersing agent or protecting colloid, and which causes a 25% increase of volume, is added Neutral salts may be present Thus, a mixt of *m*-cresol and $CH_2O$ is added to distd water and gum arabic and heated A yellowish sand like resin powder results Further examples are given Cf. *C. A* 23, 1189

Phenol-aldehyde condensation products. Bakelite G m b. H. (Fritz Seebach, inventor) Ger 516,766, July 18, 1928 Pure resin like $PhOH$-$CH_2O$ condensation products are prepd by dissolving the crude condensation products in aq solns. of readily sol salts of $PhNH_2$ or toluidine with acids such as HCl, HBr, $HNO_3$ or $CH_2ClCOOH$, and distg the soln The distn may take place *in vacuo* or with addn of superheated steam In an example, aniline-HCl, water and cresol-$CH_2O$ condensation products are distd Further examples are given Cf *C A* 24, 3662

Moldable mixtures. Bakelite Corp. Fr. 698,183, June 28, 1930. A moldable mixt. contains a resin of the hexamethylenetetramine, triphenol type, an org retarder such as colophony and a filler such as mica or a hardened and divided resinoid Cf *C A* 25, 2823

Resinic acid derivatives. Chemische Fabriken Kurt Albert G m b. H Fr 697,470, June 16, 1930 Derivs of natural or artificial resinic acids are prepd. by heating resinic acids with acid derivs b above 200°, the acid of which when liberated may be easily eliminated by phys or chem means. Examples are given of the heating of colophony and of various copals with dibutyl phthalate, benzyl acetate, triglycerostearin or acetamide

Resins. John M Weiss. Fr 698,623, July 7, 1930. See Brit. 338,845 (*C. A* 25, 2581).

Fractionating rosin into resene and abietic acid. Fredrick W. Kressman Can 310,774, Apr 28, 1931 Rosin is distd at a pressure not greater than 10 mm of Hg Between 205° and 240° the vapors contain principally resene. Between 240° and 260° abietic acid chiefly distils over

Synthetic resins. Georg Walter. Austrian 121,999, Nov 15, 1930 Resinous products are prepd by warming with bases monomethylolurea or monomethylolthiourea, or reagents yielding them, or the products obtained from them by splitting off water, in the absence of any substantial amt of solvent Thus, monomethylolurea may be mixed with 1–7% of NaOH, added either as a solid or in concd soln , and the mixt heated to 100 130° The base may be neutralized at the end of the reaction The

products can be hardened by heat, with or without pressure, and may be used as molding powders or lacquer ingredients. Examples are given.

Synthetic resins. I. G. Farbenind. A.-G. (Leo Rosenthal, inventor). Ger. 520,858, Apr. 18, 1929. Addn. to 517,477 (*C. A.* 25, 2313). Compds. of $BF_3$ with aliphatic hydroxy acids, or with unsatd. aliphatic acids are used in the process of Ger. 517,477.

Synthetic resins. Bakelite Corp. Fr. 697,525, June 16, 1930. A moldable material is made by treating fusible resinous products from the condensation of PhOH, with substances, such as $Ca(OH)_2$, which transform the PhOH into phenolate. The cooled or solidified product is mixed with a compd. contg. active $CH_2$ groups to transform the fusible resin into an insol. infusible resin. Appropriate filling materials may be added. Cf. *C. A.* 25, 2867.

Synthetic resins. Bakelite Corp. Fr. 697,753, June 21, 1930. The hardening of a phenol furfurol resin is accelerated by the addn. of a basic substance such as lime and a compd. contg. $CH_2$ such as $(CH_2)_6N_4$.

Synthetic resins. Lucien Sellet. Fr. 697,908, Oct. 1, 1929. The OH groups of compds. such as glycerol are satd. with natural resins of acid function (colophony, copal, etc.) and a dibasic acid (adipic). Thus, glycerol 95, colophony 150 and adipic acid 146 g. are heated together.

Synthetic resins. Ellis-Foster Co. Fr. 698,598, July 3, 1930. Resins which may be dissolved or dispersed in water are made by treating the condensation products of a polyhydric alc. with a polybasic acid, with or without monobasic acids, by a base such as an oxide or hydrate of Ca, Ba, Mg or Zn or $NH_4$ or an org. base such as $(CH_2)_6N_4$. Cf. *C. A.* 25, 2312.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. Schierbel

**Problems of the research laboratory for the chemistry and biochemistry of fats in the Central Food Institute.** S. Ivanov. *Chem. Umschau Fette, Oele, Wachse u. Harze* 38, 96–100(1931).—A general review of the various problems concerning the compn. of fatty acids, the formation of oils within the plant from glucose via fatty acids and glycerol, the dependence of compn. upon climatic and geographic location and the possibility of control of this compn., all with reference to the development of agriculture and the oil and fat industry in the U. S. S. R. P. Escher.

**The so-called rancidity reactions of fats.** I. D. Holde, W. Bleyberg, G. Brilles. *Allgem. Öl Fett-Ig.* 28, 3–7, 25–9(1931).—When fats contg. mono- and di-glycerides are irradiated with ultra violet light in the presence of air, the free alc. groups are oxidized to aldehyde groups. Tristearin contg. mono- and di-glycerides when irradiated in the presence of atm. O gave a neg. Kreis test, a pos. Ag reaction (reduction of ammoniacal $AgNO_3$) and a neg. peroxide test. Synthetically prepd. tristearin, free of mono- and di-glycerides, after irradiation gave neg. reactions to all 3 tests. Irradiated olive oil and also triolein gave pos. reactions to all 3 tests. Irradiated tributyrin gave a neg. Kreis test, but pos. reactions to both the Ag and peroxide tests. Before irradiation all samples gave neg. reactions to the 3 tests. Tricaprin and 2 dicaprins were synthetically prepd., the latter from 1,2- and 1,3-dibromohydrin and were irradiated both in air and in an atm. of N. They were then subjected to modified Kreis tests and the Ag test. The Kreis test was modified by using only 0.05 g. of substance dissolved in 5 cc. benzine and in one test a 1% soln. of phloroglucinol and in the other a 1% soln. of resorcinol was used. The phloroglucinol reactions were as follows: all samples whether irradiated in air or N gave neg. results after 15 min. irradiation. The dicaprins after 4 hrs. gave a pale green and after 24 hrs. a dark green coloration. A 1:1 mixt. of tricaprin and dicaprin (prepd. from 1,2-dibromohydrin) gave a pale green coloration after 24 hrs. The same dicaprin irradiated in N gave neg. results after 72 hrs. The reactions in the resorcinol test were essentially the same as in the phloroglucinol, except that the color produced was red. The reactions in the Ag test were as follows: All samples gave neg. tests before irradiation. The dicaprins as well as the 1:1 mixt. of tricaprin and dicaprin gave pos. tests after 5 min. irradiation, while the tricaprin irradiated in air, and the dicaprin (from 1,2-dibromohydrin) irradiated in N gave neg. tests after 4 hrs. Before irradiation the tricaprin had a pleasant taste, after irradiation, an ozone like taste. The dicaprins, although they do not melt in the mouth after 8 hrs.' irradiation produced a slight to distinct "scratchy" sensation. The

1 1 mixt of tricaprin and dicaprin, which did melt in the mouth, also produced a "scratchy" sensation after irradiation W. F Hollens

**Yellowing of the fat in Australian frozen rabbits. Its nature and cause.** J. R. Vickery *J Council Sci Ind Research* 4, No 1, 1-5(1931) —The yellowing of the fat, especially about the kidneys, is due to long-continued action of O on the unsatd fat acids, specifically linoleic glycerides The yellow fraction of the fat was purified and resembled an oxidized acid contg 18 C atoms, the pigment existing *in situ* as an unsatd ketonic compd of undetd compn The yellowing occurs at cold-storage temps as low as —10°, though sharp freezing greatly retards the development and the accompanying rancidity When the fatty tissues of the rabbit were cold stored in an atm of pure N, no yellowing of the fat occurred The yellow color appeared soon after the reintroduction of O Various impermeable coatings were tried without success Blood and hemoglobin are effective catalysts for the production of the yellow color; hence the complete removal of blood is advised Some relief is obtained by packing the rabbits so that the muscular wall of the intestine covers the abdominal fat Cold-storage temps of below —14° are recommended C. R Fellers

**The detection of less than one-half per cent of oil of sesame in fats.** R. Lucentini *Ann chim applicata* 21, 82 3(1931) —See *C A* 25, 2316 A W. Contieri

**Determination of iodine number of liquid fats with mixtures of ether and water.** V I Tsafova *Zhur Prikladnoi Khimii* 3, 1207 21(1930) —The method of Margosches (*C A* 18, 2436) is satisfactory for liquid fats but in the presence of unsatd hydroxy acids the results are high If not enough $I_2$ is added HI unites with fats V K

**The aniline point as a constant of fats and oils.** C G Katrakis and J G Megaloikonomos *Praktika Akad Athenon* 5, 267 9(1930) —To det the aniline point of fats and oils, a certain quantity of the oil or fat is filtered, neutralized with NaOH (15% at 60°) and mixed with the same vol of normal benzine (Kahlbaum) Five cc of this mixt is placed in the app and 5 cc of aniline added to det the aniline point This method is useful in detg whether or not a particular oil or fat has been adulterated by the addn of other oils or fats with the same refractive index N v P

**A further study of the reactions occurring when oils and fatty acids are heated in the presence of active nickel on a support.** H I Waterman and M J van Tussenbroek *Chem Weekblad* 27, 146 7(1930) cf *C A* 24, 742 —The hexabromide value for soy-bean oil as detd by the method of Carriere is not altered by the usual technical method of deodorizing The hexabromide value is lowered by heating in a vacuum to 225°, the presence of infusorial earth and especially active Ni increasing the change The acid value increases on heating in a vacuum, and the change is largest in the presence of active Ni Elaidic acid is relatively stable toward active Ni on a support and in this respect resembles oleic acid F d Leeuw

**Fatty-acid components of the oil from the Malayan gavial, Tomistoma schlegeli and some properties of the oil from Pecten (patinopecren) yossensis Jay.** Seiichi Ueno and Nobuo Kuzei *J Soc Chem Ind Japan* 34, Suppl binding 92-3(1931) — Consts of the oil from the Malayan gavial, *Tomistoma schlegeli*, are $d_4^{15}$ 0 9166, $n_D^{40}$ 1 4623, I no 77 4, sapon no 197 6, acid no 19 4, R M no 0 54, acetyl no 22 4, unsaponifiable 0 44% The liquid fatty acids amounted to 64 3% and consisted mostly of oleic acid with small quantities of linoleic and linolenic acids The I no was 92 8 and the neutralization no 201 The satd acids consist of palmitic and a small quantity of stearic acid Oil from *Pecten yossensis* Jay had the following consts $d_4^{100}$ 0 9894, $n_D^{40}$ 1 4781, I no 204, sapon no 187 7, R M no 1 2, acid no 9 5 The mixed acids + unsapon gave $n_D^{40}$ 1 4705, I no 199 8, m p 30 9°, neutralization no 187 7, Br content 70 34%, ether insol bromides 50 46% E Schierubel

**A plant for continuous oleic acid distillation.** O Krebs *Teer u Bitumen* 29, 71-5(1931) —Crude oleic acid, the filtrate from the hydraulic fatty acid press, is heated by combustion gases to 340° in a special tubular heater the vapors are passed through a vertical purifying column, from which any nonvaporized liquid portion flows off at the bottom to a soft pitch reservoir, while the pure distd oleic acid is condensed and gives off its heat to preheaters P Escher

**Preparation and purification of linoleic acid.** H I Waterman and J A van Dijk *Verfkroniek* 4, No 2, 15-9(1931) —The fatty acids of sesame oil were brominated and the tetrabromostearic acid obtained was debrominated to linoleic acid This product $n_D^{20}$ = 1 4681 was fractioned in a cathode vacuum A further purification was obtained by dissolving 1 vol of linoleic acid in 2 vol of acetone (b 56 0-56 1°), cooling to —15° to sep out oleic acid and satd fatty acid, and then cooling to —30° to sep.

out linoleic acid, followed by refractionation in vacuum. The final product obtained had a $d_4^{20}$ 0.9031 and $n_C^{20}$ = 1.46643, $n_D^{20}$ = 1.46944, $n_F^{20}$ = 1.47642, $n_\infty$ = 1.48228, mol refraction $M_D$ = 86.49. F. J. G. DE LEEUW

**Hydrogenation of fatty oils by the so-called wet process. I. Hydrogenation in presence of nickel acetate under atmospheric pressure.** SEI ICHI UENO AND TAKAO YUKIMORI. *J. Soc. Chem. Ind. Japan* 34, Suppl. binding 109–11(1931).—Catalysts were prepd. as follows: A soln. of $NiSO_4$ was pptd. with $Na_2CO_3$ and the $Ni(CO_3)_2$ was dissolved in acetic acid and evapd., ground and screened. (2) Ni acetate was dissolved in water and kieselguhr, equal to 4 times the wt. of Ni in the acetate, was added, this was then dried and screened. (3) Kahlbaum Ni acetate was crushed and screened in the same manner. (4) Kahlbaum Ni acetate and kieselguhr were mixed as above. (5) Kahlbaum Ni acetate and pumice were mixed as in (2). (6) $Ni(CO_3)_2$ was mixed with kieselguhr equal to 4 times the wt. of Ni in the carbonate. The oil used had an I no. 188.3 and acid value of 0.5. Catalysts from 0.2 to 0.0% were added to 40 g. of oil and the temp. was raised and held 5 min. at 280° and then lowered to 180° and hydrogenation carried out for 1 hr. Catalyst No. 6 was first reduced in H. It was very difficult to control the expts. by this method and app. The rate of decrease of I nos. was not proportional to the amt. of catalyst used, and the catalytic power was far inferior to that of catalyst no. 6. E. SCHERUBEL.

**Absorption of oxygen by unsaturated oils. I. Influence of solvent on the rate of absorption.** SEI ICHI UENO, ZENSAKU OKAMURA AND TEI-JI SAIDA. *J. Soc. Chem. Ind. Japan* 34, Suppl. binding 106–8(1931).—The accelerating effects of various solvents on the oxidation of unsatd. oils was studied. A shaking app. was used. Co linoleate drier was added to linseed and sardine oil. The rate of oxidation was estd. from the vol. of absorbed O. A comparison of the effects of various solvents on the rate of oxidation shows in decreasing order for linseed oil as follows: glacial AcOH, decalin, EtOAc, turpentine, $CHCl_3$, acetone. With sardine oil: glacial AcOH, decalin, turpentine, acetone, $CHCl_3$, petr. ether. E. SCHERUBEL.

**Hydrogenation of oils at high temperatures and under high pressures. I. Hydrogenation with nickel under constant high pressures.** SEI ICHI UENO, TAKAO YUKIMORI, HEIJIRO TSUCHIKAWA AND SEIGORO UEDA. *J. Soc. Chem. Ind. Japan* 34, Suppl., binding 111–5(1931).—Three hundred g. of sardine oil of I no. 171.0, sapon. no. 190.7 and acid no. 1.05 was used with 3 g. catalyst consisting of 22.5% Ni and 77.5% kieselguhr in a steel tube of 2 l. capacity. The expts. were carried out with 50, 40, 30, 20 and 10 atms. for 1 hr. at temps. of 150°, 180°, 200° and 230°. The tube was shaken by a Shita's shaking mechanism. The following detns. were made upon the hardened product: m. p., I no., sapon. no., thiocyanogen no. The mixed and solid fatty acids were analyzed for m. p., I no. and neutralization value. The reaction was most rapid at temps. of 180° and 200°. Results are tabulated. E. SCHERUBEL.

**Solidifying point of vegetable oils.** J. MÓTYUSZ. *Kisérlet Közlemények* 31, 321–31 (1931).—Good results were obtained by a modified Mohr method with 6–7 g. of oil instead of 30–35 g. Solidifying points do not increase proportionally with addn. of solid triglycerides. Solidifying point curves bear a relation to the consistency of solid fats. The solidified fat is cryst. if the temp. increases upon solidification. Solidification curves of some glycerides change upon adding other fats to them, while some retain their original characteristics. S. S. DE FINÁLY.

**The cottonseed-oil industry.** E. L. CARPENTER AND LEO HOLDREDGE. *Mech. Eng.* 53, 353–9(1931).—Its history, economics, processes and problems. E. H.

**Preliminary study on peanut varieties at the Lamao Experiment Station, Lamao, Bataan.** PEDRO L. PAULINO. *Philippine J. Agr.* 1, 273–86(1930).—The oil contents of 13 varieties of peanuts are given. Varieties proving rich in oil, as per sample submitted, were Japanese, 56.90%, Tennessee Red, 56.40%; North Carolina Runner, 54.37% and the San Jose No. 1, 54.13%. Other varieties had 44.99–54.10% oil content. By analysis on the dry basis Tennessee Red contained 60.07% of oil, Japanese, 58.80%, San Jose No. 1, 58.08%, and San Jose No. 2, 58.01%; while other varieties contained 49.08–56.94%. JOHN O. HARDESTY.

**Greek tobacco-seed oil.** J. D. KANDILIS AND N. S. KARNIS. *Praktika (Akad. Athenon)* 4, 475–81(1929).—The (drying) oil (36.85%) had: I value 117.8–137.9, $d_{15}$ 0.9253–0.9440, $n^{25}$ 1.4735–1.4828, acid value 2.25–16.93, sapon. value 186.8–201.6, Hehner value 95.21–96.34, Reichert Meissl value 0.32–2.03, Polenske value 0.15–0.30. B. C. A.

**Factors of quality in copra.** F. C. COOKE. *Malayan Agr. J.* 19, 128–36(1931).—About 6% represents the water content of the av. stable condition for kiln-dried

copra stored in bulk Higher moisture produces deterioration with development of heat, acidity, rancidity and internal darkening and formation of white, brown, green and black molds As deterioration progresses the oil % increases because of the disappearance of tissue in the form of gas and water vapor. It has been found that bad Malaya copra with a high degree of rancidity, if stored under free ventilation, will diminish in acidity, while the copra, as a whole, will become dry and clean and the mold will fall away as dust. Drying arrests acid formation from the neutral oil, while the existing fatty acids are converted into water vapor and gas and thus reduce the free acid Rubbery copra does not press below 7% oil content; it results from young nuts Copra can be compressed to advantage for shipment at a pressure of 1 ½ cwt. per sq in without loss of oil E. Schierbel

**Examination of textile oils.** I. Ralf B Truesler. *Oil and Fat Ind.* 8, 51–7, 77 (1931).—The app that was designed to measure the susceptibility of an oil to oxidation consists of 3 parts, a reaction bulb, a gas-measuring device and a shaker. The bulb is made of pyrex glass and is 138 mm long and 40 mm in diam and holds 130 cc., which accommodates 25 g oil and 100 ml of O An inlet for O is provided by a capillary tube with a stopcock The oil sample is admitted through a sep. capillary tube near the bottom of the bulb The gas measuring device consists of a leveling flask of 300 ml capacity contg sufficient Hg to fill the tubing and to maintain a column in the stem of the manometer and to fill the gas buret. The flask is adjustable by means of a ring clamp The balancing manometer serves as a means for attaining a standard pressure in the buret when a vol of O is to be detd It is made from a 100 ml. pipet. The shaking device provides the means for oxidizing oils under conditions that can be controlled and duplicated It consists of a rocker arm 14 mm long from the axis of the shaft to the center of the bulb The upper part of the rocker arm from the axis of the shaft to the pivot of the rocker beam is 7.5 cm The rocker beam is given a transverse motion by a rotating wheel about which it travels in a circle of 36 mm diam at its point of attachment II. *Ibid* 103–6, 109.—A measure of the oxidizability of oils to predetermine their desirability for textile purposes can be ascertained by treating 25 g of oil with a definite amt of O in a reaction bulb at a definite temp in an oil bath and shaking at the rate of 140 shakes per min for 1 hr in a shaker It was found that fatty oils appear to pass through 3 stages of oxidation At ordinary temps. peroxide combinations are produced which are assocd with the subsequent occurrence of rancidity Increased temp during oxidation causes stable oxygenated compds. to be formed At higher temps oxidation resembles combustion in that $CO_2$ is evolved This reaction is most common with unsatd acids The accuracy of the method is approx 0.2% Dry oils should be used The new method permits numerous applications to problems dealing with the behavior of oils toward oxidation *E. g.*, the presence of unsatd free acids in a glyceride was found to render an oil more sensitive to oxidation The accuracy of this test permitted a study of textile oils regarding their stability toward O and also gave a means for evaluating antioxidants and for measuring their effect upon oxidizable oils E. Schierbel

Toilet-soap manufacture. W H. Simmons *Mfg Chemist* 2, 95–9, 107(1931).—A review. E. H.

**Unsaponifiable matter and so-called iso-oleic acids contained in toilet soaps on the market.** *Sei-ichi Ueno, Gentaro Inagaki and Heijiro Tsuchikawa. J. Soc. Chem Ind Japan* 34, Suppl binding 90–2(1931).—The unsaponifiable matter of 12 samples of soap was detd by Spitz and Hönig's method The insol mixed acids were subjected to the Pb salt alc method for sepn into solid and liquid acids The iso-oleic acids were calcd by A S Richardson's formula and varied from 2.2 to 5.5% It has been shown by the authors that 36–43% of the total acids are converted to iso-oleic acids during hydrogenation and by calcn about 5 to 10% of hardened oil was used in the raw material for these soaps, some of which were toilet soaps E. S

**Influence of the component glycerides of the soap base in the production of a white (milled) toilet soap when dried in a Proctor dryer.** G F. Caley. *Chem Eng Min Rev* 22, 472–3(1930).—*The transparent appearance, characteristic of milled soaps* made from soap that has been prepd by sudden chilling in a cooler and dryer, can be avoided by careful control of the proportions of solid and liquid acids in the soap stock B C. A

**Soap solutions. IX. Surface tension of aqueous solutions of binary mixtures of soaps having extremely different molecular weights.** J Mikumo *J. Soc. Chem. Ind* (Japan) 34, Suppl binding 115–6(1931), cf *C A* 25, 427.—Na salts of fatty acids whose mol wts are very small or very large are inefficient as detergents Surface tension at 40° was measured by Traube's stalagmometer for aq solns of binary mixts

of the lowest Na soaps of satd acids $C_6$ to $C_{10}$ and $C_{12}$ and also Na erucate, $C_{22}$. In these systems this soap is the primary adsorbate and dominant in quantity at the surface, even in the presence of more capillary active laurate, $C_{12}$. Soaps of $C_{14}$–$C_{22}$ are not able to improve the surface activities of their solns. by the addn. of soaps below $C_{16}$. Sometimes soaps below $C_8$ have a coagulating tendency upon the $C_{16}$–$C_{22}$ soaps because they are common electrolytes in dil. solns. E. Schreuber

**Migration of sodium chloride in soap cakes.** J. Mikumo. *J. Soc. Chem. Ind.* (Japan) 34, Suppl. binding 116(1931).—The fact of salt migration was verified for all aged cakes of boiled and settled and even milled soaps. The direction of migration is detd. by the difference in vapor tension between the outside and inside of the cake. M. believes that NaCl and other sol. impurities diffuse through the interfibrillar water of the cake mass. Sepd. curd soaps vary their structure during cooling, maturing and storage, becoming more and more fibrous, liberating a part of the hydration $H_2O$ as free (syneresis). Tenacity of the soap base seems to be closely related to the nature and content of soaps of higher liquid acids (oleate, ricinoleate, linolate) which form the basal structure by cementation of total mass and also give finer fibers to soaps of higher solid acids which otherwise would be very hard and brittle. F. S.

**Fats and waxes.** John G. Stephens. Fr. 697,572, June 17, 1930. Fats and waxes are atomized and coated with a harmless powder such as flour to prevent agglomeration and keep them in an easily used form, *e. g.*, as ingredients for cakes, confectionery, etc.

**Saponifying fats and oils.** Clemens Bergell. U. S. 1,799,496, April 7. In soap manuf. comprising a first and main saponification of oils and fats succeeded by a second and final saponification, the first sapon. is effected by boiling with an alkali lye, a small quantity of an electrolyte and water (the mixt. being boiled contg. about 56% of combined and uncombined fatty acids and 1.0–1.5% of the electrolyte) so that the product after boiling can be rendered viscous by addn. of a small proportion of water, and the second sapon. is effected by boiling after adding sufficient water that the mixt. contains about 50% of combined and uncombined fatty acids.

**Soft fat or oil from solid fats.** Yositora Iwamoto. Japan. 90,175, Feb. 6, 1931. Soft fat or liquid oil is manufd. from solid fats by the action of silent discharge against the fats *in vacuo* or in $N_2$ or $H_2$.

**Rotary drum apparatus suitable for extracting animal or vegetable oils or fats with solvents or for other extraction operations.** Walter E. Sanger and Oscar H. Wurster (Sanger's executor to Wurster). U. S. 1,799,481, April 7. Structural features.

**Polymerizing oils and fats.** I. G. Farbenind. A.-G. Fr. 697,785, June 23, 1930. Products particularly for use in the textile, linoleum and rubber industries or as addns. to varnishes, etc., are made by polymerizing vegetable oils or fats or their derivs. in the form of emulsions, small quantities of O or S or compds. liberating them being used as accelerators.

**Apparatus for extracting oily substances from grain, etc.** Philipp L. Fauth G. m. b. H. Fr. 697,296, June 12, 1930.

**Apparatus for removing oil from soy-beans and for semi-baking the beans.** Teiichi Satow. U. S. 1,799,256, April 7. Various details are described of a rotatable drum app. which may be supplied with solvent.

**Extracting oily substances from citrus fruit peel.** Wilbur A. Pipkin. U. S. 1,798,555, March 31. App. and mech. details of operation are described.

**Wax compositions.** I. G. Farbenind. A.-G. Fr. 698,643, July 8, 1930. Wax compns. contain wax and org. derivs. of $NH_3$ contg. at least one alkoxy or cycloalkoxy radical or both, or salts or derivs. of these compds., *e. g.*, mono-, di- or triethanolamine. Cf. *C. A.* 24, 1535.

**Cleansing agent.** Maurice Sado. Fr. 697,751, June 21, 1930. A cleansing agent is composed of black soap, powd. $CaCO_3$, boric acid, $Na_2CO_3$ and water.

**"Washing compound."** Joseph A. Seibert. U. S. 1,799,930, April 7. Coloring matter, perfume and alc. are successively added to a mixt. of $Na_3PO_4$, powd. soap and borax, with thorough mixing.

**Soap.** Saccharin Fabrik A.-G. vorm. Fahlberg List & Co. Ger. 522,367, Apr. 22, 1928. In the manuf. of soap contg. salts of aromatic chlorosulfonamides, decompn. of the salts in the presence of the soap is avoided by preliminarily treating the

soap or the fat from which it is prepd, with hypochlorites or Cl in an amt exceeding that necessary for bleaching

Soaps, etc. Soc. Parfy & Cie Fr. 649,716, Oct. 11, 1929 Soaps of all kinds, creams, etc, are improved by incorporating therewith org matter as from the secretions of glands of the digestive organs of an male, particularly the intestines

Soap powder. Adolf Wolter. Ger. 516,993, Nov. 1, 1928 See Brit. 322,760 (C. A. 25, 430)

## 28—SUGAR, STARCH AND GUMS

J. E. DALP

The sugar plant of the future. Eduard Gutwirt *Listy Cukrovar.* 49, 265–8 (1931).—A discussion of allied industries which may become subordinated to sugar plants as artificial leather, silk, gums, adhesives etc Frank Marpsh

A review of Czechoslovakian patents pertaining to sugar technology. Jiří Vondrák *Listy Cukrovar* 49, 229–32 (1931).—All patents are listed and described briefly Frank Marpsh

A contemporary comparison of the sugar-cane and sugar-beet industries. O Fallada *Chem. Listy* 25, 111–4 (1931) Frank Marpsh

The revaluation of raw sugar types used by the Prague exchange for goods and valuable papers K. Šandera *Listy Cukrovar* 49, 267–71 (1931).—On account of the effect of sunlight etc upon raw sugars the standards have to be rechecked every 2 yrs The color of the specimens is detd relative to one of the standards of a medium color After a search for mineral standards powd glass resembling sugar in color and in grain size was chosen as a standard Complete matching was not possible, for sucrose is cryst optically anisotropic and colored only on the surfaces glass has lustrous cleavage, is optically isotropic and is colored throughout its thickness All standard types of raw sugar showed an increase of 0.08 g in wt during the 2 yr period as a result of an increased humidity In 31 of the standards, the change in absorption did not exceed 1.5%, 6 standards showed an increase greater than 3% 2 were altered to visual inspection and discarded Since all standards are kept in the dark at 20° Š thinks that changes in humidity lead to a spontaneous refining of the raw sugar The small changes permit the same standards to be used for another (3rd) year Frequent (monthly) retesting is of no value Frank Marpsh

Adsorption from sucrose solutions. IV. Sucrose according to the stratum method. J. Vašátko and J. Vácha *Listy Cukrovar* 49, 215–9 (1931), cf. *C. A.* 24, 6053.—Sucrose solns lower the decolorizing effect of activated charcoal Sucrose solns (*d* 1.0904, *p*H 7.3) at 20° were passed through 10 g dry charcoal spread out in layers 7–8 mm thick The vol of sucrose passing through the charcoal layers increases linearly with time The time required for the flow of 50 cc of the above sucrose soln varied with different charcoals standard norite 27 sec, supranorite (5+) 41 sec, polycarbon 49 sec, supranorite (3+) 53 sec, carboraffin 56 sec, supracarboraffin 66 sec, and radite 93 sec. The same values were obtained with water, in dil solns, sucrose has little effect upon the rate of flow through charcoals The dry charcoal adsorbs more water than sucrose during early filtration Plotting the adsorbed sucrose against vol of soln filtered showed a typical isotherm with an asymptotic approach at a vol of 50 cc of filtered soln Colored sucrose solns deviated greatly from water curves, during the start of filtration water is adsorbed more rapidly than sucrose so that even a *neg.* absorption of sucrose may occur The max sucrose adsorbed by this layer method is the same as the max sucrose adsorbed by charcoal in suspension, providing the same ratio of soln to charcoal exists Leaching expts show a complete reversibility of the adsorption of sucrose upon charcoal Frank Marpsh

*p*H and acidity determinations of cane juices expressed by a fourteen-roller milling plant. Francisco S Gomez *Philippine Agr.* 19, 609–34 (1931).—Detns of total acidity by titration, *p*H by quinhydrone electrode and Brix solids were made of the juices coming from each mill of a sugar central The total acidity of the first mill juice is greater than that of crusher juice This is not due to bacterial action but to expression of acids from the rind of the cane Large amts of sucrose are lost when juice is allowed to stand more than 24 hrs When the mills are thoroughly washed once every shift, bagasse is periodically removed and the juices are handled promptly, the increase in acidity due to bacteria is negligible The use of chemicals in cleaning the mills is not advisable A. L. Mehring

**The results of eugenic experiments with sugar beets.** F. Chmelař and Jar Šimon *Listy Cukrovar* 49, 265-70(1931).—Four domestic varieties of sugar beets, 4 German and 1 Polish were grown on 12 plots. The order of total yield of sugar was Dobrovická, Zapotilova, Selecta Praha, Wohanka, Schoblert, Schreiber SS, Kleinwanzlehen N. Mette and Buszczynski P. Dobrovická, Zapotilova and Selecta Praha were characterized by a high yield and good sugar content and excelled all foreign varieties in total sugar yield. Wohanka had the highest sugar content but only an av. yield. Frank Marsh

**The increased sugar-beet yield by early planting and late harvesting.** Koch *Zuckerrubenbau* 12, 73(1930); *Listy Cukrovar.* 48, No. 12, Rozhledy 41.—Late harvesting is recommended. Frank Marsh

**The time for beet thinning.** Kamlah *Zuckerrubenbau* 12, 78(1930); *Listy Cukrovar* 49, No. 4, Rozhledy 1. Frank Marsh

**The prediction of the quality of a seasonal run of beets on the basis of beet analysis.** Jiří Vondrák. *Listy Cukrovar.* 49, 384-7(1931).—The quality of the alky. of beet liquors was predicted correctly in 10 out of 12 cases from the amide N content of the beet. V. considers the amide N an index of what the alky. of the juices will be from the same beets unless the alky. is not decreased by the inversion of sucrose. The frequency of rainfall is the most reliable criterion for making the above prediction. F. M.

**Parasites and diseases of beets for 1930 (Czechoslovakia).** F. Rambousek. *Listy Cukrovar.* 49, 387-97(1931).—A detailed annual report is given for all forms of parasites including the extent, no., type of destruction and effective means of eradication. Beet pathology is discussed in the same manner. Frank Marsh

**A negative correlation observed between the nitrate nitrogen in the juice of beet leaves and the weight of the leaves.** Donald D. Fran *J. Agr. Research* 42, 53-6(1931).—In order to reduce the possibility of serious sampling error it is necessary to choose leaves that are approx. the same size. W. H. Ross

**The yield of sugar from dried slices.** J. Hanous *Listy Cukrovar* 49, 352-3(1931).—A computation is given showing the cost of manuf. of sugar from dried beets. Frank Marsh

**The increase of polarization of sugar-beet mash by grinding, mixing and drying.** O. Kopecký. *Listy Cukrovar* 49, 275-83(1931). *cf. C. A.* 24, 312.—Samples ranging from 100 to 1790 g. were ground, mixed and weighed. The following facts were observed: (1) Beets lose weight during weighing. (2) Beet mash loses weight during mixing and weighing. (3) The loss in wt. is due to an evapn. of water, it is responsible for higher polarization values for mash than for beets. (4) The loss in wt. and increase in the polarization vary directly with the time of grinding, time and rate of mixing, time of analysis, temp. and humidity of the atm. and surface area of the exposed mash. (5) The smallest loss in wt. occurs during the weighing, the largest during grinding. (6) The increase in polarization always exceeds 0.1%, and may exceed 0.2%. F. M.

**Experiments on decolorizing greens from refined loaf sugar with norite.** I. F. Zelikman and A. I. Sichkarenko. *Nauk. Zapiski Tzukrovoi Prom.* 10, 403-17(1930).—Greens of 65° Brix mixed with 0.75% of standard norite were heated for 15 min. at 60°, 75° and 90°. The increase of the temp. from 60° to 75° gave a decrease in color of about 7% and with a further increase of the temp. to 90°, the color decreased about 5% more. To prevent an increase of reducing sugars at the high temp. all further expts. were made at 75°. Decrease of the d. from 70° to 50° Brix gave about 20% more decolorizing effect. An increase of the time of contact of norite with greens from 15 to 45 min. gave a very slight increase in decolorization. An increase of standard norite from 0.5 to 1.0% gave a noticeable decrease in color. A further increase of norite to 1.25% did not show any further benefit. Expts. at the refinery gave better results than in the lab., probably because of the thickness of the norite cakes in the filter presses. The quality of the sugar from greens treated with norite was lower than that of refined sugar of middle quality. Norite was regenerated by the following scheme. Discharged from filter presses it was mixed with water to about 20° Bé. and boiled with HCl for 1 hr., filter pressed and washed to a slight acid reaction. It was then heated in retorts. Norite used for lower grades of refined sugar was first boiled with NaOH for 2 hrs., then treated as above. Regenerated norite gave very poor results in decolorizing greens. The decolorizing power of norite depends on the initial color of the liquors. Hence decolorizing of refinery greens with bone black is more advisable as the decolorizing results are better and manuf. costs are lower. *V. E. Baikow*

**The Teatini method of clearing liquors.** K. Smoleński and M. Werkenthinówna. *Gazeta Cukrownicza* 68, 145-8(1930); *Listy Cukrovar* 49, No. 26, Rozhledy 24.—The process of using 1.01% CaO in the Hougaerde factory decreased the time of

filtration, and extn. of slices with a high CaO recovery. The [illegible] throughout the process are given. FRANK MARESH

The course of the first saturation. V. Saturation with oxalic acid in solutions of lime and sucrose. J. DĚDEK AND D. IVANČENKO *Listy Cukrovar.* 47, 271–3 (1931); cf. C. A. 25, 1700–1.—Studies in the course of satn. of a CaO sucrose [illegible] showed that the origin and quantity of sediments are not proportional to the quantity of $CO_2$, and that with a delayed or sudden formation of sed. ment, CaO and sucrose are removed from soln. Further satn. with $CO_2$ allows both CaO and sucrose to reenter the soln. from the sediment. The release of CaO exceeds the rate of satn. with $CO_2$ and leads to a temporary increase in alky. Solns. contg. 15% sucrose and 1% CaO were treated with increasing quantities of $(COOH)_2$. The course of the first satn. with $(COOH)_2$ gave the same picture of changes in alky. as $CO_2$, the withdrawal of CaO from soln. by the sediment occurs only at full satn. or at elevated temp. The addn. of $CaC_2O_4$ to CaO-sucrose-solns. causes an immediate withdrawal of CaO from soln. with the sediment. The alky. of the solns. after equil. is reached corresponds to a satd. CaO soln. CaO from a freshly or undersatd. soln. cannot be adsorbed by sediment. Sucrose is only adsorbed with adsorbed CaO. A max. of 2.5 equivs. of CaO is ppd. by $CaC_2O_4$. FRANK MARESH

Glycerophosphoric acid during filtration and saturation. BLAHOSLAV DUDOUŇ *Listy Cukrovar.* 49, 371–4(1931).—Sucrose solns. (15%) contg. 0.2 or 2.0% CaO were treated with Ca glycerophosphate (0.3 g. per 100 cc.) and digested 12–60 hrs. at 20° and 100°. The amt. of Ca glycerophosphate hydrolyzed ranged from 2.6 to 4.8%; and independent of temp. and time. During the satn. of a 15% sucrose soln. contg. 2% CaO at 80°, the hydrolyzed Ca glycerophosphate did not exceed 6.3% and 83.8% of the phosphate was carried down with the sediment in an insol. form. The ratio of inorg. phosphate to org. phosphate was 1:13. In com. preps., the reverse ratio holds because of the presence of inorg. phosphate in the root of the beet. During the 2nd satn., only traces (0.06%) of the Ca glycerophosphate hydrolyzed and 6.2% was ppd. with the sediment in an insol. form. The total Ca glycerophosphate recovered in analysis was 96.4%. Solns. contg. 15% sucrose, and 1.2491 g. Ca glycerophosphate per 500 cc. were made slightly acid with HCl and treated with 3.5 g. $CaHPO_4$. The ratio of org. P to inorg. P was 1.5. After heating the solns. were made alk. with milk of lime, cooled, made up to 1 l. vol. and filtered. The Ca phosphate ppt. carried with it 85.1% of the added glycerophosphate. The addn. of 1.4 g. $CaHPO_4$ to the preceding clear filtrate and a repetition of the treatment carried down 8.2% more of the org. P. The Ca glycerophosphate is hydrolyzed very little to glycerol + Ca phosphate during filtration, and satn.; it is deposited without decompn. in the sediment. This pptn. is due to the adsorption of the org. P upon the ready formed Ca phosphate ppts. Further studies with glycerophosphates from lecithin are promised. FRANK MARESH

The porosity of sediments. J. DĚDEK AND L. DOSTÁL. *Listy Cukrovar.* 49, 375–82(1931).—A series of runs with Krogg, Sweetland and Kelly presses contg. satn. sediments is described in detail. Increasing addns. of CaO up to satn. decrease the porosity; in a semi-com. plant when the CaO was increased from 1.2 to 4% the porosity decreased from 62.4 to 43.8. This is a reversal of the experience in com. operation. D. ascribes the discrepancy to an increased sp. gr. of the sediment with a decreased vol. of porosity. FRANK MARESH

Antiseptic medium "Lystonol." J. ZALESKI. *Gazeta Cukrownicza* 66, 653–5 (1930). *Listy Cukrovar.* 49, No. 4, Rozhledy 4.—During the foaming of liquors in the diffusion process, 20–40 g. Lystonol is added per ton of beets to prevent infection. Analysis shows $H_2O$ 72.43, HCHO 0.79, $ZnCl_2$ 8.03, NaCl 17.07, $CaSO_4$ 0.46, $FeCl_2$ 0.27, and $NH_4Cl$ 0.56%. The active disinfectants are $ZnCl_2$ and HCHO. F. M.

Volumeter of modified construction and its manipulation. V. YAVORSKII. *Nauk. Zapiski Tsukrovoi Prom.* 10, 423–9(1930).—The vol. of a lump of sugar is detd. by the difference in the vols. of kerosene in a volumeter (*C. A.* 23, 297; 24, 257). Instead of kerosene Hg can be used and has the advantage that the same sample of sugar can be used for crushing and soly. tests. The methods for the detn. of the constant of the app. and limits of the error are described. V. E. BAIKOW

Isolation of choline from beet molasses. V. STANĚK. *Z. Zuckerind. Czechoslov.* 55, 103–5(1931).—See *C. A.* 25, 1406. G. G.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Various vegetable tanning materials from Eritrea.** G. A. BRAVO. *Ann. chim. applicata* 21, 141–6(1931).—Several plants have been found in Italian Eritrea which contain high percentages of tanning materials. Among these *Osyris abissinica* (Eritrea sumach) and *Acacia nilotica* both have considerable tannins, 18.4 and 35%, resp., the first is widely diffused, but is readily affected by parasites while the latter is compara

tively rare However, *Caesalpinia tinctoria*, having tannin contents up to 51%, has been cultivated, and promises to become a source of tannins, and also to become a good substitute for sumach A W Contieri

**Analysis of miscellaneous tannery materials. Committee report.** V. J. Mel'nik. *J Am Leather Chem Assoc* 26, 249–57(1931) — Provisional procedures (based on familiar methods) are submitted for the routine analysis of sodium sulfide, lime, Epsom salt, soda ash, $NaHCO_3$, NaOH, $H_2SO_4$ and $NaHSO_3$ H B Merrill

**Determination of moisture in tanning extracts. Committee report. 1930-31.** Gene W Stanberry, *et al* *J Am Leather Chem Assoc* 26, 214–6(1931), cf *C A* 23, 3368 — Samples of quebracho and chestnut exts were analyzed for $H_2O$ by the direct and by the indirect methods Quebracho showed no difference outside the permissible range of expt'l error chestnut gave lower results by the direct method Lowest total solids resulted from 6–16 hrs' drying in the direct, and 16 hrs' in the indirect method Variations in humidity are without effect when the prescribed dryer is used The electric oven at 99–103° gave results for $H_2O$ that are very slightly higher than those obtained with the "evaporator dryer" H B Merrill

**Quantitative method for determining tannin colorimetrically and the value of the method of P. Menaul.** A B Shakhkeldian *Zhur Prikladnoi Khim* 3, 1117–24 (1931) — The unknown soln should contain 0.5–2.0 g tannin per l Add to 100 cc of it 0.315 g chem pure tannin dried at 100° and to 10 cc of the resulting soln add 10 cc of a 2% $(NH_4)_6Mo_7O_{24}$ soln and dil to 100 cc To 10 cc of the unknown soln add also 10 cc of a 2% $(NH_4)_6Mo_7O_{24}$ soln (neutral salt can be used) and dil to 100 cc After 15 min standing compare both solns in a Duboscq colorimeter and calc the results, assuming that 0.315 g chem pure tannin of Kahlbaum contains 0.015 g impurities This method is only 1/10 as sensitive as the method of Menaul (*C A* 18, 1005) but is simple, rapid and the color produced is more stable V Kalichevsky

**Some notes on microscopic technic with special reference to microtannology.** Fred O'Flaherty *J Am Leather Chem Assoc* 26, 257–64(1931) H B M

**Tanning and dyeing of furs.** A Dohogne *Bull officiale staz sper ind pelli mat concianti* 8, 168–71(1930) — Directions are given G Schwoch

**Application of colloidal mills to the leather industry.** Alan A Claflin *Leather Manuf* 42, 59–60(1931) — It is suggested that better emulsions with less emulsifying agent can be made for fat liquoring by the use of the colloid mill H B Merrill

**Skin color tests. Committee report, 1931.** C A Blair, *et al* *J. Am Leather Chem Assoc* 26, 223–34(1931), cf *C A* 25, 2325 — Pickled calf skin and sheep skivers were depickled with borax, adjusted to $p_H$ 4.8 with acetate buffers, and preserved with borophenol soln Tanning tests were made with cutch, quebracho and chestnut exts under a variety of conditions Collaborators' comments indicate that the method is generally satisfactory, divergent opinions are expressed regarding working details H B. Merrill

**Collagen and gelatin.** G C Hering and H R. Kruyt *Chem. Weekblad* 28, 142–50(1931) — A review F de Leeuw

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Evaluating gas blacks by the D. P. G [diphenylguanidine] adsorption method. I. DROGIN. *India Rubber World* 83, No 6, 57–9, 62(1931) —Not all gas blacks adsorb a given accelerator to the same extent, and therefore the rate of vulcanization of a rubber mixt. contg the accelerator varies with the gas black used The analytical method described is claimed to be reliable in evaluating the effect of gas blacks on the rate of vulcanization and on the phys properties of the vulcanizate, with diphenylguanidine as accelerator *Procedure*—Agitate 2 g of gas black with 100 cc. of MeOH solns of diphenylguanidine of 6 different normalities (0.0025–0.20 *N*), centrifuge and titrate *10 cc. of the supernatant liquid with MeOH solns of HCl of the corresponding nor*malities (bromophenol as indicator) All calcns. are expressed volumetrically in terms of a single normality of HCl. The quantity of diphenylguanidine adsorbed as a function of the quantity remaining in soln. (both in terms of HCl), when expressed in graphical form (ordinate and abscissa, resp.) gives a curve which, converted to a logarithmic basis, becomes a straight line. The distance between the abscissa axis and the point of intersection of this straight line with the ordinate axis represents the logarithm of a const. The antilogarithm of this const. represents the value of the gas black. Exptl. data show the application of this method to 4 different gas blacks C. C. DAVIS

Behavior of various clays with crude and reclaimed rubber. H. A. WINKELMANN AND E. G. CROAKMAN *Ind. Eng. Chem.* 22, 865–9(1930) —Often the influence of 2 different clays on the properties of a rubber mixt. is greater in the uncured than in the cured mixt. The present paper shows the variations in raw rubber and in reclaimed rubber produced by various com. clays, as judged by plasticity, retentivity, phys tests, artificial aging and chem. analysis A microscopic examn. also shows the relation between particle size and phys properties of the raw and reclaimed rubbers The results are described in detail and shown graphically, and lead to certain general conclusions: (1) Chem analysis of a clay gives little or no useful information about its behavior in raw or reclaimed rubber On the other hand, its acidity or alky has an influence on the rate of vulcanization and should be detd. The color of a clay does not indicate its purity or behavior (2) There are wide differences in the effects of different clays on the plasticity, retentivity and softness of raw and reclaimed rubbers. (3) In cured new and reclaimed rubbers, clays vary greatly in their effect on the phys properties, the same relative effects being obtained in the new and reclaimed rubber mixts. There is not, however, so much variation in tensile strength in reclaimed rubber vulcanizates as in new rubber vulcanizates (4) Artificial aging in compressed O *serves better to distinguish clays and is an important test in judging their merits.* (5) By microscopic examn. it is possible to judge the relative effects of clays in new and reclaimed rubber, both uncured and cured. C. C. DAVIS

Rosin and rosin oil in rubber and reclaimed rubber. H. A. WINKELMANN AND E. B. BUSENBURG *Proc. Am. Soc. Testing Materials* 30, Pt. II, 807–27(1930) —Rosin and rosin oil can be satisfactorily used as softeners for rubber, with due regard to proper compounding conditions. Different types and grades of rosin and rosin oil are described, and the phys. properties of both gum and wood rosins are given in tables.

"Synthetic" rosin oils of low rosin content, retort pine tar and kiln pine tar, having acid nos. of 65–90, can be used interchangeably as softeners, but rosin oils contg much rosin, rosin itself or neutral rosin oil must each be handled differently. Besides acting as a softener during the mfg process, rosin also activates the accelerators, but because of its relatively greater effect as a softener the cure is slower with rosin than with fatty acids To prevent rosin from lowering the modulus and tensile strength of rubber, greater proportions of accelerator must be used Three different grades of rosin appeared to affect modulus, tensile strength and aging equally. If wood rosin is substituted for the pine tar in an ordinary tread stock formula, the rate of vulcanization and tensile strength are slightly lowered, and if substituted for the stearic acid there is considerable softening and the rate of vulcanization is lowered A no of expts are described, in which various grades of gum and wood rosin, pine tar and "synthetic" rosin oil are incorporated as softeners in a rubber compn and their effect on plasticity, "nerve," elongation and tensile strength, aging and softness ascertained Rosin is also useful in imparting tackiness to rubber, and as a devulcanizing agent Also in *India Rubber World* 83, No 6, 63–5, 67(1931), 84, No 1, 56–8(1931) H K. Salzberg

**Some recent engineering applications of rubber.** J R. Hoover and F. L. Haushalter *Ind Eng Chem* 23, 402–9(1931).—The discussion includes rubber bearings, electrodeposited rubber products, absorption of vibration and noise, heat resisting and oil resisting rubber products, rubber products resistant to chemicals, rubber as a preventive of aviation ice hazard and various other applications. C. C. Davis

**Toxic substances in the rubber industry. XX. Sulfur monochloride.** P. A. Davis. *Rubber Age* (N Y.) 29, 77–8(1931). cf *C. A.* 25, 2329.—A review and discussion of the physiol properties of $S_2Cl_2$ and preventive and remedial measures to be taken C. C. Davis

**Accelerated discoloration tests for white rubber products and methods of measuring the extent of the discoloration.** Harlan A Depew. *Rubber Age* (N Y.) 29, 27–30(1931).—The discoloration (yellowing) of vulcanized rubber upon exposure to sunlight is a function of (1) the character of the light (the shorter the wave length the more rapid the discoloration), (2) the temp (the higher the temp the greater the discoloration) and probably (3) moisture (the yellow color is leached away by water) Light from a Hg arc may be used as the basis of an artificial discoloration test, and the changes in color may be measured by a "K and E." color analyzer. In this way it was shown that the higher the lithopone content of vulcanized rubber the less did the latter discolor, and that ZnO inhibited the yellowing of vulcanizates contg lithopone C. C. Davis

**The effect of grit upon the stress and strain properties of a carbon-black stock.** L. P. W. Kearsley and C. R Park *Rubber Age* (N Y.) 29, 79–80(1931).—From a practical point of view, a small proportion of grit in C black does not impair the resistance to abrasion of a vulcanizate contg it, as shown by Twiss (cf. *C. A.* 20, 3838), and it is only the ultimate elongation and tensile strength which may be seriously affected. The present paper describes expts on this latter effect, a field of investigation not well covered in the literature To the base mixt : rubber 100, S 3.5, diphenylguanidine 1.25, ZnO 5, were added samples of a C black to which had been added increasing proportions of C-black grit from elsewhere The mixts were cured 20, 60 and 90 min. at 140° and tested for tensile strength and modulus. Up to 3% the grit had no measurable effect on the tensile strength or on the modulus. Above this proportion, the values began to decrease progressively When poor results are obtained with gas black, factors other than grit are responsible, notably poor dispersion of the pigment (cf Endres, *C. A.* 19, 1208) *Agglomerates in the unwet state disintegrate upon stretching and form points of weakness* The present day tendency to minimize times of mixing results in incomplete dispersion, and it is probable that premature tread wear and cracking are a result of this rather than of gritty pigments C. C. Davis

**A contribution to the problem of the impregnability of cord threads with rubber.** F A Hauser and M Hünemörder *Metallgesellschaft Periodic Rev.* No. 5, 13 S (1931).—There is almost no literature on the impregnability of fabrics by latex and by rubber in org solvents except the investigations of Dietrich (*C. A.* 24, 1543) and Grenquist (*C. A.* 22, 4875), and the methods used by both give untrustworthy results because of the changes which may take place during the rigorous treatment. For this reason a new microscopic method was developed which should be free of these shortcomings and with which were examd fabric or cord (1) covered with visibly thick rubber, *e. g.*, coated on both sides with or without previous impregnation, and (2) protected by a rubber coating of no significant thickness, *e. g.*, impregnated with latex or rubber in an org. solvent. In case (1) the sample is set in hard paraffin, dissected and

frozen with $CO_2$ to a depth of 200$\mu$, a microsection 20–30$\mu$ thick is cut on a sliding microtome, immersed in warm water, dried on a microscope slide, immersed in concd $H_2SO_4$ for 1–2 hrs., washed clean with $H_2SO_4$ and examd. directly or preserved in Canada balsam. In case (2) the sample is immersed in 7% gelatin soln. and solidified by cooling, and the same procedure used as before. The samples thus examd. were: (1) thread soaked in 5% benzine rubber soln., (2) sample (1) after treatment with $H_2SO_4$, (3) thread soaked in 33% latex (ammoniated), (4) sample (3) after treatment with $H_2SO_4$, (5) dry cord threads frictioned with rubber, (6) sample (5) after treatment with $H_2SO_4$, (7) cord fabric soaked in rubber in $C_6H_6$, then skimcoated on both sides and finally treated with $H_2SO_4$, (8) latex cord fabric coated on both sides and treated with $H_2SO_4$, (9) cord fabric coated on both sides and after vulcanization treated with $H_2SO_4$, (10) latex cord fabric coated on both sides and after vulcanization treated with $H_2SO_4$; and (11) dry cord fabric in sheets treated with $H_2SO_4$ after vulcanization. Microscopic examn. of these different samples made possible, in conjunction with earlier expts. on phenomena taking place during vulcanization (cf. *C. A.* 22, 4870, 23, 3597), the drawing of certain general conclusions. A fabric previously soaked in a $C_6H_6$ soln. of rubber is already completely impregnated with rubber before vulcanization, whereas a fabric soaked in latex is only covered with an external coating of rubber, even after vulcanization. When threads which have not been treated are embedded in rubber sheets, or when rubber mixts. are frictioned on dry fabrics, there is no impregnation previous to vulcanization, but impregnation takes place to a high degree during vulcanization as a result of the flow of the rubber. The extent to which weftless cords can be impregnated in a vulcanized state depends not upon whether the fabric has been previously treated but upon the phys. condition of the rubber. The reason that the rubber in latex is merely deposited on the surface is that the rubber hydrocarbon is present as particles whose av. diam. is 1–2$\mu$, and the capillary interstices of the fibers are smaller than these particles. The question whether cord fabrics and weftless cords prepd. with $C_6H_6$ solns. of rubber or those with latex are superior in strength, elasticity and durability is not settled by the present investigation. C. C. Davis

**Graphical tensile-testing machine for rubber threads.** S. H. Hahn and E. O. Dieterich. *Ind. Eng. Chem., Anal. Ed.* 3, 218–21(1931).—The new machine, the construction and operation of which are described in detail, allows the testing of thread having breaking strengths of approx. 400–2000 g. and elongations up to 1000%, with great precision at 200–700% elongation. Curves show the stress-strain curves of typical threads by this method and a comparison in 1 case with the stress-strain curve of the same vulcanizate by the ordinary method. C. C. Davis

**Experiments on some technical mixtures with reference to their electrical properties.** I. Jacobs. *Kautschuk* 7, 4–7(1931).—The object of the expts. was to ascertain to what extent the compn. and the color of rubber matting influence the elec. insulating power. In expts. already described (cf. *C. A.* 24, 4058) it was found that certain coloring agents like ocher and C black have unfavorable effects on the resistance to elec. puncture. In places where the sheets were united during vulcanization, and at the junctions of 2 colors in mottled samples, the resistance to breakdown was no lower than in the corresponding homogeneous sections. The higher the voltage the shorter the time before breakdown. A systematic study of the influence of various fillers on the dielec. resistance of matting was carried out by using a base mixt. contg. 45% natural whiting and comparing the behavior of this with corresponding mixts. contg. kaolin, kieselguhr, slate powd., marble and pptd. $CaCO_3$ instead of whiting. With kaolin and with pptd. $CaCO_3$ the resistance to elec. breakdown was less than with the other fillers. Kieselguhr and powd. marble gave the highest resistances, followed by slate and natural whiting, which were greatly inferior to kieselguhr and powd. marble. In every case the green *matting samples contg.* $Cr_2O_3$ *were inferior to the gray ones.* The quant. results of the elec. measurements are given in tables. C. C. Davis

**Accelerators of vulcanization.** I. Jacobs. *Caoutchouc & gutta-percha* 28, 15438–45 (1931), cf. *C. A.* 25, 2330.—The manuf., phys. and chem. properties and behavior from an accelerating point of view of com. thiuram derivs. are described, with quant. data. *Ibid.* 15485–91.—The properties and behavior of tetramethylthiuram disulfide under various conditions and in various types of rubber products are described, with quant. data. C. C. Davis

**Rubber compositions.** Paul Hoyer and Hans Hoyer. Ger. 522,091, Aug. 25,

1920 A fusible rubber compn that resumes its original condition on cooling is prepd by heating rubber or gutta percha with about 20–25% of paraffin, adding S to the melt in the proportion required for vulcanization and further heating until a liquid of watery consistency is obtained, to which fillers addnl rubber and S, etc., may be added The mixt should be stirred throughout the process The product may be cast, or applied to containers as a protective lining It contains only a little paraffin, the greater part evapg during the process An example is given

**Sponge rubber.** Gummi und Balata Werke "Matador" A G Austrian 122,000 Nov 15 1930 Variegated sponge rubber showing marbled or veined effects is prepd by combining a no of differently colored rubber masses to each of which suitable softening and gas forming reagents have been added The masses may be drawn out into thin sheets and superposed then rolled up together twisted and rolled out into strips which are laid side by side in a mold and vulcanized

**Preventing the deterioration of rubber.** The Naugatuck Chemical Co Fr. 697,630 June 18 1930 Rubber and other vulcanizable materials are treated with products obtained by the reaction in the presence of a dehydrating agent of a secondary aromatic amine having the general formula R NH R′ with an acid of the general formula RCOOH in which R is an org radical or H and R and R′ are mono or polycyclic residues in each of which the C atom α to the N atom is joined to a H atom Methylacridine obtained by the reaction of $Ph_2NH$ on AcOH naphthbenzacridines from phenylnaphthylamine or diacridylethane may be used

**Inhibiting cracking of rubber when exposed to sunlight** Sidney M Cadwell and Ludwig Meisel (to Naugatuck Chemical Co) U S 1,798,133 March 31 Sulfoxides (suitably 1–5% the quantity of the rubber) are used such as diphenyl sulfoxide, di *p*-tolyl sulfoxide, dibenzyl sulfoxide, dibutyl sulfoxide or dibenzyl disulfoxide

**Antioxidant for treatment of rubber.** Sidney M Cadwell and Sherman I Strickhouser (to The Dominion Rubber Co Ltd) Can 310,115, Apr 7, 1931 *Deterioration and surface cracking of rubber are retarded by treating vulcanizable rubber stock* with the material obtained by mixing a polyethylenepolyamine b above 130° and a monohydroxynaphthalene, and then vulcanizing the stock

***Antioxidant for treatment of rubber.*** Clyde Coleman (*to* The Dominion Rubber Co, Ltd) Can 310,141, Apr 27 1931 The deterioration of rubber is retarded by treating rubber in the presence of an accelerator and a vulcanizing agent with 4,4′-diaminodiphenylmethane, and subsequently vulcanizing the rubber

**Regenerated rubber.** American Glue Co Fr. 698,452, July 7, 1930 Rubber is recovered from waste rubber by submitting the waste to the action of the cleavage products from the dissocn of tanned leather during the process of devulcanization

**Plastic materials.** Jean Barr Fr. 697,641, June 18, 1930 A plastic-elastic material is made by dissolving in $CS_2$ the polymerization products of halogenated hydrocarbons of the group $C_nH_{2n+2}$ with polysulfides and by mixing this soln with natural rubber latex *Cf C A 24, 528*

**Masses resembling hard rubber.** I G Farbenind A.-G. Fr 698,208, July 2, 1930 Mixts of natural rubber and artificial masses resembling rubber are treated in the same way as *hardened rubber is usually treated* Besides S vulcanization accelerators and fillers may be added

**Temperature-regulating system for rubber extrusion apparatus.** Ralph B Day (*to Goodyear Tire & Rubber Co*) U S 1,800,180, April 7

**Rubber coatings.** Dunlop Rubber Co, Ltd, and The Anode Rubber Co, Ltd Fr 697,762, June 21, 1930 Cellulosic or fibrous vessels are coated with rubber or similar vegetable resins applied in the form of solns or aq emulsions or dispersions, which may also contain a wax or mixt of waxes

**Hose of rubber and fibrous material.** Charles W Leguillon (to B F Goodrich Co) U. S 1,798,798, March 31 Various details of mech assembly and vulcanization are described

**Compounding soap-forming materials with other substances.** Willis A Gibbons (to American Rubber Co) U S 1,798,253, March 31. In forming products suitable for compounding with rubber latex, a water-sol volatile base soap of a higher aliphatic acid such as $NH_4$ stearate is first mixed with a filler such as C black, in finely divided fluid form, which is nonreactive with the acid, the material is mixed with a rubber latex, *and the soap is then reconverted into the original material* (suitably by removing $NH_3$ in a drying operation)

**Synthetic rubber.** I. G. Farbenind A.-G. Ger. 522,090, July 13, 1928 Butadiene hydrocarbons are polymerized by treatment *with NaH at atm* or raised temp. An example is given.

Synthetic rubber. I G FARBENIND A.-G Fr. 697,679, June 19, 1930 In the polymerization of 1,3 butadiene or its homologs or analogs by the aid of alkali metals, the metal is placed in a vessel with one or more walls and is in communication through openings of at least 2 mm diam with the hydrocarbon. The vessel used may be filled up with the hydrocarbon which is allowed to polymerize and then added to the main mass of hydrocarbon

Rubber-vulcanization accelerator. RALPH V. HEUSER (to American Cyanamid Co.) U S 1,798,159, March 31. Dibenzylguanidine is used as an accelerator and general mention is made of the use of some similar compds

Rubber-vulcanization accelerators THE NAUGATUCK CHEMICAL CO. Fr 698,259, July 1, 1930 The aliphatic bases produced by the reaction of dihalides of ethylene or its homologs with $NH_3$ are used as accelerators

Triazine derivatives containing sulfur. SOC ANON. POUR L'IND CHIM À BÂLE. Fr 697,599, June 18, 1930 Triazine derivs contg at least one atom of exchangeable halogen are condensed with at least one mol of a S deriv. contg an SH group and a group easily removed. Such derivs of S are thiosulfates, thiocyanates, xanthogenates, di or poly sulfides The products are transformed by sapon and reduction to mercaptotriazines Examples are given including the prepn of dimercaptophenylaminotriazine (m 248°), mercaptoaminophenylaminotriazine (m 240°), dimercaptonaphthylaminotriazine (m 260–262°) and mercaptoamino-α-naphthylaminotriazine (m. 257–258°) The products are used in the *vulcanization of rubber*.

Apparatus for vulcanizing tire and other rubber articles. PAUL WIECHARDT (to Fr Krupp Grusonwerk A G.) U S 1,798,826, March 31 Mech. features

Vulcanizing rubber. I G FARBENIND A G Fr 697,568 June 17, 1930 Mixts. of rubbers obtained in different ways from natural and synthetic rubbers are vulcanized in the presence of finely divided C (lampblack) *Cf. C. A.* 25, 1412

# CHEMICAL RESEARCH PERIODICALS

COMPLETE SETS. VOLUMES OR SINGLE COPIES OF DOMESTIC AND FOREIGN CHEMICAL & SCIENTIFIC MAGAZINES. BOUGHT & SOLD.

## B. LOGIN & SON, INC.

Estab. 1887

29 East 21st St., New York

## Professional Directory Announcements
